A. B. 1203, by Voigt, Gilbert, Pelletier, Reaves and Richie (referred to Committee on Medical and Dental Laws). Regulates persons engaged in and training for the practice of naturopathy and the schools instructing persons to engage therein.

A. B. 2315, by Gilmore (referred to Committee on Medical and Dental Laws). Relates to the raising of educational qualifications of the drugless practitioner.

Nursing

(Six Bills)

A. B. 563, by Fulcher (referred to Committee on Medical and Dental Laws). Practical Nursing Act.

A. B. 564, by Fulcher (referred to Committee on Governmental Efficiency and Economy. Relates to the Board of Practical Nurse Examiners.

A. B. 619, by Cronin, Hugh M. Burns, Poulson, Meehan, Field, Call, Robertson, Sawallisch, Allen, Redwine, Daley and Eleanor Miller (referred to Committee on Medical and Dental Laws). Establishes Board of Nurse Examiners.

A. B. 620, by same authors as A. B. 619 (referred to Committee on Medical and Dental Laws). Nursing Practice Act.

S. B. 960, by Kenny and Biggar (referred to Committee on Governmental Efficiency). Identical with A. B. 619.

S. B. 961, by Kenny and Biggar (referred to Committee on Public Health and Quarantine). Identical with A. B. 620.

Optometry

(Five Bills)

A. B. 1718, by George P. Miller (referred to Committee on Medical and Dental Laws). Relates to the advertising of glasses and of optometry.

A. B. 1720, by Redwine (referred to Committee on Medical and Dental Laws). Relates to registered optometrists.

A. B. 2627, by Lyon (referred to Committee on Governmental Efficiency and Economy). Relates to admission to the practice of optometry.

A. B. 2628, by Lyon (referred to Committee on Governmental Efficiency and Economy). Relates to disciplinary actions under the chapter on optometry.

A. B. 2633, by George P. Miller (referred to Committee on Governmental Efficiency and Economy). Relates to offenses against the chapter on optometry.

Osteopathy

(One Bill)

A. B. 2346, by Daley (referred to Committee on Education). Relates to health and development certificates.

Pharmacy and Drugs

(Twenty-three Bills)

A. B. 450, 472, 689, 1018, 1019, 1067, 1131, 1147, 1177, 1574, 1695, 1830, 2080, 2441, 2722.

S. B. 517, 792, 817, 818, 819, 820, 1208, 1215.

Radio Advertising

(One Bill)

A. B. 666, by Gilbert (referred to Committee on Crime Problems). Relates to false advertising by radio and providing penalties for violation thereof.

Physically Defectives

(Seven Bills)

A. B. 1068, 1069, 1070, 1071, 2112, 2338. S. B. 658.

Public Medical Care

(One Bill)

A. B. 1874, by Del Mutolo (referred to Committee on Medical and Dental Laws). An act to promote the public health by providing for public medical care, including medical, dental, nursing, hospital, pharmaceutical and therapeutic appliance care for needy persons; providing for the apportionment of the cost of such medical care between the State and the counties and providing for the administration and enforcement thereof.

Sales Tax

(Six Bills)

A. B. 10 and A. B. 11, by Rosenthal (referred to Committee on Ways and Means). Exempts medicines.

A. B. 33 and A. B. 34, by Houser (referred to Committee on Revenue and Taxation). Exempts medicines.

A. B. 235 and A. B. 236, by Redwine (referred to Committee on Revenue and Taxation). Exempts orthopedic supplies.

Tuberculosis

(Six Bills)

A. B. 1117 and 1118, by Daley (referred to Committee on Social Service and Welfare). Relates to grants in aid for persons afflicted with tuberculosis.

A. B. 1184, by Lore (referred to Committee on Ways and Means). Appropriation for Bureau of Tuberculosis, Department of Health, for purpose of conducting a survey as to the prevalence of tuberculosis among persons on relief.

A. B. 1307, by Gilbert and Andreas (referred to Committee on Social Service and Welfare). Relative to aid for convalescing tuberculous persons.

A. B. 1964, by Garland (referred to Committee on Education). Relates to physical examinations of teachers for active tuberculosis.

S. B. 696, by Mixter (referred to Committee on Education). Companion measure to A. B. 1964.

(Continued on Page 217)

CALIFORNIA LEGISLATURE, 1939—FIFTY-THIRD SESSION

Query: Have you sent the number of your Assembly District to the central office? In the roster of Assemblymen, given below, do you know the name of the Assemblyman in whose district you live?

MEMBERS OF THE ASSEMBLY AND ADDRESSES—CALIFORNIA LEGISLATURE—FIFTY-THIRD SESSION, 1939

Name	*Occupation*	*Party*	*District*	*Home Address*	*Sacramento Address*
Allen, Don A.	Engineer	D	63	1226 W. 30th Street, Los Angeles	Hotel Sacramento
Andreas, Godfrey A.	Orange Grower	D	72	515 W. 17th St., Upland	
Atkinson, Maurice E.	Journalist	D	70	906 Obispo Ave., Long Beach	2405 D Street
Bashore, Lee T.	Rancher	R	49	250 Live Oak, Glendora	Hotel Governor
Bennett, F. Ray	Attorney	D	51	5041 Gafford Street, Los Angeles	910 O Street
Burns, Hugh M.	Funeral Director	D	36	2055 San Joaquin Street, Fresno	Hotel Senator
Burns, Michael J.	Master Mechanic	R	1	1644 Summer Street, Eureka	3135 42nd Street
Burson, Roscoe W.	Farmer	R	40	Fillmore	Hotel Sacramento
Call, Harrison William	Attorney	R	29	Eaton Drive, Redwood City	Hotel Sacramento
Carlson, Arthur W.	Attorney	R	16	Piedmont	Hotel Senator
Cassidy, James M.	Mfr.'s Representative	D	13	1520 89th Avenue, Oakland	Hotel Lenhart
Clarke, George A.	Farmer	R	33	Rt. 1, Box 54, Le Grand	Hotel Berry
Collins, George D., Jr.	Attorney	D	22	1456 Union Street, San Francisco	Elks Club
Corwin, Gordon W.	Citrus Grower	R	73	749 Chestnut Avenue, Redlands	Hotel Sacramento
Cronin, Melvyn I.	Attorney	R	25	1424 5th Avenue, San Francisco	Hotel Senator
Crowley, Ernest C.	Attorney	D-R	5	Suisun	
Daley, Jeanette E.	Contractor	D	78	4430 Boundary Street, San Diego	Lewis Apartments
Del Mutolo, M. G.	Attorney	D	31	1731 Glen Una Way, San Jose	Hotel Berry
Desmond, Earl D.	Attorney-Farmer	D	9	2022 22nd Street, Sacramento	2022 22nd Street
Dills, Ralph C.	Teacher	D	69	1505 N. Spring Street, Compton	514-A 13th Street
Dilworth, Nelson S.	Farmer	R	76	119 N. Buena Vista Street, Hemet	
Donnelly, Hugh P.	Insurance	D	32	114 Lyons Avenue, Turlock	Hotel Sacramento
Doyle, Thomas J.	Business Manager-Retired Railway Conductor	D	45	4333 Griffin Avenue, Los Angeles	901 26th Street
Evans, John W.	Accountant	D	65	717½ W. 46th Street, Los Angeles	Hotel Sacramento
Field, C. Don	Trucking Contractor	R	43	1552 Rideway Drive, Glendale	1116 O Street
Fulcher, Clinton J.	Garage	D	2	Lookout	Hotel Sacramento
Gallagher, Dan	Drayman	D	23	1670 Folsom Street, San Francisco	Elks Club
Gannon, Chester F.	Attorney	D	8	3543 H St., Sacramento	613 Capital National Bank Bldg.
Garland, Gordon H.	Citrus Grower-Farmer	D	38	Woodlake	3020 10th Avenue
Gilbert, Wilbur F.	Mechanical Engineer	D	54	3537 The Paseo, Los Angeles	Hotel Sacramento
Gilmore, Joseph P.	Secretary	D	21	442 Excelsior Avenue, San Francisco	Hotel Berry
Green, Robert Miller	Attorney	R	28	214 19th Avenue, San Francisco	Hotel Senator
Hawkins, Augustus F.	Business	D	62	719 E. 43rd Place, Los Angeles	2790 43rd Street
Heisinger, S. L.	Farmer-Poultryman	D	37	Rt. 4, Box 90E, Fresno	Hotel Lenhart
Houser, Frederick F.	Attorney	R	53	19 W. Pine Street, Alhambra	Hotel Senator
Johnson, Gardiner	Attorney	R	19	765 San Luis Road, Berkeley	Elks Club
Kellems, Jesse Randolph	Minister	R	60	454 Cuesta Way, Bel-Air, Los Angeles	Hotel Sacramento
Kepple, Gerald C.	Attorney	R	50	1952 Valley View, Whittier	1124 45th Street
Kilpatrick, Vernon	Publisher	D	55	1116 S. Flower Street, Los Angeles	1217 15th Street
King, Cecil R.	Merchant	D	67	1152 W. 88th Street, Los Angeles	Hotel Sacramento

---

Venereal Diseases
(Twelve Bills)

A. B. 32, by Hawkins (referred to Committee on Public Health and Quarantine). Provides for premarital examinations.

A. B. 106, by Redwine, Kellems, Poulson, Stream, Corwin, Kepple, Waters, Bashore, Knight, Allen, Doyle, Pelletier, Daley and Eleanor Miller (referred to Committee on Medical and Dental Laws). Provides for premarital examinations for syphilis.

A. B. 490, by Hugh M. Burns, Heisinger, Garland, Corwin, Kepple, Dilworth, Kilpatrick, Redwine, Knight, Miss Miller and Mrs. Daley (referred to Committee on Public Health and Quarantine). Provides for prenatal examinations for syphilis.

A. B. 492, by same authors as A. B. 490 (referred to Committee on Governmental Efficiency and Economy). Provides for prenatal examinations for syphilis.

A. B. 493, by same authors as A. B. 490 (referred to Committee on Medical and Dental Laws). Provides for prenatal examinations for syphilis.

A. B. 831, by Tenney, Allen, Evans and Atkinson (referred to Committee on Medical and Dental Laws. An act to require serological blood tests for syphilis of pregnant women.

S. B. 79, by Kenny and Fletcher, by request (referred to Committee on Judiciary). Premarital examinations for venereal diseases.

S. B. 80, by Kenny and Fletcher, by request (referred to Committee on Public Health and Quarantine). Prenatal examination for syphilis.

S. B. 130, by Fletcher, Biggar, and Kenny (referred to Committee on Public Health and Quarantine). Prenatal examinations for syphilis.

S. B. 173, by Fletcher, Biggar, and Kenny (referred to Committee on Public Health and Quarantine). Premarital examinations for syphilis.

S. B. 767 and S. B. 768, by Law (referred to Committee on Prisons and Reformatories). Relates to prisoners suffering from venereal diseases.

Vital Statistics
(Eight Bills)

A. B. 431, 432, 546, 2011, 2012, 2129, 2703. S. B. 144.

X-ray
(One Bill)

S. B. 1183, by Carter (referred to Committee on Public Health and Quarantine). An act to safeguard the public health, to regulate the use of x-ray and x-ray appliances in connection with the examination of the jaws, teeth, alveolar process, gums and the immediate adjacent structures of living human beings, as an aid to the diagnosis and treatment of diseases and lesions pertaining thereto, to regulate the use, ownership and possession of x-ray appliances for said purposes; providing for the licensing of persons operating dental x-ray laboratories and x-ray appliances and setting up qualifications for such use.

Miscellaneous
(Seventeen Bills)

Medical Examinations of Persons Arrested for Driving Under the Influence of Intoxicating Liquors—A. B. 839, by Allen, Tenney, and Evans.

Blood Grouping Tests—A. B. 1246, by Redwine.

Blindness at Childbirth—A. B. 2764, by Johnson (by request).

Clinics and Dispensaries—S. B. 659, by Mixter and Foley.

Hospital and Medical Care for Students in State Colleges—A. B. 1815, by Robertson.

Jail Physicians—S. B. 676, by Garrison.

Laboratories—S. B. 292, by Slater.

Massage—A. B. 2585 and 2586, by Allen, by request.

Prophylactics—A. B. 2144, by Lyon. S. B. 601, by Westover.

Professional Standards—A. B. 2672, by Daley.

Surgical Supplies—A. B. 2436, by Call.

Trichinosis—A. B. 1704, by Johnson (by request).

Veterinary Medicine—A. B. 2413, by Corwin; S. B. 446, by Metzger; S. B. 977, by Phillips.

COMMITTEE ON PNEUMONIA CONTROL

Acting as a subcommittee to the standing California Medical Association Committee on Health and Public Instruction, the Committee on Pneumonia Control, Dr. Roy Thomas, Los Angeles, chairman, and Dr. William Shepard, San Francisco, secretary, has been making an earnest effort to forward its work. As an expression of its activities in Los Angeles County, the following item is reported concerning the educational film on pneumonia, entitled "A New Day." The item from the "Bulletin" of the Los Angeles County Medical Association follows:

Showing Film on Pneumonia

Enthusiastic coöperation is being offered by the Fox West Coast Theaters in the pneumonia educational campaign in Los Angeles County.

Some weeks ago the film, "A New Day," approved by the United States Department of Public Health, and produced in Hollywood by the Metropolitan Life Insurance Company, was viewed by the members of the Pneumonia Control Committee of the California Medical Association and by motion-picture representatives. The Los Angeles County Medical Association asked the theaters to coöperate in the campaign to end unnecessary pneumonia deaths.

The film, which was described in the last "Bulletin," is a dramatic story of the effectiveness of serum in the treatment of pneumonia.

All doctors are urged to see this film and to tell their patients and friends about it.

A schedule of the showing of this film follows:

Glendale

February 9-16—California Theater.
February 15-18—Capitol Theater.
February 24-28—Bards Theater.
March 19-21—Gateway Theater.
March 26 to April 1—Glendale Theater.

Van Nuys

February 12-14—Rivoli Theater.

Pasadena

February 8-14—Strand Theater.
February 15-21—Tower Theater.

South Pasadena

February 12-15—Ritz Theater.

Monrovia

February 11-14—Lyric Theater.

Los Angeles

February 12-16—Arroya Theater.
February 18-21—Starland Theater.

The film was shown last week in North Hollywood and other theaters in Van Nuys, Sherman Oaks, Pasadena, South Pasadena, and in Los Angeles.

Appreciation is expressed to the motion-picture theaters for helping so greatly in such important work of public-health education.

CALIFORNIA TUBERCULOSIS ASSOCIATION 1939 ANNUAL MEETING

A new projection machine which makes it possible to project full sized x-ray plates directly from the film onto a motion picture screen will be demonstrated during the three-day annual meeting of the California Tuberculosis Association in Santa Cruz, April 13 to 15, according to the announcement of Dr. C. R. Howson, president of the association.

This new instrument, which is the first of its kind to be designed to use a 2,000-watt lamp, makes it possible for a large audience to study an original x-ray film with about the same measure of detail as provided by the ordinary viewing box for a group of three or four. The projector will be used for a special x-ray symposium to be held on Saturday afternoon, April 15. Chairman for this symposium will be Dr. Rolla G. Karshner.

Doctor Howson further stated that Dr. Bruce Douglas, tuberculosis controller of Detroit, will be the guest speaker at the meeting, discussing "Tuberculosis Control" as a part of the joint clinical and sociological session on Friday afternoon, April 14.

As a special feature of the annual meeting, a Pacific Coast Post Seal Sale Conference will be conducted by Mr. Charles L. Newcomb, Seal Sale Director for the National Tuberculosis Association, on Thursday afternoon, April 13. This conference will be of interest to all lay tuberculosis workers on the West Coast.

An outstanding program of interest to both physicians and public health workers has been arranged for the annual meeting by a committee consisting of Dr. Charles L. Ianne (chairman), Dr. Edward Hayes, Dr. Walter Brown, Dr. William G. Burkhard, and Doctor Howson, ex-officio member.

The Friday morning clinical section, for which Dr. William G. Burkhard has been named chairman, will deal with medical education in medical schools, postgraduate medical education and nursing education. The Saturday morning clinical section will discuss "Clinical Rehabilitation of Tuberculosis Patients as a Public Health Problem," with Dr. Harold Brunn as chairman. Papers on extrapleural pneumothorax, pneumonolysis, tracheobronchial tuberculosis and "The Limitation of Present Status of Chest Surgery" will be presented.

The Friday afternoon session will be a joint meeting of the clinical and sociological sections. Dr. Charles L. Ianne will be chairman, and the general subject will be "Tuberculosis: a Public Health Problem." Papers will be presented on case finding in schools, state institutions, hospitals, clinics and industry; on segregation by force for the examination of suspects; on the "Newer Interpretation of Old Diagnostic Procedures"; on "The Handling of Tuberculosis as a Communicable Disease in Hospitals and Clinics" and on tuberculosis control.

The two morning sociological sections will deal with the program of the state tuberculosis association on Friday morning, and school health on Saturday morning. This latter session, under the chairmanship of Dr. Walter H. Brown, promises to be of outstanding interest, especially to school groups as it will discuss both health supervision and health instruction.

The anual banquet will be held at 7 o'clock on Friday evening, at which time Dr. C. R. Howson will present the report of the president, Dr. Chesley Bush, will bring greetings from the National Tuberculosis Association, and an address will be presented by a speaker not as yet named.

The meeting will be held at the Casa del Rey Hotel in Santa Cruz, and will be the first three-day convention to be held by the California Tuberculosis Association since its Riverside meeting in 1937. Last year, the state association met for a business meeting only in conjunction with the Los Angeles convention of the National Tuberculosis Association.

Physicians as well as the lay public interested in the latest problems in tuberculosis control, treatment and prevention are welcome to attend. A sizeable meeting is anticipated, and early hotel reservations are suggested.

COUNTY SOCIETIES

CONTRA COSTA COUNTY

The regular monthly meeting of the Contra Costa Medical Society was held on Tuesday, February 14, at the Hotel Carquinez, Richmond.

The following program was presented: *Diseases of the Thyroid,* by Dr. Mayo H. Soley of the University of California Hospital. Doctor Soley's paper was discussed by Dr. U. S. Abbott of Richmond and Dr. Thomas Dozier of Antioch. C. E. Dietderich, *Secretary*.

HUMBOLDT COUNTY

The Humboldt County Medical Society met on Thursday evening, February 10, at the St. Joseph Hospital in Eureka. Dr. John S. Chain, Vice-President, presided in the absence of Dr. S. P. Burre.

Dr. Mayo H. Soley gave a very instructive talk on the *Treatment of Goiter*. He stressed some of the newer conceptions of therapy that have found their way in very few textbooks on the subject. The manner of selecting cases for x-ray treatment or surgery was explained. He also discussed the proper handling of patients before and after each type of treatment.

There was a good attendance, and his remarks were well received by the members. Many intelligent questions were asked and a lively discussion was entered into by most of the members present.

Mr. J. O. Thorpe, General Manager of the Intercoast Hospitalization Insurance Association, discussed the *Relationship of the Medical Profession to Hospital Insurance*.

The Ethics Committee, under the chairmanship of Dr. A. R. Watson, was instructed to draw up a new set of by-laws. Dr. C. C. Falk, Sr., suggested that a uniform fee schedule be adopted for this county and a committee, headed by Dr. W. J. Quinn, was appointed to work out a solution to this problem. J. S. Woolford, *Secretary*.

SACRAMENTO COUNTY

The regular annual business meeting of the Sacramento Society for Medical Improvement was called to order by the president, Dr. Dave Dozier, at the Auditorium, on December 20. There were fifty-five members and guests present.

The report of the Board of Directors was read by the President. The financial and membership report of the Secretary was read and approved.

A motion was made by Doctor Kanner that the assessment for 1939 be the same as last year, namely, $15. The motion passed unanimously.

Doctor Scatena discussed some phases of the *New Health Insurance Program* being formulated by the California Medical Association.

The following were nominated and elected to the Board of Directors for the year 1939: Drs. M. L. Azevedo, H. M. Kanner, George Briggs, Ralph C. Teall, H. F. Schulter, E. S. Babcock, R. M. Wallerius, Norris Jones, W. Pollock.

Nominations were made for California Medical Association delegates to replace Dr. F. MacDonald and for alternates to replace Dr. Wayne Pollock. Both were reëlected.

Dr. G. E. Millar was nominated and elected to the office of secretary-treasurer for 1939.

G. E. Millar, *Secretary-Treasurer*.

SAN BERNARDINO COUNTY

The January meeting of the San Bernardino County Medical Society was held at the San Bernardino County Charity Hospital in San Bernardino on Tuesday, January 3. About seventy members and guests were present.

The application for membership of Dr. Herbert P. Nottage of Ontario was favorably voted upon.

Dr. A. D. Neubert reported on the special meeting of the House of Delegates of the California Medical Association, held in Los Angeles, to consider the prepayment plan for medical care.

Dr. Arnold H. Gegel of Los Angeles addressed the Society on *Résumé of the Latest Developments in the Care of Goiter,* as presented at the Third International Goiter Conference.

The discussion was opened by Dr. John L. Nevin of San Bernardino. Considerable general discussion and questions followed.

The meeting adjourned at 10 p. m., following which refreshments were served.

* * *

The February meeting of the San Bernardino County Medical Society was held at the San Bernardino County Charity Hospital in San Bernardino on Tuesday, February 7.

In the absence of the President and two Vice-Presidents, Dr. Walter Cherry called the meeting to order at 8 p. m. About sixty-five members and guests were present.

It was moved, and seconded, that the following applications for membership be approved: Dr. C. A. Herrmann, Chino; Dr. Thomas E. Puthoff, San Bernardino; Dr. C. T. Halburg and Dr. William G. Patton, both of Redlands. The motion passed.

Mrs. Gabrielle Mulvane spoke briefly on behalf of the *Nursing Practice Act* and asked the support of the Society members.

The program of the evening was as follows: *The Diagnosis of Syphilis in General Practice,* by Dr. F. F. Abbott (colored lantern slides); *Standard Treatment of Syphilis,* by Dr. Paul Foster of Los Angeles; and *Dangers of Antiluetic Treatment,* by Dr. Fletcher Hall of Los Angeles.

Discussion opened by Dr. James W. Moreland of San Bernardino. Arthur E. Varden, *Secretary*.

SAN MATEO COUNTY

The meeting of the San Mateo County Medical Society was held on Wednesday, January 25, at the Benjamin Franklin Hotel. Dr. N. D. Morrison presided.

The Chairman announced that, with the consent of the San Francisco County Medical Society, Dr. E. W. Cleary had made an application for active membership by transfer. A motion was made, seconded and carried that Doctor Cleary be elected to active membership of this Society. The Chairman announced the election, to associate membership, of Dr. James K. Hazel. An announcement was made by the Chairman that an application for membership had been received from Dr. William R. Jepson.

The Chairman introduced Mrs. Opal Fennel, who gave a report on the *San Mateo County Chapter of the American Red Cross* for the past year. Further remarks were made by Mrs. Helen Cheseborough and Mrs. Howard. In her report, Mrs. Fennell expressed hope that the doctors would favorably endorse the proposed Nursing Practice Act to be acted upon by the Legislature.

The Secretary read the financial report for 1938. A motion was made, seconded and carried, that the report be approved.

The Secretary announced that a letter had been received from the State Association relative to Postgraduate Conferences. He suggested that in lieu of the formal Postgraduate Conference, a short series of lectures be provided on some subject of interest. This suggestion was approved unanimously.

The Secretary read a letter from the California Medical Association concerning the proposed Nursing Practice Act, and suggested that the Society and its members refrain from endorsing this bill until further information had been received from the State Association.

A letter from the Veterans' Administration Facility in Palo Alto, inviting the Society to hold a joint meeting with their society in April, was read. This was unanimously approved.

A letter of thanks for their Christmas gift from the Mills Hospital nurses was read.

The Secretary made an announcement concerning a pathological conference to be held at the annual session of the California Medical Association in Del Monte, to which the general practitioners are invited.

An announcement was also made concerning the desire of the Committee on Scientific Work of the California Medical Association to have photographs of physicians' offices to be exhibited at the annual meeting of the California Medical Association.

The Secretary made a report on a matter which had been submitted to him concerning the recommendation of physicians by school nurses, with particular reference to eye examinations. The matter had been precipitated when a school nurse submitted to a child's parents the names of physicians in the community who were practicing eye work and did not submit a list of optometrists. The Secretary submitted a verbal opinion from Doctor Schaupp, Chairman of the Council of the California Medical Association, to the effect that "school nurses are supposed to recommend physicians for health defects in children." The Secretary also mentioned the fact that the local optometrists had offered free examination of school children in the San Mateo schools. On motion, duly made, seconded and unanimously carried, the Secretary was directed to write a letter to the Board of Education and state therein that the County Medical Society was opposed to the mass examinations of children's eyes conducted in the schools by optometrists for commercial purposes. The letter was further to state that the County Society recommended that the school nurses refer all children with special defects to their family physician, from whom advice could be obtained concerning appropriate care for these defects.

The Chairman introduced Dr. Edwin Schultz of the department of bacteriology at Stanford University, who gave a very interesting talk on the subject of *Virus Infection, with Especial Reference to Poliomyelitis.* Doctor Schultz's talk was supplemented by a demonstration of lantern slides, including some colored slides of beautifully stained specimens, demonstrating the histology in poliomyelitis. Doctor Schultz's talk and demonstration were enthusiastically received.

J. Garwood Bridgman, *Secretary.*

⁂

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society was held in the Medico-Dental clubrooms in Stockton on February 2. The meeting was preceded by the customary supper meeting at the Hotel Wolf, at which there were twenty-four members present. The paper of the evening was presented by Dr. George H. Sanderson, who spoke on the *Recent Academy of Orthopedic Surgeons at Memphis, Tennessee.*

The regular meeting was called to order by President Neill P. Johnson at 8:20 p. m.

The applications of Doctors L. B. Saslaw and E. L. Blackmun, Jr., being reported on favorably by the California Medical Association and the Membership Committee, and there being no objections from the floor, they were declared elected to membership. Dr. W. W. Fitzgerald, Chairman of the Finance Committee, reported on the solvency of the local society and suggested that members pay their dues promptly. Dr. C. A. Broaddus presented several certificates to newly elected members of the Medical Academy of Graduate Study.

The paper of the evening was read by Sidney Olsen of the University of California, who spoke on *Urinary Lithiasis.* This paper was illustrated by lantern slides and films. The paper occasioned considerable discussion from the floor.

There being no further business to come before the Society, the meeting was declared adjourned at 10 p. m. and refreshments were served.

G. H. Rohracher, *Secretary.*

⁂

SANTA BARBARA COUNTY

The regular monthly meeting of the Santa Barbara County Medical Society was held in the Bissell Memorial Auditorium at 8 p. m. on February 13, 1939.

The subject for the evening's discussion was *The Surgery of Pulmonary Tuberculosis.* Dr. Samuel Robinson opened the program with a discussion of the value of collapse therapy in pulmonary tuberculosis and also discussed the advantages and disadvantages of the eight possible methods of collapsing the lung. Dr. Bruce Steele next discussed the history of, indications for, and results of pneumothorax. Dr. Irving Wills discussed thoroscopy and intrapleural apicolysis. Dr. E. L. Markthaler discussed the indications, contraindications, and results of phrenicectomy. Dr. Harry Henderson discussed pneumoperitoneum. Each of these discussions, except the opening one, was illustrated by drawings and lantern slides. Dr. Samuel Robinson closed the symposium with a detailed discussion of the Sauerbruck type of thoracoplasty, extrapleural apicolysis, and extrafascial apicolysis. This talk was illustrated by lantern slides and a demonstration of patients on whom these various procedures had been carried out. This symposium was discussed by Doctors Gates, Clark, Main, Cohn, and Ullmann. The discussion was closed by Doctors Robinson and Steele.

At the business portion of the meeting a resolution favoring the proposed *Nursing Practice Act* was introduced. Doctor Ullmann made a motion, seconded by Doctor Means and unanimously carried, that this resolution be laid on the table until we have a report from the Legislative Committee of the California Medical Association.

A motion was made by Doctor Clark that the Santa Barbara County Medical Society go on record as recommending that all milk used in hospitals in the county be pasteurized. This motion was seconded by Doctor Ullmann. It was discussed by Doctors Heiges, Main, and Means, and unanimously passed. D. H. McNamara, *Secretary.*

⁂

YUBA-SUTTER COUNTY

The meeting of the Yuba-Sutter County Medical Society was held at the Rideout Memorial Hospital. Mr. and Mrs. G. Waite Curtis were hosts at a dinner to the Society prior to the scientific program and business meeting.

Delegations from both the Sutter County Tuberculosis Association and the Yuba County Tuberculosis Association met with the Society to work out a plan whereby the Tuberculosis Associations and the local Medical Society would be able to function together and facilitate the work in using the approximately $3,000 on hand for this work to the best advantage.

President P. E. Thunen appointed Dr. P. B. Hoffman and Dr. B. F. Miller, giving Doctor Hoffman the power to choose a third member to work with them and the committees of the two Tuberculosis Associations.

Dr. Chauncey D. Leake, of the chair of pharmacology of the University of California, spoke on the *Physiochemistry and Pharmacology of Sterols.* He named and classified the various sterols, giving their characteristic actions, therapeutics, and toxicology.

The outstanding examples which he discussed were the alkaloidal preparations of opium and related substances, and vitamin D and its many components.

He discussed cancer-producing sterols which, except for their nature, in effect are very closely related to recognized therapeutic sterols.

Doctor Leake, admonished the Society against the too free use of proprietary agents and drugs and strongly urged the strict adherence to the use of the United States Pharmacopeia. He also made a very positive statement regarding the use of pain-killing drugs, stating that in pain from traumatic injury, opiate derivatives are indicated, but where the pain is caused by swelling and edema of the tissues the coal-tar preparations are superior in alleviation of the pain, and the danger of drug addiction is nil. Doctor Leake, further discussed other sterol and near-sterol substances, such as the sex hormone, the cardiac glucocides, and the adrenal cortex hormone.

With the exception of two members, the entire society was present to hear Doctor Leake's talk.

President P. E. Thunen appointed the 1939 Board of Censors as follows: Drs. Francis P. Wisner, Leon M. Swift, and Romayne B. Whitney.

The meeting was adjourned until March 7.

Leon M. Swift, *Secretary.*

OBITUARY

Frank Holmes Smith

1879–1938

In the rush and hurry of our everyday lives there occasionally come moments when remembrance bids us pause and turn our thoughts back to some sorrow or joy which was with us some time in the past. Such a moment came to us the other day and we feel that it is not inappropriate for us to dedicate a few thoughts to the memory of one who was loved by us all, and whose passing just one year ago this month, left an ache in our hearts which will be long in healing.

Too seldom in this life does it become our privilege to have the acquaintance of a man as universally admired as Frank Holmes Smith. Devoted to the highest ideals of his profession, he enjoyed the fond respect of his contemporaries, both young and old. His wide experience in the practice of medicine was being continually fortified by virtue of his seeking for the latest knowledge to be gleaned from medical literature. Few men of his generation could be held in more esteem by their younger colleagues.

We shall not soon forget his jovial wit, nor the kindliness of his nature. His personality may perhaps best be characterized by the image which will always be most vivid in our memory—a tall smiling figure in a black bowler hat, smoking the inevitable cigar, and carrying an armful of flowers for the table in the hospital library. Good humor and friendliness followed him wherever he went.

Loved by his patients and revered by his friends, he left us with the knowledge that our lives were somehow richer through knowing him. And so, on this first anniversary of his death, it is fitting that we let Memory hold us by the hand for a moment, so we may turn and wave one last farewell to this kindest of men, Frank Holmes Smith. Peace rest his soul.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

MRS. CLIFFORD A. WRIGHT..............................President
MRS. FRED H. ZUMWALT..............Chairman on Publicity
MRS. FRANK H. RODIN..Assistant Chairman on Publicity

Official Notices

A Visitor from the National Auxiliary.—Mrs. Charles A. Tomlinson of Omaha, Nebraska, President of the Woman's Auxiliary to the American Medical Association, visited in San Francisco during the State Board Meeting, held February 17.

Mrs. Tomlinson shared honors with Mrs. Clifford A. Wright, President of the State Auxiliary and the State Board members at a tea in the afternoon of February 17, given by the Board of Directors of the San Francisco Auxiliary.

Mrs. E. J. Morrissey, Chairman of Arrangements, and her committee, graciously welcomed the guests at the home of the San Francisco County Medical Society. Mrs. J. C. Geiger, a member of the National and State Boards, and Mrs. William W. Newman, poured the tea, while Misses Horner and Gibson and Mrs. Douglas Tesky, the lovely daughters of Auxiliary members, dressed in formal afternoon gowns, served the guests.

Beautiful spring blossoms decorated the tea table and were in evidence everywhere.

Meeting of State Board of Directors.—The spring meeting of the officers and Board of Directors of the Woman's Auxiliary to the California Medical Association was held Friday, February 17, at the Fairmont Hotel.

The President, Mrs. Clifford A Wright, presided with the following officers and members of the Board and visiting County Presidents in attendance: Mrs. Frederick N. Scatena, president-elect; Mrs. A. E. Anderson, first vice-president; Mrs. George Calvin, second vice-president; Mrs. G. Wendell Olson, recording secretary; Mrs. E. Eric Larson, corresponding secretary; and Mrs. Harry O. Hund, treasurer.

Councilors at large: Mesdames Arthur T. Newcomb and Fred H. Zumwalt.

District councilors: Mesdames F. G. Lindemulder, J. R. Walker, Lawrence M. Knox, J. C. Geiger, Harold Trimble, and Robert M. Furlong.

County presidents: Mesdames Frank Baxter, Alameda; N. T. Enloe, Butte; C. N. Vanderberg, Fresno; Bernard J. Conroy, Marin; Garth Parker, and A. A. Arehart (publicity chairman), Monterey; George Spencer, Sacramento; Thomas E. Gibson, San Francisco; C. R. Kennedy, San Luis Obispo; J. C. Bridgman (publicity chairman), San Mateo.

After a busy morning session, the State Board and guests recessed for lunch.

Mrs. F. D. Fellows of San Francisco was in charge of reservations and arrangements, assisted by Mesdames John Humber and Thomas E. Gibson.

After luncheon, Mrs. Thomas E. Gibson, President of the San Francisco Auxiliary, presented the honored guest, the National President of the Woman's Auxiliary to the American Medical Association, Mrs. Charles A. Tomlinson, who is no stranger to the members of the California Auxiliary.

---

† As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Frank H. Rodin, Assistant Chairman of the Publicity and Publications Committee, 2457 Bay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Rodin and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

She is well remembered for her gracious manner and inspiring messages given to the Auxiliary members at the Convention of the American Medical Association, held in San Francisco last June. Again Mrs. Tomlinson inspired her listeners regarding the activities of the Auxiliary and the importance of its place in the County, State and Nation.

Mrs. Gibson also called on Mrs. Wright, who responded with an interesting talk on the importance of friendliness and coöperation as the key to a successful auxiliary.

The afternoon session was called to order by the President, Mrs. Wright and interesting reports were given by members of the Board.

It was proposed by Mrs. Harold Trimble, Councilor from Seventh District, that a revision be made in the Constitution of the Woman's Auxiliary to the California Medical Association in Section 1 of Article IX—Nominations and Elections.

Article XV—Amendments—provides that:

> This Constitution may be amended at any regular annual meeting of this Auxiliary by a two-thirds vote of the members of the House of Delegates present and voting, provided a copy of the proposed amendment shall have been mailed to each member of the Board of Directors and to the Secretary of each County Auxiliary at least sixty (60) days prior to the date of said meeting; and provided further that said amendment shall have been published at least once in CALIFORNIA AND WESTERN MEDICINE at least three months prior to the adoption thereof; and provided finally that such amendment shall, prior to the adoption thereof, have been approved by the Council of the California Medical Association evidenced by resolution thereof.

The following proposed amendment is published as provided for in Article XV—Amendments:

> SECTION 1. For the years 1939 to 1940 and 1940 to 1941 the Nominating Committees, each consisting of five members, shall be elected at the Annual Meeting, held in May, 1939. Each committee shall consist of five members, two of whom shall be elected by the Board of Directors, and three to be members at large, elected by the House of Delegates. The members elected by the Board of Directors shall be elected at the regular meeting held previous to the Annual Meeting, while the members elected by the House of Delegates shall be elected at the first session of the Annual Convention. The Board of Directors shall designate the chairman of each committee. The Nominating Committee so elected for 1939 to 1940 shall present this report of nominees as soon as possible. The Nominating Committee so elected for 1940 to 1941 shall meet sixty days prior to the Annual Meeting of 1940 and prepare its report and submit the same at the first session of the Annual Meeting in 1940.
>
> Beginning with the Annual Meeting in 1940, and annually thereafter, the Nominating Committee shall be elected each year in advance and shall consist of five members, two elected by the Board of Directors and three to be members at large, elected by the House of Delegates.
>
> It shall be the duty of the Nominating Committee to nominate and present, in the regular order of business, candidates for the following offices: President-elect, first vice-president, second vice-president, recording secretary, treasurer and four councilors-at-large, to serve for one year or until their successors assume office.

Section 1 of Article IX at present provides as follows:

> A Nominating Committee, consisting of five members, shall be provided as follows: Two members to be elected by the Board of Directors at the regular meeting held previous to the annual meeting, and three members at large, to be elected by the House of Delegates at the first session of the annual convention. The Board of Directors shall designate the chairman. It shall be the duty of this committee to nominate and present in the regular order of business, candidates for the following offices: President-elect, first vice-president, second vice-president, recording secretary, treasurer and four councilors-at-large, to serve for one year or until their successors assume office.

Component County Auxiliaries

Alameda County

Mrs. A. A. Alexander of Piedmont was chairman of arrangements of the annual dinner dance given by the Woman's Auxiliary to the Alameda County Medical Association honoring their husbands, the doctors of Alameda County, on February 15.

The Athens Athletic Club was the scene of the gala spring party, which provided an excellent floor show, bridge, Chinese checkers, and "just visiting" in the lounge of the club.

The guests were graciously received by the Reception Committee and dinner was served at 8 p. m. to over three hundred doctors and wives.

Spring was the theme for the decorations used by Mrs. Wallace T. Partch and her committee in the lounge and on the dinner tables.

Mrs. I. O. Church was chairman of entertainment, assisted by Mrs. Walter Adams, who was in charge of games.

Reservations were made with Mrs. George Calvin.

MRS. GRANT ELLIS, *Publicity Chairman.*

⁂

Fresno County

The Woman's Auxiliary to the Fresno County Medical Association were happy to welcome Mrs. Harold G. Trimble of Piedmont, Councilor for Seventh District and State Hygeia Chairman, at their meeting on February 7. Thirty members were present.

Mrs. Trimble spoke on the *Value and Purpose of the Hygeia Health Magazine to the General Public Through a Wide Circulation.* She also gave splendid ideas on the ways and means of developing the circulation. Her inspiring talk created much enthusiasm among the members.

Mrs. Kenneth Staniford presented Dr. Elliot Sorsky, who gave a talk on the *Comparison of Health Conditions in India with Those in America.* He illustrated his talk with colored movies, which were very instructive and entertaining.

Heart Disease will be the topic for discussion at a public health meeting on March 10. Mrs. J. R. Walker is chairman, and is developing an interesting program.

MRS. CHARLES H. INGRAM, *Publicity Chairman.*

⁂

Los Angeles County

The regular monthly meeting of the Los Angeles County Woman's Auxiliary was held at the Orthopedic Hospital on January 24. Luncheon was served promptly at noon to 136 members and guests.

After luncheon, the President, Mrs. William H. Leake, called the meeting to order. Reports were given by the Treasurer and standing committees.

Mrs. Leake requested the members to convey to her personally their ideas of *The Courier.*

Dr. Charles L. Lowman, Chief of Staff of the Orthopedic Hospital, welcomed the members and guests of the Auxiliary with a short address. Mrs. Leake also introduced Mrs. Weir, coördinator of Educational Activity, and Miss Berry, assistant superintendent of the hospital.

Dr. Robert L. Carroll, a member of the hospital staff, described a very interesting and beneficial Educational Activity provided for the patients, which he calls *The Therapeutic Theatre.* Any patient may join the orthopedic drama group regardless of deformity, and the results are extremely satisfactory.

Mrs. Tyrone Power directed the well-written play, entitled "For Distinguished Service Under Fire." A story dealing with the eternal triangle in the lighter vein.

One of the guests of honor, Mme. Gosta Dohlman, wife of Professor Dohlman of Lund University, Sweden, was generous in her praise of Southern California. She compared its beauty and charms with those of Sweden. Mme. Dohlman pointed out that although her country was not very rich, indigent persons were well cared for by the government.

MRS. KARL VON HAGEN, *Publicity Chairman.*

Orange County

The doctors' wives and members of the Woman's Auxiliary joined in the celebration of the fifty years of organized activity of the Orange County Medical Association at their annual installation and banquet, given January 10, at the Santa Ana Country Club.

A string trio furnished music before and during the dinner hour. Cantu, a magician from Mexico City, entertained the guests with feats of magic.

Greetings from the Woman's Auxiliary were extended by the President, Mrs. Hiram Currey.

The guest speaker, Hon. Judge Franklin West, addressed the members on *Leaves From the Notebook of a Lawyer.*

MRS. G. WENDELL OLSSON, *Publicity Chairman.*

⁂

Riverside County

The Riverside County Medical Association and the San Bernardino Medical Association were joined by the members of the Woman's Auxiliary of Riverside County for a banquet honoring the officers of the California Medical Association on January 18.

About 110 doctors and wives met at the Riverside Woman's Club. The guests of honor were State Officers: Doctors W. W. Roblee, president; Charles Dukes, president-elect; George Kress, secretary. Also the charming President of the State Auxiliary, Mrs. Clifford A. Wright and her secretary, Mrs. E. Eric Larson.

After dinner, the *Proposed Medical Service Plan* was discussed by Dr. Charles Dukes.

Later in the evening the doctors and the wives met separately, at which time Mrs. Wright addressed the women with a message of inspiration and interest.

Although the doctors' wives of San Bernardino County are not organized into an auxiliary, it was very gratifying and a great pleasure to have so many guests from that county. MRS. T. A. CARD, *Publicity Chairman.*

⁂

San Diego County

The Woman's Auxiliary to the San Diego County Medical Association was honored January 10 by a visit from the State President, Mrs. Clifford A. Wright and her secretary, Mrs. E. Eric Larson.

An informal reception was held in the lounge of the University Club, followed by a luncheon at 12:30. Sixty-eight members were present.

In the absence of the President, Mrs. C. O. Tanner, the Vice-President, Mrs. R. Emerson Bond, presided.

Mrs. Wright gave a brief talk on the *Need of a Woman's Auxiliary in Imperial County* and enlisted the aid of the San Diego County Auxiliary in establishing one. Mrs. Wright also urged the use of books from the State Auxiliary library for book reviews and study. Mrs. Larson spoke a word of greeting to the members.

Mrs. F. G. Lindemulder, Chairman of Public Relations, gave a report of the Public Health Institute, held November 1. Mrs. E. H. Christopherson, chairman of the annual bridge benefit given on November 14, reported on the activity. MRS. H. K. ALBERTSON, *Publicity Chairman.*

⁂

San Francisco County

The regular monthly meeting of the Woman's Auxiliary to the San Francisco County Medical Society was held January 17 in the County Medical Society Building. The president, Mrs. Thomas E. Gibson, presided with over one hundred members and guests present.

The guest speaker, Mrs. Frances Parish, gave a very interesting talk about her *Seeing-eye Dog.* She told of her experience and how she had obtained her dog. It was through listening to a radio broadcast by Mr. Alexander Wollcott on the Town Crier program that she learned of the service of the seeing-eye dog in assisting and caring for blind persons in their need for a guide. Mr. Wollcott assisted Mrs. Parish in obtaining her dog from the Society for Seeing-eye Dogs in Morristown, New Jersey, where this special breed are raised and trained.

After the meeting, tea was served in the library. Mesdames A. S. Musante and Harry Oliver, assisted by their committee, were the hostesses of the day. Spring blossoms were used in the beautiful decorations.

MRS. CLAIN F. GELSTON, *Publicity Chairman.*

⁂

Santa Barbara County

A luncheon meeting of the Woman's Auxiliary to the Santa Barbara County Medical Society was held at the Colonial Tea Room, January 9, with seventeen members and one guest present.

The treasurer was authorized to notify the Superintendent of Nurses of the Knapp School of Nursing that the Auxiliary would make the customary award of $10 to the best student nurse in the graduating class of April, 1939.

Mrs. William Renfry Hunt reviewed William MacCarthey's book, "Fifty Years a Country Doctor."

The first vice-president, Mrs. Alfred Wilcox, invited members of the Woman's Auxiliary to attend a meeting of the American Association of University Women's Forum at her home, January 18. *Socialized Medicine* was the topic for discussion.

MRS. C. W. HENDERSON, *Publicity Chairman.*

⁂

Santa Clara County

The regular January and February meetings of the Woman's Auxiliary to the Santa Clara Medical Association were held at Savin's Restaurant in San Jose, where the members met for luncheon.

Mrs. Russell V. Lee, program chairman, has followed the theme of Public Health and Public Health Laws this year and presented Dr. Edward Liston of Palo Alto at the January meeting. Dr. Liston talked on *Medical and Hospital Insurance* and reported on the House of Delegates meeting in Los Angeles. He explained that much had been accomplished and that there was still much to be worked out.

In February, Dr. Walter Brown, Professor of Hygiene at Stanford University, spoke on *Public Health, Past and Present.* Doctor Brown gave a very vivid picture of his recent trip to the Norwegian countries where he visited the leading public health centers, medical schools, and hospitals, and was invited to speak at these various institutions. He described Norway's method of controlling venereal disease and the tremendous program for the care of children's teeth which are in poor condition due to the lack of necessary vitamins in the average diet.

The members voted to send $5.00 to the County Tuberculosis Association and $5.00 for the *Courier.*

A silver tea is being planned to take place early in May at the home of Mrs. R. Stanley Kneeshaw, who is Chairman of Arrangements. The proceeds will be used to send as many children as possible to camp this summer.

MRS. CHARLES E. MOORE, *Publicity Chairman.*

⁂

Santa Cruz County

The Woman's Auxiliary to the Santa Cruz County Medical Society met for luncheon at Buckhart's in Watsonville on January 23, with eighteen members present. The president, Mrs. Alfred L. Phillips, presided.

A very interesting and educational program on the *Cure and Prevention of Cancer* is being planned for April.

At the conclusion of the meeting, the members were taken on a tour of inspection of the beautiful new Watsonville Hospital. MRS. R. C. ALSBERG, *Publicity Chairman.*

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, St. Louis, Missouri, May 15 to 19, 1939. Olin West, M. D., Secretary, 535 North Dearborn Street, Chicago, Illinois.

California Medical Association, Hotel Del Monte, May 1 to 4, 1939. George H. Kress, M. D., Secretary, 450 Sutter Street, San Francisco.

Pacific Coast Surgical Association, San Francisco, Oakland, Del Monte, March 28 to 31, 1939. H. Glenn Bell, M. D., Secretary, University of California Hospital, San Francisco.

Medical Broadcasts*

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of March is as follows:

Thursday, March 2—KECA, 10:45 a. m., The Road of Health.
Saturday, March 4—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, March 9—KECA, 10:45 a. m., The Road of Health.
Saturday, March 11—KFI, 8:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, March 16—KECA, 10:45 a. m., The Road of Health.
Saturday, March 18—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, March 23—KECA, 10:45 a. m., The Road of Health.
Saturday, March 25—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, March 30—KECA, 10:45 a. m., The Road to Health.

Health for the Masses—How?—In a series of articles, commencing on February 6, the San Francisco *News* presented an interesting series of articles, three of which were from the pen of Dr. T. Henshaw Kelly of San Francisco, who presented the story of Voluntary Medical Service and the newly organized California Physicians' Service. The foreword of the third article of the series follows:

"Should health insurance be on a compulsory or voluntary basis? This issue confronts Californians, with the State Administration sponsoring a compulsory health insurance bill, pending in the Legislature, and the California Physicians' Service, organized by the California Medical Association, announcing it is about to offer a state-wide voluntary health insurance. Having discussed the need for health insurance, and the steps already taken toward it, the *News* offers the views of proponents of each system: First, Dr. Barbara N. Armstrong, professor of law at the University of California, author and expert in the field of social security, presents the case for the Administration's bill, which she helped prepare, in a series of articles of which the following is the first. Next, Dr. T. Henshaw Kelly, assistant secretary-treasurer of the California Physicians' Service, will discuss the voluntary system.—The Editor."

Federal Income Tax Reports: Deductions.—A summary of possible deductions allowable for physicians appeared in California and Western Medicine, March, 1938, on page 228. Readers who are compiling their income tax reports may wish to refer to the article.

American Board of Obstetrics and Gynecology: Examinations.—Application for admission to the Group A, May, 1939, Board examinations must be on file in the Secretary's office not later than March 15, 1939.

The general oral, clinical and pathological examinations for all candidates, Part II Examinations (Groups A and B), will be conducted by the entire Board, meeting in St. Louis, Missouri, on May 15 and 16, 1939, immediately prior to the annual meeting of the American Medical Association. Notice of time and place of these examinations will be forwarded to all candidates well in advance of the examination dates.

Candidates for reëxamination in Part II (Groups A and B), must request such reëxamination by writing the Secretary's office before April 1, 1939. Candidates who are required to take reëxaminations must do so before the expiration of three years from the date of their first examination.

The annual dinner meeting of the Board to which all diplomates and candidates are invited, as well as their wives and others interested in the work of the Board, will be held at the Congress Hotel, St. Louis, on Wednesday evening, May 17, following the close of the examinations.

Application blanks and booklets of information may be obtained from Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh, (6) Pennsylvania.

The Samuel D. Gross Prize: Fifteen Hundred Dollars.—The conditions annexed by the testator are that the prize "shall be awarded every five years to the writer of the best original essay, not exceeding 150 printed pages, octavo, in length, illustrative of some subject in Surgical Pathology or Surgical Practice founded upon original investigations, the candidates for the prize to be American citizens."

It is expressly stipulated that the competitor who receives the prize shall publish his essay in book form, and that he shall deposit one copy of the work in the Samuel D. Gross Library of the Philadelphia Academy of Surgery, and that on the title page it shall be stated that to the essay was awarded the Samuel D. Gross Prize of the Philadelphia Academy of Surgery.

The essays, which must be written by a single author in the English language, should be sent to the "Trustees of the Samuel D. Gross Prize of the Philadelphia Academy of Surgery, care of the College of Physicians, 19 South Twenty-second Street, Philadelphia," on or before January 1, 1940.

Each essay must be typewritten, distinguished by a motto, and accompanied by a sealed envelope bearing the same motto, containing the name and address of the writer. No envelope will be opened except that which accompanies the successful essay.

The committee will return the unsuccessful essays if reclaimed by their respective writers, or their agents, within one year.

The committee reserves the right to make no award if the essays submitted are not considered worthy of the prize.

---

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to California and Western Medicine, 450 Sutter Street, San Francisco, for inclusion in this column.

Lawrence to Speak at National Physicians' Meet.—The work of the University of California cyclotron in producing radioactive substances and in the direct treatment of cancer through its neutron rays is to be made the subject of the convocation address of the annual meeting, American College of Physicians, in New Orleans. The address is to be made by Dr. E. O. Lawrence, director of the University's radiation laboratory. Dr. William J. Kerr, head of the department of medicine, in the University's Medical School, San Francisco, is president of the College. The meeting is to be held March 27 to 31.

Doctor Lawrence has selected for his topic, The Newer Physics and Medicine. He will go into the production of the radioactive substances and the neutron ray in some detail, and will touch on their application in the field of medicine from the viewpoint of the physicist solely.

Portland Postgraduate Course in Ophthalmology and Otolaryngology.—The Fourth Annual Spring Postgraduate Course in Ophthalmology and Otolaryngology will be held in Portland, Oregon, the week of April 3 to 8, 1939. It is announced that the course will be honored by the presence of two nationally known guest teachers for the full week. They are Dr. John J. Shea of Memphis, and Dr. Webb W. Weeks of New York. This course is sponsored jointly by the University of Oregon Medical School and the Oregon Academy of Ophthalmology and Otolaryngology. The program is a diversified one; mornings are occupied with didactic lectures, afternoons are devoted to clinical work and at the evening sessions there will be classes in the Department of Surgical Anatomy. Added features to this "fourth" course will be a course in cat's eye surgery given by Doctor Weeks, and Teaching Moving Pictures, which have proven so popular at the American Academy meetings.

The preliminary programs will be ready about March 1. These, and additional information can be secured by writing to Paul Bailey, Secretary, 929 Medical Dental Building, Portland, Oregon.

A New Treatment for Diphtheria and Lockjaw.—The use of a single agent designed to protect against the diseases of diphtheria and tetanus is being started by the department of pediatrics of the University of California Medical School as part of its disease prevention program. In the past, diphtheria prevention was first accomplished by the use of toxin-antitoxin mixtures. It was later shown that formalin could be used in place of the antitoxin and that the resultant preparation known as toxoid was not only more efficient as an immunizing agent, but also avoided the horse serum present in antitoxin.

More recently, Doctor Ramon, who first developed toxoid at the Pasteur Institute has shown that the same method can be applied to tetanus. While the toxoids of diphtheria and tetanus can be given separately, Doctor Ramon and others working in the field of immunology have shown that the combination of the two toxoids is of benefit.

Thus, an infant or a child with no more manipulation than is now done to protect against diphtheria, can also have the benefit of protection against tetanus. It is hoped the procedure may avoid for some sensitive individuals the hazard of tetanus antitoxin administration.

At the present time emergency hospitals use the antitoxin as a preventive measure against tetanus developing in injuries, particularly from street accidents. It is hoped that with the new program a final injection of toxoid for such individuals as have had the program will be more efficient and simpler.

The program has been adopted by the French Army and a few clinics in the United States. As a measure of considerable merit for public health a more extensive adoption can be anticipated.

Public Health League of California. — The annual meeting of the Northern District of the Public Health League of California was held on Thursday evening, February 9, at the Veneto Restaurant in San Francisco.

Bills now before the Legislature and the election of officers were the major items on the program.

Stanford University School of Medicine.—Stanford University is pleased to announce that the twenty-seventh course of Lane Lectures will be given by Dr. Thomas M. Rivers on May 22, 23, 24, 25, and 26, 1939. The general title for the series of lectures will be "Viruses and Virus Diseases."

Doctor Rivers is the director of the Hospital of the Rockefeller Institute for Medical Research, and is an international authority on virus diseases.

"Syphilis and Your Town."—"The cheapest thing any town can do with syphilis is to cure it."

That was the keynote of a recent announcement by Dr. R. A. Vonderlehr, Assistant Surgeon-General in charge of the Division of Venereal Diseases, United States Public Health Service, of a new nine-point program for syphilis control in the local community. The effort is a part of the Government's nation-wide campaign to check the spread of venereal diseases.

The program is outlined in a new publication, *Syphilis and Your Town,* designed to assist local communities in making an adequate check upon the scope, effectiveness and facilities of local venereal disease control projects. The nine points, set forth in a questionnaire intended to suggest best results from unified action by local groups, are as follows:

1. Do your state and town have a trained public health staff that knows how to deal with syphilis?
2. Does your state require reporting and follow-up on all cases of syphilis?
3. Are patients in your town assured of good syphilis treatment even if they cannot afford to pay?
4. Do physicians and clinics in your town have access to free laboratory service for blood tests?
5. Do your state and town distribute free antisyphilitic drugs to all physicians and clinics?
6. Is every expectant mother required to have a blood test in your state?
7. Are medical certificates, including a blood test for syphilis, required before marriage in your state?
8. Does every complete physical examination given in your town include the blood test?
9. Has your town an education program aimed at age groups most frequently acquiring syphilis?

Doctor Vonderlehr pointed out that public education is the crux of syphilis control, and added, "People must learn to consult a doctor or clinic. They must know that drugstore remedies and self-treatment are worthless. They must know that treatment begun early will cure syphilis in nearly every case, while, if left untreated, the patient is likely to develop brain, heart, or nervous system complications."

The Public Health Service stressed the value of the blood test and the importance of making this test a part of every complete physical examination. "Syphilis control programs," said the new publication, "should make provision for blood tests, not only for prenatal examination but as routine for every hospital patient and a part of every insurance examination. Life expectancy of untreated syphilitics is 20 per cent lower than normal."

Doctor Vonderlehr concluded by insisting that the public must realize the cost of syphilis—its share in lives wasted, its toll in dollars. "All this is preventable if adequate control programs can be started and continued in every part of the country," he declared. "It will be cheaper, too—the cheapest thing any town can do with syphilis is to cure it."

Southern California Medical Association.—The one-hundredth semi-annual meeting of the Southern California Medical Association will be held at the headquarters of the Los Angeles County Medical Association, 1925 Wilshire Boulevard, Los Angeles, Wednesday and Thursday, March 15 and 16, 1939. A splendid program of scientific papers and discussions has been arranged.

Commemorating the fiftieth anniversary of the Association, a semi-centennial celebration will be held on the evening of Wednesday, March 15, 1939, at seven o'clock, at the California Club. Following a semi-formal stag dinner, addresses will be made by a brilliant array of leaders of organized medicine.

All members of the county medical societies of Southern California are invited to attend the scientific meetings and the dinner program. Since it is anticipated that there will be a large attendance at the dinner, it will be necessary that reservations be made without delay. Covers will be laid only for those who have paid reservations. Checks in the sum of $2.50 per plate should be made payable to the Southern California Medical Association, and may be sent to Suite 501, 1930 Wilshire Boulevard, Los Angeles. On receipt of remittances, tickets, which will be numbered, will be forwarded without delay.

The program follows:

March 15

WEDNESDAY AFTERNOON SESSION

2 p. m.

Pneumonia—The Results of Specific Therapy in Cases Due to Pneumococci of the Higher Types.—Roy E. Thomas, M.D., Los Angeles.
Discussion by George T. Burke, M.D., Pasadena, and Louis E. Martin, M.D., Los Angeles.

Prophylactic Measures in Pernicious Anemia.—John Martin Askey, M.D., Los Angeles.
Discussion by William S. Kiskadden, M. D., and A. M. Roberts, M.D., both of Los Angeles.

Functional Indigestion as Related to Acidity of the Duodenal Contents.—Alfred E. Koehler, M.D., Santa Barbara.
Discussion by William C. Boeck, M.D., and Ernest C. Fishbaugh, M.D., both of Los Angeles.

Gout.—Philip S. Hench, M.D., Rochester, Minnesota.
Discussion by Joseph A. Pollia, M.D., and Ray A. Carter, M.D., both of Los Angeles.

The Relation of Medicine to Insurance.—William H. Scoins, M.D., Los Angeles.
Discussion by Verne R. Mason, M.D., and John C. Wilson, M.D., both of Los Angeles.

* * *

March 15

Semicentennial Celebration on the occasion of the One Hundredth Semiannual Meeting of the Southern California Medical Association.

Dinner, Wednesday, March 15, 7 p. m., California Club, Los Angeles.

PROGRAM

Address of Welcome, John C. Ruddock, M.D., President
Toastmaster, Edward M. Pallette, M.D.

GUEST SPEAKERS

Philip S. Hench, M.D., Rochester, Minnesota; Associate Professor of Medicine, Mayo Foundation, University of Minnesota.

William W. Roblee, M.D., Riverside; President, California Medical Association.

William J. Kerr, M.D., San Francisco; Professor of Medicine, University of California; President, American College of Physicians; President, American Heart Association.

Donald C. Balfour, M.D., Rochester, Minnesota; Professor of Surgery, Mayo Foundation, University of Minnesota; Past President, American College of Surgeons; Regent, American College of Surgeons.

Rock Sleyster, M.D., Wauwatosa, Wisconsin; Medical Director, Milwaukee Sanitarium; President-elect, American Medical Association.

March 16

THURSDAY MORNING SESSION

10 a. m.

Late Results Following Operations on the Biliary Tract.—James H. Saint, M.D., Santa Barbara.
Discussion by Leroy B. Sherry, M.D., Pasadena, and Conrad J. Baumgartner, M.D., Los Angeles.

The Present Status of the Treatment of Fractures of the Neck of the Femur.—Francis M. McKeever, M.D., Los Angeles.
Discussion by Vernon P. Thompson, M. D., and Paul E. McMaster, M.D., both of Los Angeles.

Osteomyelitis of the Frontal Bone.—Joseph B. Stevens, M.D., Los Angeles.
Discussion by Pierre P. Violé, M.D., and J. Mackenzie Brown, M.D., both of Los Angeles.

The Management of Strabismus.—John P. Lordan, M.D., Los Angeles.
Discussion by M. N. Beigelman, M.D., and A. Ray Irvine, M.D., both of Los Angeles.

March 16

THURSDAY AFTERNOON SESSION

2 p. m.

Hypoglycemia with Special Reference to Adenoma of the Pancreas.—Hildahl I. Burtness, M.D., Santa Barbara.
Discussion by Percival A. Gray, M.D., Santa Barbara, and George Thomason, M.D., Los Angeles.

Sulfanilamide.—A. G. Bower, M.D., and William J. Mitchell, Jr., M.D., Los Angeles.
Discussion by A. Elmer Belt, M.D., Los Angeles, and Paul M. Hamilton, M.D., Alhambra.

Avitaminosis as Seen in Private Practice.—Arthur A. Marlow, M.D., La Jolla.
Discussion by Howard F. West, M.D., Los Angeles, and Benjamin N. Tager, M.D., West Los Angeles.

Urolithiasis and Protracted Recumbency.—Albert J. Scholl, M.D., Los Angeles.
Discussion by James A. May, M.D., San Diego, and Henry Verrill Findlay, M.D., Santa Barbara.

March 16

THURSDAY EVENING SESSION

Joint Meeting of the Southern California Medical Association with the Los Angeles County Medical Association.

The Social Aspects of Medicine.—Rock Sleyster, M.D., Wauwatosa, Wisconsin; Medical Director, Milwaukee Sanitarium; President-elect, American Medical Association.

Malaria Infection: Color Test for Blood Corpuscles.—A new and simple biochemical color test of blood corpuscles which promises to disclose a malaria infection when parasites cannot be found under the miscroscope has been devised by H. O. Proske, Chief Medical Technician, and Dr. Robert B. Watson, Senior Malariologist, Division of Malaria Studies and Control of the Tennessee Valley Authority and the technique of the new test method is described in a paper, "The Protein Tyrosin Reaction," in the current issue of *Public Health Reports* of the United States Public Health Service.

A diagnosis of malaria from clinical findings alone has sometimes proved to be inconclusive because some of its many symptoms are similar to those of other diseases. For this reason it is necessary to resort to the use of certain laboratory tests—such as the miscroscopic demonstration of malaria parasites in the red blood corpuscles or a specific pigment in certain white blood cells. This is not always easy to accomplish, however, particularly when the number of parasites in the blood circulation is small.

The new Proske-Watson test is based upon the fact that a certain fraction of the blood proteins, the euglobulins, is increased in most cases of malaria, and that this increase can be demonstrated by the color intensity developed by this protein.

No equipment other than is found in any clinical laboratory is necessary to perform this test, and the reagents employed may be purchased from clinical supply houses. Sterility of equipment is unnecessary. The only major precaution is that all glassware must be chemically clean.

In 1927, Henry described a seriodiagnostic test for malaria. This test was based on the assumption that malaria pigment is an active substance which either gives rise to the production of antibodies or imparts flocculating pecularities to the serum of malaria patients.

It has been suggested that a photometer be used in connection with the reading of the Henry test and its principal modifications. Since this instrument is expensive, the performance of the test has thus been limited to unusually well-equipped laboratories, a circumstance possibly accounting for the fact that the Henry test has not been much used in this country.

It was the purpose of Proske and Watson to devise a simpler and more accurate biochemical method for the quantitative estimation of serum euglobulin which would give results comparable to the melano-reaction of Henry and the distilled water method of Chlorine, obviate the necessity for the use of an expensive photometer, and be relatively easy to perform, so that it could be more generally adaptable for the diagnosis of malaria.

The originators of the new test, in a recent series of experiments, have obtained 97.4 per cent positive reactions in known malaria cases as compared with 81.9 per cent yielded by microscopic examination. The test is positive in a few other diseases, but these can be differentiated by specific tests.

Medical School, University of California: Alumni Day, March 22, 1939.—Commemorating the seventy-first charter anniversary of the University of California, the Medical School will celebrate its alumni day on Wednesday, March 22, 1939, at the University of California Hospital, Medical Center, San Francisco.

The program follows:

MORNING

Toland Hall

9:00 a.m. to 10:30 a.m.—Demonstration clinics, Division of Medicine.—Dr. William J. Kerr and staff.

10:30 a.m. to 11:15 a.m.—Demonstration clinics, Division of Surgery.—Dr. Howard C. Naffziger and staff.

11:15 a.m. to 11:30 a.m.—Intermission.

11:30 a.m. to 1:00 p.m.—Demonstration clinics, Division of Pediatrics.—Dr. Francis S. Smyth and staff.

Operating Rooms

9:00 a.m. to 1:00 p.m.—Operative clinics, Division of Surgery—Dr. Howard C. Naffziger and staff. Operative clinics, Division of Obstetrics and Gynecology.—Dr. Frank W. Lynch and staff.

Afternoon

2:30 p.m. to 4:00 p.m.—Tour of inspection of the Medical Center. Senior medical students will act as guides.

Annual Congress on Medical Education and Licensure.—The thirty-fifth session was held on February 13 and 14, at the Palmer House, Chicago.

The program follows:

MONDAY MORNING, 10:00

Ray Lyman Wilbur, M.D., Presiding

The Protection of the Public Through the Activities of the Council on Medical Education and Hospitals of the American Medical Association.—Ray Lyman Wilbur, M.D., LL.D., Chairman, Stanford University, Calif.

College Education for the Future Doctor.—James B. Conant, Ph.D., President, Harvard University, Cambridge, Mass.

The Organization and Subject Matter of General Education.—Robert Maynard Hutchins, LL.D., President, University of Chicago.

Canadian Experiments in Medical Economics.—T. C. Routley, M.D., LL.D., General Secretary, Canadian Medical Association, Toronto, Ont.

* * *

MONDAY AFTERNOON, 2:15

Fred Moore, M.D., Presiding

The South as Testing Ground for the Regional Approach to Public Health and Public Welfare.—Howard W. Odum, LL.D., Director, Institute for Research in Social Science, University of North Carolina, Chapel Hill. Discussion.

Symposium on the Small Hospital

The Community Hospital.—Barry C. Smith, General Director, The Commonwealth Fund, New York.

Organization and Management of the Small Hospital.—Malcolm T. MacEachern, M.D., Associate Director, American College of Surgeons, Chicago.

Planning for a Small Hospital.—William Henry Walsh, M.D., Consultant Specialist on Hospitals, Chicago.

The Construction of the Small Hospital.—Carl A. Erikson of the firm of Schmidt, Garden and Erikson, Architects, Chicago. Discussion.

TUESDAY MORNING, 10:00

J. H. Musser, M.D., Presiding

The Program of the National Committee for Mental Hygiene.—Clarence M. Hincks, M.D., General Director, National Committee for Mental Hygiene, New York. Discussion.

Fundamentals of Industrial Hygiene.—T. Lyle Hazlett, M.D., Professor of Industrial Hygiene, University of Pittsburgh School of Medicine, and Medical Director, Westinghouse Electric and Manufacturing Company, Pittsburgh. Discussion.

The Relation of Anesthesiology to Medical Education.—Ralph M. Waters, M.D., Department of Anesthesia, University of Wisconsin Medical School, Madison. Discussion.

Tenure of Members of the Faculty in Schools of Medicine.—Anton J. Carlson, Ph.D., Frank P. Hixon Distinguished Service Professor of Physiology, University of Chicago. Discussion.

* * *

TUESDAY, 12:30

What the Undergraduate College Should Give the Future Doctor.—William Mather Lewis, LL.D., President, Lafayette College, Easton, Pennsylvania.

* * *

MONDAY, 6:30

Recent Impressions of British Medical Education.—Willard C. Rappleye, M.D., Dean, Columbia University College of Physicians and Surgeons, New York.

Presidential Address.—H. J. Lehnhoff, M.D., President, The Federation of State Medical Boards, Lincoln, Nebraska. Round table discussion.

* * *

TUESDAY MORNING, 9:30

H. J. Lehnhoff, M.D., Presiding

Does Modern Medical Licensure Procedure Conform to the Accepted Standards of Medical Education?—A. C. Furstenberg, M.D., Dean, University of Michigan Medical School, Ann Arbor.

Examination Results Before Massachusetts State Board of Registration in Medicine.—Edward A. Knowlton, M.D., Holyoke; Stephen Rushmore, M.D., Boston.

American Graduates of British Medical Schools.—Harold Rypins, M.D., Secretary, New York State Board of Medical Examiners, Albany.

Citizenship and Medical Licensure.—J. Earl McIntyre, M.D., Secretary, Michigan State Board of Registration in Medicine, Lansing.

Legal Status of the Interne.—Fred E. Clow, M.D., Secretary, New Hampshire Board of Registration in Medicine, Wolfeboro. Discussion.

* * *

TUESDAY AFTERNOON, 2:00

H. J. Lehnhoff, M.D., Presiding

Hospital Interne Service in the United States.—Robin C. Buerki, M.D., Director of Study, Commission on Graduate Medical Education, Chicago.

Looking at Health Insurance Abroad.—J. George Crownhart, Secretary, State Medical Society of Wisconsin, Madison.

Trends in the Distribution of Medical Care.—R. G. Leland, M.D., Director, Bureau of Medical Economics, American Medical Association, Chicago. Discussion. Executive session.

American Association for the Study of Goiter: Van Meter Prize Award.—The American Association for the Study of Goiter again offers the Van Meter Prize Award of Three Hundred Dollars and two honorable mentions for the best essays submitted concerning original work on problems related to the thyroid gland. The Award will be made at the annual meeting of the Association, which will be held in Cincinnati, Ohio, on May 22, 23, and 24, 1939, provided essays of sufficient merit are presented in competition.

The competing essays may cover either clinical or research investigations; should not exceed three thousand words in length; must be presented in English; and a typewritten, double-spaced copy sent to the Corresponding Secretary, Dr. W. Blair Mosser, 133 Biddle Street, Kane, Pennsylvania, not later than April 15, 1939. The committee, who will review the manuscripts, is composed of men well qualified to judge the merits of the competing essays.

A place will be reserved on the program of the annual meeting for presentation of the Prize Award Essay by the author if it is possible for him to attend. The essay will be published in the annual Proceedings of the Association. This will not prevent its further publication, however, in any journal selected by the author.

Report of Health Survey Forthcoming.—The California Medical Economic Survey, carried out in 1934 and 1935 at a cost of $100,000 and designed to give the facts regarding both private and public medicine and their relation to the economic picture in the state, is about to issue from the Graphic Arts Press in Washington, D. C. The survey was sponsored by the California Medical Association, the California State Board of Health and the Federal Public Health Agencies.

Much of the research in the survey was handled by Dr. Ernest F. Penrose, associate professor of economics in the University of California on the Berkeley campus, and Dr. Paul A. Dodd, assistant professor of economics on the Los Angeles campus. Doctor Dodd investigated medical care as an economic problem, and Doctor Penrose studied the public health and insurance phases of the survey. Particular attention was paid to the condition and the costs of both public and private medical care in the state and recommendations were made to cover defects the survey disclosed.

An abbreviated copy of the survey was published by the California Medical Association. According to Doctor Penrose the forthcoming volume is the first publication of the survey findings in full.—*Press Sheet, University of California.*

Traffic Officers Given Facts on Drinking Drivers.—Due to the looseness of existing traffic codes the drinking driver is given a valid, though somewhat left-handed argument when it comes to showing that a few libations do not impair his ability as a motorist. He can usually show that his driving is done more carefully, and with less danger of accident, than that of the epileptic, who might fall unconscious at the wheel, and others with unbalanced minds or unbalanced nerves, who are permitted to operate motor vehicles without the slightest restriction under the law.

This was stated to the first Pacific Coast Traffic Officers Training School at the University of California by Dr. George K. Rhodes, associate professor of clinical surgery in the University's medical school in San Francisco. Doctor Rhodes suggested that the best way for the public to upset that dangerous argument would be to devise a system whereby the prospective driver would be subjected to a medical examination and other tests.

Doctor Rhodes presented figures tending to show that 46 per cent of the traffic arrests are for drunken driving and that about 12 per cent of the average driving public are suffering from varying degrees of intoxication. Answering the question as to when a driver may be considered intoxicated, Doctor Rhodes said that a concentration of one-tenth of 1 per cent alcohol in the blood would begin to show indications of intoxication. A concentration of between 1-10 and 2-10 of 1 per cent would show actual intoxication, and from 2-10 to 3-10 of 1 per cent would show a dangerous degree of intoxication, particularly for the man himself, so dangerous in some instances that artificial respiration might be needed.

One out of every 250 drivers may figure to be intoxicated in some degree, Doctor Rhodes said. The peak age for drunken driving appears to be between 25 and 30.

Press Clippings.—Some news items from the daily press, on matters related to medical practice, follow:

Olson Names Board to Study Health Bills

Governor Olson yesterday named a state-wide committee of twenty-one members, headed by Chester H. Rowell, to make an exhaustive study of the compulsory health insurance bills pending before the Legislature.

The Governor has asked the committee to make a report to him on two companion measures, Assembly Bill No. 2172 by a group of authors, including Assemblyman Ben Rosenthal, Los Angeles, and on Senate Bill No. 1128 by Senators John F. Shelley, San Francisco, and Robert W. Kenny, Los Angeles.

Selected on Committee*

Those selected on the committee are: Paul C. Smith, general manager of the *Chronicle*; Dr. Samuel C. May of the University of California faculty; Sheriff Daniel C. Murphy, San Francisco; E. A. McMillan, San Francisco, representative of the Railway Brotherhoods; J. Vernon Burke, San Francisco, executive secretary of the Labor Non-Partisan League; Hugh Wilkins, Los Angeles, representing the Labor Non-Partisan League; Herman Stuyvelaar, secretary of the San Francisco District Industrial Union Council; Dr. Clyde Emery, Los Angeles; Dr. Paul Dodd, professor at the University of California at Los Angeles; Dr. S. J. Sperling, Los Angeles; Ansley Salz, San Francisco industrialist; Hazel C. Woods, representative of the California Nurses' Association; Dr. Thomas Addis, San Francisco; Professor Barbara W. Armstrong, of the law department of the University of California; Dr. Elmer Belt, Los Angeles; Dr. Philip King Brown, San Francisco; Dr. Francis Pottenger, Los Angeles; Dr. Eaton McKay, La Jolla; Dr. Aaron J. Rosanoff, State Director of Institutions; and Dr. G. Chester Gummess, San Francisco.

Medical Aid Plan

These bills set up a plan under which persons would be given medical services, hospitalization and laboratory and other services benefits. Drugs and medicines would be provided. The plan would include maternity cash benefits.

The program would be administered by a new bureau of medical services in the State Department of Employment.

A program of health insurance fund contributions by employers and employees is contemplated. Top contributions by employers would be 2 per cent of the pay roll covering low wage bracket workers. Top contributions by employees would be 1½ per cent in the case of salaries running in excess of $200 a month. Workers earning under $70 a month would be insured without making contributions.

Physicians would be permitted to register under the proposed setup for the purpose of contracting with the state to render services to beneficiaries.—San Francisco *Chronicle*, February 28.

* * *

Doctor Pottenger Says Nation Will Adopt Health Insurance

Dr. Francis M. Pottenger, formerly president of the American College of Physicians and Surgeons, in an address before Town Hall at the Biltmore yesterday, said he approved of health insurance. His view is at variance with that of the State Medical Society.

"Compulsory health insurance," he said, "is the only plan which will insure complete, stable income from all groups that require medical care. No matter what may be done by medical men, some form of medical insurance which will give satisfactory service is sure to come."

He said that some form of health insurance like that in England is likely to come in this country eventually. He said that at present 50 per cent of the population of this country is being given medical care by the Government and that another 40 per cent lack funds to pay for a protracted illness.

Doctor Pottenger is head of the Pottenger Sanitarium at Monrovia.—Los Angeles *Times*, February 21.

* * *

Use of Narcotics Drops in State

Sacramento, February 27 (AP).—Use of narcotics in California is rapidly decreasing, State Director of Institutions Aaron J. Rosanoff reported to Governor Olson's monthly council meeting today.

Doctor Rosanoff recommended the narcotic hospital at Spadra, which he said is the only state institution of its kind, be closed as a narcotic hospital and be converted to some other or more urgently needed use.

---

* The list of twenty-one committee members appointed by Governor Olson include nine members of the medical profession, as follows: From San Francisco, Thomas Addis, M.D., and Philip King Brown, M.D.; from Los Angeles, Claude Emery, M.D., S. J. Sperling, M.D., Elmer Belt, M.D., Francis M. Pottenger, M.D., and Chester Gummess, M.D.; from San Diego, Eaton McKay, M.D.; from Sacramento, Aaron J. Rosanoff, M.D.

He said the hospital, with a capacity of 122 beds, now has but eighteen patients.

With the objective of reducing the population of the state hospitals, Rosanoff said, the department will coöperate with various health agencies in the administration of the malarial inoculation treatment for syphilis in cases with evidence of involvement of the nervous system. Such treatments will be given in all the state hospitals, he said.

The Council also heard Director of Public Works Frank W. Clark's prediction the Federal Government will coöperate in the construction of a steam-electric power plant at Antioch in connection with the Central Valley project.

The plant would cost approximately $20,000,000 and be designed to handle public power distribution prior to the completion of the Shasta Dam unit of the undertaking.

Clark asked Governor Olson to give immediate consideration to a request for $250,000 with which a preliminary study and survey of the Antioch project would be made.

Reporting on the work of the revised Golden Gate International Exposition Commission, Clark said a brief investigation had led him to the belief the state's chances of regaining its $5,000,000 investment "do not look too encouraging."

"Well, most fairs seem to end in deficits instead of surpluses," the Governor remarked.—San Francisco *Chronicle,* February 28.

* * *

California Physicians' Service Incorporated*

Sacramento, February 3 (UP).—Voluntary insurance for medical service and hospital care was offered today by the California Physicians' Service in articles of incorporation on file with Secretary of State Frank C. Jordan.

The corporation is composed of members of the California Medical Association, but the voluntary medical service plan may be participated in by all doctors of medicine so desiring, the statement of incorporation said.

President Ray Lyman Wilbur of Stanford University and six prominent physicians signed the articles.

The statement of incorporation declared that "prompt and adequate medical attention and hospital care whenever needed" would be provided to the people of California on a budgeting basis "without injury to standards of medical service, without disruption of proper physician-patient relations and without profit to any agency."

All payments made by patients, the statement read, will be utilized for medical service and hospital care, except costs of administration. It assured efficient public and civic service "without commercial exploitation of patients or profession . . . and without restrictions of individual right freely to select the doctor and hospital desired."

Increased costs of medical attention were attributed to the "very advances made by modern science." The statement predicted medical service and hospital costs would increase as new methods and equipment are discovered.

San Francisco was designated as headquarters of the new corporation, which has administrative membership of seventy-five physicians and an unlimited professional classification and beneficiary group. — San Francisco *News,* February 3.

* * *

California Medical Body Acts to Form Health Group

Periodic Payments Would Care for Members in Ill Health

Sacramento, February 3 (INS).—Because the "always unpredictable injury or illness is a financial catastrophe too great to be borne by some persons," and because "the total cost of these injuries and illnesses is within the means of a group," articles of incorporation had been filed in Sacramento today by all members of the California Medical Association for the "California Physicians' Service."

"Open to All"

Under terms of the articles, the group would "establish and maintain a fund by periodic payments by its beneficiary members for medical services."

There is no limit to the authorized number of beneficiary members.

The articles set forth that any member of the service may select the doctor, hospital and treatment desired.

The fund for this group treatment would be accumulated by payment of dues but members would not be liable to assessments.

The Members

Directors of the socialized medical group are:

Dr. Ray Lyman Wilbur, Stanford University; C. Kelly Canelo, San Jose; W. Earl Mitchell, Berkeley; Samuel Ayres, Jr., Los Angeles; Alson R. Kilgore, San Francisco; Lowell S. Goin, Los Angeles, and T. Henshaw Kelly, San Francisco.—San Francisco *Call-Bulletin,* February 3.

Name Two Hospital Supervision Groups

Los Angeles County General Hospital supervision was put under scrutiny by the Board of Supervisors today with appointment of two committees, one to effectuate medical school supervision of all hospital work, the other to study reforms in the method of collecting hospital bills from those less able to pay.

The committees were announced by Supervisor Gordon L. McDonough, Chairman of the Hospital Advisory Committee.

To put into effect the recently voted plan for having medical supervisors from the two medical schools, University of Southern California and College of Medical Evangelists, supervise the 479 physicians and surgeons who give part of their time to General Hospital, the following committee was named: Dean Paul S. McKibbon, of the U.S.C. medical school; Dean Percy M. Magan, of the College of Medical Evangelists; Dr. Walter A. Bayley, member of the attending staff; County Manager Wayne R. Allen and County Counsel John H. O'Connor.

To study the hospital billing system, recently complained of by the Grand Jury in a report which said that "indiscriminate billing of indigents resulted in unjustifiable hardship and hounding of persons unable to pay," the following committee was selected:

County Auditor Joseph M. Lowery, Superintendent of Charities; Rex Thomson and Grand Jury Auditor Eugene Berger.—Los Angeles *Examiner,* February 5.

* * *

Indigents Face Ambulance Toll

Recommendation that indigents who used county ambulance service prior to July 1, 1937, be required to pay $2.50 was made yesterday to the Board of Supervisors by J. H. O'Connor, county counsel.

O'Connor pointed out that previously the board had ruled that after June 29, 1937, indigents would be required to pay this amount for ambulance service, but no provision previous to this time had been made.

An order to effect collection of this money will be passed on by the board at tomorrow's meeting.—Los Angeles *Examiner,* February 6.

* * *

Rule Given on Medical Aid

A ruling of Attorney General Earl Warren yesterday limited the right of private institutions or unlicensed persons to render medical services through the medium of a hired physician and surgeon.

In a letter to Charles B. Pinkham, Secretary-Treasurer of the Board of Medical Examiners, the Attorney General held that a licensed physician cannot render medical services to patients of unlicensed persons in consideration of a salary paid to him for performing such services.

In addition, the ruling held that a private institution cannot represent itself as rendering medical services and hire physicians to render such services.

Pinkham's request for the ruling cited the case in the first instance of two unlicensed persons operating a sanatorium and employing a licensed medical man as medical director.—San Francisco *Examiner,* February 11.

* * *

Wider Use for Hospitals of Counties, Plan

More general use of the facilities of county hospitals will be possible if a bill now before the Legislature, sponsored jointly by doctors and farmers, becomes a law, according to Dr. Louis A. Packard, Bakersfield, Chairman of the Committee on County Hospitals and a member of the Council of the California Medical Association.

Speaking before Santa Maria Valley Farm Center last night, he told members that the farmers and doctors, former enemies on the county hospital situation, had finally got together on a bill which they are jointly sponsoring (Assembly Bill 2499) and asked careful consideration of the measure and support for it.

Doctor Packard said the measure agreed upon between representatives of the Farm Bureau Federation of the State and the California Medical Association, would eliminate the words "dependent" and "indigent" from the present requirement for admission to county hospitals and set up three classes of patients—(a) those unable to pay; (b) those able to pay something, and (c) those able to pay actual costs, and provide for their treatment in county hospitals, those being able to pay being allowed to call in doctors of their choice.

He declared that the present county hospital regulations "are chaotic" and are mostly the result of court decisions and interpretations by the attorney general and that the pending bill will clarify present obscurities.

He said a wider use of public hospitals is advisable since 40 per cent of the people of the United States, according to federal statistics, are living on an income of $600 a year or less.—Santa Maria *Daily Times,* February 7.

---

* For Articles of Incorporation, see CALIFORNIA AND WESTERN MEDICINE, February, 1939, on page 134.

Smallpox Increase Reported in State

San Francisco, February 4 (AP).—Dr. W. M. Dickie, State Director of Public Health, today warned that smallpox is on the increase in California and that all persons who have been exposed should be vaccinated immediately regardless of how recently they may have been immunized.

He said seventy-seven cases of smallpox were reported last month from seven counties as compared with twenty-eight cases in December from four counties.

Smallpox now prevalent, he said, is a mild form of the disease and in early stages may be mistaken for influenza.—Los Angeles *Examiner*, February 5.

* * *

Battle Rages on Municipal Health Service Plan of San Francisco

Charging unfair discrimination, spokesmen for osteopaths and chiropractors ended a spirited session with the City Health Service Board last night, announcing their intention to ask the courts to force their inclusion in the health plan for which city employees assess themselves each month.

The pronouncement was made by Dr. W. W. Vanderburgh on behalf of the osteopaths and by Dr. David T. Jones and Attorney Newell Hooey, speaking for the Affiliated Chiropractors of California.

Their determination was voiced after they declared they would not be discriminated against, and Cameron King, board chairman, had asserted he would not be insulted by them or "anyone else."

The drugless practitioners attended the board meeting for the purpose, they said, of getting a "final ruling," promised two weeks ago, on whether or not they were to share in the health plan.

Fight Starts Quickly

Chairman King had hardly launched the hearing with the declaration that the "plan of inclusion" was, in reality, not a plan of inclusion, but a demand for a separate plan calling for an additional $2.50 per month payment by city employees or dependents, before a quarrel broke.

Attorney Hooey challenged that interpretation and accused the board of misleading city employees by a letter sent to them declaring the plans submitted by osteopaths, chiropractors and drugless practitioners "seem to call for separate contributions of $2.50 per month by members seeking such service."

A sharp exchange brought Doctor Jones to his feet with the question: "Is it the medical doctors who won't work with us or is it the extra $2.50 that's at the bottom of this? Let's get it straight."

A "Damned Shame"

"I'm not going to sit here and be insulted by you, Davey Jones, or Mr. Hooey, or anyone else," Chairman King answered.

After further conversation, Doctor Jones returned to the attack and asked if it wasn't true that the crux of the "discrimination" was that doctors of medicine didn't want to include others. King replied that was "not all, but part" of the situation. Declaring "it's a damned shame that such things can exist within a democratic government," Doctor Jones said, "we are going ahead with court action."

His assertion was echoed by Doctor Vanderburgh, who declared osteopaths have been recognized on a parity with physicians and surgeons by State and Nation and "we're not going to lay down here."—San Francisco *Chronicle*, February 16.

Medical Art Association

The San Francisco branch of the American Physicians' Art Association will open its first local show Monday. And for the first time in its seventy-two years the San Francisco County Medical Society is sponsoring an art show in its quarters at 2180 Washington Street. Cosponsor is the American Medical Association.

The national group was organized last year by Dr. Francis H. Redewill, its present president and secretary. Its first exhibition was held at the San Francisco Museum of Art during the medical convention here. More than 600 entries were shown at that time.

Physicians who are showing in the art exhibition are:

R. W. Burlingame, R. De R. Barondes, Martha Mottram, Ernest Nast, J. M. B. Olmsted, Colonel Brooks Grant, Paul Wedgewood, Harrington B. Graham, Asa Collins, Portia Hume, J. Tavlopoulos, Emelie Anderson De Eds, L. Courtright, Rodoric O'Connor, Signor Ettore Cadorin, Otto Schulte, W. W. Henry, W. H. Strietmann, Avard Fairbanks, W. K. Fisher, Mrs. Dr. Fred Stauffer, Fred Stauffer, F. H. Redewill, Ralph Sweet, Julius Goldsand.—San Francisco *News*, February 11.

New San Fernando Unit to Receive 109 Patients

San Fernando, January 31.—Containing modern accommodations and treatment facilities, the new $197,000 addition to the United States Veterans' Hospital will be opened to 109 patients tomorrow under direction of Col. D. C. Farnsworth, M. D., chief of staff.

Plans have been made for the transfer of eighty patients from Sawtelle, while the remaining twenty-nine will be selected from waiting lists. The hospital now will have 359 patients under treatment.

Doctors' and nurses' quarters are provided in the building, as well as kitchens and dietitians' rooms.

Automatic tray servers, operated similarly to elevators, are an innovation in the building. Doctor Farnsworth pointed out that twenty-four trays can be sent quickly to the patients without loss of time or inconvenience to nurses.

There is a shower room for use by wheel-chair patients.

Attending the patients are fourteen doctors, a dentist, forty-three nurses and the executive staff, who will be present when dedication ceremonies are conducted February 14 under direction of the American Legion.—Los Angeles *Times*, February 1.

Hospital Plan Draws Patrons

Million and Half Join With Service Groups in Year

Chicago, January 29 (AP).—Nearly a million and a half new subscribers enrolled in the fifty-three nonprofit hospital service plans during 1938, Dr. C. Rufus Rorem of the American Hospital Association, said today.

Total subscribers neared the 3,000,000 mark on January 1, 1939, he said, compared with almost 1,400,000 the first of 1938.

The plan was started in sixteen additional places during the last year. They are Atlanta, Los Angeles, Decatur and Alton, Illinois; Newark, Canton, Toledo and Youngstown, Ohio; Harrisburg, Pittsburgh and Philadelphia, Pennsylvania; Denver, Louisville and Covington, Kentucky; Danbury, Connecticut, and a state-wide plan in Mississippi.

The nonprofit plans approved by the American Hospital Association are a form of nongovernmental social insurance by which the hospitals guarantee services to subscribers.—Los Angeles *Times*, January 30.

* * *

Municipalities Studying Indigent Hospitalization

Chicago, February 12 (Exclusive).—With many local governments dependent upon nongovernmental hospitals to care for their needy sick because of the insufficiency of public facilities, the American Public Welfare Association and the American Hospital Association today suggested that cities adopt systems of paying for the care of indigents in private hospitals at a flat rate per day.

Findings of Survey

The report, made jointly by the two associations, showed that about 1,300 of the 3,000 counties in the United States have no governmental hospital. In the 296 most populous counties nongovernment hospital beds constitute approximately two-thirds of the total accommodations.

Two Pay Systems

Although many cities are paying for hospital care of their indigents according to services rendered, some of them are paying on a lump sum or subsidy basis. It was suggested that payment be made exclusively on the basis of service actually rendered, at a flat, per diem rate, including all charges for laboratory work, x-ray and other services. A single rate cannot be predetermined for all places, it was pointed out, but must be established individually in accordance with local conditions.—Los Angeles *Times*, February 13.

* * *

California Cash Dole Load Reaches Total of 307,303

California has reached a new peak in cash dole relief to unemployed persons with 307,303 names carried on the State lists, according to Dr. H. Dewey Anderson, State Relief Administrator.

This figure was taken from the State files for the week ending February 2, Doctor Anderson said.

Tells Increase

The total case load has increased 5 per cent during the last week and 25 per cent since last January 1, according to the administrator.

The increased unemployment problem in California exists despite the fact that WPA employment has been increased 22 per cent, according to the official statistics. Of those receiving SRA relief, 107,000 are living in Los Angeles County and the number is increasing daily, Doctor Anderson pointed out, indicating a heavy winter influx of transients from other states.

More Funds Needed

"If California is to provide even the bare necessities of life for these persons," Doctor Anderson said, "it will be necessary to reduce the present dole of $36 a month for a family of four or $16 for a single person, or for the State Legislature to appropriate approximately $6,000,000 to defray the cost of this charity until June 30."—Los Angeles *Times*, February 13.

* * *

$23,757,218 Paid in Job Insurance

Unemployment compensation checks to the amount of $23,757,218.36, about $2,159,747 monthly, were paid to 295,211 jobless men and women in the State during eleven months of last year, the State Department of Employment announces in a report just released.

California's average weekly payment for total unemployment benefits aggregated $10.53, which sum was identical to the average national weekly payment, the report states.

Pointing out that benefits for total unemployment first became payable in the State on February 7 of last year, the report declares that 2,484,311 checks were distributed from that date to December 31.

Summarizing its finances for the year, the department reports that the trust fund, including net collections and earned interest, totaled $130,748,678.21, and after deducting the amount paid out the fund had a reserve balance on December 31 of $107,033,324.84.—Los Angeles *Examiner*, February 13.

* * *

10 Million in Jobless Checks Issued County

The State Department of Employment in Sacramento announced today that 1,092,043 unemployment compensation checks were issued in Los Angeles County during 1938, having a total value of $10,692,538.76.

Carl L. Hyde, executive director of the department, issued a report which stated that 470,025 people throughout the State applied for benefits, with 383,736 of these found to have valid compensation claims. He said that 2,484,311 benefit checks, aggregating $23,575,218.36, were issued throughout the State last year.

The number of checks issued and their value to cities in Los Angeles County is as follows:

Los Angeles County, 1,092,043 checks, $10,692,538.76; City of Los Angeles, 457,400, $4,323,497.16; Covina, 5,264, $44,856.85; Culver City, 25,565, $257,674.72; Glendale, 64,242, $649,189.52; Hollywood, 96,023, $980,658.26; Huntington Park, 129,433, $1,320,315.11; Inglewood, 46,397, $482,358.20; Long Beach, 66,191, $666,907.04; Pasadena 29,956, $296,632.83; San Pedro, 32,159, $262,892.77; Santa Monica, 22,614, $230,004.26. —Los Angeles *Herald-Express*, January 30.

* * *

Social Eugenics*

I have just been reading in *The Times* the semiannual report of Rex Thomson, superintendent of public charities, to the Board of Supervisors. He reports that there are about 100,000 persons in the city and county of Los Angeles on the dole, receiving public relief.

Then I recalled a similar report on the city of Rome and its immediate environs in the last years of the republic. The total population of Greater Rome was estimated at 3,000,000, about the population of Los Angeles city and county, and the number of what the report termed the rabble, living on "food and the circus," was given at 100,000.

The army and the rabble dictated who should be the dictator. For more than 200 years the changing governments sent the legions to despoil and levy tribute on the whole of the Mediterranean Basin, carrying the treasure to Rome to support the populace. Whenever there was a shortage in the dole riots followed; the ruling dictator was devitalized and one who promised the most in the way of the dole was clad in the royal purple, which, almost without exception, proved to be a garment of Nessus, fatal to Hercules.

But the time came, as it had to come, when the "barbarians" and the despoiled peoples revolted and despoiled Rome.

Naturally, I am wondering how long the city and county of Los Angeles can carry a similar load. We have no foreign regions to despoil; we can only despoil those who are producing among ourselves. What will happen when the last despoiled taxpayer goes on the dole?

I find in another report that some 50,000 other persons applied here for relief, but thousands of petitions from those qualified to receive relief were rejected because additional funds were not available.

It seems to be a case of the devil take the hindmost.

The sociologist is working on the economic problems involved. But the eugenist is primarily interested in the human material of these 150,000 actual or would-be dependents.

Not all the needy are physical or mental defectives; but about three-fourths of the physical and mental defectives are on the dole. It has been iterated and reiterated that poverty and disease are no crimes; but the hereditary physical and mental weaklings on the dole are, to a large measure, the victims of crimes of omission committed by organized society during the past three or four generations. So long as these defectives are permitted to reproduce their kind, the number on the dole, a burden to themselves and the community, will continue progressively to increase. The actual number on the dole is double that five years ago.

For at least three generations philanthropists and sociologists have been thinking wishes, hoping that some higher power would intervene to eliminate the hereditary taint in the bloodstream of the next generation. Despite their wishes, hopes and prayers, the progressive taint persists, with a multiplying ratio in each succeeding generation. Is this not proof enough that the powers that rule the universe, use what name you will, cast on the human animal the full responsibility for protecting its bloodstream?

When these human animals reside in populous communities and organize governments, their first duty would logically be to act collectively to keep that bloodstream pure. What are we of California, what are we this side of the Atlantic, doing about it? We destroy lesser breeds that carry germs which infect the human blood; but the human disease carriers we preserve at public expense. What folly!—Los Angeles *Times*, February 12.

United States Aid Asked to Help Migrants

Washington, February 15 (AP).—Federal aid in solving problems arising from the migration of hordes of destitute families to California was demanded of President Roosevelt today by that State's congressional delegation.

A petition left at the White House by Representative Elliott (Democrat, California), asserted immediate action was imperative and suggested a broad program for State and Federal coöperation.

"California feels," the delegation informed the President, "that interstate migration is a national, not a local problem, and that in general the cost of necessary care for people who at present have no legal residence in any state should be borne by the Federal Government."

Describing the situation in California as "critical and almost desperate," the petition said "thousands of penniless newcomers" have given rise to serious employment, health, relief, housing, and education problems, and added:

"Generally, our position is: First, that our California standards of old age pensions, of relief, of education, of wages, should not be sacrificed to our efforts to do our part to solve this great national problem, and second, that in spite of the excellent work done by farm security and other Federal agencies, the Federal Government has so far not contributed its share to its solution."—San Francisco *Chronicle*, February 16.

* * *

California Migrant Problem

President Roosevelt has ordered formation of a special group to solve the critical relief problem arising in California from the influx of thousands of economically distressed families, it was disclosed yesterday.

The President's action was announced by Representative Elliott, California Democrat, according to Associated Press dispatches from Washington, D. C. WPA Administrator F. C. Harrington will head the new group.

Elliott made public a letter from Stephen Early, White House secretary, in which the latter described the President as "strongly sympathetic with California."

Chairman Named

Early said the President left instructions before departing Thursday night for Florida to have Harrington serve as chairman of the special group. Early added:

"The President hopes that through Colonel Harrington's coördination, the various departments and agencies of the Federal Government will find a way without delay to extend all possible coöperation to the State in alleviating the conditions existing."

Key Members

The President suggested that key members of Administrator Harrington's group should include the heads of the Farm Security Administration, the United States Employment Service, the Housing Authority, and the Surgeon General's Department.—San Francisco *Examiner*, February 19.

* * *

Migrant Aid Plan Mapped

Californians in House to Ask Presidential Support for Program

Washington, February 13 (AP).—California House members seeking a cure for a serious migrant relief problem today agreed on a multiphased program of Federal coöperation and arranged to ask President Roosevelt for his support.

---

* By Fred Hogue.

Elliott's Report

Representative Elliott, chairman of a group studying the problem, said a subcommittee of three hopes to present the plan to the Chief Executive before he leaves for his Caribbean cruise. He said he and Representatives Voorhis (Democrat), and Welch (Republican), the other subcommittee members, will ask for a Wednesday appointment.

Details of the program were not made public. It is understood, however, to contemplate a concerted attack on all phases of the transient problems, including employment, health, relief, housing and education.

Program's Scope

Members would not be quoted, but these were reported to be the principal steps which would be suggested to the President:

Expansion of the Farm Placement Service so that migratory agricultural workers can be given accurate information concerning employment opportunities or their lack in other parts of the nation.

Additional Federal funds to aid the agricultural workers —health and medical assistance in improving health conditions among the State's surplus population, and to encourage establishment of clinics in Federal migratory camps.

Food Provision

Development of a program whereby the Surplus Commodities Corporation would furnish a balanced ration of foodstuffs to undernourished transients.

Inauguration of a system of grants to states to defray cost of relief extended to nonresidents by the states or counties.

Establishment of more Federal camps for migratory agricultural workers and the development also of a very low-cost housing program designed to take transients out of shack towns.

* * *

State Assured of Aid for Migrants

Washington, February 23 (AP).—Representatives of Federal agencies were reported today to have agreed California's critical migrant relief problem had nation-wide implications and its solution should be attempted on such a basis.

Californians who attended the first meeting of the group, formed at the suggestion of President Roosevelt, predicted legislative recommendations would be forthcoming to deal with the situation.

They said a committee would be organized immediately to formulate a program.

"Colonel F. C. Harrington (WPA administrator) and the others agreed with us today," said Representative Leland M. Ford (Republican, California), "that the problem looked national in scope, and it probably would have to be solved by specific legislation."

Meanwhile, Harrington agreed, said Ford, that Federal agencies should give widest possible dissemination to information that unemployed persons "should not come to California from other states seeking jobs."

R. W. Moore, secretary to Representative Elliott (Democrat, California), said Harrington named William R. Lawson, Northern California WPA head, as chairman of the interdepartmental committee, and told the group "to devote its whole time to finding a solution."

California House members had appealed to the President to help solve the transient problem.—San Francisco *Chronicle*, February 24.

* * *

State May Get Migrant Aid

President Orders WPA to Call Problem Conference

(By a *Times* Staff Correspondent)

Washington, February 18 (Exclusive).—Federal officials were summoned today, in response to orders from President Roosevelt, to work out a plan through which the Federal Government can assist California in taking care of the transient relief load.

Under the direction of Works Progress Administrator Harrington, six government agencies will meet next week and study a request from the California delegation in Congress for Federal coöperation in stopping the westward migration of job-seekers and farmers from the dust bowl, and in lightening the present burden on State and local bodies. Harrington requested five other officials to meet with him Thursday to discuss the problem.

Notice of Survey

The movement was launched in response to instructions issued by the President before departing for his vacation trip to the Caribbean. Mr. Roosevelt was stirred to action by a lengthy appeal submitted by a committee headed by Representative Elliott (Democrat), of Tulare, which said that the influx of needy persons from other states is undermining California's standards of living, presenting serious social and health problems, and threatening the State's financial resources.

Notice that the President has asked WPA to survey the situation was received by Representative Elliott today. A letter from White House Secretary Stephen T. Early said "the President is in strong sympathy with California because of the migration there of large numbers of 'economically distressed' from other sections of the country."

Committee to Form

Early added that Mr. Roosevelt hopes the various Federal departments can find some method of alleviating the conditions which are causing concern to municipal, county, and State authorities.

The President directed Harrington to form a committee which will "undertake to extend to California all possible coöperation with a view to finding a solution to the problem" outlined by the congressional delegation. Secretary Early wrote the WPA head that Mr. Roosevelt "thought you should call upon" Farm Security Administrator Alexander, Surgeon General Parran, the United States Housing Authority and the United States Employment Service to aid in working out a relief plan.—Los Angeles *Times*, February 19.

Nonmedical Service City Health Issue

Municipal Employees Polled to Determine If Additional Charge Should Be Assessed

A poll of members to determine whether an extra charge should be made for service by drugless practitioners was started yesterday by the municipal employees health service board.

Meanwhile, complaints of participating doctors concerning financial policies of the service were under investigation by the County Medical Society. The protests were based on delayed payments of fees and alleged slicing of bills.

Problem Outlined

Regarding possible service by osteopaths, chiropractors, and drugless practitioners, the board declared:

"The question of cost is at the heart of the difficulties. Plans for osteopathic, chiropractic, and drugless practice service submitted by representatives of those three professions seem to call for separate contributions of $2.50 per month by member seeking such service.

Hospital Ruling

"On the other hand we are informed that none of the hospitals under contract with the health service board admit osteopaths or chiropractors to practice in them.

"The sum of $2.50 would be excessive where no service can be rendered in a hospital case."

The ballot sent members asked them if they required service of drugless practitioners and whether they would be willing to pay an additional fee. The average fee under the present system is $2.50 per month.—San Francisco *Examiner*, February 15.

Insurance for Medical Service Offered by Doctors

Wilbur and Six Prominent Physicians Sign Incorporation

Sacramento, February 4 (UP).—Voluntary insurance for medical service and hospital care was offered yesterday by the California Physicians' Service in articles of incorporation on file with Secretary of State Frank C. Jordan.

The corporation is composed of members of the California Medical Association, but the voluntary medical service plan may be participated in by all doctors of medicine so desiring, the statement of incorporation said.

President Ray Lyman Wilbur of Stanford University and six prominent physicians signed the articles as directors.

The statement of incorporation declared that "prompt and adequate medical attention and hospital care whenever needed" would be provided to the people of California on a budgeting basis "without injury to standards of medical service, without disruption of proper physician-patient relations and without profit to any agency."

All payments made by patients, the statement read, will be utilized for medical service and hospital care, except that costs of administration would be deducted. It assured efficient public and civic service "without commercial exploitation of patients or profession . . . and without restrictions of individual right freely to select the doctor and hospital desired."

Increased costs of medical attention were attributed to the "very advances made by modern science." The statement predicted medical service and hospital costs would increase as new methods and equipment are discovered.

"The cost of always unpredictable injury or illness is a financial catastrophe too great to be borne by the few citizens of California . . . although the total cost over any period is within the means of a group," the statement declared.

San Francisco was designated as headquarters of the new corporation, which has an administrative membership of seventy-five physicians and an unlimited professional classification and beneficiary group.

Directors signing the petition for incorporation were Ray Lyman Wilbur, C. Kelly Canelo of San Jose, W. Earl Mitchell of Berkeley, Samuel Ayres, Jr., of Los Angeles, Alson R. Kilgore of San Francisco, Lowell S. Goin of Los Angeles, and T. Henshaw Kelly of San Francisco.—Visalia *Morning Delta*, February 4.

Federal and State Bill Submitted at Washington

Washington, February 28 (AP).—Legislation to carry out Administration aims for a greatly expanded public health program was introduced today by Senator Wagner (Democrat, New York), author of much social legislation.

His "national health bill" called for a Federal outlay of $80,000,000 the first year, increasing to more than $250,000,000 annually within three years.

Wagner said the Federal funds would go to states as grants for expanding general public health work, child and maternity care, construction of hospitals, medical care, and temporary and permanent wage payments for workers disabled by sickness and disease.

Immediately there were some signs of criticism because of the cost involved.

Senator Vandenberg (Republican, Michigan) announced he was opposed to "any expansion of the Government's social services until we begin to pay for those we've got."

"We can't go on spending $15,000 every minute, while taking in only $8,000, and survive," he added.

Another Republican, Senator White of Maine, commented all members of Congress thought it was "time we go pretty slow" on additional spending.

In Chicago, Dr. Morris Fishbein, Editor of the American Medical Association, advocated "careful consideration" of the bill by Congress.—San Francisco *Chronicle*, March 1.

Migrant Aid Appeal Made*

Californians Ask President to Assist Needy Horde in State

Washington, February 15.—A system of Federal grants-in-aid to California, and other Government assistance toward feeding, clothing, and giving employment to approximately 200,000 penniless transients who have entered the State during the last three years was asked of President Roosevelt today by the California House delegation.

Calling attention to conditions which were termed "nothing short of deplorable," the House group—headed by Representative Elliot (D.), Santa Maria—requested Federal funds for the relief of migratory workers who flooded California when serious drought conditions forced them from their own states.

Expected to Remain

From 150,000 to 250,000 "floating families" can be expected to remain in California permanently, the delegation declared, adding that "we know that in spite of anything that can be done, more people will come in the future."

Among the suggestions projected by the delegation's Committee on Interstate Migration were (1) expansion of the farm placement service to help migratory agricultural workers find employment; (2) working out of a program through which the Surplus Commodities Corporation would furnish foodstuffs to the State Relief Administration or to the Farm Security Administration for distribution to the transient needy; (3) a system of Federal grants to defray the cost of relief, with the Social Security Board the probable administrator; and (4) establishment of more camps of the type now operated by the Farm Security Administration.

Lack of Jobs Told

Other Federal agencies which would be called upon for assistance include the United States Housing Authority, the Works Progress Administration, and the Public Health Service.

Approximately three workers exist for every available job in California, the committee told the President, and taxpayers of the State are carrying an almost unbearable burden in order that wandering families from other sections of the country may be cared for.

The Editorial Circuit Rider*

A Symposium of Editorial Comment from California Newspapers

Need for the proposed health insurance program in this State is generally recognized, according to many California editors.

If the medical profession itself can work out a practical plan, it was agreed, both the patients and the doctors would benefit.

"There is a definite need," notes the Calexico *Chronicle*, "for some system where medical care can be secured at less expense for classes that frequently neglect calling a doctor for an illness or accident because the expense would be prohibitive or at least restraining. This need is recognized by the California Medical Association. Apparently it is considered compatible with the best interests of doctors to attempt to evolve some sort of insurance system whereby that need be met."

"That the medical profession itself has taken the initiative in attacking the problem is the best assurance of the plan's successful operation," said the Monterey Peninsula *Herald*. "Freedom from political interference and probable bureaucratic evils of socialized medicine, at least during the experimental stages, will mean much in the way of efficiency and economy, with resulting benefits to both the profession and the public. That threat of socialized medicine has hastened the decision of the profession to enter this field may be admitted without detracting from the credit due the profession for its decision, the California leadership in the realm of progressive action looking toward a healthier, happier citizenry is more firmly established as a result."

"The plan," states the San Jose *News*, "seems to get away from most of the dangers which have caused the medical men in general and some laymen to look askance at such proposals. The patient may select his own physician and his own hospital and the personal element of trust and confidence between patient and physician which is so important in the treatment of illness will be retained."

"Although the plan has been highly controversial, meeting opposition within the medical profession," declares the Stockton *Record*, "it does offer advantages to the doctors. They know they will get some remuneration for their services rather than having uncollectible fees on their books. Programs such as that adopted in California—and to be followed in other states—were inevitable to meet changing conditions and to preclude governmental entry in the socialized medicine field."

"The plan's intent," comments the Alameda *Times-Star*, "is proper, but how it would work out and whether or not it would actually result in the lowering of the standards of the profession is a matter to be taken into account. . . . Socialized medicine may come but it must not be adopted merely on the theory, the actual working of it being the only real criterion by which it may be judged."

"How the plan would work," concludes the Eureka Humboldt *Standard*, "is something upon which nobody can hazard a guess, since there is no precedent upon which to base a prediction. But doubtless it will appeal to a vast number of people. In any event, the State's medical profession certainly has evidenced sincerity of purpose in the performance of its basic job—to keep the public well."—Yreka *News*, January 30.

President Roosevelt Orders Study of Migrant Problem

Washington, February 18 (AP).—President Roosevelt, it was disclosed today, has ordered formation of a special group, headed by F. C. Harrington, WPA administrator, to attempt solution of a critical relief problem in California arising from the migration there of thousands of economically distressed families.

The President's action was announced by Representative Elliott (D., Calif.), who made public a letter from Stephen Early, White House secretary, in which the latter described the President as "strongly sympathetic with California."

Early said the President left instructions before departing Thursday night for Florida to have Harrington serve as chairman of the special group, and added:

"He hopes, through Colonel Harrington's coördination, that the various departments and agencies of the Federal Government will find a way without delay to extend all possible coöperation to the State in alleviating the conditions existing.

Early said the Chief Executive had suggested that the heads of the Farm Security Administration, the United

---

* By Lorania K. Francis, *Times* Staff Correspondent.

* By J. F. McLaughlin, United Press Staff Correspondent.

States Employment Service, and the Housing Authority, as well as the Surgeon-General should be made key members of Harrington's group. He also authorized the WPA administrator to "call in such others to make this group representative of Federal departments and agencies whose works are related to various phases of California's problems as a whole," Early said.

Presidential action followed quickly the receipt of a petition from California House members urging immediate steps be taken to help the State solve its transient relief problem.

Members told the President that thousands of penniless families fleeing drought and depression, had crossed into the State in recent years and had created unprecedented relief, employment, health, housing, and education problems.—Oakland *Tribune*, February 18.

Health Plan Growth Seen

Group Says Medical Insurance May Care for Forty Million

Cleveland, February 8 (AP).—An American Hospital Association accountant predicted today 40,000,000 Americans will have guaranteed hospital and medical care by 1944 if doctors agree to supplement the group hospital insurance plans now in effect in fifty-two cities.

The accountant was Dr. C. Rufus Rorem of Chicago, Director of the Committee on Hospital Service of the American Hospital Association.

Approximately 3,000,000 persons were participating in the group hospital insurance plans last January 1, Doctor Rorem said. This figure, he predicts, will increase to 12,000,000 by 1942 under the force of guaranteed hospital service alone, and would swell to 40,000,000 by 1944 if doctors agree to supply medical service under similar arrangements.

Plan Explained

Under the hospital service plan, subscribers pay certain amounts of money every month; some of these subscribers go to their local participating hospitals for care; the plan then pays the hospitals for the care given, retaining a reserve for epidemics and administration costs.

Heads of the various community plans came here today for a midwinter conference. Their officials expressed hope physicians and surgeons soon will embrace the hospital plan and provide medical care under a similar arrangement.

Frank Van Dyk, Director of the Associated Hospitals of New York, said Government medical regulation is inevitable unless some such plan of group medical care is made nation-wide by the medical profession itself.

Doctors Warned

"This program is growing so fast doctors will be forced into it whether they like it or not," he said. "If they 'strike,' the only alternative is Government control."

He said studies have shown such combined medical-hospital care could be provided in New York for not more than $3 a month a family or $15 a year for an individual.—Los Angeles *Times*, February 9.

* * *

Thomson Denies Department Costs Tenth of Aid Funds

Rex Thomson, Superintendent of County Charities, yesterday denied the administrative costs of his department are more than 10 per cent of relief money expended, the highest of any county in the State.

Thomson said this in a letter addressed to Wayne Allen, chief administrative officer, following release of a report on relief costs for all the counties in California.

Orange Second

Allen's report showed Los Angeles County uses more money than ten counties. Orange County was second with 8.91 per cent for administration, while Sacramento was lowest with 2.98 per cent.

"A few years ago nearly 20 per cent of charity money went for administration." Thomson said. "This proportion has been reduced each succeeding year. In 1937-1938 it was 10 per cent, and now it is less than 8.5 per cent.

Promises Further Cut

"This will be further reduced in the budget request for 1939-1940, which will be submitted to your board for consideration shortly," the superintendent's letter said.

Thomson recently explained that a comparative report of the costs expended by counties in the State is impossible because of widely divergent methods of accounting.

"Considerable effort is being made by Federal organizations to establish uniform systems of determining expenditures on a comparative basis for all counties," he said.

"This county has a higher case load per capita of relief clients than forty-eight of the State's fifty-eight counties. It is possible to make more reductions in administrative costs. Such reductions, however, would jeopardize the ability to prevent distribution of relief money to ineligible persons."

The superintendent said this county gives relief services not found elsewhere in the State. He stated expenditures had been charged against the collection department, but no allowance apparently made for nearly a million dollars collected annually from persons who regained ability to pay.—Los Angeles *Times*, February 21.

* * *

Migrant Labor Influx to Southland Slackens

San Francisco, February 15 (AP).—A decrease in migratory workers in Southern California was reported today by Dr. S. F. Farnsworth, coördinating officer of the State Department of Health.

Doctor Farnsworth returned today from a survey of southern counties, where agricultural work is in progress. He said fewer migrants were entering the State in search of agricultural work, and that sanitary and living conditions among farm workers has shown considerable improvement.

No Squatter Camps

In Imperial County, usually the location of the major problem this time of year, there are no squatter camps and no ditch-bank camps, he said.

Doctor Farnsworth reported that more than 700 persons are residing at the Federal Farm Security camp at Brawley, and more than 1000 are at the temporary camp at Calipatria.—Los Angeles *Times*, February 16.

* * *

Hospital Plan Advice Asked

Supervisors Refer Proposed Changes to Two Committees

The proposed change in the administration of General Hospital yesterday was referred to the Lay Advisory and Medical Advisory committees of the institution by the Board of Supervisors.

On a resolution presented recently by Supervisor William A. Smith, the change would involve the ouster of Everett Gray, executive superintendent of the hospital, merging his post with that of Rex Thomson, Superintendent of Charities.

A plea by the Lay Advisory Committee that it be permitted to offer its recommendation on the proposed merger was read to the Supervisors.

"This change should be considered by the advisory boards of the hospital," said Supervisor Gordon L. McDonough, arguing against the proposal. "The committees are the only ones who can give us an impartial view of the situation at the institution."—Los Angeles *Times*, February 23.

Mass Insurance for Health

The new health insurance service projected by the California Medical Association makes an excellent beginning by placing at the head of its governing board Dr. Ray Lyman Wilbur, president of Stanford University, and a nationally recognized leader of the movement for a better distribution of the costs of medical care.

Doctor Wilbur is a pioneer in the movement.

He rendered extremely valuable public service through his work with the national committee investigating the high costs of medical care, and in the publication of the report of this committee.

That report has become a solid, factual foundation for the building of the movement for making modern medical care available to the great mass of Americans without disastrous financial sacrifice.

The movement gained headway slowly through the years. Like all new ideas, departures from old methods and traditions, it was unpopular. It aroused bitter antagonism. But with the backing of such men as Doctor Wilbur, it progressed. Necessity and logic were on its side.

The movement will progress much farther. We are seeing only its beginning now.

This community, headquarters of the hospital insurance movement for central California, can be proud that it has contributed something to this spread of better medical care at a lower cost.

As long as the movement is guided by such men as Doctor Wilbur and by others who have at heart the interests of both medical science and the mass of human beings who need its ministrations, it cannot fail to be constructive and an instrument of immense public good.—Oakland *Post-Enquirer*, February 6.

To Publish Report on Medical Survey

The California Medical Economic Survey, carried out in 1934 and 1935 at a cost of $100,000 and designed to give the facts regarding both private and public medicine and their relation to the economic picture in the State, is about to issue from the Graphic Arts Press in Washington, D. C. The survey was sponsored by the California Medical Association, the State Board of Health and the Federal public health agencies, the latter assuming two-thirds of the cost.*

Much of the research in the survey was handled by Dr. Ernest F. Penrose, associate professor of economics in the University of California on the Berkeley campus, and Dr. Paul A. Dodd, assistant professor of economics on the Los Angeles campus. Doctor Dodd investigated medical care as an economic problem, and Doctor Penrose studied the public health and insurance phases of the survey. Particular attention was paid to the condition and the costs of both public and private medical care in the State and recommendations were made to cover defects the survey disclosed.

An abbreviated copy of the survey was published by the California Medical Association. According to Doctor Penrose, the forthcoming volume is the first publication of the survey findings in full.—Berkeley *Gazette,* February 9.

* * *

Medico Plan Survey

San Francisco, February 14 (UP).—Dr. A. R. Kilgore and Allen W. Widenham, secretary and general manager, respectively, of the new California Physicians' Service, returned today after a survey of two medical service plans in the Pacific Northwest.

Prior to the inauguration of the "modified" socialized medicine plan being sponsored by the California Medical Association, they inspected the King County medical service plan at Seattle and the Oregon State medical plan.

The two men noted the present trend finds patients willing to pay sufficient sums to provide "complete coverage" for all ailments; that the great majority of patients served are of the low income group; that the aggregate return to physicians is not lowered but tends to be actually greater under prepayment service plans.

They said Northwestern doctors suffer no loss from uncollected accounts and that patients whose earning capacities are extraordinarily low are able to finance operations with no loss of self-respect or the incurring of debt as a result of the plan.

Report

In their report to trustees of the California plan, Doctor Kilgore and Widenham said that "open staff medical and hospital service plans are successful, smooth running and satisfactory in just the degree to which doctors and patients have a clear appreciation of their purposes and the objectives of the plan."

These aims, they said, could be attained through:

1. Removal of the financial barrier between patient and doctor.
2. Freeing the doctor from restrictions on use of hospital, x-ray and laboratory procedure imposed by the patient's inability to pay their costs.
3. Furnishing the most complete medical care possible and imposition of no restrictions upon the doctor in the care of his patients that are not absolutely necessary for establishment of these objectives with fairness to doctor and patient.—Alameda *Times-Star,* February 14.

* * *

Pottenger Urges Group Insurance

Compulsory health insurance was indorsed yesterday by Dr. Francis M. Pottenger, former president of the American College of Physicians and Surgeons, as "the only plan which will insure complete, stable income from all groups that need medical care."

In an address to the Town Hall Club in the Biltmore Hotel, the doctor, who is head of the Pottenger Sanatorium, Monrovia, declared:

"No matter what medical men may do, some form of medical insurance that will give satisfactory service to all is sure to come.

"I feel that this means compulsory insurance, and if the attitude of medical men is sympathetic, we will come nearer to getting what is right to serve the intended purpose when it does come."

His attitude, he added, is at variance with the opinion of the California Medical Society, of which he is a member.—Los Angeles *Examiner,* February 21.

* * *

Farm Bureau Members Hear Discussion of Pending Bills

Ray Wiser of Gridley, president of the California Farm Bureau Federation, led the discussion on the legislative program now before the State Legislature, including such items as hospitalization and medical care, especially to rural people, at a luncheon meeting in Red Bluff High School cafeteria today.

Sixty-five Tehama County Farm Bureau members attended, including representatives of each farm center who will take part in the spelling bee to be held at the Show Boat February 25.

President Wiser said Senate Bill No. 1128 dealt with the matter of hospitalization and medical care. Assembly Bill No. 2499, which would liberalize the present act regarding county hospitals, he said, would permit the admission of part-paying and paying patients to county hospitals and also provide for proper investigation of such cases and permit any doctor to enter the county hospital to treat patients when such patients request it.

He also discussed hospital and health insurance, and stated Assembly Bills No. 2501 and No. 2494, sponsored by Assemblyman Garland of Tulare County, which deal with hospital and health insurance, would attempt to set up suitable working plans whereby hospitals and health insurance can be provided to those who are unable to pay for their own under present conditions.

Wiser quoted the Surgeon-General of the United States as stating that this country could reduce its sickness by 70 per cent in one generation by simply making it mandatory for people generally to have proper medical care.—Red Bluff *News,* February 11.

LETTERS

Subject: Bequest of late Walter Jarvis Barlow, M. D., to the Los Angeles County Medical Association Library.*

(COPY)

CALIFORNIA COMMUNITY FOUNDATION
SECURITY-FIRST NATIONAL BANK OF LOS ANGELES
TRUSTEE

Los Angeles, California,
January 23, 1939.

To the Editor:—Your letter of January 17, asking information concerning the gift of the late Dr. Walter Jarvis Barlow to the library of the Los Angeles County Medical Association has been received.

The following is an excerpt from Doctor Barlow's will:

> I give and bequeath the sum of ten thousand dollars ($10,000) to Security-First National Bank of Los Angeles, a national banking association, with its principal place of business at Los Angeles, California, and its qualified successors, in trust for the charitable uses and with the powers and duties both as to principal and income which are fully set forth in a resolution recorded in Book 242, page 182, of Miscellaneous Records of Los Angeles County, adopted on the first day of June, 1915, by the board of directors of Security Trust and Savings Bank, which on April 1, 1929, duly merged into or consolidated with said Security-First National Bank of Los Angeles, providing for a community charitable trust designated in said resolution as Los Angeles Community Foundation, which said resolution is incorporated herein by reference with the same force and effect as if herein set forth at length.
>
> It is my request that the said set income be distributed in quarterly or other convenient installments to the Los Angeles County Medical Association of Los Angeles, California, to be used for medical library purposes so long as said Los Angeles County Medical Association shall exist and continue to maintain a medical library. In the event that the purposes and objects above mentioned should at any time fail or said Trustee be unable to apply, expend and disburse said net income for said purposes, then it is my request that thereafter the net income from said trust fund shall in perpetuity be paid in quarterly or other convenient installments to the Barlow Sanatorium Association, a charitable corporation, of Los Angeles, California, to be used for its general purposes. In none of the cases in this Article mentioned shall the Trustee be required to see to the application of said funds for the purposes herein specified, but the receipt of the proper officer or custodian of Barlow Medical Library or the Library of Los Angeles County Medical Association, or the proper officer of said Barlow Sanatorium Association, as the case may be, shall be sufficient discharge of the Trustee therefor.

From this excerpt you will see that the bequest was not to the library direct, but to the Security-First National

---

* Actual figures from California Medical-Economic Survey, on page xx, are: California Medical Association, $46,126.84; Federal Government, $55,425.42.

* See also editorial comment, page 172.

Bank of Los Angeles, Trustee for the Los Angeles Community Foundation, which is now known as the California Community Foundation. The amount of the bequest was $10,000 and the check for $210 tendered in the Foundation's letter of December 30, 1938, to the Los Angeles County Medical Association for medical library purposes, represented the first payment of income made pursuant to the Decree of Distribution. It is the expectation that further payments will be made quarterly.

You may be interested in the accompanying copy of the California Community Foundation's booklet, which explains the purposes for which it was founded and the scope of its activities. In 1928 Doctor Barlow was selected to be a member of the Foundation's first Advisory Committee, and until his death on September 4, 1937, he served on the committee, taking an active and constructive part in all its affairs.

Should an article concerning this gift by Doctor Barlow appear in your publication, CALIFORNIA AND WESTERN MEDICINE, I should very much appreciate your sending me two copies for my files.

It is indeed a pleasure to give you these data, and should you at any time desire more information concerning the California Community Foundation, I shall be glad to supply it.

215 West Sixth Street.

Very sincerely yours,
(MISS) LOUISE BENNETT,
Secretary, California Community Foundation.

Subject: A California Medical Association member's comments on California's state-wide voluntary medical service plan.

Fresno, California.
February 24, 1939.

To the Editor:—The doctors of the country will probably never completely agree on *a* method or plan for furnishing medical service. Proverbially, doctors do not agree. There are too many "rugged individualists" among them. Some three thousand plans and experiments are now being tried in the United States. No one plan, probably, can ever be adapted to meet the varying needs and conditions prevailing in our great country, with the multitude of factors to be considered, such as climate, employment, housing, density of population, medical and hospital facilities, varying nationalities and races, transportation facilities, etc. But certain general and fundamental principles for such plans have already been accepted by the American Medical Association. Free choice of physician, preservation of patient and doctor confidential relationship, reasonable compensation for services, and elimination of political control, are some of the essentials. To this might be added flexibility of the plan so as to permit changes warranted by accumulated experience, and development of new needs for service. Our California Physicians' Service, which will be launched shortly, has all these essential features. It was adopted by an almost unanimous vote by the representatives of the six thousand members of the California Medical Association and, if accepted as generally by the profession throughout the state, it will be a new high point for agreement among the doctors.

The California Physicians' Service is the most extensive experiment in distribution of medical and hospital service in this country. Many years of study and planning by earnest, clear thinking members of the California Medical Association have evolved this plan of service. It should and must succeed. It is hoped it will provide needed services for those whose low incomes make payment of doctor bills a hardship, and enable the thrifty to budget medical costs in a simple practical way. (A recent Gallup poll, on voluntary health insurance, showed that some twenty-five million people, largely in a group earning over $980 a year, were willing to pay $3 a month for complete medical and hospital care.)

It is also hoped that the threatened organization of *all* medical service on a taxation or compulsory insurance basis will not find many supporters when this medical service is made generally available. It is also thought that the flexibility of this plan of service will permit government agencies to arrange for the care of groups now a taxpayers' burden, and make some provision for compensation for medical care now donated by our profession. Some definite assurances from leaders of the farm organizations of the state make it very probable this service will appeal to the rural population and will answer their demand for "group practice" and medical service on the prepayment basis. The availability of this service is also eagerly watched for by many employers, who are trying to make provisions for their employees against the contingencies of sickness and hospital expense. Many employers now using commercial insurance contracts for this purpose find these insurance policies so restricted and limited that a full coverage such as is contemplated by California Physicians' Service will offer the needed protection. The 35 to 40 per cent profit charged by commercial companies also makes a poor comparison with a nonprofit organization with an estimated 10 per cent administration cost. Labor organizations, city employees, industrial groups, and individual wage-earners will, in many instances, welcome the opportunity to provide against the cost of ill health and the flexible features of the Service will, I believe, enable us to offer what these people need and can afford to pay for.

Now that we have committed ourselves to offer this Service to the public, we must give it whole-hearted support and, if possible, make it such a success that it may serve as a pattern for other states. Adjustments and changes will be necessary as experience shows the need. These can be readily made, and improvements added as required.

Some of the immediate problems to be met, such as the patient demanding hospitalization and surgery for some chronic ailment or elective surgical condition, may cause some difficulties during the first few months, as shown by the San Francisco Municipal Employees' Service. But experience gained there will help us meet this situation. About 95 per cent of our people are reasonably honest. Impositions and demands for unnecessary service will come from about 5 per cent of beneficiary members. Coöperation on the part of the doctors rendering service will keep the expense from this source at a minimum. Unfortunately, the percentage of honesty is no greater for the practitioner of medicine. Chiseling will occur, but there are many safeguards against unfair practices by the professional members, and I believe it will prove no serious problem. One of the primary requisites for success of this service is sufficient spread of beneficiary members to provide the funds for the risks involved. I believe every member of the California Medical Association should help promote and advertise this Service to all of his clientele entitled to enroll as a beneficiary member. There should be no hesitation about recommending it to patients who pay their bills if they are in the proper income classification. The doctor will be remunerated for his services on a unit of service basis, but experience again has already provided a guide which will permit returns to the doctor of at least the usual fees for his services. It is possible, of course, that during the initial period of some months the returns may be less, but we should accept this possibility with no great flurry of disappointment, as provisions have already been made to reimburse for the lean early months by payments from later surplus receipts. The average income of the general practitioner in the United States is only $3,500 per year. The total cost to the country for medical service is about three and a half billion dollars. It is estimated that the administrative cost of any compulsory or tax-supported medical service would be another billion dollars. The compulsory health insurance proponents offer better incomes for the doctors to enable more frequent postgraduate courses of study and thus provide an improved medical service. Our already overloaded tax burden would be increased by another billion or two on this score.

Political appointees would, under any form of state medicine, dictate to the profession. Bureaus and red tape are a part of such a system. Malingering and pseudo-illness on the part of the public have always developed. Increased and unnecessary hospitalization always increases the cost. The quality of medical service has always deteriorated. Free choice of doctors and hospitals is impractical and impossible. Records of ailments become public property. Political control and graft is unavoidable.

If, therefore, we can make a success of our Physicians' Service and satisfy the clamor for social changes in the methods of distributing medical and hospital care, we will not only preserve to ourselves the essential elements of the private practice of medicine (for which as yet no superior system has been found) and perhaps escape the regimentation and odious conditions of compulsory State Service practice but do a great service to the taxpaying public and still assure our people of the best medical care offered anywhere in the world.

Medical Group Building.

Respectfully submitted,
Axcel E. Anderson.

Subject: Opinion of California Attorney-General on legal right of licentiate to aid an unlicensed practitioner.

420 State Office Building,
Sacramento, California,
February 20, 1939.

To the Editor:—Enclosed please find copy of Opinion No. NS1409, rendered by the Attorney-General on February 9, 1939, which we thought might be of interest for publication in California and Western Medicine.

Very truly yours,
C. B. Pinkham, M. D.,
Secretary-Treasurer.

* * *

(copy)

State of California
Legal Department

San Francisco, February 9, 1939.

Charles B. Pinkham, M. D.,
Secretary-Treasurer,
Board of Medical Examiners,
420 State Office Building,
Sacramento, California.

Dear Sir:

In your communication of January 3, 1939, you enclosed a copy of a letter written you by Special Agent W. N. Anderson, wherein he requests an opinion as to whether the conditions set forth in his letter warrant charging a licentiate with aiding and abetting an unlicensed practitioner or with practicing under a fictitious name. You request that such an opinion be forwarded to you.

From the facts disclosed in Mr. Anderson's communication, two unlicensed men own a sanatorium essentially for the treatment of alcoholism, and employ a licensed physician and surgeon "as a medical director." The latter is paid a salary of $200 a month and as such medical director handles all cases coming into the sanatorium.

In reply, please be advised that a licensed physician and surgeon cannot render medical services to patients of unlicensed persons in consideration of a salary paid to him for so doing. In *People* vs. *Painless Parker, Dentist* (Colo.) 275 Pac. 928, the defendant corporation employed dentists to render professional services and the court held that it was too clear to require discussion that the defendant corporation was engaged in dental practice when it selected natural persons to extract teeth, diagnose conditions of patients, and perform dental surgery.

In *Masters* vs. *Board of Dental Examiners,* 15 Cal. App. (2d) 507, the licensed person was charged with having aided and abetted an unlicensed person, to wit: the Western Health and Hospital Corporation, Ltd., a corporation, to practice dentistry, by knowingly accepting employment from such corporation to perform dental operations and give dental treatments for such corporation, such corporation, to the knowledge of Doctor Masters, offering to perform operations upon and treat diseases of the human teeth, etc. The order of the Board revoking the license of Doctor Masters was affirmed, the latter unsuccessfully urging that the accusation did not state facts sufficient to constitute unprofessional conduct or warrant the suspension or revocation of his dental license.

Again, in *Granger* vs. *Adson,* et al. (Minn.), 250 N. W. 722, the Supreme Court of Minnesota indicated:

"What the law intends is that the patient shall be the patient of the licensed physician, not of a corporation or layman. The obligations and duties of the physician demand no less. There is no place for a middleman."

It would hence appear that if the institution advertised, offered to treat, or treated a sick or afflicted person, alcoholic or otherwise, the licensed employee would be guilty of aiding and abetting an unlicensed person in the practice of medicine.

A closer question exists as to whether a licensed person receiving a salary from laymen for handling patients of such laymen would be practicing under a fictitious firm name, where the institution advertised under a name such as "Health Sanatorium." Provided the institution held itself out as rendering medical services, such fact might constitute, in point of law, the adoption of such name by the licensed person, where the latter, with such knowledge, continued to render medical services for the institution.

Such was the fact in the case entitled *Berry* vs. *Alderson,* 59 Cal. App. 729, where the licensed person adopted the name "K. B., Bloodless Surgeons," a name other than his own, in connection with his practice. Such was likewise the case in *Grisso* vs. *Board of Medical Examiners,* 75 Cal. App. 385, where the licensed person filed a certificate indicating that he was the sole owner of "Bohannon Cancer Institute" and was doing business under that name.

Mr. Anderson's communication also asks if two laymen may obtain an institution license and hire a medical man to handle all cases therein requiring treatment of the sick and afflicted.

In reply, please be advised that the licensing of private institutions is covered by Chapter I, of Part 2, Division 6, of the Welfare and Institutions Code. Section 5700 thereof prohibits persons who have not first obtained a license from the State Department of Institutions from conducting such institutions. The section referred to, and those following, are concerned with the physical aspects of the premises, the capacity of the buildings, the extent and location of the grounds appurtenant thereto, and the number of patients proposed to be received therein, rather than with the personnel thereof. Consequently, the first portion of such question may be answered in the affirmative, there being nothing in said sections to prevent a layman from securing such a license.

The second portion of such question must, however, be answered in the negative, as the unlicensed owners of such an institution cannot hold themselves out as rendering medical services and hire a licensed physician to render such services for them.

The Supreme Court, in the case of *Painless Parker* vs. *Board of Dental Examiners,* 216 Cal. 285, indicated that on grounds of public policy a corporation could not manage, conduct or control the licensed dentist and term it "the business side" of the practice of dentistry, as such profession could not be divided into departments.

Very truly yours,
EARL WARREN, *Attorney-General.*

Subject: "May Day"—Children's Bureau of United States Department of Labor.

UNITED STATES DEPARTMENT OF LABOR
CHILDREN'S BUREAU
WASHINGTON
February 9, 1939.

To the Editor:—I am enclosing, for your information, copies of suggestions in connection with May Day—Child Health Day, 1939, which have been forwarded to the health officer and May Day chairman of each state. You will note that all of the material emphasizes the need for medical care for children.

Whether or not the enclosed suggestions on nutrition are used will depend upon the decision of State May Day committees, since each state emphasizes in its Child Health Day plans the subjects that will be most helpful in rounding out its own child-health program. We shall be glad to send additional copies of the material if desired. . . .

Sincerely yours,
MARTHA M. ELIOT, M. D.,
Assistant Chief.

Washington
MAY DAY—CHILD HEALTH DAY, 1939
Monday, May 1
Suggestions for Observance

Child Health Day activities are sponsored by the Children's Bureau at the request of the State and Provincial Health Authorities of North America in accordance with the Congressional Resolution of May 18, 1928, which authorized the President to proclaim May Day as Child Health Day.

Slogan: The health of the child is the power of the nation.

Objective: To bring to the attention of each community—The importance to the child's health, development, and well-being throughout life, of proper food, rest, exercise, medical care, and protection against disease; the ways of informing parents and others how child health may be safeguarded; and the means whereby such safeguards may be made available for all children.

Leadership: State May Day chairmen and representative State May Day committees appointed by State health officers. State departments of education coöperate in planning school Child Health Day programs.

Program: The State May Day Committee decides upon the Child Health Day emphasis that will best contribute toward strengthening the year-round child health program. Community groups arrange for the presentation to the public of child health needs in the community, for planning by interested groups of joint efforts for advancing child health during the year, and for launching new child health projects. School children, as a climax to the year's health education program, show by exhibit, demonstration, programs, and plays what they have learned about safeguarding their own and the community's health, and celebrate in festivals and games progress made during the year.

For State programs write to May Day Chairmen, State Departments of Health.

What is your community doing to promote good nutrition of mothers and children? An outline for a survey
to be made in preparation for
MAY DAY—CHILD HEALTH DAY, 1939

(*a*) *Health Services*

Through: Family physicians; specialists in obstetrics and pediatrics; public health nurses; maternal and child health conferences; school health supervision; food protection; health camps; hospitals; children's institutions.

1. Check the above health services available in your county or community. Are there others?

2. Can all expectant and nursing mothers obtain reliable information on their food needs? Where?

3. Can all mothers obtain health supervision for their babies and growing children? Does this health supervision include information on food needs of children?

4. Do most of the mothers in the community know that these services are available? Do those that need these services most take advantage of them?

5. Are vacation camps, nursery schools, special classes, or other facilities available for improving the condition of undernourished children?

6. Do hospitals, maternity homes, and child-caring institutions have consultation service (if not full-time service) from a trained dietitian?

7. Are the nutritive quality and cleanliness of milk and other essential foods sold in the community insured through adequate legislation and regulation?

8. Is the nutrition of children safeguarded by other health services? Specify.

(*b*) *Educational Programs*

Through: Health agencies; schools; adult education classes; home demonstration clubs, boys' and girls' organizations.

1. Check above health education opportunities in your community.

2. Can newly married couples and young parents obtain systematic instruction in the relation of everyday food practices to health?

3. Can mothers, foster mothers, and individuals engaged in feeding children in groups obtain systematic instruction in food production, food purchasing, menu planning, food sanitation, and food preparation? Is emphasis placed on the relation of these activities to the health and pocketbook of the family?

4. Do public and private schools offer a comprehensive program of health instruction that reaches all students?

5. Do schoolboys and schoolgirls who present special nutritional problems receive attention and care according to their individual needs?

6. Do the schools consider the feeding of children at school as part of the health education program? As such, is it supervised by a worker who knows the nutritional needs of children?

7. Is the sale of unsuitable foods on the school premises forbidden as contrary to a sound program of nutritional education?

8. Do boys' and girls' organizations stimulate interest in good nutrition as an end in itself as distinguished from interest in competitive awards for health achievement?

9. Do health agencies and educational agencies coöperate in spreading sound information on nutrition? Do they help the public to discriminate between sound and unsound information that is disseminated from other sources?

10. Is the nutrition of mothers and children promoted by other educational programs?

(*c*) *Economic Assistance*

Through: Public and private relief agencies; emergency relief agencies—e. g., WPA, NYA, FSA; service clubs; churches.

1. Do dependent families receive sufficient assistance (cash, grocery orders, commodities, garden seeds, etc.) to enable them to have an adequate diet?

2. Do allowances to dependent families provide for the special needs of expectant and nursing mothers, growing children, and undernourished individuals of all ages?

3. Do families and individuals who receive public assistance receive also information that will enable them to obtain an adequate diet on their food allowance?

4. Are families helped to increase their own food supply through planting home or community gardens, canning and storing food surpluses, and taking advantage of other opportunities for home food production?

5. Do child-caring institutions in rural areas take advantage of the opportunity to improve their food supply and keep down the cost through producing part of their food supply?

6. Where climate permits do rural schools maintain gardens to furnish vegetables for the school lunch?

7. Are plans made so that school children who are not able to pay for a lunch at school are provided with lunch without having it known that they cannot pay?

8. Are families and individuals helped in other ways to get an adequate food supply?

SUMMARY

1. What community activities are promoting good nutrition for mothers and children?

2. Which of the efforts to promote good nutrition in the community are most effective?

3. What are the outstanding shortcomings in the community activities that relate to nutrition?

Subject: Seal sale of the California Tuberculosis Association.

San Francisco, February 1, 1939.

To the Editor:—The Board of Directors of the California Tuberculosis Association has asked me to extend to you their sincere appreciation for the article concerning the work of our association and the importance of the Christmas Seal sale carried in California and Western Medicine for the month of December.

Early returns in California indicate a banner Seal sale—one which will probably exceed our successful 1937 sale.

We feel that your service has played a part in winning for us this whole-hearted support of the general public.

45 Second Street.

Sincerely yours,
W. F. Higby, *Executive Secretary.*

Subject: Correspondence from London, regarding a Los Angeles chiropractor.

(copy)

Rosary Gardens
South Kensington, S. W. 7
London
January 6, 1939

To the Secretary of the California Medical Association,
San Francisco, California.

Dear Sir:

I must apologize for troubling you—but I should be very grateful if you could help me.

During last summer I came in touch with Dr. ——— of Los Angeles when she was in London, and became very interested in her treatments by her radiotherapy instrument. I took my little daughter to see her, as she is a backward child and not a case for the ordinary practitioner.

Doctor ———, with the aid of her instrument, diagnosed the trouble as caused by a malformed pituitary gland and feels that regular treatment with one of her instruments would probably help the child very considerably.

It is almost impossible over here to find out much about the results of her treatment, as she was only over—I believe for the first time—this summer, and it would take some time before the effects of the treatment would show themselves in a case like our daughter's. We are naturally anxious to help our child in any way we can, but feel that we should know more about this treatment before trying it for her.

We should be most grateful if you could advise us and if you could tell us of any similar cases that have been helped by Doctor ——— treatment.

I am, dear sir,
Yours truly,
(Signed): Mrs. ———————.

* * *

San Francisco, California
January 31, 1939
Yours of January 6
Re: ———, D. C.

Mrs. ———
Rosary Gardens
South Kensington, S. W. 7
London, England

Dear ———:

Your letter of January 6, addressed to the Secretary of the California Medical Association, has been forwarded us for reply.

You stated therein that you became interested in Dr. ———, when she was in London, with her radiotherapy instrument, following the diagnosis made by said Dr. ——— and her machine of your little daughter, described as a backward child. You relate that "Dr. ———, with the aid of her instrument, diagnosed the trouble as caused by a malformed pituitary gland" and advised you that "regular treatment with one of her instruments would probably help the child very considerably."

Our records show that Dr. ———, a graduate of the Los Angeles College of Chiropractice, December 21, 1926, is licensed by the Board of Chiropractic Examiners to practice "chiropractic." So far as we know, she has no medical training. Our records indicate that for the past three or four years she has been operating the "——— Laboratory of Radiotherapy—Home of the Homo-Vibra Ray, ———, Los Angeles." She is said to operate "a sort of laboratory and clinic," using the "homo-vibra ray" (whatever that may be) and other so-called radio modalities, one of which is known as the "——— Short Wave Outfit," which assertedly diagnoses and treats all diseases.

One informant reported at our Los Angeles office September 30, 1938, that she consulted ———, "who she says is diagnosing and treating by radio. The patient puts a drop of blood on a piece of blotting paper and sends it to Mrs. ———, who makes her diagnosis from this specimen."

Our informant related that "One patient, who is in the East some place, sent a drop of blood and ——— diagnosed this case as broken ribs, the fourth and fifth ribs."

The last-mentioned report indicates the possibility that ——— is using an electrical appliance similar to that of the old Abrams electronic machine (also called an oscilloclast), a totally unscientific apparatus, which was the subject of an article printed in the *Journal of the American Medical Association,* September 20, 1924, page 939; also in the *Scientific American,* October, 1923, issue.

Very truly yours,
C. B. Pinkham, M. D.,
Secretary-Treasurer.

Subject: American Physicians' Art Association.

San Francisco, February 10, 1939.

To the Editor:—The American Physicians' Art Association, composed of over seven hundred physicians throughout the country who have become proficient in all kinds of art work as an avocation, will conduct their second art exhibit at the City Art Museum of St. Louis next May during the convention of the American Medical Association.

In order to bring this matter to the attention of thousands of your subscribers, we are hoping that you may arrange to publish the notice below in an early issue of your noted and valued journal. Please notice that the *Journal of the American Medical Association* has already published such a notice in their issue of February 4, 1939, Vol. 112, No. 5, page 456.

Thanking you in advance for such a courtesy and hoping you may be able to send us a copy of the issue that may contain such a notice, I beg to remain

521 Flood Building.

Respectfully yours,
Francis H. Redewill, M. D.,
President.

"The American Physicians' Art Association, composed of members in the United States, Canada, and Hawaii, will hold its second Art Exhibit in the City Art Museum of St. Louis, May 14 to 20, 1939, during the annual session of the American Medical Association. Art pieces will be accepted for this art show in the following classifications: (1) oils, both (a) portrait and (b) landscape; (2) water colors; (3) sculpture; (4) photographic art; (5) etchings; (6) ceramics; (7) pastels; (8) charcoal drawings; (9) book-binding; (10) wood carving; (11) metal work (jewelry). Practically all pieces sent in will be accepted. There will be over sixty valuable prize awards. For details of membership in this Association and rules of the Exhibit, kindly write to Max Thorek, M. D., Secretary, 850 Irving Park Boulevard, Chicago, Illinois, or F. H. Redewill, M. D., President, 521-536 Flood Building, San Francisco."

MEDICAL JURISPRUDENCE†

By Hartley F. Peart, Esq.
San Francisco

OPERATIONS UPON PERSONS LEGALLY INCOMPETENT TO CONSENT TO SAME

It is a general rule of law that a physician or surgeon cannot operate upon a person without his express or implied consent, or if the person to be operated upon is legally incapable of consenting, then without the express or implied consent of one legally competent to consent for him.

Two classes of persons who are, by law, incompetent to give consent are minors and mentally incompetent adults. Consent to operate upon such persons must be obtained from the person duly appointed to act as guardian, or in the case of minors with living parents, from the parents, since they are, in point of law, natural guardians of their children. In early days, another class was recognized, namely, wives. Consent of the husband was necessary then, due to the fact that the wife and husband were considered as one entity, and the husband had the sole right to contract for anything affecting that entity. Today the laws of this and most other states grant to a wife equal rights in regard to binding oneself by contract, and apparently to consenting to surgical operations.

Since two elements, implied consent and emergency, are constantly used to create exceptions to the general rule requiring consent, one can only reach a conclusion as to what a court may do in a particular instance by reviewing decisions handed down in the past.

Typical instances of the application of the general rule are the following:

In *Zoski* vs. *Gaines,* 271 Mich. 1, 260 N. W. 100, defendant physician removed the tonsils of a nine-year-old boy without consent of his parents and at a time when no emergency existed. Defendant was held liable to the boy's parents.

In *Moss* vs. *Risworth,* 222 S. W. 225, a physician was held liable for a similar operation upon an eleven-year-old child although he was accompanied by an adult sister.

And in *Pratt* vs. *Davis,* 224 Ill. 300, 79 N. E. 562, 7 L. R. A. (N. S.) 609, it was held that consent by a man to an operation upon his insane wife for the removal of her uterus and ovaries is not shown by the fact that, after an operation of a minor nature to which he consented, which did not prove successful, he complied with a direction to bring his wife again to the surgeon for treatment.

Evidencing judicial treatment of the question of implied consent, the following cases are enlightening:

In *Theodore* vs. *Ellis,* 141 La. 709, 75 So. 655, the decision in favor of a patient who lost forever his manhood powers by reason of the unnecessary performance of an operation, was based largely upon the ground that he would not have consented if the doctor had informed him concerning, or prescribed, as he failed to do, a well-recognized remedy which might have afforded the desired relief.

In *Van Meter* vs. *Crews,* 149 Ky. 335, 148 S. W. 40, it was held that the conclusion would have been warranted that there was an understanding that the surgeon might operate if he found it necessary to do so, the matter having been talked over with relatives at the hospital as well as with the patient herself.

In *Bakker* vs. *Welsh,* 144 Mich. 632, 108 N. W. 94, 7 L. R. A. (N. S.) 612, it was held that a father could not complain because his express consent had not been procured for an operation on his seventeen-year-old son for a tumor, where the operation was not of a very dangerous character and there was nothing to indicate to the doctors, before proceeding to operate, that the father did not approve of his son's going with his aunt and adult sisters to consult one of the doctors and following his advice.

---

† Editor's Note.—This department of California and Western Medicine, presenting copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

Thus it can be seen that, although a physician is allowed to proceed when the words or actions of the patient or guardian imply acquiescence, the physician should always obtain a commitment more definite than a mere retained for examination and treatment.

Emergency, the other element granting to physicians a certain amount of freedom to act as he thinks best, is usually a proper defense if actually present.

In *Luka* vs. *Lowrie,* 136 N. W. 1106, 41 L. R. A. (N. S.) 290, a fifteen-year-old boy had his foot crushed by a train. Hospital physicians thought amputation necessary before the parents, who lived across town, could be reached. The court held that their consent was not necessary due to the existing emergency.

In *Jackovach* vs. *Yocum,* 237 N. W. 444, plaintiff, a boy of eighteen years, fell off a train, suffering a severe gash in the head and a mangled arm. While under an anesthetic given to enable the gash to be sewn up, the surgeons concluded that amputation of the arm would soon be necessary and made amputation immediately to avoid a second shock to the boy's system, which would necessarily occur if ether should be given to him again. It was held that the danger to the boy's life, created by the emergency, was a defense.

However, in *Franklyn* vs. *Peabody,* 249 Mich. 363, 228 N. W. 681, it was held that the unauthorized removal of fascia or membranous tissue from the thigh of a patient, in order to afford sheathing for the tendons of his finger, which were found to be adhered together, could not be justified upon the theory of an emergency, since the primary operation on the patient's stiff finger was in no sense a major one; and in *Mohr* vs. *Williams,* 95 Minn. 261, 104 N. W. 12, 1 L. R. A. (N. S.) 439, it was held that no emergency existed such as would justify operating without the patient's consent, nor was implied consent shown where only one ear had troubled the patient and the surgeon had given assurance that the other was in good condition, but, when about to operate on the one which troubled the patient, the surgeon discovered that it did not require an operation, and then immediately proceeded to operate upon the other, which he found to be in bad shape, no objection being made by the patient's family physician, who was present.

It should be stated that the courts have sometimes made a distinction where the patient is a minor and old enough to be capable of understanding. For instance, in *Bishop* vs. *Shurly,* 237 Mich. 76, 211 N. W. 75, a nineteen-year-old fatherless boy was taken by his mother to a physician's office for examination. The physician recommending a tonsillectomy, the mother specified a general anesthetic. At the time of the operation the boy requested a local anesthetic, which was given without the mother's knowledge. He died on the operating table. The Court held that the physician was not liable and stated that a nineteen-year-old boy may contract for necessities without parental consent. This was a Michigan case and, although it probably would be followed in California, too much reliance should not be placed upon it. The *Bakker* case, referred to earlier, is also interesting in this regard.

From the foregoing cases and from other decisions examined, the following conclusions may be drawn:

1. If no emergency exists and if the patient is a child under the age of sixteen (this is not an arbitrary age limit), it is absolutely necessary for the physician to secure consent of the child's parent or guardian before undertaking a major or minor surgical procedure. Failure to obtain consent will render the physician liable for assault and battery.

2. If the patient is under the age of 21, but over 16 or 17, a minor surgical operation may be performed without the express consent of the patient's parent or guardian even though no emergency exists. The cases supporting this rule are of such a nature that it is recommended that caution be used by all physicians.

3. If an emergency exists and it is necessary to resort to emergency or minor surgery in order to save the patient's life, the physician may safely proceed without first obtaining the consent of the patient's parent or guardian even though the patient is a child of tender years. This rule, however, is restricted to extreme cases. In other words, the emergency must be a real one.

4. The law makes no distinction between major and minor surgery except where minor surgery is employed upon a boy or girl seventeen years of age or over.

5. In the case of insane persons, a physician should always procure consent from the guardian, unless there is an acute emergency.

LOS ANGELES COUNTY HOSPITAL:[*] ALAMEDA INSTITUTIONS COMMISSION[†]

(COPY)

Report of the Charities and Health Committee of the 1938 Grand Jury of Los Angeles County

To the Foreman and Members of the 1938 Grand Jury:

The members of this committee consist of the following: William W. Nuzum (chairman), Harvey S. Black, Charles G. Van Hook, Mrs. Sarah Frank, Mrs. Mary Ethel Robb, William Arthur Tucker, Mrs. Pauline Case.

Among the various duties assigned to this committee was an inspection and a study of the various county departments commonly charged with the administration of charities and health functions. Pursuant to that delegation of authority, your committee has made a tour of inspection of the Olive View Sanatorium, the Los Angeles County General Hospital and the Rancho Los Amigos County Farm. Various items of relative importance were noted and comments made to the heads responsible for the respective departments, with a view of improving conditions where such improvement was, in the opinion of your committee, necessary or desirable.

ADMITTING DEPARTMENT OF THE LOS ANGELES COUNTY HOSPITAL

Particular attention was given to the conditions at the Los Angeles County General Hospital. It was noted, among other things, that the present facilities of the Admitting Department were inadequate to take care of patients in a proper and humane way. It was found by your committee that, on various occasions, many seriously ill patients were kept waiting in the admitting room hours before they were sent to a ward where proper and competent care could be given them. This matter was discussed with the hospital authorities, and particularly with the admitting physician in charge of that department. It was considered that some of the available space, adjoining the space occupied by the Admitting Department, could be utilized for the purpose of enlarging the facilities of that department. At the suggestion of your committee, the hospital adopted the plan of increasing the facilities of the Admitting Department so that patients, who formerly would have been required to spend some time in the admitting room before they could be transferred to a ward, are now placed in a regular hospital bed in a room immediately adjoining the Admitting Department. After several months' operation of this new feature, your committee has been informed that patients are handled with greater dispatch and without any increase in the number of persons employed.

---

EXISTING ERRORS IN ADMINISTRATION

The audit report submitted to the Grand Jury by Eugene M. Berger reveals a number of situations which call for immediate action. Because the report is complete in all of the details relating thereto, no specific mention is considered necessary in this report of all of the items covered. Some of the outstanding situations to which our attention was called by the audit report—which, by reference, is made a part of your committee's report—are as follows:

1. Excessive charges to patients.
2. Increase in total number of persons employed, and increase in cost per employee.
3. Lack of discipline of the hospital personnel.
4. Dilatory practices in admitting patients, and in transferring them to other institutions.
5. Piling up of an unusual amount of work in the technical departments.
6. Failure on the part of interns and residents to perform their functions properly.
7. The unsatisfactory condition created by failure to exercise proper supervision over the attending staff.

The disclosures called to our attention were carefully considered, as were the recommendations submitted for their correction, with the result that your committee now recommends:

1. *That the present policy of billing all patients indiscriminately be abolished.*

Your committee feels that whatever charges should properly be made against the indigents for care given them at a hospital should be that amount which, in the judgment of the Social Service Department, constitutes a fair and reasonable charge in keeping with the indigent's ability to pay. In order to carry out this program, your committee further recommends:

2. *That no charges be made and no security be exacted from the indigent except upon the approval of the Social Service Department.*

At the present time, the Social Service workers attached to the hospital are a part of the Charities Department, and are not subject to any supervision by the hospital authorities. Your committee feels that those Social Service workers should be made a part of the general organization of the General Hospital, and be put directly under the executive superintendent of the hospital, and, therefore, recommends:

3. *That the Social Service Division attached to the Hospital be transferred from the Charities to the General Hospital.*

With respect to the number of wasted patient days, it was found that the cause of that condition is chargeable to the lack of supervision over interns, residents, and members of the attending staff. Your committee is informed that, on numerous occasions, a patient's stay is needlessly prolonged because of one of the following reasons:

(*a*) The intern has failed to prepare the patient for examination by the resident physician.

(*b*) The resident physician has failed to prepare the patient for consultation or treatment by the attending man.

(*c*) The attending man, because of his private practice, has been unable to perform a scheduled operation on time, or has failed to examine the patient when prepared.

Other factors which contribute to the waste of patient days are enumerated in the audit report, but the above three items are considered of utmost importance and are, therefore, specifically set forth herein.

REMEDIES SUGGESTED

To remedy the situation and to obviate in the future the waste of money caused by the loss of patient days, two plans have been suggested.

1. To dispense with the attending staff and replace them with full-time, county-paid physicians.

It was thought that by the expenditure of approximately $100,000 a year for salaries of such full-time men, approximately 60,000 patient days could be conserved, in which case, either the appropriation for the hospital could be materially reduced or approximately 9,000 additional patients could be cared for, for the same amount of money now being spent.

PLAN FOR THE LOS ANGELES MEDICAL SCHOOLS

Because, however, of the representations that the standard of medical care would greatly suffer by the introduction of such a revolutionary change, another plan was considered. It was thought advisable to require the two medical schools, which are now using the facilities of the County Hospital for teaching purposes (University of Southern California Medical School, and the College of Medical Evangelists), to assume complete authority for the administration of medical care, thereby bringing all of the attending men under the supervision, and within the jurisdiction, of either of the schools now associated with the hospital. It is felt that this plan would place the administration of medical care on a much more efficient basis.

However, in order to insure the success of such a program, your committee has felt that the two schools should furnish, at their own expense, a personnel sufficient to exercise control over every major department of medicine and surgery. This plan has been discussed formally with the responsible representatives of the medical schools, and your committee has been assured that, insofar as the schools are concerned, the plan is entirely acceptable to them. The plan was likewise submitted to the Board of Supervisors. At a meeting held with the Board on January 9, 1939, which meeting was attended by members of this committee together with Eugene M. Berger and President Percy Magan of the College of Medical Evangelists, Deans McKibben and McPherson of the two medical schools, a member of the Board of Trustees of the University of Southern California, Doctor Raulston, Chief of the Medical Service of the County Hospital, and Col. Wayne Allen, County Manager, the Board of Supervisors, we are pleased to report, unanimously expressed themselves in favor of the plan as submitted by your committee, and have assured us that they will take the necessary action to bring the plan into operation immediately.

In the opinion of your committee, the plan, if adopted, will materially improve conditions at the General Hospital; it will eliminate the waste of patient days; and it will bring under central responsible authority all of the elements involved in the administration of care; and your committee, therefore, respectfully recommends:

2. That in consideration of allowing the local medical schools the continued use of the County Hospital facilities for teaching purposes, the medical schools be required to assume the responsibility for the control of the medical functions, and that the medical schools, in order to meet their responsibility, provide at their own expense a supervisorial staff suitable for that purpose.

SURVEY OF THE ALAMEDA COUNTY HOSPITAL INSTITUTIONS COMMISSION PLAN

In addition to the study of conditions at the General Hospital, which the committee has made its major assignment during the year 1938, your committee has studied the administration of like institutions in Alameda and San Francisco counties. The plan followed in Alameda County in administering its functions with relation to the hospital is one that received particular study from us. It was found that in Alameda County the Board of Supervisors had created an Institutions Commission which administers all of the county health institutions. To quote:

"Briefly, the Alameda County Plan is now coördinating the Alameda County's Charity program as it relates to hospitalization and the care of indigent sick, and also exercises some degree of supervision over the volunteer agencies that have become associated with the Commission for the purpose of forming a unified program dealing with medical and preventive care of all persons living in Alameda County. It is reported that, under the Alameda County Plan, indigents requiring care, whether at the home of the indigent, by way of out-patient relief, or in a hospital in the county, is supplied at the expense of the county.

"As to that class of persons falling in the bracket of the so-called middle class, which are those able to pay some part of the expense, the organized medical profession, through the Alameda County Medical Association, has agreed to take care of such patients on a part-pay basis, usually less than normal fees. It is reported that this part-pay program has been operating for several years, and was organized by mutual agreement between the Alameda County Medical Association and the Alameda County Institutions Commission. Such so-called middle-class patients who are unable to pay full fees, but who are not eligible for county care because of failure to meet the legal requirements as indigents, are referred to members of the County Medical Association in rotation for such care as the patients may require.

"The Alameda County Institutions Commission, in the administration of its various functions, provides free medical care for persons who meet the following requirements:

"1. Legal residence of Alameda County and State of California.

"2. Who require care in clinics, hospitals, sanitariums or preventoriums.

"3. Who are unable to pay for such care at minimum rates without depriving themselves or their families of the basic necessities of life.

"4. Whose responsible relatives are likewise unable to provide such care.

In the main, the Alameda County Institutions Commission renders free care only to persons who meet the statutory requirements as laid down by State law and county ordinance, which requirements are in all essentials similar to those of Los Angeles County.

"The Institutions Commission of Alameda County functions through a medical director and administers:

"1. The Highland Hospital for acute general patients, its emergency department together with its psychopathic ward.

"2. The Fairmont Hospital for chronic patients, including tuberculosis patients of all types, and indigent patients.

"3. The Arroya Sanatorium for tuberculosis patients.

"4. The Del Valle Preventorium.

"5. Clinics at Berkeley, Oakland, Alameda, San Leandro, and Hayward.

"The Medical Social Service, such as is administered in Los Angeles County by the Superintendent of Charities, covering both in-patients and out-patients, is administered in Alameda County directly under the Institutions Commission, through its medical director. Originally, there was a separation of functions between the medical part of the organization and the general executive part of the organization in Alameda County; but now those two functions are consolidated, and both are administered by one man—the Medical Director—who is superintendent as well.

PRESENT LOS ANGELES COUNTY ORGANIZATION

"The situation in Los Angeles County is, briefly, as follows:

"The General Hospital is administered by two persons: one a medical man responsible for the professional standards, and the other a business man responsible for the business part of the institution. The Olive View Sanatorium is similarly administered, and the Rancho Los Amigos also has its own separate heads. While all of the institutions are nominally under one central head—the Superintendent of Charities—each one must of necessity steer its own course. It is manifestly impossible for one person acting as Superintendent of Charities to be in close contact with the intimate details of each of the institutions in Los Angeles County, especially when it is realized that our General Hospital alone is probably larger and spends more money than do all of the Alameda County institutions combined.

PROPOSED CHARTER AMENDMENTS

"The Los Angeles County Medical Association, acting through one of its special committees, is now proposing an amendment to the charter of Los Angeles County, by the terms of which amendment the Los Angeles County General Hospital, the Olive View Sanatorium, the Rancho Los Amigos, and the County Cemetery, would be under the exclusive charge of an Institutions Commission. The proposed amendment also provides that the Institutions Commission would have the power to appoint the superintendents and all other personnel, and would have complete charge of the institutions, subject only to the general laws of the State in so far as the same provide for the approval of the County Board of Supervisors. If such an amendment is adopted and incorporated in the laws of the county, the Board of Supervisors would appoint an Institutions Commission, who would in turn take over the complete responsibility for running the institutions above mentioned. The Superintendent of Charities, would, of course, continue to administer, as heretofore, all matters of social service and general charity work, except in so far as the same may relate to cases under the jurisdiction of the Institutions Commission.

ADVANTAGES OF AN INSTITUTIONS COMMISSION

"It is pointed out that the Institutions Commission would be an independent, nonpolitical organization entirely divorced from the Board of Supervisors and subject to no political domination. If appointments to such commission are made from among the citizens of this county who are public-spirited and qualified by experience and training to serve on such commission, unquestionably a great deal of good can be accomplished. The Institutions Commission in Alameda County is made up of business men, physicians, university professors, a dentist, and a police judge; and while we have had no opportunity to inquire into the detailed affairs of the Alameda County Institutions, we are under the impression that the Commission has functioned efficiently throughout the years of its existence.

"Whether or not a similar commission in Los Angeles County will meet with the same degree of success depends, of course, upon the caliber of persons appointed to such commission and the integrity of the personnel through whom such commission will administer its affairs."

* * *

In view of the fact that the proposed charter amendment heretofore mentioned in this report was received by the Board of Supervisors at too late a date for their consideration and to be placed on the November, 1938, ballot, your committee suggested that an Institutions Commission be established by ordinance, which met the approval of the Board.

Your committee feels that if, and when, an ordinance is adopted and the Institutions Commission comes into being, much can then be done to bring the various institutions under one central responsible authority. A central clearing house of information could thus be established, and the transfer of patients from one institution to another, wherever necessary, could be much more expeditiously accomplished. . . .

Respectfully submitted,

Charities and Health Committee.

William W. Nuzum, *Chairman*.

Approved, January 11, 1939.

Hospital Aid Group Asks Economies

Would Put Issue Up to Board

"Too Complex System" Is Pointed Out

A study of County General Hospital management today was advocated by the hospital advisory committee as a means toward proper and economical management.

The committee includes Dr. Robert A. Millikan, Archibald B. Young and Albert B. Ruddock of Pasadena, and Maynord McFie, Mrs. John D. Fredericks, J. Walker Schneider, Mrs. Helen Van Dyke, John C. Macfarland and Roy E. Noftzger. All joined in the recommendation except Mr. Young, who was absent from the city and could not be reached.

In its communication received by the Board of Supervisors today, the advisory committee declared that the effectiveness and economical operation of the hospital is handicapped by the complexity of relationships between different authorties. The committee also complains of the lack of clarity of its own position.

Specific reference is made to plans of the Board of Supervisors to combine the hospital and charities department managements. Such a move should not be made until the study suggested has been completed. The committee recommended that either it be named to conduct this study or a special committee be appointed to do so.—Pasadena *Star News*, February 18.

ANNUAL REPORT OF THE SURGEON GENERAL, U. S. PUBLIC HEALTH SERVICE, FOR THE FISCAL YEAR 1938: SUMMARY

Surgeon General Thomas Parran in his annual report said: "A greater advance has been made in public health in the United States during the past two years than ever before within a comparable period."

Doctor Parran, reviewing the work of the organization, at the close of the 140th year of its existence, noted developments that have followed the assumption of new responsibilities by the Government in matters relating to public health, particularly with reference to activities made possible through the enactment by Congress of the Social Security Act, the Venereal Disease Control Act and the National Cancer Institute Act.

GENERAL HEALTH CONDITIONS

Commenting upon health conditions in the United States during the fiscal year ended June 30, 1938, the report states that the general death rate for the calendar year 1937 was 10.9 per 1,000 population, as compared with 11.3 for the preceding year. This favorable condition continued in 1938, when preliminary figures for the first six months disclosed a mortality rate of 10.8 per 1,000 population as compared with 11.8 for the corresponding period of 1937.

There was also recorded a decrease in infant mortality from 57.1 per 1,000 live births for 1936 to 54.4 in 1937. The maternal mortality rate continued to decline; 4.6 per 1,000 live births in 1937 against 5.3 during 1936.

As infant, maternal and general death rates are sensitive indexes of prevailing health conditions, the reduced rates in these fields indicate a decidedly favorable trend.

Tuberculosis mortality resumed a downward course after a slight increase in 1936. The improvement was apparent in the provisional tuberculosis death rate which declined from 51.7 per 100,000 population in 1936 to 49.6 in 1937.

During 1937 lowered death rates were reported for typhoid fever, scarlet fever, diphtheria, tuberculosis, malaria, pellagra, nephritis and puerperal causes. With regard to smallpox, Doctor Parran said: "During 1937 a total of 11,673 cases of smallpox was reported, as compared with 7,834 in 1936 and 7,957 in 1935. The number of reported cases in 1937 was the highest since 1931. Fortunately the prevailing smallpox is of a mild, nonvirulent type, causing relatively few deaths. The eradication of this unnecessary disease depends upon the intelligent application of vaccination."

The United States suffered minor epidemics of influenza and poliomyelitis in 1937. The number of cases of poliomyelitis, 9,511, has been exceeded only in four previous years for which records are available, 1916, 1927, 1931 and 1935.

The leading causes of death in 1937 were diseases of the heart, cancer and other malignant tumors, pneumonia, cerebral hemorrhage and softening, nephritis, accidents (except automobile) and tuberculosis.

QUARANTINE AND IMMIGRATION

The magnitude of federal quarantine and immigration activities is indicated by the Public Health Service inspection of ports at entry of 1,784 airplanes carrying 23,172 passengers and inspection of 15,873 vessels carrying 789,591 passengers and 1,196,688 seamen. Fumigation of 1,004 vessels was performed and 5,399 rats were examined for evidence of plague infection. Medical officers at various United States ports of entry inspected 2,447,339 alien passengers and 805,306 alien seamen. Of these, 20,372 passengers and 1,438 seamen were reported as having some certifiable disease or defect. In foreign countries 65,261 applications for immigration visas were examined by Public Health Service officers.

The continued success of so-called radio pratique at New York and Boston made practicable the extension of this time-saving measure to certain vessels entering the ports of San Francisco and Los Angeles.

VENEREAL DISEASE CONTROL

The most important event in the campaign against the venereal diseases during the fiscal year was the enactment by the Congress of the Venereal Disease Control Act, whereby facilities for the more effective control of syphilis and gonorrhea were placed upon a permanent national basis.

During the year the Congress appropriated $3,000,000 for the purpose of assisting States and their political subdivisions in establishing and maintaining adequate measures for the prevention, control and treatment of venereal diseases. There were also included provisions for training of personnel and for making studies, investigations and conducting demonstrations designed to develop more effective control measures.

The use of Social Security funds for the training of physicians in the clinical management and public health control of the venereal diseases was continued in several universities and clinics. A number of State health officers availed themselves of this opportunity to recruit qualified personnel. . . .

The experimental control of syphilis among indigent people of rural areas was demonstrated by the use of a trailer clinic in Georgia. . . .

MENTAL HYGIENE

With the completion of the Public Health Service hospital at Fort Worth, Texas, for the care and treatment of drug addicts the facilities for this specialized work have been materially increased. The hospital at Lexington, Kentucky, engaged in treating drug addicts and making scientific investigations, operated to full capacity with an average daily census of 949 patients.

The Public Health Service continued to supervise and furnish medical, psychiatric, technical and other scientific services to federal and penal institutions. Special studies were conducted in coöperation with the Mental Hygiene Survey Committee to stimulate interest in the adequate care of the mentally ill, to bring about greater equality and wider distribution of facilities, promote uniform policies and improve the facilities for psychiatric instruction.

A feature of the work of this division was the field studies in mental hygiene for determining the basic nature and factors involved in the production of mental disorders encountered in a typical American community.

MARINE HOSPITALS AND RELIEF STATIONS

The twenty-seven hospitals of the Public Health Service, engaged in the care and treatment of legally designated beneficiaries, and also in scientific clinical research, furnished hospital and outpatient relief at 154 ports, where 566,931 accredited persons applied for treatment. This represents an increase of 211,121 patients over the preceding year. Merchant seamen continued to constitute the largest class of beneficiaries.

Research was continued in pyretotherapy, focal infections, arthritis and psoriasis. Vitamin D was shown to be valuable in the treatment of psoriasis.

NATIONAL INSTITUTE OF HEALTH

The erection of a group of specially designed structures for the National Institute of Health on a site near Bethesda, Maryland, makes available increased facilities for scientific research into the causes and prevention of disease. The investigative work of the Institute covers an increasingly broad field. Continued attention was directed to the control of biologic products, particularly antipneumonococcic rabbit serum, antimeningococcic serum, and close supervision over the stability of arsphenamine.

In the field of industrial hygiene investigations were directed to the development of means for the protection and the improvement of the health of workers in various fields of industry among which the pottery, granite, lead storage batteries, fur and manganese industries may be mentioned.

"The activities of the National Institute of Health," comments the Surgeon General, "are becoming increasingly varied and numerous. Thus, one group of workers is engaged in chemical and chemotherapy research while another is directing its attention to studies of such infectious diseases as Rocky Mountain spotted fever, typhus fever, scarlet fever, Weil's disease, leprosy and poliomyelitis. A special series of investigations have shed considerable light upon the various phases of trichinosis infection and the means of its prevention. Clinical, epidemiological and laboratory studies of heart disease, especially the rheumatic type, have produced valuable information."

The interesting discovery was made that flourides, which cause mottled enamel that disfiguring discoloration of the teeth, may be removed from drinking water by treatment with manganese dioxide, a method which gives promise of economical development.

A firm basis for future cancer studies is being laid through grants-in-aid to selected institutions and the training of research specialists. Already a broad field of investigation is receiving attention.

COÖPERATIVE ACTIVITIES

Every state and many cities, as well as every department and independent agency of the Federal Government has received some degree of assistance from the Public Health Service in solving special health problems arising in the course of routine operations. This coöperative work, carried on principally by the Division of States Relations, is one of the most important functions of the Service.

The availability of funds under the provisions of the Social Security Act has made it possible to assist in improving state and local health administration. It is especially noteworthy that whole-time health services in rural areas have been greatly augmented. From January 1, 1935, to December, 1937, there was an increase in full-time health units of 96 per cent. Facilities for the promotion and supervision of such full-time facilities have been developed in nineteen states.

Stimulated by federal grants-in-aid the state and local appropriations for public health purposes have increased $8,000,000 annually.

Coöperation was continued with the states and the Works Progress Administration by providing technical supervision of work relief labor projects for the construction of sanitary toilets, malaria control drainage in the South and sealing of abandoned coal mines. Certification of water supplies used by interstate carriers, a valuable measure in preventing water-borne illness, continued without interruption.

NATIONAL HEALTH PROGRAM

"It is a matter of grave concern," comments Doctor Parran, "that approximately 40,000,000 people in the United States—the lower economic third of our population—are unable to provide themselves with medical care during serious illness. In the country as a whole there is a deficiency of 360,000 hospital beds, including facilities for the care of mental and tuberculous patients."

Fortunately, the National Health Survey, conducted several years ago by the Public Health Service with work relief personnel, has furnished a great deal of reliable, even though astounding, information concerning the kinds of illness prevailing in this "third of the population," the ages of the victims, their approximate economic status, their employability and other facts closely related to their ability to secure adequate medical treatment.

When these data had been studied and tentative conclusions formulated by the President's Interdepartmental Committee on Coördination of Health and Welfare Activities, it was obvious that the Federal Government had a definite responsibility in seeking a remedy for this undesirable state of affairs. It was shown, for instance, that despite the improvement of state and local health services resulting from the application of grant-in-aid provisions under Titles V and VI of the Social Security Act there are large rural areas and many cities in which adequate health service is not yet available. Only a few states have even fairly satisfactory programs for the prevention of mortality from pneumonia and cancer and there still are serious deficiencies in the control of tuberculosis and malaria. Very little is being done by most of the states in the field of mental hygiene, and there is need for a much greater expansion of industrial hygiene activities.

In closing his report Surgeon General Parran recommended among other essentials, the establishment in the National Institute of Health of a unit for wider chemotherapy investigations, additional funds under the Venereal Disease Control Act on an increasing scale until an annual appropriation of $25,000,000 is reached, and the establishment of a neurological institute for laboratory and clinical investigations of mental and nervous diseases.

STATE MEDICAL LEGISLATION

Under the above caption, the *Journal of the American Medical Association* is printing in each number summaries of medical legislation proposed in various states. In the issue of February 25, 1938, the comments given below appeared concerning bills introduced in the California Legislature, now in session. Supplementary to other items in this issue of CALIFORNIA AND WESTERN MEDICINE,* the following informative data may be of interest to members of the California Medical Association. Excerpt follows:

CALIFORNIA

Bills Introduced.—S. 548 proposes so to amend the Insurance Code as to permit the organization of corporations to operate so-called nonprofit health and hospital service plans whereby there may be furnished by those corporations to their subscribers (1) medical care through licensed physicians employed by the corporation, (2) hospitalization, (3) nursing care, (4) dental care, and (5) drugs and medicines.

S. 696 proposes to authorize county boards of education to require school teachers to present certificates from physicians that they have submitted to physical examinations within three years last past and have been found free from tuberculosis.

A. 1018, to amend the State Food and Drug Act, proposes, among other things (1) to re-define the term "drug" so as to include specifically "all chemicals or substances of whatsoever nature in the treatment of obesity due to whatever cause," and (2) to provide that the standard of purity of drugs shall be that of the United State Pharmacopeia and National Formulary and such further standards of strength, quality or purity as the state board of health may make relating to drugs not in the United States Pharmacopeia or in the National Formulary, and the regulations and definitions adopted for the enforcement of the Federal Food and Drugs Act of 1906.

A. 1019 proposes to make the sale, dispensing, administering or prescribing of diphenylamin for any purpose a felony.

A. 1131, A. 1147, and A. 1177 propose to enact a new law to regulate the sale and distribution of drugs, cosmetics, and therapeutic devices.

A. 1147 and A. 1177 propose to regulate also the sale and distribution of food.

A. 1515, to amend the Workmen's Compensation Act, proposes (1) to give an injured employee the right to select a consulting physician, at the expense of the employer, if the employee is dissatisfied with the medical treatment being received from the physicians retained by the employer or insurance carrier; and (2) to provide that no injured workman, shall be required to submit to an examination by an independent expert medical examiner selected by the industrial commission.

S. 517, S. 1208, and S. 1215 propose to enact a so-called "Consumers' Protection Act" to regulate the sale, distribution and advertising of foods, drugs, cosmetics, and health devices.

S. 524 proposes to authorize the Director of Institutions, with the approval of the State Board of Control, to provide an institutional unit or units for the custodial care and treatment of defective or psychopathic delinquents of both sexes.

S. 551 proposes to enact a compulsory health insurance act whose so-called benefits are to be available to all employees in the state and to such other persons as voluntarily elect to come under the act. The benefits are to consist of all forms of medical, dental, hospital and nursing services, cash payments in the event of disability, and certain cash maternity benefits. These benefits are to be paid for from a payroll tax amounting to 6 per cent of wages paid.

S. 1128 and A. 2172 propose to establish a system of compulsory health insurance applicable to all persons now subject to unemployment insurance. The bill proposes to make available to such individual all forms of medical, dental and hospital services which will be paid for by means of an additional payroll tax. The bill also proposes to permit any other person to elect to come under the act if his annual income is not more than $3,000.

A. 1203 proposes to enact an independent naturopathic practice act and to create a so-called "self-sustaining board of naturopathic examiners" to examine and license persons desiring to practice naturopathy.

A. 1505, to amend the Business and Professions Code, proposes that "All advertising of medical business or the actual practicing of any system or mode of treating the

CALIFORNIA PHYSICIANS' SERVICE*

Questions and Answers Concerning the Medical Service Plan

The following questions and answers have been edited by the Board of Trustees of the California Physicians' Service; the answers, therefore, constitute the official statements of the California Physicians' Service:

(Note: All of the chapter and section numbers refer to chapter and section of the by-laws which furnish authority for the answer given.)

(Q.) *What is California Physicians' Service?*

(A.) It is a California non-profit corporation formed for the purpose of enabling its beneficiary members to pay their physicians and hospitals for medical and hospital care by means of pooling periodic payments. (Chap. 1, Sec. 1.)

(Q.) *Will anybody make a profit?*

(A.) No one. (Chap. 1, Sec. 1.)

(Q.) *What will the corporation do with the money it receives?*

(A.) A minimum amount of it will be used for administrative costs, hospitalization and the establishment of a reserve against the possible unforeseen risks such as epidemics. The rest of the money will be distributed to the doctors who give the service. (Chap. 1, Sec. 2.)

(Q.) *On what basis will be the doctors be paid?*

(A.) On the unit system. (Chap. 19, Sec. 2.)

(Q.) *What is meant by the unit system?*

(A.) A method of computing the compensation due to the physician who has rendered medical or surgical service whereby a proportional valuation is set upon each kind of service by counting each such service as a determined number of units. (Chap. 19, Sec. 1.)

(Q.) *How will the value of a unit be determined?*

(A.) First, a fee schedule in units will be adopted; each second month the total number of units of medical service furnished by the professional members that month and billed for will be added together; third, the total amount of money received will be computed; fourth, a proportion of this money will be set aside for cost of hospitalization, administration and reserve; fifth, the total amount of money remaining will be divided by the total amount of units and the result will be the monetary value of one unit for that month. (Chap. 19, Sec. 1.)

(Q.) *What would happen if there were not enough money in the fund to pay the unit value?*

(A.) This can't happen because the amount of money on hand, no matter how small, can always be divided by the number of units. This is the reason for the unit system rather than cash indemnity.

(Q.) *What would happen if there were more money than was needed to pay the full schedule established by the Board of Trustees?*

(A.) Such surplus will be handled as a reserve fund by the trustees and when they deem it possible they will distribute it on the unit system to those doctors who have previously received for their services less than the schedule provided as a maximum for the services so rendered. Any surplus beyond that will be used either to reduce rates to the beneficiaries or to extend the services offered them. (Chap. 19, Sec. 4.)

(Q.) *Are there different kinds of members?*

(A.) Yes. There are administrative members, professional members and beneficiary members. (Chap. 2, Sec. 1.)

(Q.) *May a person belong to more than one class of members?*

(A.) If he is otherwise eligible he may belong to all classes of members. (Chap. 2, Sec. 1.)

(Continued on Advertising Page 38)

---

* These questions and answers will be printed in a separate brochure, with copy of the by-laws, physician's registration blank, etc. A copy of the pamphlet will be sent to every doctor of medicine licensed in California. The address of the medical service corporation is California Physicians' Service, Mills Building, 220 Montgomery Street, San Francisco. Mr. Allen Widenham, manager. See also, in this issue, on page 210.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XII, No. 3, March, 1914

From Some Editorial Notes:

What Is the Value of Anything?—A very great objection to the schedule of fees offered by the associated insurance companies for the services of physicians under the new insurance and compensation act, is the fixing of a flat fee. Fees for professional work cannot be absolutely fixed; as a matter of fact, the value of everything is relative, and the old saying of "charging what the traffic will bear" is fundamentally true and right. The freight rate on silk is more per ton than that on pig iron; a lawyer gets a bigger fee for incorporating a fifty-million-dollar concern than a thousand-dollar company; a surgeon is entitled to a larger fee for removing the appendix of a millionaire than for taking out that of a car conductor. Some of our best surgeons have a system of charging that is based upon the income of the individual and represents one or more month's income for the work to be done, and this seems to be a reasonable and equitable way of fixing the fee. It is foolish for anyone to say that it is as much work and strain and responsibility in the case of the poor man as in that of the rich man. Just as much coal is burned in hauling a ton of silk as in pulling a ton of pig iron over a certain distance. Therefore, the contracting to do certain professional work for certain fixed fees, irrespective of the income of the patient, is fundamentally wrong and vicious.

* * *

Squeezing the Companies.—Doctor French read a paper on the subject of industrial compensation insurance, etc., before the Los Angeles County Medical Association and, in the main, took the attitude voiced in your journal in connection therewith. One point he brought up, however, is new in so far as it has not been mentioned in these pages; that is, the fact that some physicians will try to make the bill unduly large if they know that an insurance company of large capital is going to pay out the money. Probably that is, in a few cases, true. Physicians are average men and probably have but a little more than the average rate of honesty; in every walk of life and in every calling we shall find rascals and dishonest men; occasionally one reads of some clergyman who has been detected leading an immoral or a dissolute life, but because of that we do not condemn all clergy nor do we think of them as all being dissolute. Every practicing physician does a great deal of work for nothing, and the very nature of his calling leads him to try to think more honestly than does the daily occupation of the average man in any other calling; therefore, we truly believe that physicians are to some extent more honest in the average than those in other walks of life. But even at that there will be some cases of attempted grafting, no matter what is done. The plan presented in this issue and strongly recommended to county medical societies for their consideration, will, we think, do away with the charge of possible graft. Still, it seems to be a peculiar phase of human nature that everyone must try to get "something for nothing," particularly when it is a corporation that is to be depleted. People who would never put a hand in an individual pocket will avoid paying car fare if they can, and we all know the predatory instinct that removes things from hotels! Doubtless many physicians who would be perfectly honest with an individual patient would not think it wrong to try to "stick" a corporation. It is a queer people!

* * *

Important Business.—Not in the past twenty years have so many questions of vital importance to the medical profession and to the members of our society presented themselves as at the present time. They will come up for discussion and for action at the annual meeting next month,

(Continued in Front Advertising Section, Page 20)

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By Charles B. Pinkham, M.D.
Secretary-Treasurer

Board Proceedings

At a regular meeting of the Board of Medical Examiners held February 6 to 9, 1939, in Independent Foresters' Hall, 1329 South Hope Street, Los Angeles, the following changes were made in the status of various licentiates:

LICENSES RESTORED

Mahlon C. Cooley, M.D., license revoked on June 30, 1938, following his conviction of asserted ambulance chasing and insurance frauds; restored on February 9, 1939, and placed on probation for a period of five years on condition that he obey all laws and report at the Los Angeles meeting each year.

Anton Lopez del Castillio, M.D., license revoked on March 1, 1934, for alleged abortion; restored on February 6, 1939, and placed on probation for five years; to report at each Los Angeles meeting.

Paul F. Eid, M.D., license revoked on March 10, 1938, on record of conviction which was set aside by San Mateo Superior Judge Cotton; restored on February 6, 1939, because of setting aside of record of conviction.

W. Burlin Humphrey, M.D., license revoked on June 30, 1938, on record of conviction of so-called ambulance chasing and insurance fraud; restored on February 9, 1939, and placed on probation for five years; to report at each Los Angeles meeting.

Louis Kameny, M.D., license revoked on June 30, 1938, on record of conviction of so-called insurance fraud; restored on February 7, 1939, and placed on probation for five years; to report at each San Francisco meeting.

Samuel Calvin Long, M.D., license revoked on July 1, 1937, for alleged abortion; restored on February 6, 1939, and placed on probation for five years; to report at each Los Angeles meeting.

William Raymond McDannell, M.D., license revoked on October 27, 1938, for failure to comply with terms of stipulation. Reopened on February 6, 1939. To be restored on filing, within seven days, a stipulation limiting the character of his advertising. Stipulation filed February 8, 1938.

Guy O. McKeehan, M.D., license revoked on June 30, 1938, based on record of conviction of so-called ambulance chasing and insurance fraud; restored on February 9, 1939; placed on probation for five years; to report at each Los Angeles meeting.

William F. Meyer, M.D., license revoked on October 19, 1937, based upon adjudication of insanity; restored on February 6, 1939, based on certification of restoration to competency.

Alfred H. Valentine St. John M.D., license revoked on February 10, 1937, on record of conviction in connection with so-called Pacific Coast Abortion Ring; restored on February 6, 1939, based upon the setting aside of record of conviction and granting of new trial.

Arthur M. Tweedie, M.D., license revoked on June 30, 1937, for violation of probation; restored on February 6, 1939, and placed on probation for five years without narcotic privileges; to report at each Los Angeles meeting.

PENALTIES IMPOSED FOLLOWING HEARINGS

Boyajian B. Armen, M.D., license revoked on February 8, 1939, based on narcotic conviction.

Winfield L. Bartow, M. D., was on February 8, 1939, found guilty of use of fictitious name. Placed on probation for five years.

Arthur Bowen, M. D., was on February 8, 1939 found guilty of prescribing for a known addict. Placed on probation for three years without narcotic privileges or possession. To report at each Los Angeles meeting.

Harry W. Boyd, M.D., charged with (1) aiding and abetting, (2) use of fictitious name, both in connection with the so-called Samaritan Treatment for Alcoholism, Los Angeles Branch. Found guilty on February 8, 1939,

ful of sod and deposited it in a golden bucket held by Dr. Howard M. Engle. Through the services of Doctor Engle, the late Mrs. Viola Dunn bequeathed $100,000 to the hospital rebuilding fund, Dr. Ward announced. The old hospital was razed in 1930. Marshal Hale, who presided over the ground breaking ceremony, acknowledged other large bequests made by the late E. D. Tenny, Mrs. John H. Miller, P. C. Hale and John B. Blair. 'This splendid hospital—with its excellent facilities and free clinic—has been very much needed in the city's hospital system,' said Dr. J. C. Geiger, public health director. Other speakers included John L. McNab, Miss Alice Boldemann and Mrs. Juliette Bartel. (San Francisco *Examiner,* February 2, 1939.)

"Attorney-General Earl Warren announced today that he will leave for Washington this week to aid the California congressional delegation in its fight against the resolution of Senator Gerald P. Nye, under which the federal government would take steps to acquire California's invaluable oil bearing tidelands. . . . The attorney general said he was here to attend a 'routine' meeting of the State Board of Medical Examiners and to confer with members of his staff here. . . ." (Los Angeles *Herald and Express,* February 6, 1939.)

"Charged with the illegal operation death of Mrs. Bertha May Murray, Oakland housewife, last December, Mrs. Lena Mareck, 819 Ocean Avenue, was held for a Superior Court trial by Municipal Judge Kaufman at a preliminary hearing yesterday. Mrs. Mareck pleaded not guilty. Bail was fixed at $10,000 cash or $20,000 bond. Following this, Attorney Nathan Coghlan filed a petition for her release on a writ of habeas corpus, contending no crime had been proven against her. A hearing on the petition was set for February 10." (San Francisco *Chronicle,* February 4, 1939.) (Previous entries February, 1927; November, 1934.)

"Congressional action to bring medical advertising by radio under control of the Federal Communications Commission was urged yesterday by the North End Improvement Association. A resolution sent to the California delegation in Congress, declared that 'the constant, promiscuous advertising of drugs over the radio is a source of injury to the general public,' that 'many statements as to the virtues claimed for the drugs are false and misleading,' and that 'the patient is encouraged to make his own diagnosis, which may be completely in error.' The association urged that the commission be instructed to investigate all claims and recommendations made by radio concerning the action of drugs." (San Francisco *Examiner,* January 28, 1939.)

"An impending shortage of officers in the Navy Medical Corps will require the appointment of seventy-five officers annually for the next five years, according to a Navy Department report received here today." (San Diego *Sun,* January 24, 1939.)

"Articles of incorporation and by-laws of the California Physicians' Service, sponsored by the California Medical Association, are getting their final examination this week at the office of the association's counsel. Hartley Peart, association attorney, said it was hoped to obtain the necessary signatures of doctors from Sacramento to San Diego and file the articles of incorporation by Saturday. Dr. T. Henshaw Kelly, trustee of the new service, said the health insurance plan might be put in operation in the San Francisco and Los Angeles areas in less than three months. Headquarters will be here. The association council, meeting here Saturday, loaned the corporation—which will operate autonomously and independently of the associa-

tion—$15,000. Trustees named were Drs. Ray Lyman Wilbur, Lowell T. Goin, T. Henshaw Kelly, C. Kelly Canelo, W. Earl Mitchell, Samuel Ayers and Alson Kilgore. . . . Employed groups in certain income brackets—still to be determined—will be the first eligible to the medical and hospital service upon payment of a flat monthly fee. Later it is planned to open membership to individuals, including indigents. . . ." (San Francisco *News,* January 16, 1939.)

"Robert A. Gilbert, stage hypnotist, who won an appeal from conviction of conspiracy to perform an illegal operation, recently walked from the county jail a free man. Superior Judge A. A. Scott, in whose court Gilbert was convicted by a jury last September 16, signed an order for his release. Gilbert was sentenced to two to five years and has awaited outcome of his appeal in the county jail ever since. The district court of appeal reversed the conviction, declaring no evidence of any crime was given at the trial indicating any effort had been made to bring about an abortion." (Los Angeles *Daily News,* January 18, 1939.)

"Dr. Roy G. Labachotte, nationally known Redwood City chiropractor, has been notified of his appointment to the State Board of Chiropractic Examiners. . . . Dr. Labachotte succeeds Raymond C. Foy. . . ." (Half Moon Bay *Review,* January 5, 1999.)

". . . Some years back, the writer sponsored the rather famous law directed against the 'diploma mill' which was grinding out diplomas in medicine, law and most everything else at a modest sum, to all takers. The enactment put a check to the easy diploma getting. Yesterday a widely known physician told the writer that even today it is necessary to be on the alert to prevent further outbreaks of the 'diploma mill,' particularly in Los Angeles. . . ." (Editorial by Senator Herbert W. Slater, printed Santa Rosa *Press Democrat,* January 14, 1939.)

"Dr. Melville Z. Ellis, Long Beach, has been named as president of the State Board of Chiropractic Examiners. . . . Dr. Selma Giese, Los Angeles, was named vice-president by the board here yesterday, and R. Joseph Stacy, Sacramento, was made secretary." (Associated Press Dispatch, dated San Francisco, January 11, printed Pasadena *Star News,* January 11, 1939.)

"Two variations of old 'rackets' were reported today by the Better Business Bureau to be operating in San Francisco. Girls representing themselves to be student nurses of St. Joseph's Hospital have been soliciting for a magazine in doctors' offices, Sister M. Bebe of the hospital's school of nursing told the bureau. She declared no such soliciting has been authorized. The bureau reported office workers who purchased pens represented by a glib salesman to be a $7.50 value for $1.00 have later found that they could be purchased in 5 and 10 cent stores for 29 cents." (San Francisco *Call-Bulletin,* January 23, 1939.)

" 'Group medicine,' as conducted by the Pacific Health Corporation, constitutes a violation of the California State Medical Practice Act, the United States Supreme Court ruled in effect yesterday. The nation's highest tribunal refused to pass upon an appeal brought by the corporation from a decision handed down originally by Judge C. J. Goodell in 1934, and subsequently upheld by the State Supreme Court. Judge Goodell ordered the corporation to desist from the practice of medicine. The State Supreme Court had held that the corporation, by selecting and paying licensed physicians to care for members, was in reality

(Continued on Page 38)

RECENT ADVANCES IN THE SCIENCE OF NUTRITION

VII. The Unknown Vitamins

● The past twenty years of biochemical research have steadily brought additions to the list of vitamin factors known to be indispensable in proper human nutrition. Today, only vitamins A, B_1, C and D, riboflavin and the P-P factor are universally considered as essential to man. In general, the requirement for these factors is greater in certain phases of the human life cycle than in others.

This list of essential factors is probably incomplete. It has been aptly stated (1) that our species has evolved in the direction of lengthening rather than shortening the list of known dietary essentials. However, it is reasonable to believe that the above list, although incomplete, probably does include all factors whose absence from the ration may cause the most severe types of human dietary deficiency disease.

Investigations on the nutritive requirements and the biochemistry of the lower forms of animal and plant life constitute the frontiers of modern vitamin research. From studies such as these may come the first clues as to new vitamins which may ultimately be proven essential in human nutrition. For example, it was upon research of this type that the dietary requirement of the rat for riboflavin was established and the importance of riboflavin (1) in human nutrition postulated.

During recent years, a large number of factors essential to animals other than man has been enunciated (2). As examples might be mentioned the factor in plant juices required by herbivora (3); the factor in fresh meat essential to trout (4); and vitamin K, needed for normal blood coagulation in fowls (5). Whether these or others of the factors essential to lower forms of life will also prove indispensable to man, the future must decide.

The knowledge that our present list of essential vitamins may be incomplete, need not be alarming. However, such knowledge should serve to emphasize the desirability of a diet formulated according to the best present concepts of the science of nutrition. Nature intends that man should receive all dietary essentials, known or unknown, through food and it will be through the medium of a judiciously chosen, varied diet that these essentials can best be obtained. Needless to state, the several hundred varieties of wholesome, nutritious, commercially canned foods lend themselves admirably to formulation of such varied, protective diets.

practicing medicine in violation of the State law. . . . It was generally believed that the decision will have no bearing upon the 'group medicine' plan now being organized by the State Medical Association. Attorneys for the association formulated that plan in the light of the State Supreme Court decision in the Pacific Health case." (San Francisco *Examiner,* January 31, 1939.) (Decision printed in California and Western Medicine, November, 1935, page 392.)

"Released by Attorney General Warren yesterday were circulation title and summary for a proposed initiative measure embracing a thorough-going plan for socialized medicine. The proposal would create a Public Health Commission of nine laymen, would vest in the commission authority to establish and maintain hospitals, provide adequate and uniform hospitalization for all California residents. Subject to public service employment by the commission would be all physicians, surgeons, pharmacists, dentists, optometrists, osteopaths, chiropractors, embalmers, funeral directors and registered nurses." (San Francisco *Chronicle,* January 31, 1939.)

"A ruling of Attorney General Earl Warren yesterday limited the right of private institutions or unlicensed persons to render medical services through the medium of a hired physician and surgeon. In a letter to Charles B. Pinkham, secretary-treasurer of the Board of Medical Examiners, the Attorney General held that a licensed physician cannot render medical services to patients of unlicensed persons in consideration of a salary paid to him for performing such services. In addition, the ruling held that a private institution cannot represent itself as rendering medical services and hire physicians to render such services. Pinkham's request for the ruling cited the case in the first instance of two unlicensed persons operating a sanitorium and employing a licensed medical man as medical director." (San Francisco *Examiner,* February 11, 1939.)

"A complaint for declaratory judgment was filed here by Percy Purviance of Richmond against Charles Brockman, Jackson chiropractor, Monday in Superior Court. Purviance claims Brockman refused to comply with terms of a contract made by the two men on November 1, 1938. Purviance, also a chiropractor, according to the complaint, entered into a contract with Brockman whereby Purviance was to work for Brockman and receive 40 per cent of money taken in for treating patients. Purviance is acting as his own attorney." (Press dispatch from Jackson office, Stockton *Record,* dated February 8, printed Stockton *Record,* same date.) (Previous entries, August, September, November, December, 1925; January, February, June, July, September, October, 1926; February, 1927; March, April, July, 1928; January, October, 1929; May, June, 1931; June, 1932; May, June, November, 1934; April, August, September, November, 1935.)

CALIFORNIA PHYSICIANS' SERVICE

(Continued from Text Page 247)

(Q.) *What is an administrative member and how is he chosen?*

(A.) An administrative member must be (1) an active member of the California Medical Association and elected to administrative membership by a plurality vote of those professional members who are represented within the administrative district in which he resides, at an election for such purpose held pursuant to these by-laws, or (2) a person recommended in writing for administrative membership by the affirmative vote, or written assent of not less than two-thirds of all the then administrative members. (Chap. 2, a.)

COMPTON SANITARIUM

(A General Hospital)
COMPTON, CALIF.

1052 West 6th Street Los Angeles
Telephone MIchigan 3454

Glenn Myers, M. D. • Philip J. Cunnane, M. D.
Medical Directors

Approved by American College of Surgeons

(Q.) *What are the duties and rights of administrative members?*

(A.) They hold the voting rights; they elect the trustees; they elect the other administrative members. They adopt, amend or repeal by-laws and they have the right to refer any matter or question of policy to the professional members or to the beneficiary members or both for advisory vote. (Chap. 32, Sec. 1.)

(Q.) *What is a professional member?*

(A.) A legally licensed doctor of medicine who makes application to become a professional member. (Chap. 2, Sec. 6.)

(Q.) *Does he need to be a member of the County Medical Association?*

(A.) No.

(Q.) *Does he pay to join?*

(A.) Yes; $5.00 by resolution of the House of Delegates.

(Q.) *Can he hold office?*

(A.) Yes.

(Q.) *Can he be assessed?*

(A.) Only by majority vote of the professional members (the doctors). The professional members themselves must authorize the assessment. (Chap. 18, Sec. 2.) It may be noted that there is nothing unfair in permitting the doctor to levy an assessment on himself and it is to be noted that it cannot be done without his consent.

(Q.) *Are there any other rules and regulations regarding a doctor becoming a professional member?*

(A.) Yes. He must carry malpractice insurance satisfactory to the trustees. He must abide by the rules and regulations adopted from time to time by the trustees.

(Q.) *Who is a beneficiary member?*

(A.) Any person whose annual income is less than an amount to be determined, and certainly not more than $3,000 per annum, who wishes to obtain the benefits of this organization and who fulfills such requirements as may be imposed. (Chap. 2, Sec. 5.)

(Q.) *What might such requirements be?*

(A.) In the beginning they will, no doubt, be members of any group selected to provide adequate spread of risk, desirous of obtaining medical service.

(Q.) *Will individuals be taken in?*

(A.) Yes, as soon as possible, but experience must be developed and safeguards set up to insure the organization that those who will apply are not solely those who are sick.

(Q.) *How about voluntary groups?*

(A.) The same answer will apply.

(Q.) *Will the state be administered as a whole or by districts?*

(A.) The administration will be decentralized as far as possible into districts.

(Q.) *How many districts?*

(A.) Not less than ten nor more than thirty. (Chap. 2, Sec. 6.)

For Acidity and Allied Conditions, we suggest
ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

A Natural Mineral Water
SHOWING MAIN CONSTITUENTS
By Prof. Sydney A. Tibbetts, *Berkeley*

ADAMS SPRINGS, LAKE COUNTY, CALIFORNIA

Steam heated hotel, open all year around.

3000 feet up in the Lake County Pines.

(Since 1870)

(Q.) *Won't those in official positions be likely to direct patients to their friends?*

(A.) No. This will not be tolerated.

(Q.) *How will the patient get a physician?*

(A.) Just as he does now.

(Q.) *How will the physician get his patient?*

(A.) Just as he does now.

(Q.) *Do you mean that there will be no change in the way we practice medicine?*

(A.) There will be almost no change. The change will be in the method by which the doctor is paid and to prevent raids upon the pooled funds there will necessarily be a minimum of supervision. This supervision will be discussed a little later.

CALIFORNIA PHYSICIANS' SERVICE

(Continued from Preceding Page)

(Q.) *Is hospital care under this plan limited?*

(A.) Yes. Hospitalization will be limited to the terms of the hospital contract held by the beneficiary member. (Rules and Regulations.)

(Q.) *Will the amount of money to be spent on hospitalization be limited?*

(A.) Yes, to a definite sum per month, out of the total subscriptions paid by the beneficiary members.

(Q.) *Will medical care be limited?*

(A.) Very slightly.

(Q.) *What limitations are there?*

(A.) Excluded is the treatment of insanity, chronic alcoholism, drug addiction, injuries or diseases incurred while committing lawless acts (since these are matters for the police anyway) and injuries coming under the scope of the Workmen's Compensation Act (since these are otherwise cared for).

(Q.) *Will we take care of sanitarium patients with tuberculosis?*

(A.) No, their sanitarium care will not be provided.

(Q.) *Will we take care of obstetrical cases?*

(A.) It is contemplated we shall under suitable rules and regulations.

(Q.) *Will consultation be allowed?*

(A.) Yes.

(Q.) *Who will choose the consultant?*

(A.) The physician and the patient.

(Q.) *Won't he be chosen by the medical director?*

(A.) No.

(Q.) *What do you mean by medical director?*

(A.) A doctor of medicine employed to supervise the medical details of this plan. The medical director at present is Dr. Morton R. Gibbons, Sr., of San Francisco.

(Q.) *What are his powers?*

(A.) They are rather absolute, but he is expected to use them in great moderation. He will not concern himself with the details of your treatment nor the type of operation you wish to perform except that it will be his duty to assure himself that unscrupulous physicians or patients are not taking advantage of the organization by raiding its funds. His powers will be exercised largely by his assistants in the districts.

(Q.) *Do you mean he will tell me how many calls I can make on a patient?*

(A.) No. Not within any reasonable limits. But if it should be shown that an average broken leg requires medical care for six weeks in the hands of ninety-nine percent of the physicians serving under this plan while one percent insist on attending patients with broken legs for fifteen weeks the medical director would need to assure himself that there is some reason for this before authorizing payment for the additional visits.

(Q.) *Do I have to get his consent before I operate?*

(A.) Yes.

(Q.) *What will I do if it is an emergency?*

(A.) You will use your best judgment?

(Q.) *How will you know whether my patient should have an appendectomy?*

(A.) The medical director or his district assistant will be inclined to trust you until he has reason to do otherwise, but when and if he wishes to he may have your patient examined by an advisor appointed by himself from a list provided by the board of trustees.

(Q.) *Is the same thing true in medical treatment?*

(A.) Yes, but remember that this plan is to be administered by physicians who are practicing medicine the same as you are. They have the same problems that you have

(Continued on Page 42)

Now is the time to begin treatments for this season's

HAY FEVER

. . . 60% OF ALL HAY FEVER SUFFERERS *east of the Mississippi are sensitive to Ragweed; about 40% are sensitive to grasses.*

IT IS ASTONISHING to learn that there are Hay Fever subjects who still inquire whether or not there is any method of treating their affliction with a reasonable prospect of success.

It is more astonishing to learn of physicians who are unaware of the simplicity, the accuracy, the safety and the economy with which the modern treatment of Hay Fever in its most effective form can now be applied by the general practitioner.

The Pollen Antigens and the Pollen Diagnostics of Lederle Laboratories are distributed in glycerinated solution which is at once a preservative against deterioration and against bacterial contamination—a double safeguard.

The simple quantitative Scratch Test, described and illustrated in Lederle's literature, is an approximate guide to the proper dosage of Pollen Antigens in each case.

Lederle's Allergy Department welcomes correspondence about difficult or unusual cases.

and there is no reason to assume that they will assume or even wish to assume any autocratic power over you.

(Q.) *Will there be lots of unnecessary calls?*

(A.) Probably. You don't need to accept them if you don't want to.

(Q.) *You mean I don't have to take a case under this plan if I don't want to?*

(A.) Certainly not. You don't have to now, nor will you under this plan.

(Q.) *Suppose the patient doesn't like his doctor?*

(A.) He will do just as he has always done. Discharge him.

(Q.) *Will our offices be crammed with patients who are beneficiary members to this plan?*

(A.) We hope so since that will mean that the people are getting the care they need and the doctor is prospering.

(Q.) *What will we do with the neurotics?*

(A.) Put up with them. Remember that the trustees can drop a person from the plan if satisfied that he has abused his privileges as a beneficiary member.

(Q.) *How will you control the "chiseler"?*

(A.) In the first place, there probably won't be very many. Generally speaking, physicians have a rather high average of integrity and honor, and we will have to deal only with the few who constitute the exception. It is these few that compel us to have some supervision, and for these there will be disciplinary measures provided which can be made adequate.

(Q.) *Can the various types of members, including the beneficiary members, be dropped from the plan?*

(A.) Yes. (Chap. 3, Sec. 1.)

(Continued on Page 44)

WELL NOURISHED BABIES ARE CONTENTED

When fed S.M.A., normal infants show steady progress in growth, weight, bone development and tissue structure.

S.M.A., like human milk, is easy to digest and assimilate. When diluted according to directions it closely resembles human milk, not only in proportions of food essentials but also in the chemical constants and physical properties.

S.M.A. is antirachitic and antispasmophilic. The Vitamin A activity of each feeding is constant throughout the year. With the exception of orange juice it is usually unnecessary to give vitamin supplements.

ACCEPTED AMERICAN MEDICAL ASSN. Council on Foods

S. M. A. is a food for infants . . . derived from tuberculin tested cows' milk, the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil; with the addition of milk, sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, it is ESSENTIALLY SIMILAR TO HUMAN MILK in percentages of protein, fat, carbohydrate and ash, in chemical constants of the fat and in physical properties.

(Continued from Page 42)

(Q.) *How will you get rid of an administrative member who is found not to be useful?*

(A.) He can be expelled for cause from administrative membership by two-thirds majority of the Board of Trustees. (Chap. 3, Sec. 2.)

(Q.) *Can a professional member be expelled or suspended?*

(A.) Yes, under the following conditions: he must be notified of the charges against him ten days before the meeting of the trustees at which action will be taken; he must have a full opportunity to be heard at that meeting; and it requires two-thirds majority of the trustees to expel a professional member. (Chap. 3, Sec. 3.)

(Q.) *Can a beneficiary member be dropped?*

(A.) Yes, by two- thirds majority vote of the trustees. (Chap. 3, Sec. 4.)

(Q.) *Will the administrative members meet?*

(A.) Yes. There will be an annual meeting in March of each year except the year 1939, in which year the first meeting will occur on October 14; thereafter the annual meeting will occur in March. Also special meetings of the administrative members may be called by the president; by the board of trustees; or by any ten administrative members. (Chap. 5, Sec. 2.)

(Q.) *Will there be meetings of the professional members?*

(A.) Yes, they may be called by resolution of the board of trustees; by two-thirds of the administrative members or by any two hundred fifty professional members. District meetings of professional members may be held at stated intervals to elect administrative members or those administrative members may be elected by mail vote.

(Q.) *When are the trustees elected?*

(A.) At the annual meeting of the administrative members. (Chap. 5, Sec. 12.)

(Q.) *To what term is a trustee elected?*

(A.) Three years. (Chap. 7, Sec. 1.)

(Q.) *Could a trustee be removed from office?*

(A.) Yes, by vote of three-fourths of the administrative members. (Chap. 7, Sec. 2.)

(Q.) *What are the powers of the trustees?*

(A.) To control and manage the property and conduct the affairs of California Physicians' Service. (Chap. 7, Sec. 3.) These powers include the power: to adopt a fee schedule or schedules; to make rules and regulations necessary in relationship to the rendition of medical and surgical service and hospital care; to establish a unit system; to engage agents, representatives and employees; to fix dues which may be in different amounts for different classes of beneficiary members; to make contracts; and in general to carry out the purposes of this organization. (Chap. 7, Sec. 3.)

(Q.) *Will there be any financial responsibility upon any member, administrative, professional or beneficiary, for any debts or liabilities for California Physicians' Service?*

(A.) No.

(Q.) *Do the trustees receive a salary?*

(A.) No; they may, however, allow themselves a fee for attendance at board meetings and their actual traveling expenses (Chap. 7, Sec. 4). It may be noted that the trustees feel that they will not accept any fees until such a time as the organization is on a sound footing.

(Q.) *Must the officers of the organization be trustees?*

(A.) No, they may be but they need not be. (Chap. 9, Sec. 3.)

(Q.) *Who appoints the medical director?*

(A.) The trustees. (Chap. 9, Sec. 3.)

(Q.) *Is his appointment for a definite term?*

(A.) No, the length of his service depends on the trustees.

(Q.) *Who may be medical director?*

(A.) A doctor of medicine holding a valid and unrevoked physicians and surgeons' certificate issued to him by the Board of Medical Examiners of the State of California. (Chap. 14, Sec. 1.)

(Q.) *Will there be more than one medical director?*

(A.) No, but there will be at least one assistant medical director in each district who must have the same qualifications as the medical director.

(Q.) *What are the duties of the medical director?*

(A.) To supervise the rendition of medical and surgical and hospital care to beneficiary members. As an executive

(Continued from Page 44)

officer of the organization he will also administer and enforce the rules and regulations, and all acts, resolutions, proceedings and orders of the trustees relating to the administration of the medical service.

(Q.) *Do beneficiary members have any representation in this plan?*

(A.) Yes. Chapter 16, Section 1, provides for a board of advisory governors to be selected from the professional and beneficiary members, and the function of this board is to advise the trustees on question of policy.

(Q.) *Why do the rules and regulations require a professional member to carry malpractice insurance?*

(A.) Because (1) otherwise the funds of California Physicians' Service, from which doctors are to be paid, would be in jeopardy in the event of claimed malpractice on the part of a professional member; and (2) any physician who does not carry adequate malpractice insurance is not properly protecting his own welfare.

The following are questions which were circulated in mimeograph form at some of the County Medical Society meetings at which this plan was discussed.

(Q.) *What precautions have been taken to prevent the patient from abusing the plan until the value of a unit drops below the minimum amount upon which the doctor can make a living, pay his expenses and render decent service?*

(A.) Precautions will have to be taken when the need arises for them. The people can be taught that this plan is for their benefit and it is to their benefit not to abuse it. People in general are pretty fair-minded. The average person does not particularly enjoy going to a doctor, and there is no particular reason to believe that any considerable number of them will do so purely for pleasure.

(Q.) *Will the officials involved in this plan be paid on a unit basis, or will their salaries be guaranteed along with all other expenses before the doctor who is rendering the medical service gets paid?*

(A.) The trustees must have the right to pay all employees on a monetary basis. The present medical director, Dr. Morton R. Gibbons, Sr., has agreed to accept compensation on a unit basis.

(Q.) *What definite provisions have been made in the basic plan to guarantee the continuous free choice of the physican by the patient?*

(A.) Every provision that could be thought of has been made and there is nothing in the entire plan that will prevent a free choice of physician. The right of the beneficiary member to select his own physician from among the professional members cannot be denied.

(Q.) *What will prevent any employee of this plan from using his influence to direct patients to certain favored doctors?*

(A.) This question should be answered in three parts: first, the employee will not have any influence; second, the employees will not have any contact with any group of patients except their own relatives and friends; third, it will be impossible to prevent an employee from recommending a physician just as any employee of any company now recommends a physician of his liking to his acquaintances and friends.

(Q.) *What prevents the employer of any group of beneficiaries from directing his employees to any certain doctors?*

(A.) Nothing really prevents it except that the employer has no control over the destiny of his employee and could only advise in any case. It is to be noted that nothing now prevents an employer from directing a group of his em-

What are the Products of *Karo* in Infant *Digestion?*

INFANT FEEDING PRACTICE POINTERS

Answers to Physicians' Questions

1. **Q.** What is the composition of Karo Syrup?

A.

Dextrin	*50.0%*
Maltose	*23.2%*
Dextrose	*16.0%*
Sucrose	*6.0%*
Invert sugar	*4.0%*
Minerals	*0.8%*

(Dry Basis)

2. **Q.** What are the Karo equivalents?

A.

1 oz. vol.	*40 grams* *120 cals.*
1 oz. wt.	*28 grams* *90 cals.*
1 teaspoon	*15 cals.*
1 tablespoon	*60 cals.*

3. **Q.** What is the difference in caloric value between Karo and dry maltose-dextrins products?

A. *Karo Syrup furnishes twice as many calories as similar dry sugars.*

Karo is prepared by the acid-hydrolysis of cornstarch. It is first converted into dextrins and then into maltose and dextrose. These are the same stages through which starch passes during digestion in the human body:

$$\underset{(C_6H_{10}O_5)_n}{\text{Starch}} \xrightarrow{H_2O} \underset{(C_6H_{10}O_5)_n}{\text{Dextrin}} \xrightarrow{H_2O} \underset{C_{12}H_{22}O_{11}}{\text{Maltose}} \xrightarrow{H_2O} \underset{C_6H_{12}O_6}{\text{Dextrose}}$$

The composition of the final mixture is carefully regulated for uniformity in these sugars. And the mixture is heated to 165° F. and poured into preheated cans and vapor vacuum-sealed for bacterial safety.

"Infants Thrive ON Karo Formulas"

ACCEPTED AMERICAN MEDICAL ASSN Council on foods

Infant feeding practice is primarily the concern of the physician; therefore, Karo for infant feeding is advertised to the Medical Profession exclusively. For further information, write Corn Products Sales Company, Dept. SJ3, 17 Battery Place, New York City, N. Y.

VITAMIN D REQUIREMENTS

Journal of the American Medical Association, August 20th, 1938, Vol. 111: 703

> "... Tentatively the vitamin D requirement of the infant fed cow's milk may be stated as between 300 and 400 units daily, these amounts having been shown to be efficient in prophylaxis of rickets, in producing ample retention of calcium and phosphorus and in permitting excellent skeletal growth and dentition. This requirement is stated in terms of vitamin D of no greater concentration than is found in average high grade cod liver oil."
>
> "... 300 to 400 units daily as cod liver oil or as milk containing 400 units to the quart allows sufficient vitamin D to prevent rickets of clinical significance in both full term and prematurely born infants."

The above excerpts were taken from the article entitled, "The Human Requirement of Vitamin D," by Doctors P. C. Jeans and Genevieve Stearns of Iowa City.

For a very fine discussion on vitamin D requirements we recommend the reading of this entire article.

Special Morning Milk contains 500 units of vitamin D to the reconstituted quart (16 fl. oz. Special Morning Milk and 16 fl. oz. water). The vitamin D added to Special Morning Milk is obtained from the natural source—cod liver oil. However, there is no cod liver oil taste in the milk.

BECAUSE THERE IS NO COD LIVER OIL TASTE IN SPECIAL MORNING MILK, THE ADMINISTRATION OF VITAMIN D IS GREATLY SIMPLIFIED.

MORNING MILK COMPANY

STOCKTON, CALIFORNIA

Digitol WAS FIRST PHYSIOLOGICALLY ASSAYED THIRTY-EIGHT YEARS AGO

BACK IN 1901, Digitol was a pioneer in the field of physiologically assayed tinctures of digitalis. Then, as now, precision and reliability in a tincture of digitalis appealed to the physician and made Digitol a product of choice.

In the years that have intervened, the methods of physiological assay have been refined and made more accurate. Each lot of Digitol is physiologically standardized by the "one-hour frog method" official in the U.S.P. XI. The date of this test appears on the label of each bottle.

Digitol is a fat-free tincture; it makes a more sightly mixture with water on administration. Its elegant appearance, absence of precipitation, accurate standardization and dependable activity are advantages which have been maintained. Digitol is marketed only in one-ounce sealed bottles supplied with a dropper for ease of administration.

ployees to a particular physician if the employer wishes to do so.

(Q.) *What will prevent a few doctors, such as those already engaged in industrial practice, from employing more salaried assistants and corraling a major part of the employed patients in California, leaving the balance of the medical profession worse off than before this plan was adopted?*

(A.) First, the trustees intend to make such rules as are necessary to prevent this situation from arising; second, the most effective preventive, however, will be the unwillingness of the average doctor to assume the financial responsibility necessary to employing assistants, enlarging his office, etc. It is also unlikely that he would be able to make contacts with any particular group of patients, since there would be no particular benefit to the patient and since most of them have their own idea about their doctor.

(Q.) *What incentive is there in it for any man to do more than render a minimum of service to a maximum number of patients or to acquire any special skill or training above the average?*

(A.) This question does not seem very sound. The answer is, of course, that it is the same incentive that makes a man render more than a minimum of service, etc. It all comes down to the fact that a man who renders a minimum of service and who does not acquire any special skill or training will not be a very successful doctor whether under this plan or in the practice of medicine as it has always been practiced.

(Q.) *Does this plan involve the solicitation of patients?*

(A.) No. Solicitation in the ethical sense means the asking of a person to become the patient of a particular doctor. There probably will be solicitation not to become patients of any particular doctor or doctors, but to associate themselves in a common enterprise which will enable them to pool their funds so that when they need hospital or medical care the physician and hospital of the patient's choice may be paid for out of the pooled funds. There is no sense whatever in which such a proposal could be called a solicitation of patients.

(Q.) *Isn't it unethical to advertise?*

(A.) Of course it is, when the advertisement is that of a physician or group of physicians seeking patients, but not when the advertisement is that of an organization inviting people to become members so that the organization may pay some doctor for taking care of some patient. In other words, California Physicians' Service has no medical services to offer or to sell; being an organization it could not have patients and it does not propose to render medical or hospital care. All that the organization proposes to do is to pay for hospital and medical care when such care is given by a physician and hospital chosen by the patient from the funds of the beneficiary members which it holds in trust and administers for this purpose.

(Q.) *Many people are saying that the fees will be very small.*

(A.) This is a pure assumption not founded on any particular fact. There is no reason to believe that if the organization is successful the fees paid will not be very adequate for the class of patient it is supposed to serve.

(Q.) *Could California Physicians' Service ever take care of groups of people unable now to pay for their medical service?*

(A.) Yes. The organization has the power to contract with Federal, state or local governments or any agencies thereof to furnish medical care to any groups or individuals for whose care they may be responsible.

(Continued on Page 52)

IODOBISMITOL *with Saligenin*

. . . for the patient with early syphilis
. . . for the patient who is sensitive to arsenic

IODOBISMITOL WITH SALIGENIN
Administer intramuscularly, preferably into the upper outer quadrant of the gluteus maximus muscle. One ampul (2 cc. size) provides an average therapeutic dose. Injections should be made every three days. Give at least 8 to 12 consecutive doses in a course. Best results are usually obtained by the continued administration over long periods of time without rest intervals. Iodobismitol with Saligenin treatment need not be interrupted when arsphenamines are being given.
Care should be taken that there is no leakage back into the subcutaneous tissues as collections of Iodobismitol with Saligenin beneath the skin will cause lump formation. To avoid trackage of the solution back along the needle, after filling the syringe, draw about ½ cc. of air into it and when injecting clear the needle of Iodobismitol with Saligenin with this air at the end of the stroke.

A RECENTLY PUBLISHED clinical study[1] of combination bismuth therapy includes the comment that: "One of the problems of bismuth therapy for syphilis is to achieve a rapid rise of the metal in the blood stream to a therapeutic level and to keep it there without too great hardship on the patient. . . . This we believe we have achieved by the combined use of iodobismitol or sobisminol and weekly injections of bismuth subsalicylate. . . . Such a form of bismuth therapy would be particularly useful in the acute stage of syphilis when the patient is sensitive to arsenic and it is necessary to rely on other antisyphilitic measures. Moreover, for the patient with early syphilis, who is just starting therapy, this schema might be employed in the first course of bismuth therapy when the clinician is desirous of dealing a heavy blow to the spirochetes from another angle than that of arsenic."

Iodobismitol with Saligenin is a propylene glycol solution containing 6% sodium iodobismuthite, 12% sodium iodide, and 4% saligenin (a local anesthetic).

It is rapidly absorbed and slowly excreted and is useful in both early and late syphilis. It presents bismuth largely in anionic (electronegative) form.

STATE MEDICAL LEGISLATION

(Continued from Text Page 247)

sick or afflicted, which is intended or has a tendency to deceive the public or impose upon credulous or ignorant persons and so be harmful or injurious to public morals or safety constitutes unprofessional conduct within the meaning of this chapter."

A. 1574 proposes to make it a felony for any person to sell, dispense, administer or prescribe dinitrophenol for any purpose.

S. 817 proposes to restrict the retail sale and distribution of "any registered, trade-marked or copyrighted preparation or compound registered in the United States patent office" containing barbital to sale or distribution on the prescription of a licensed physician, dentist, or veterinarian. The present law imposes such a restriction on the sale of such a registered, trade-marked, copyrighted preparation only when it contains more than fortly grains to the avoirdupois or fluidounce.

S. 990 proposes to create the dental corporation of California, which is to consist of all licensed dentists and licensed dental hygienists in the state. The corporation is to be governed by a State Dental Board, whose members are to be selected eventually by members of the corporation. The present members of the Board of State Dental Examiners are to constitute the first State Dental Board, but as their terms expire they are to be replaced by persons selected by the corporation. The State Dental Board is to exercise all the rights and assume all the duties now in the Board of Dental Examiners. The bill also proposes to repeal the existing laws relating to the practice of dentistry and to enact an entirely new dental practice act. This bill, so far as it will integrate the dental profession, is quite similar in theory and set-up to so-called bar integration acts in force now in a number of states.

S. 1183 proposes to regulate the use of x-rays and x-ray appliances in connection with the examination of the jaws, teeth, alveolar process, gums, and the immediate adjacent structures of living human beings, as an aid to the diagnosis and treatment of diseases and lesions pertaining thereto. The bill proposes to create a dental x-ray qualifying committee to determine the qualification of applicants for permits authorized by the bill and to report the qualifications to the Board of Dental Examiners, which on the recommendation of the committee will issue such permits to qualified applicants. Two permits are proposed by the bill: first, an unlimited permit, the holder of which is to be called a dental roentgenologist and is to be authorized to diagnose and treat the diseases and lesions of the jaws, teeth, alveolar process, gums, and immediate adjacent tissues by means of x-rays or radiographs and to own, possess, or operate x-ray devices or x-ray laboratories; second, a limited permit, the holder of which is to be called a dental radiographer and is to be authorized to own, possess or operate a dental x-ray laboratory and to render technical descriptions of the shadows visible in roentgenograms to those licensed by law to diagnose ailments and treat the sick. The bill specifically provides that it is not to be construed to prohibit the ownership, possession or operation of x-ray devices used for the lawful diagnosis and lawful treatment of persons by licensed physicians, dentists, osteopaths, drugless practitioners or chiropractors.

A. 1307 proposes stated state and county aid to persons convalescing from tuberculosis. A person is to be deemed convalescing until he is able to return to the regular employment in which he was engaged prior to contracting tuberculosis.

A. 1712, to amend the law authorizing the organization of corporations to operate nonprofit hospital service plans, proposes in effect to permit such corporations to enter into contracts covering the "indemnification of the beneficiary or subscriber for the costs and expense of professional medical service rendered in connection with hospitalization."

A. 1796 proposes to prohibit the manufacture, advertising, sale or transportation of adulterated, mislabeled, or misbranded cosmetics and to regulate the traffic in cosmetics and complexion soaps.

A. 1874 proposes a system, under the supervision of the State Department of Public Health, for providing medical care, including medical, dental, nursing and hospital care, and the supplying of pharmaceutical and therapeutic appliances to needy persons, the cost of which is to be apportioned between the state and the counties. The bill specifically provides that, subject to the rules and regulations adopted by the department, "medical care shall be provided . . . to any resident of the state who has not sufficient income . . . to provide himself and his dependents with proper medical, dental, nursing, hospital, pharmaceutical,

(Continued on Page 56)

CALL ON US!

Undoubtedly questions arise from time to time relative to the effects of smoking . . . . .

We have complete files of the literature on this subject, from which we will gladly furnish any information which may bear on your question.

Any question on the subject of smoking is welcome. If the answer is available in the literature, we have it, and will be happy to pass it on to you.

Colfax School
for the
Tuberculous

COLFAX, CALIFORNIA

◀ There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

STATE MEDICAL LEGISLATION

(Continued from Page 54)

and therapeutic appliance care, without depriving himself or his dependents of necessary food, clothing, shelter, and similar necessities of life."

S. 657 proposes to establish a health and safety code, which contains provisions relating to, among other things, (1) the duties and rights of the State Department of Health and local health departments and officers; (2) the regulation of clinics and dispensaries and maternity hospitals; (3) the quarantine laws of the state; (4) the maintenance of tuberculosis hospitals by governmental subdivisions; (5) sanitation and sanitary districts; (6) dead bodies, their burial, removal and disinterment, including the disposal of unclaimed dead bodies; (7) cemeteries; (8) vital statistics; and (9) the regulation of the possession and distribution of narcotic drugs.

Necessity of Reopening Abdominal Surgical Wounds Is Decreasing.—Reopening of abdominal surgical wounds and postoperative hernia are on the decrease, Albert O. Singleton, M.D., and Truman G. Blocker, Jr., M.D., Galveston, Texas, point out in *The Journal of the American Medical Association* for January 14.

They state, in summary, that this is due primarily to more study of the problems involved in making and closing wounds, and to the more successful postoperative care due to the increasing use of gastric suction, obviating vomiting and distention by gas.

Disruption of wounds and postoperative hernia in the upper part of the abdomen, with their distressing consequences, can be almost completely eliminated by the use of carefully made anatomic incisions. A transverse abdominal incision decreases the likelihood of hernia and disruption of abdominal wounds.

Of all the special sense organs the eyes are the most advanced in structure and function.

VEGEX

BREWERS YEAST EXTRACT
B VITAMIN COMPLEX
EXTRINSIC FACTOR

SPECIAL PURPOSE FOOD for the VITAMIN B COMPLEX (including antincuritic B_1; riboflavin B_2; antipellagric G; complete vitamin B complex growth factor); the EXTRINSIC FACTOR and available FOOD IRON.

●

INGREDIENTS

A brewers' yeast extract from a salt-enzyme autolyzing process—see analysis—with added pure vegetable flavor and added available iron salt—ferrous malate.

As used, a teaspoonful to a cup of liquid, the salt concentration is less than in toast. The vegetable flavor is of possibly no physiological significance. Meat-like flavor, but entirely meat free. Starch and sugar free for restricted diets; easily borne by infants and patients on liquid diets.

VEGEX ANALYSIS

B VITAMIN TEST

Average per Gram

Sherman-Chase B_1.....	45 units
International B_1.........	25 units
Sherman-Bourquin riboflavin	35 plus units
B Complex full growth	2 to 3 units

Mass clinical use indicates one man unit each anti-beriberi, anti-pellagric and extrinsic factor (anemias) per ounce.

●

Adequate nutrition requires the whole of the vitamin B complex. Vegex supplies it.

THE COMPLETE VITAMIN B COMPLEX

Based on Both Extensive Biological Tests and Mass Child and Man Clinical Use

There are more than two hundred favorable references to the use of Vegex for "vitamin B"—the vitamin B complex—in medical literature; alone, now fifty-seven in the field of the anemias.

The physician, in selecting a dependable B complex product high in B_1, B_2, the whole antipellagric G, and with the extrinsic factor (anemias), can turn to a product with a record of mass child and man clinical results.

A POTENT, NATURAL FOOD SOURCE OF THE ENTIRE B COMPLEX

With the division of the vitamin B complex into B_1, B_2, riboflavin, B_6, etc., there is as yet unsuccessful effort to build up a complete vitamin B complex out of these fractions. The whole "G", including its antipellagric factor and other factors of the vitamin B complex have not been separated and concentrated. The full effect of the larger B_1, riboflavin or other factor seems to be limited by the amount of the rest of the B complex present.

Vegex, the extract of autolyzed brewers' yeast, is a *natural* food source of the *complete* vitamin B complex. It is not a mixture of synthetic vitamins.

Dried brewers' yeast was found to be the richest source of "vitamin B"—the B complex. The B vitamins, proteins and minerals are contained within the tough little yeast cell which requires a high powered microscope to see. Autolyzing, or self-digestion with the yeasts' own enzymes, breaks open the cells and the contents are condensed into Vegex. Chemically and biologically like meat proteins, the yeast proteins take on a meat-like flavor.

MASS CHILD AND MAN TESTS

The relation of the vitamin B complex to mother and child feeding and to disorders due in part to vitamin B complex deficiencies were, to a large extent, pioneered with Vegex-Marmite.

Few, if any, products have had wider biological (pigeon and Albino rat) tests; few, if any, as wide child and man clinical test, under physicians and in the foremost of medical centers.

Research workers have definitely established the presence of a potent anti-anemic principle in Vegex. The extrinsic factor seems to be developed or freed, naturally, in the autolyzing process.

SIMPLE USES

The simple uses are (a) a scant teaspoonful to a cup of hot water, (b) one-half teaspoonful to a cup of hot milk and (c) in broth or soup. It may be given several times throughout the day and before retiring.

In the dilution in which Vegex is regularly consumed, that is, a scant teaspoonful to a cup of liquid, the salt content is less than that of toast.

Vegex and milk is one of the most ideal food combinations known in the science of nutrition, needing in human nutrition added vitamin C. The proteins of both are biologically complete. Vegex is high in phosphates, milk is high in lime. Vegex adds the B complex factors and iron in which milk is low. The dried whole milk adequately supplies vitamin A in the animal tests. It has been found that Vegex increases milk consumption.

Sherman uses two-thirds whole wheat to one-third whole milk in his longevity diet. Five per cent of Vegex with whole milk, in repeated animal tests, Vegex Laboratories, give the best growth producing, reproduction and rearing of the young diet that we have known. Applying this to human nutrition and based on the solids (4 ounces), this means one teaspoonful of Vegex (6 grams) to a quart of milk.

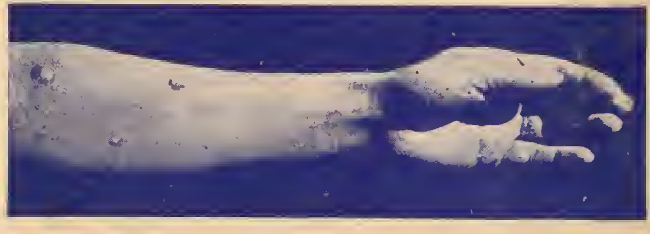
HAY FEVER SUFFERERS

can be your most satisfactory type of patients

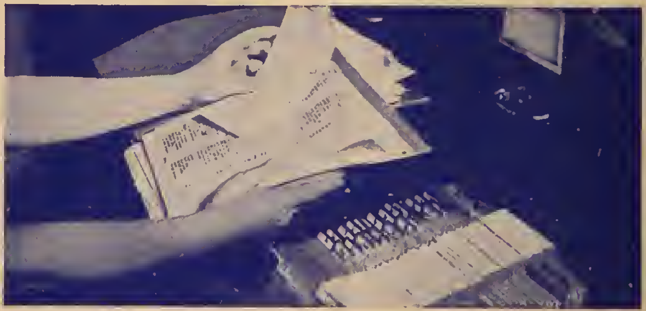
Contrary to many physicians' belief, *proper* pollen therapy is not intricate and seldom fails to produce results. Treatment with Cutter Pollen Extracts, as indicated below, neither takes questionable short-cuts nor gets the physician involved in non-essentials.

1 **TESTING** with Cutter's regional pollen test sets requires but a single sitting lasting little longer than your average office visit.



2 **REACTIONS ARE READ** within 10 to 20 minutes and the exact pollen offenders are known, as the tests are for individual pollens, not "pollen groups."

3 **RECORD OF REACTIONS** is made on the test slip itself by sketching a "picture" of your patient's reactions alongside each of the offending pollens listed.



4 **THE TEST SLIP** is usually mailed to the Cutter Allergy Staff, who compare it against their compiled case histories from your locality.

5 **EACH TREATMENT SET** is individually made up from the offending pollens, in varying proportions, according to local case histories (in our files) and your patient's reactions.

6 **EACH TREATMENT CONTAINS** more than 150,000 pollen units, adequate for your patient requiring co-seasonal treatment, as well as pre-seasonal. The combination of proper testing, proper selection of pollens and adequate treatment makes the "batting average" of physicians using Cutter Pollen Extracts exceptionally high.

Regional pollen test sets, $1.50. Treatment sets (single pollen), $9.00. Each additional pollen in specially prepared treatment sets, 50¢.

Decholin
REG. U.S. PAT. OFF.

When Diuresis Is Indicated

A True Choleretic
●
A Single Chemical Entity
●
Virtually Nontoxic

In congestive heart failure accompanied by ascites and biliary engorgement, 10 cc. of Decholin sodium—the sodium salt of c.p. dehydrocholic (triketocholanic) acid—exerts a favorable influence upon water excretion. Upper right quadrant pain is reduced, the discomfort of abdominal distention is relieved, and dyspnea is lessened.

When intense and immediate diuresis is imperative, 10 cc. of Decholin sodium administered in conjunction with mercurial diuretics (in the same syringe) enhances and prolongs the action of the latter.

Weigand, F. A.: Diuretic Action of Intravenous Sodium Dehydrocholate, J.A.M.A., 105: 2034 (Dec. 21) 1935.

Physicians are invited to send for the second edition of the comprehensive brochure "Biliary Tract Disturbances."

ACCEPTED AMERICAN MEDICAL ASSN. Council on Pharmacy and Chemistry

Riedel-de Haen, Inc.
105 Hudson Street New York, N. Y.

Syphilis Cause of Blindness.—Approximately 15 per cent of all blindness can be traced to syphilis, says the National Society for the Prevention of Blindness.

"The venereal diseases—syphilis and gonorrhea—are among the major destroyers of sight," the statement points out. "For that reason, we have a special interest in the efforts to control these diseases, and we are glad to coöperate with the campaign sponsored by the American Social Hygiene Association.

"The importance of this problem may be realized from the fact that about 60,000 babies are born with congenital syphilis every year. Most of them develop a serious eye condition at some time in early life, unless they receive adequate medical care.

"Prenatal syphilis is preventable if the expectant mother who is infected begins treatment in the early months of pregnancy. The Society advocates a routine blood test for every expectant mother, because such a test can usually determine the presence of syphilitic germs.

"The compulsory use of prophylactic drops in the eyes of all babies at birth has brought about a marked reduction in the amount of blindness from gonorrheal infections; and a great decrease in the amount of blindness from prenatal syphilis can be achieved also.

"In industry, too, the eye hazards are greater when workers are suffering from syphilis. The presence of this disease increases the severity of eye injuries; a little cut or bruise of the cornea, that would notherwise pass unnoticed, may develop into a serious condition if the worker is suffering from syphilis.

"The consequent lowering of sight to a point of economic blindness carries with it the full indemnity for complete loss of vision; and the courts have held that the existence of syphilis does not lessen the responsibility of the insurance carrier unless it can be definitely shown that the loss of sight would have progressed even if the injury had not occurred."

Interrupted loud mechanical noise is more disturbing than continuous noise of the same type.—*Hygeia.*

ISOPHRIN
TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is 1/4% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel's.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

FITZHUGH BUILDING
GArfield 4417 San Francisco, Calif.

ROSTER OF COUNTY MEDICAL SOCIETIES, CALIFORNIA MEDICAL ASSOCIATION

(County society secretaries are requested to promptly notify "California and Western Medicine" when changes are indicated in their roster information.)

Alameda County Medical Association

2404 Broadway, Oakland

President, Frank H. Bowles, 426 Seventeenth Street, Oakland.

Secretary, Gertrude Moore, 2404 Broadway, Oakland.

Meeting, *Third Monday, 8:15 p. m., Hunter Hall, Oakland.*

Butte County Medical Society

President, E. L. Meyers, Fourth Street and Broadway, Chico.

Secretary, J. O. Chiapella, 131 Broadway, Chico.

Meeting, *Second Thursday.*

Contra Costa County Medical Society

President, Kabo Daily, 314 Tenth Street, Richmond.

Secretary, Clifford E. Dieterich, 1306 Pomona Avenue, Crockett.

Meeting, *Second Tuesday, 8 p. m.*

Fresno County Medical Society

President, Roland W. Dahlgren, 1006 Mattei Building, Fresno.

Secretary, Lester R. Nielson, 1006 Mattei Bldg., Fresno.

Meeting, *First Tuesday, University-Sequoia Club, Fresno.*

Humboldt County Medical Society

President, Samuel P. Burre, 507 F Street, Eureka.

Secretary, Joseph S. Woolford, 350 E Street, Eureka.

Meeting, *First Thursday.*

Imperial County Medical Society

President, Henry B. Graeser, 115 E. Fifth Street, Holtville.

Secretary, William A. Clarke, Holtville.

Meeting, *Third Tuesday, 7 p. m., Barbara Worth Hotel, El Centro.*

Kern County Medical Society

President, C. I. Mead, Haberfelde Building, Bakersfield.

Secretary, C. S. Compton, 428 C Street, Bakersfield.

Meeting, *Third Thursday, 8:00 p. m.*

Kings County Medical Society

President, P. K. Edmunds, Corcoran.

Secretary, William A. Johnstone, Hanford.

Meeting, *Second Monday, 8 p. m., Legion Hall, Hanford.*

Lassen-Plumas-Modoc County Medical Society

President, C. I. Burnett, Susanville.

Secretary, Fred J. Davis, Jr., Westwood.

Meeting, *On Call.*

Los Angeles County Medical Association

1925 Wilshire Boulevard, Los Angeles

President, William H. Daniel, 1930 Wilshire Boulevard, Los Angeles.

Secretary, George D. Maner, 1925 Wilshire Boulevard, Los Angeles.

Meetings, *First and Third Thursdays, 1925 Wilshire Boulevard, Los Angeles.*

Marin County Medical Society

President, Harry N. Hensler, Home Market Building, San Anselmo.

Secretary, Carl W. Clark, 510 B Street, San Rafael.

Meeting, *Fourth Thursday, 7:00 p. m., Marin Golf and Country Club.*

Mendocino-Lake County Medical Society

President, Robert B. Smalley, Willits.

Secretary, Dallas Wagner, Fort Bragg.

Meeting, *On Call.*

Merced County Medical Society

President, E. M. Soderstrom, Merced.

Secretary, Fred O. Lien, Shaffer Building, Merced.

Meeting, *Third Thursday, Hotel Tioga, Merced.*

Monterey County Medical Society

President, Walter P. Farr, 308 Main Street, Salinas.

Secretary, Herbert Archibald, Salinas National Bank Building, Salinas.

Meeting, *First Thursday.*

Napa County Medical Society

President, Alexander H. McLeish, Veterans Home Hospital, Yountville.

Secretary, M. M. Booth, Bruck Building, St. Helena.

Meeting, *First Wednesday.*

Orange County Medical Society

President, M. W. Hollingsworth, 1806 No. Main Street, Santa Ana.

Secretary, Glenn Curtis, 323 So. Pomona Street, Brea.

Meeting, *First Tuesday, 8 p. m., Chapel of the Orange County Hospital, Orange.*

Placer County Medical Society

President, William M. Miller, Auburn.

Secretary, Robert A. Peers, Colfax.

Meeting, *At Call of President.*

Riverside County Medical Society

President, N. K. Bear, 3655 Fourteenth Street, Riverside.

Secretary, Thomas A. Card, 3616 Main Street, Riverside.

Meeting, *Second Monday, 8 p. m., Library, Riverside Community Hospital.*

Sacramento Society for Medical Improvement

President, Manuel Azevedo, 1027 Tenth Street, Sacramento.

Secretary, Glenn E. Millar, 321 Physicians Building, Sacramento.

Meeting, *Third Tuesday, 8:30 p. m., Auditorium, Sacramento.*

San Benito County Medical Society

President, J. M. O'Donnell, Hollister.

Secretary, L. E. Smith, Hollister.

Meeting, *At Call of President.*

San Bernardino County Medical Society

President, Delbert B. Williams, 1151 D Street, San Bernardino.

Secretary, A. E. Varden, Medico-Dental Building, San Bernardino.

Meeting, *First Tuesday, 8 p. m., San Bernardino County Charity Hospital.*

San Diego County Medical Society

Fourteenth Floor, Medico-Dental Building, 233 A Street, San Diego

President, Hall G. Holder, 1109 Medico-Dental Building, San Diego.

Secretary, C. V. Bernardini, Medico-Dental Building, 233 A Street, San Diego.

Meeting, *Second Tuesday, El Cortez Hotel.*

San Francisco County Medical Society

2180 Washington Street, San Francisco

President, Edwin L. Bruck, 384 Post Street, San Francisco.

Secretary, Stanley H. Mentzer, 2180 Washington Street, San Francisco.

Meetings, *Every Tuesday, 8:15 p. m., 2180 Washington Street, San Francisco.*

San Joaquin County Medical Society

President, N. P. Johnson, Medico-Dental Building, Stockton.

Secretary, George H. Rohrbacher, Medico-Dental Building, Stockton.

Meeting, *First Thursday, 8:15 p. m., Medico-Dental Club Rooms, Stockton.*

San Luis Obispo County Medical Society

President, J. B. V. Butler, 722 Marsh Street, San Luis Obispo.

Secretary, E. M. Bingham, County Health Department, San Luis Obispo.

Meeting, *Third Saturday, 6:30 p. m., Gold Dragon Cafe, San Luis Obispo.*

(Roster lists continued on advertising page 6)

San Mateo County Medical Society

President, N. D. Morrison, 205 Third Avenue, San Mateo.

Secretary, J. Garwood Bridgman, 205 Third Avenue, San Mateo.

Meeting, *Fourth Wednesday, Benjamin Franklin Hotel, San Mateo.*

Santa Barbara County Medical Society

President, W. H. Johnston, 1515 State Street, Santa Barbara.

Secretary, D. H. McNamara, 317 W. Pueblo Street, Santa Barbara.

Meeting, *Second Monday, Cottage Hospital.*

Santa Clara County Medical Society

President, Cletus S. Sullivan, Bank of America Building, San Jose.

Secretary, Leslie B. Magoon, 652 East Santa Clara Street, San Jose.

Meeting, *Third Wednesday, 8 p. m., Medico-Dental Building, San Jose.*

Santa Cruz County Medical Society

President, John T. Harrington, 10 Cooper Street, Santa Cruz.

Secretary, Samuel B. Randall, 84 Walnut Avenue, Santa Cruz.

Meeting, *First Monday, 7:30 p. m., Club Rio del Mar, Aptos.*

Shasta County Medical Society

President, B. F. Saylor, Redding.

Secretary, Morton J. Murphy, 1542 Market Street, Redding.

Meeting, *Second Monday.*

Siskiyou County Medical Society

President, J. B. McGuire, Mt. Shasta.

Secretary, Victor W. Hart, 113 No. Oregon Street, Yreka.

Meeting, *Sunday on call.*

Solano County Medical Society

President, Ream S. Leachman, 727 Sonoma Street, Vallejo.

Secretary, John W. Green, Box 539, Vallejo.

Meeting, *Second Tuesday, 8 p. m., Casa de Vallejo Hotel, Vallejo.*

Sonoma County Medical Society

President, D. C. Oakleaf, 301A West Street, Healdsburg.

Secretary, T. E. Albers, 600 B Street, Santa Rosa.

Meeting, *Second Thursday.*

Stanislaus County Medical Society

President, John A. Cooper, 1024 J Street, Modesto.

Secretary, Hoyt R. Gant, 403 Beaty Building, Modesto.

Meeting, *Second Friday, 7:30 p. m., Hotel Hughson.*

Tehama County Medical Society

President, O. T. Wood, Red Bluff.

Secretary, R. G. Frey, Red Bluff.

Meeting, *At Call of President.*

Tulare County Medical Society

President, Newton Miller, 231 No. Main Street, Porterville.

Secretary, Ray Cronemiller, Exeter.

Meeting, *Sunday Evening once a month.*

Ventura County Medical Society

President, W. F. Mosher, 34 No. Ash Street, Ventura.

Secretary, A. A. Morrison, 625 Main Street, Santa Paula.

Meeting, *Second Tuesday, Ventura County Country Club.*

Yolo-Colusa-Glenn County Medical Society

President, H. G. Potter, Winters.

Secretary, W. J. Blevins, Jr., Woodland.

Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society

President, P. E. Thunen, I. O. O. F. Building, Marysville.

Secretary, Leon M. Swift, I. O. O. F. Building, Marysville.

Meeting, *First Tuesday.*

PAN-PACIFIC SURGICAL CONGRESS

HONOLULU, HAWAII . . . SEPTEMBER 15 TO 28, 1939

A Scientific Program by International Authorities

Presiding, Dr. J. Hardie Neil, Auckland, New Zealand; **Dr. Frederick Reichert,** Chairman of Council, San Francisco; **Dr. Edgar Gilcreest,** Vice-President, San Francisco.

General Surgery, Surgical Pathology and Research; Traumatic, Orthopedic and Plastic Surgery; Obstetrics, Gynecology, Urology; Ophthalmology, Otolaryngology, Bronchoscopy; Roentgenology, Radiology; Neurosurgery, Thoracic Surgery, Anesthesia; Hospitals and Public Health; Round Table Discussions and Public Meetings; Surgical and Obstetrical Motion Pictures.

AN UNFORGETTABLE VACATION . . .

SAIL: Los Angeles, September 7 (San Francisco, September 8), S. S. Matsonia Luxury Liner.

MATCHLESS DAYS AT SEA: Conferences, Round Tables, Deck Sports, Swimming, Dancing and **REST.**

HONOLULU: Accommodations to suit the individual taste—special rates—air trips, motor trips, swimming, surf riding, fishing, golf—the matchless entertainment for which Honolulu is famous.

SCIENTIFIC SESSIONS: An incomparably impressive program by international figures representing the United States, Canada, The Islands, Australasia, The Orient.

RETURN: Arriving either San Francisco or Los Angeles. Three sailings to accommodate any length of stay.

Physicians in good standing in their local County Medical Societies are cordially invited

•

For folder with further information, program, rates, etc., write the Secretary-Treasurer, Dr. Forrest Pinkerton, Young Building, Honolulu, T. H. Reservations should be made at once to avoid disappointment.

•

Folder and General Information from Offices of **THE MATSON LINE,** Seattle, Portland, San Francisco, San Diego, Los Angeles, Chicago

DAILY ENJOY WHOLESOME

CHEWING GUM

It's good for you

Chewing gum helps the mouth feel moist and refreshed. Enjoy it every day and encourage your patients to. Chewing gum helps keep your teeth clean and bright. And, it aids in supplying beneficial chewing exercise. Four Factors toward Good Teeth are (1) Proper Food (2) *Clean Teeth* (3) Dentist's Care and (4) *Plenty of Chewing Exercise* . . . There is a reason, time and place for gum.

Vitamin C Foods.—Forced feeding of excess quantities of vitamin C foods in the treatment of rheumatic fever should be avoided, research experts of the United States Public Health Service declared, because of the possibility of neglecting the complete nutrition of the patient.

While lack of vitamin C in children's diets is an important cause of scurvy, they said, it is not an essential factor in the development of rheumatic fever, most common incitant of heart disease in children.

Dr. M. P. Schultz, Surgeon, United States Public Health Service, and others, described their study of the development of the fever in a summary, "Catalytic Potency of the Blood in Rheumatic Fever," in *Public Health Reports* for March 3, 1939.

"When the idea is held," they said, "that the administration of very large quantities of orange and lemon juice constitutes a single 'specific' treatment of the disease, such treatment may be carried to extremes, and the complete nutrition of the patient suffers because he comes to exist almost exclusively on such a diet."

The cause of rheumatic fever is unknown. Animal experiments have suggested that the occurrence of scurvy in children, due to an insufficient amount of vitamin C in their food, may be an essential factor in development of the disease. The fact that it occurs chiefly in growing children needing relatively large supplies of this vitamin, that it is more common in late winter and early spring when fresh fruits and vegetables are most expensive, that it is most uncommon in the tropics where these foodstuffs may be more easily had, and that in temperate climates it is essentially a poor man's malady since he may not be able to afford a varied diet—all these have lent plausibility to the suggestion.

Those who have investigated the amounts of vitamin C in patients with rheumatic fever, however, do not agree concerning the importance of scurvy as a cause of the fever.

The ability of the blood to resolve hydrogen peroxid into its component parts, oxygen and water (due to the presence of the enzyme catalase), is known to vary under certain conditions. In scurvy, for example, it is low. The present research would indicate, however, that there is no difference between the catalytic power of the blood in patients with rheumatic fever and those suffering from other febrile ("fever") diseases.

This affords further evidence, said Doctor Schultz, that a deficiency in vitamin C is not essential to the development of rheumatic fever, and this conception is of practical importance in planning the treatment of such patients. It indicates that, while it is true that adequate amounts of the vitamin should be supplied, the forced feeding of excess quantities should be avoided.

In this connection, according to Doctor Schultz, the literature indicates that rheumatic fever very rarely occurs in diabetics ("Glucose Tolerance in Rheumatic Fever," *Public Health Reports*, February 24, 1939). This has suggested that abnormalities in the utilization of sugar might account for development of the fever in afflicted individuals. One test of the patient's ability to use sugar is the determination of its concentration in the blood after a large amount is taken by mouth.

"In diabetics under the conditions of these tests," said the Report, "much sugar appears in the blood; in other rarer endocrine disturbances the reverse is true. Patients with rheumatic fever, however, when tested, did not differ in their behavior from those suffering with other febrile diseases; and the experiments afford no proof of association between the patient's ability to utilize sugar and the development of rheumatic fever."

COÖPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY — FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

THE NEW YORK POLYCLINIC
MEDICAL SCHOOL AND HOSPITAL
(Organized 1881)
(The Pioneer Post-Graduate Medical Institution in America)

PHYSICAL THERAPY
Lectures and demonstrations in diathermy, short wave diathermy and electrosurgery; galvanic and low frequency currents, electrodiagnosis; heliotherapy and artificial light therapy; hydrotherapy, massage, and exercise; fever therapy. Active clinical work in the treatment of medical and surgical conditions.

FOR THE
GENERAL PRACTITIONER
Intensive full-time instruction in those subjects which are of particular interest to the physician in general practice. The course covers all branches of Medicine and Surgery.

FOR INFORMATION ADDRESS
MEDICAL EXECUTIVE OFFICER
345 West 50th Street, New York City

Treatment of Poison Oak.—Poison oak is a cause of many disabilities among workmen, and may be regarded as an important factor in the industrial hygiene program. Dr. J. P. Russell, Chief of the Industrial Hygiene Service of the California State Department of Public Health, has provided the following information relative to the prevention and treatment of poison oak:

Wherever practicable, gloves and masks should be worn to protect the exposed skin from contact with the plant.

Personal hygienic measures, particularly washing thoroughly with soap and hot water immediately after contact or exposure, is usually effective in preventing a resulting dermatitis.

Most authorities recommend, as a prophylactic measure, the local application to the skin of a mild oxidizing agent, such as a 5 per cent ferric chlorid solution, or a 2 per cent aqueous solution of potassium permanganate, immediately after exposure. These preparations, while often effective in preventing the development of the dermatitis, have the disadvantage of producing a marked but transient discoloration of the skin.

An alternative preventive measure, which is also based on the oxidization of the toxic element in the plant, and which has been successful in many cases, is the application to the skin of a dusting powder, composed of 10 per cent benzoyl peroxid in talcum powder, prior to or immediately after exposure to the plant. This method is recommended by Doctor Leake as being preferable to the ferric chlorid or potassium permanganate, in that it does not discolor the skin: however, in using this preparation, precaution must be taken to avoid any open flame, as the powder is inflammable.

The local application to the skin of equal parts of glycerin and water, following exposure, has also been recommended.

A bulletin has been issued by the United States Public Health Service, describing the etiological symptoms, prevention, and treatment of poison oak dermatitis.

Most Poor City Workers on Deficient Food Diets.—When food budgets are very low, city workers buy little more than hunger-staying diets which, for the most part, are deficient in needed minerals and vitamins, as shown by an analysis of four thousand diets of employed wage-earners and low-salaried clerical workers in forty-three industrial center cities in eight different parts of the country.

The analysis was made by Dr. Hazel K. Stiebeling and Esther F. Phipard of the Federal Bureau of Home Economics as a Works Progress Administration project, using food records collected by the United States Bureau of Labor Statistics from 1934 to 1937.

When families could afford only $1.25 to $1.87 a person per week for food, which was the case for more than one-third of the Southern negro families and from one-fourth to one-tenth of white families in all regions, they bought mostly food that "sticks to the ribs." When the food budget rose to $3.75 to $4.37 a person a week, they purchased nearly twice as much milk, and from two to three times as much butter, eggs, green and yellow vegetables, meat and poultry, or fish.

There was, however, considerable variation in amounts of these foods consumed by families in the different regions. Pacific Coast families ate more fresh vegetables and consumed about twice as much as families in the East North Central cities, where canned foods, especially corn and tomatoes, were popular. The Pacific Coast families, for instance, ate twenty-five pounds of lettuce a person a year and twenty-three pounds of carrots. They also ate more citrus fruit—twice as much as white families in North Atlantic cities and nearly three times as much as white families in East South Central cities.

Potatoes are one of the most popular single foods, the study showed. Whatever the amount spent for food, quantities of potatoes were consumed. Nor were they only a low-income food, for with rising food expenditures even more was spent for potatoes. North Atlantic families were the heaviest potato eaters—133 pounds a person a year at the lowest food expenditure level studied and 162 pounds at the highest. Southern white families bought about one-third as many sweet potatoes as white potatoes, and Southern negro families ate about equal quantities of each.

As was expected, bread varied less in quantity with changes in income. There were, however, marked differences in bread tastes in different regions of the country. Much more rye bread was eaten in the North Atlantic cities. They also ate more macaroni, a flour product. Pacific Coast families ate more dark breads—one-fifth of the bread purchases being either whole wheat or rye.

Southern families, particularly negroes, showed a decided preference for home-baked breads, buying from two to three times as much flour and cornmeal as families in other regions.

Families in North Atlantic cities ate 87 pounds of meat, poultry and fish a person a year at the lowest food spending level studied, and 246 pounds at the highest. Families in all regions ate more beef and veal than pork or lamb.

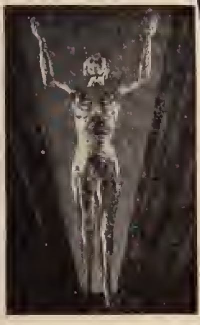
In every region, families spending little for food used only a small quantity of milk. In the South, where average food expenditures are lower than in the North and West, milk consumption also was lower. Southern white families used only 98 quarts a person a year compared with averages from 109 to 126 quarts in other regions. Southern white families, however, bought as much milk as other white families, when their food expenditures were the same.

Complete details of the study are included in Circular No. 507, of the United States Department of Agriculture. It may be had from the Superintendent of Documents. Washington, D. C., at 15 cents a copy.

Never attempt to bear more than one kind of trouble at once. Some people bear three kinds—all they have had, all they have now, and all they expect to have.—Edward E. Hale.

CAMP NATIONAL
POSTURE
WEEK
MAY 1ST–6TH
SPONSORED BY THE WORLD'S LARGEST
MANUFACTURER OF SCIENTIFIC SUPPORTS

To impress upon women the importance of good posture as an aid to health and beauty—to direct women to their physicians for consultation and check-up on the ills that stem from poor posture — S. H. Camp & Company is promoting the week of May 1st-6th as Camp National Posture Week. We invite all individuals, associations, publications and other groups interested in public health education, to cooperate with us in this effort. We believe that the important rôle this company has played in the past quarter century in helping women achieve good posture, makes it altogether fitting that we take the lead in promoting National Posture Week.



The Camp Transparent Woman, famous educational exhibit, seen by five million persons including about sixty thousand physicians. When visiting New York, see this remarkable exhibit at the New York Museum of Science and Industry at Rockefeller Center.

Heart and Functions Featured at Golden Gate Exposition.—How many times a year does the heart beat? How much does the heart accomplish in one minute, a day, a year? Why may the heart be likened to an automatic double pump? Exactly how does enlargement affect the heart?

These and many other questions pertaining to the cardiac system are answered by means of simple text, powerful drawings, animations, and unique lighting effects, at the 1939 Golden Gate International Exhibit. Sponsored by Ciba Pharmaceutical Products, Inc., of Summit, New Jersey, the display, "The Heart and Its Functions," will illustrate the different types of corpuscles in the blood and will explain such interesting phenomena as arteriosclerosis and blood pressure.

Importance of Physician.—"The Heart and Its Functions" display is truly as modern as "The World of Tomorrow." It was constructed by Ciba after months of careful study in accordance with advice and instructions from members of the medical profession, with the idea of presenting the physician's viewpoint and importance to the public. The scope of the exhibit may be glimpsed by the subjects covered. These include the blood, the blood plasma, the volume of blood, blood transfusion, the circulatory system, the heart as an automatic double pump, adjustment of the heart, the steadfast heart, the pulse, arteriosclerosis, cause of blood flow, blood pressure, x-ray of heart enlargement, the doctor.

Ciba Pharmaceutical Products, who will also exhibit at the New York World's Fair, produce highly ethical pharmaceutical specialties, advertised solely to the medical and allied professions and intended strictly for use through the physician. Several such Ciba products are Digifoline, Coramine, Resyl, Perandren, and Nupercainal. Ciba expects hundreds of thousands of physicians and their patients, pharmacists, and members of other groups allied to the medical profession to attend the heart display at the San Francisco Fair.

Life Expectancy.—Babies born in 1938 have a 62-year lease on life.

The total "life expectancy at birth" for the United States last year, according to computations based on certain estimated factors and released by the United States Public Health Service, was sixty-two years. This figure compares with an expectancy of 60.26 in 1931, and 60.9 as estimated for 1937.

While still somewhat below the biblical promise of "three score and ten," the life expectancy now is almost twice as great as it was one hundred years ago. For the seven years since 1931 a gain in expectancy of 1.74 years is indicated, while a gain of 1.1 years is shown in 1938 over 1937.

The expectancy of life at birth, it is explained, "is the average age at death of a hypothetical group of persons each of whom is subject to the same age specific mortality rates throughout his lifetime."

The important factors in the computation of life tables are those age specific death rates which are based upon the age distribution of the population and on the deaths by ages. Apparently, the actual average age at death of persons in the general population should be the life expectancy at birth. This is not likely to be true, however, since the age distribution of the living population will probably not be identical with that of the stationary population which is a function of the computed expectancy.

GENERAL OPERATIVE SURGERY

Will start April 6, 1939 » Students may enter at any time » Hours: Thursdays, 11 a. m. to 2 p. m.

The principal operations of general surgery will be included. The work will consist of the surgery of the stomach and gall-bladder, intestines and colon, urogenital organs, hernias, goiter, amputation of the breast, bone and tendon surgery, amputations, etc.

Every part of the course will be preceded by a thorough foundation of the anatomy. Opportunity will be given to have demonstrations of operations on the living.

The privilege will be given to perform certain minor operations and have demonstrations in the various clinics. The dissections and the technic of the operations will be done by the students themselves.

Fee—$15 per month

Applicants must be graduates of schools approved by the State Board of Medical Examiners

TWENTY-FIVE YEARS AGO

(Continued from Text Page 320)

wait until this plan is perfected in its details and the matter can be passed upon by the State Society at the April meeting. We must recognize the fact that the law is here and that, in some form, it is here to stay. It is very much better for us to work in harmony with the Insurance Commission and with the companies and get things into as good shape as possible than to fight them or be nasty and say that we won't play because certain things ought not to be so; it is not a question of what ought or ought not to be, but of what actually is, that we have to consider. . . .

✓ ✓ ✓

Precipitate Publication.—Great patience, circumspection, testing and retesting of results on a sufficiently numerous series so as to eliminate as much as possible the element of chance, coincidence or other sources of fallacy, denote the trustworthy investigator. A beautiful example of the honest skepticism and rigid self-criticism which the real scientist imposes upon himself when drawing conclusions from complex phenomena is preserved for all time in Darwin's "Origin of Species." In Koch's celebrated rules there is contained an admonition which no inquirer into the etiology of disease should presume to ignore. Wassermann and Noguchi have exhibited exemplary patience, to say nothing of other qualities, before publicly professing anything like certitude as to the value of their researches. And, lest the urgency of our need for therapeutic progress be advanced in extenuation of premature publication of alleged discoveries in this branch of science, the now famous number "606" gives us an arithmetical measure of the labor Ehrlich performed before submitting to the world his remedy for disease. . . .

Economic Waste on a Large Scale.—Some time ago the Journal commented on the great economic waste involved in the maintenance of two medical departments connected with two universities in California. There is no demand for two schools of this class and there can be no justification for their existence, based on anything but personal motives. The amount of money expended in the duplication of effort, totally unnecessarily, is already very great and will be an increasing amount reaching into the millions, as time goes on. . . .

✓ ✓ ✓

Closing the Hospital.—Some years ago the Journal commented on the fact that improved medical training and the betterment of medical work as a result of county medical society organizations were having a marked effect in the increase of the small hospital. All over the state, small hospitals were formed in communities that had previously been without any place where a very sick person could be properly treated or operated upon. The local men were studying up their surgery and taking postgraduate work and becoming competent to handle all the average surgical work that came along instead of sending the patient on a long, tiresome and often dangerous journey to a center where there was a hospital and a surgeon to operate. Last year we sent letters to a number of these hospitals that had formerly advertised in the Register and Directory, and several letters like the following were received in reply:

"We have decided to discontinue our hospital owing to the eight-hour law for nurses and, therefore, will not take the usual advertisement in the Register and Directory."

As a result of this law, which does not seem to do anyone the slightest good, and which an overwhelming majority of the student nurses themselves did not want, a number

When Steers Had Long Horns

THE medicinal value of the glands of internal secretion was not recognized.

But times have changed, as well as cattle. Now, the therapeutic value of certain gland products is definitely established and each year adds to our knowledge in this important field of therapeutics.

To the physician prescribing gland products we urge specification of "Wilson," because it connotes a product made at the source of supply from fresh glands, processed promptly, with the aim of conserving maximum hormone activity, in a laboratory devoted exclusively to the endocrine field.

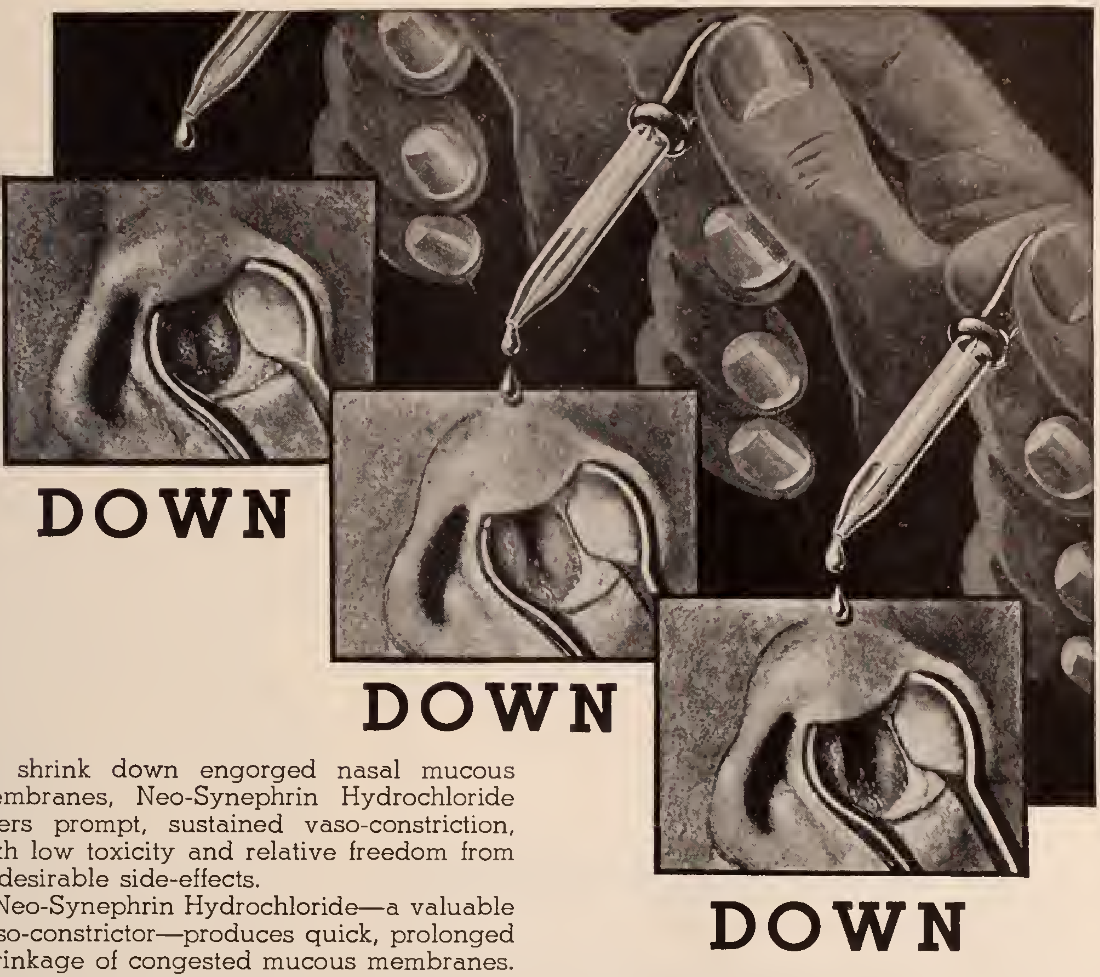
of small hospitals have closed their doors, citizens of the local community are thus deprived of the hospital advantages which they had had, a large number of women are deprived of their occupation and of the chance to be educated so as to go out into the world and earn their living in a truly womanly calling; and what good has resulted to anyone? If someone who knows will only rise up and point out to us the slightest good that has resulted, we will be profoundly thankful. We seem to have gone mad on the subject of making laws for anybody and everybody, whether they want them or not!

From an Original Article on "The Psychological Study of Mentally Defective and Otherwise Exceptional Children," by Ernest Bryant Hoag, M.D., Los Angeles.—In ancient times the feeble-minded, like the insane, were objects of derision, cruelty and persecution, and were often summarily disposed of.

At a later period, especially during the Middle Ages, these unfortunates were treated with less severity and became in many instances the "fools and jesters of the royal courts." By some, these idiots and imbeciles were regarded with superstitious respect, and it is said that the great astronomer, Tycho Brahe, listened with reverence to the meaningless chatter of a fool who had become a constant companion in his observatory.

In this incident we are reminded of the fact that the German psychologist, Freud, who is just now occupying the center of the psychological stage, would have us believe that the ravings of the maniac are all of significance if we could but read aright the workings of his disordered

(Continued on Page 18)



To shrink down engorged nasal mucous membranes, Neo-Synephrin Hydrochloride offers prompt, sustained vaso-constriction, with low toxicity and relative freedom from undesirable side-effects.

Neo-Synephrin Hydrochloride—a valuable vaso-constrictor—produces quick, prolonged shrinkage of congested mucous membranes. Low toxicity, absence of sting and more sustained action than either epinephrine or ephedrine, in therapeutic dosage, make Neo-Synephrin Hydrochloride one of the most useful agents available to the physician.

NEO-SYNEPHRIN

HYDROCHLORIDE

(laevo-alpha-hydroxy-beta-methyl-amino-3-hydroxy ethylbenzene hydrochloride)

for intranasal use is marketed in three convenient dosage forms:

Is Purer Nitrous Oxide Desirable?

Many of the leading hospitals in California, Washington, Oregon and Arizona answer "yes"—and use Stuart Hi-Pure, the nitrous oxide of 99% plus purity.

These hospitals believe that a nitrous oxide of maximum practical purity is a definite aid to more even anesthesia.

March 16, 1933, the *first* cylinder of Hi-Pure was delivered to a San Francisco hospital. So far as we know, it was then, as it is *now*, the only nitrous oxide of 99% plus purity manufactured in the United States. For complete clinical data, address us at 211 Bay Street, San Francisco.

TWENTY-FIVE YEARS AGO

(Continued from Page 16)

subconscious mind, and we cannot but wonder whether Tycho Brahe and Freud are not entitled to about the same amount of respect in this particular connection. . . .

Various classifications of the mentally deficient have long been in use, but these have never given much evidence concerning intellectual potentiality, and have therefore been of relatively little value in establishing a prognosis. Since 1905, however, when Binet and Simon, two French psychologists, published their first intelligence scale, means have been at hand for the successful classification of mental capacity, and there is at present, therefore, no longer any excuse for failure to do so. The physician who is today ignorant of these relatively simple psychological tests is in much the same position as one who is unacquainted with the Wassermann reaction or of anti-typhoid vaccination. . . .

Then came Binet with his simple device of arranging the tests in series or groups according to their difficulty as determined by age differences in performance. His data were of very limited extent and rather carelessly elaborated, but the advantages of this procedure are every day becoming more apparent and are rapidly making possible a clinical child study. . . .

From an Original Article on "The Therapy of Typhoid Fever—A Critical Review," by E. O. Jellinek, M. D., San Francisco.—In spite of the advance in the treatment of morbid conditions, brought about by the steadily growing knowledge in bacteriology, sero- and chemotherapy, we find ourselves still confronted with the painful fact that for the vast majority of diseases we have no specific treatment. Even the most optimistic disciple of science, when he reflects upon the problem to be solved, will realize that the whole question of the specific serum, vaccine, or chemotherapy of the various infections, is still in its infancy, and that it may take the efforts of generations to win supremacy over the world of microörganisms with their unlimited power of proliferation. . . .

From an Original Article on "X-ray Dosage," by Howard E. Ruggles, M. D., San Francisco.—A simple, accurate method of measuring dosage of x-rays is needed, not alone in treatments (which should be given only by experts), but equally as much in radiography and fluoroscopy, so that the safe limits of exposure may be determined.

The methods in general use are clumsy and more or less inaccurate, especially those which depend on color changes in tablets which are compared with standard tints. Different operators vary considerably in their estimation of the end points and, furthermore, it is not always convenient or possible to include one of these meters in every exposure of any length.

A much simpler way of getting at it depends upon the fact, especially emphasized by Sewall Cabot of Boston, that the quality and quantity of radiant energy given off by a

(Continued on Page 20)

WHY

THE EMULSION... Petrolagar FOR CONSTIPATION

Petrolagar is more palatable. Easier to take by patients with aversion to plain oil—may be thinned by dilution.

2. Miscible in aqueous solutions. Mixes with gastro-intestinal contents to form a homogeneous mass.

3. Does not coat intestinal mucosa. Petrolagar is an aqueous suspension of mineral oil — oil in water emulsion.

4. No accumulation of oil in folds of mucosa.

5. Will not coat the feces with oily film.

6. Does not interfere with secretion or absorption.

7. Augments intestinal contents by supplying an unabsorbable fluid.

8. More even distribution and dissemination of oil with gastro-intestinal contents.

9. Assures a more normal fecal consistency.

10. Less likely to leak.

11. Provides comfortable bowel action.

12. Makes possible five types of Petrolagar to select from to meet the special needs of Bowel Management.

Petrolagar — Liquid petrolatum 65 cc. emulsified with 0.4 Gm. agar in a menstruum to make 100 cc.

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

TWENTY-FIVE YEARS AGO

(Continued from Page 18)

tube depends absolutely upon the quality and quantity of electrical energy supplied to it. . . .

From an Original Article on "Vital Statistics," by E. Goodman, M.D., San Francisco.—In these times of intensive research and rapid-fire discoveries, it appears like foolhardiness or presumption for one of the rank and file to comment on the ways and deeds of the powers that be; yet the greatest discoveries and thoughts sprang into being overnight, out of obscurity, to upset prevailing thoughts and conditions. . . .

My subject is Vital Statistics, and the object of my criticism the Government. Statistics, at best, is no sound criterion, for the reason that it does not take into consideration conditions and is just about as scientific as taking the specific gravity without regard to temperature and pressure, or prescribing digitalis without regard to the condition of the heart and collateral circulation. . . .

From an Original Article on "The Medical Situation of the New Workmen's Compensation Act," by J. Rollin French, M.D., Los Angeles.—The new Workmen's Compensation law, which went into effect January 1, 1914, is a broad measure, relating to compensation insurance and industrial safety. It establishes an industrial accident commission, to be composed of three members, to administer its compensation features, to maintain a mutual insurance fund for the state, and regulate provisions relative to safety.

All classes of employment come under this act, excepting farm labor and domestic service, which are at present protected by common-law liability, but may elect to come under the Boynton Act. . . .

From an Original Article on "Some Principles Governing the Indications for Cesarean Section," by Alfred Baker Spalding, M.D., San Francisco.—Good results can be obtained in abnormal obstetrics if sufficient attention is given to the patient during pregnancy, and if the patient is confined by a competent physician in a hospital devoted exclusively to obstetrics. Well-conducted maternity hospitals are able to maintain a maternal mortality of a fraction of one per cent, a fetal mortality of less than five per cent, and a general morbidity rate of under fifteen per cent. This is an important point to consider in discussing the indications for such a valuable operative procedure as is cesarean section because the relative values of all obstetrical operations are based upon experience obtained in such perfected institutions. . . .

In reviewing my records in preparation for this paper, I find that I have operated myself or have assisted others with this operation in twenty-five instances. In every case there existed a grave danger for the mother or child which was met successfully, so far as all the mothers were concerned, by the cesarean operation, and yet in some instances I am convinced delivery could have been accomplished by other procedures. . . .

There is no doubt that the sphere of indications for cesarean section is growing and there is considerable danger that the pendulum will swing too far toward the operative side. It should not be forgotten that even in good hands the operation carries with it a maternal mortality in the neighborhood of five per cent, or ten times the maternal mortality obtained in confinements generally.

From an Original Article on "Hygienic Shoeing—Anatomical Facts versus Convention and Style," by C. C. Crane, M.D., San Francisco.—The evidence to be submitted consists, in the main, of four facts:

(Continued on Page 22)

THE MOST IMPORTANT YEAR!

From the very beginning of "The Most Important Year," the infant requires a carefully balanced diet for the healthy development of bone and tissue structure.

Infants do well on S.M.A. because it is nutritionally correct. Not only is it essentially similar to human milk in percentages of protein, fat, carbohydrate and ash, but equally important from a nutritional standpoint, it is also similar in other biological factors, especially in chemical constants of the fat and in physical properties.*

The vitamin content of S.M.A. remains constant throughout the year. With the exception of orange juice no additional vitamin supplement need be given.

Use the coupon at the bottom of this page to send for S.M.A. A brief trial will show convincing proof of the efficacy of S.M.A. for infant feeding.

**S.M.A. is a food for infants — derived from tuberculin tested cows' milk, the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil; with the addition of milk sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, it is essentially similar to human milk in percentages of protein, fat, carbohydrate and ash, in chemical constants of the fat and in physical properties.*

TWENTY-FIVE YEARS AGO

(Continued from Page 20)

1. In the examination of the feet of one thousand adult Puerto Ricans, who had never worn shoes, virtually not one presented evidence of foot illness or deformity.

2. In the examination of the feet of one thousand individuals, who have worn shoes for a considerable period of time, and in whom the feet are not troublesome—that is, are symptomless—it is rare to find a foot that is in normal condition.

3. A very large percentage of shoe-wearing people present evidence of foot trouble which is promptly relieved by shoeing in accordance with anatomical facts.

4. After a canvass of practically all of the local shoe stores, the hygienic shoe is found to be conspicuously infrequent. . . .

From Society Reports: Tulare County.—The Tulare County Medical Society, at its regular monthly meeting held February 10, passed the following resolution, this being, with the exception of the last paragraph, like the one passed by the Los Angeles County Medical Society:

Whereas, The State Industrial Accident Commission, in order to carry out the provisions of the recently enacted Workmen's Compensation Law of California, which is intended to safeguard the economic efficiency and prosperity of citizens engaged in industrial occupations, an object with which the ethical medical profession is in deep sympathy, as is evidenced by the service of its members in the past, in caring for many of the unfortunate sick without cost, in hospitals, dispensaries, and in private practice; . . . now, therefore, be it

Resolved, By the Tulare County Medical Society that this society, because of the above and other reasons, respectfully requests the California State Industrial Accident Commission to pass a resolution and print on the fee table they have submitted a statement to the effect that the Commission understands fully the difficulty and inequality of an inelastic fee table for medical and surgical services, and that the minimum fees presented by the Commission are so made because of the limited resources of the State Industrial Accident Fund, and because of the comparatively small financial income of the bulk of the citizens whom the industrial law is especially intended to protect and benefit. . . .

From fifteen to twenty servings of most of the common fruits and vegetables are required to yield the same amount of calcium as is contained in one pint of milk.

WAWONA

If you were building your own country retreat you would try to find a site like Wawona . . . a green valley surrounded by pine-clad mountains . . . clear air filled with "high-country" ozone . . . tennis, trout fishing, swimming, miles of trails to ride or hike . . . and best of all, a rolling nine-hole golf course that is kept in real country club shape — one that you won't tire of no matter how many times you play it each day.

Wawona is ten minutes from the Mariposa Grove of Big Trees and less than an hour from Yosemite Valley. No need to worry about the children while you're here — they'll have the time of their lives! May we send scenic folders? — they tell why all the family will like Wawona. Stop by or write to your nearest Yosemite Park and Curry Co. office: In San Francisco, 39 Geary St. (EXbrook 3906); in Los Angeles, 612 South Olive Street (VAndike 2396).

been excluded from the courtroom. . . ." (San Diego *Union*, March 1, 1939.)

"On complaint of the State Medical Board, John Alden Standish of 345 North Alta Vista Avenue and William J. Clancy, said to be his associate, were arrested yesterday afternoon on a warrant issued by Judge John A. H. Sturgeon in justice court, charging the pair with violation of the Business and Professional Code of the State of California. The charges, according to court records, were based on certain practices of Standish and Clancy in the sale of herbs, as a cure for certain ailments. Clancy was fined $100 or fifty days each on two counts, including the practice of medicine and the use of the title 'M. D.' without licenses from the State Board. . . ." (Monrovia *News-Post*, February 24, 1939.) Investigation discloses that one by the name of Dr. William James Clancy had his Wisconsin medical license revoked on June 28, 1935.)

"Camille C. Roumage, thirty-four, was arrested here yesterday by T. P. Hunter, Special Agent of the Board of Medical Examiners, and Officer P. O. Emerine of the Sacramento Police Department, who said Roumage had violated the Business and Professions Code of California. Specifically, the charge deals with the diagnosing and treating of patients without a certificate, the officers said. . . ." (Sacramento *Union*, February 26, 1939.)

"Two Salinas Chinese herbalists were at liberty today on $500 cash bail each after being arrested on charges of practicing medicine without licenses. The arrests were made late last night by Special Agent Joseph W. Williams of the State Board of Medical Examiners. According to the officer, Frederick Lee, thirty-three, and Henry Wong, forty-one, treated local residents for venereal diseases and ailments of the stomach, kidneys, and lungs. He confiscated a quantity of medicines he said the Chinese, operators of two establishments here, used in the treatment of their clients. . . ." (Press dispatch dated Salinas, February 25, and printed in the San Jose *Mercury-Herald*, February 26, 1939.)

"Dr. Lewis Robertson, Santa Cruz chiropractor, was last night held in the city jail in lieu of $500 bond on a charge of practicing medicine without a license. Robertson was arrested by Joseph Williams, special agent for the State Board of Medical Examiners, after he had allegedly given the investigator treatments outside the bounds of chiropractic practice. A similar charge, brought against Doctor Robertson last April, has not yet come to trial, Williams said, and it is possible the man will be faced with both charges when he is arraigned on Thursday." (Santa Cruz *Sentinel*, February 22, 1939.)

"Eugene Aureguy, private investigator who was a principal figure in the sensational Constance May Gavin-Flood case at Redwood City, was called before the San Francisco County Grand Jury yesterday to testify in the abortion death of Mrs. Betty Barsotti, twenty-four, at San Francisco on Monday. Aureguy said he has been retained by Dr. Reginald Grant, who treated Mrs. Barsotti at a hospital as soon as the physician saw Mrs. Barsotti's condition." (Burlingame *Advance-Star*, February 9, 1939.)

BOARD OF MEDICAL EXAMINERS

(Continued from Page 24)

"Brooklyn (New York) contractors have long been enmeshed in the tentacles of a wide-flung bribery ring operating in the Department of Housing and Building . . . Assistant General John Harlan Amen's staff revealed today. Coming on the heels of yesterday's sensational arrest of former Assistant Attorney-General Sol Ullman, who is under indictment for the alleged extortion of $13,000 in bribes from operators of a ring of Brooklyn medical malpractitioners, it was said 'some of the officials about to be indicted as "fixers," are involved in both extortion rings.' Among those are a former state assemblyman and an assistant district attorney, both of whom are alleged to have taken bribes in more than 2,000 cases of illegal operations on women. . . . Prior to his appointment by Governor Herbert H. Lehman to supersede District Attorney William F. X. Geoghan in an investigation of 'corruption and laxity of law enforcement' in Brooklyn, Amen was an Assistant United States Attorney-General in charge of the Brooklyn headquarters of the Government's Anti-Trust Division." (Press dispatch dated New York, March 11, and printed in the San Francisco *Examiner,* March 12, 1939.)

"Refugee German doctors whose licenses were canceled by decree of Adolf Hitler last year are eligible to take California State examinations provided the internship was begun before the decree was effective. . . . The ruling declared the decree of September 30 will not prevent German Jewish physicians and surgeons who started their internship prior to the issuance of the decree from being admitted to the state examinations, although state law requires graduates of foreign medical schools to hold licenses to practice in the country where the school is located to be eligible to take the state examinations. 'In view of the fact that the deprivation of the foreign license is based only on a political decree,' the ruling said, 'and was not due to any disqualification arising from any illegality or inefficiency in practice, or any mental, moral or physical deficiency . . . the Board of Medical Examiners should admit such applicants to the examinations on completion of internship.'" (San Francisco *Examiner,* March 11, 1939.)

"In its fourth month of operation, San Francisco's municipal employees' health service amassed a deficit so large that the one thousand doctors who rendered service to its members during January may expect to collect no more than 50 cents on the dollar for those services. Notice that the service has insufficient money to meet its January medical costs was served on the member doctors yesterday. . . . Although no direct comment came from doctors whose fees will be curtailed, it was generally believed that the failure of the health system to meet its obligations will be thoroughly discussed by directors of the County Medical Society in their meeting on Monday. . . . Announcement that January fees cannot be paid in full came as no surprise. Weeks ago, warning was served that December bills for medical service amounted to twice the sum available for their payment. . . . Since the plan went into effect in October, those assessments have yielded approximately $30,000 a month. Doctors who have agreed to take their fees from whatever is left after the medical director, hospitals, and laboratories are paid, received total payments as follows in the first three months: October, $13,433; November, $17,603; December, $19,829. . . ." (San Francisco *Examiner,* March 8, 1939.)

"An indictment, charging an attempt to cheat the United States Treasury out of $7,500 in income taxes by improper

Cosmetics and Your Patient's Morale

THE DOCTOR IS OF NECESSITY A STUDENT OF LIFE Each new patient presents a new study, a new problem. Psychology plays an important role in the course of treatment he prescribes With some patients he must be frank to a point of harshness, with others he must be gentle and coaxing The nature of the illness and, more particularly, the nature of the patient determine his attitude He knows from experience the value of bolstering his patient's morale As a student of psychology he knows that few things are more depressing to a woman than the fear that she is losing her charm, that when she no longer cares how she looks the chances are she has lost touch with a vital interest in life. And because he appreciates the importance of a sensible interest in personal appearance he quite rightly encourages his patients to look their best at all times. FINE COSMETICS appeal to that interest That is why they deserve to be recommended by doctors who are, after all, greatly concerned with their patient's morale.

LUZIER'S, INC., MAKERS OF FINE COSMETICS & PERFUMES

KANSAS CITY, MO.

returns, was returned yesterday by the new Federal Grand Jury against Dr. Jackson L. Martin, 'suspended' medical man of Fresno. The taxes covered a four-year period from 1932 to 1936, according to Government figures. 'Doctor' Martin's license was revoked by the State Medical Board in 1928, following the exposé of an alleged abortion. Later he was arrested in Fresno by State Board operatives for practicing without a license. This case is still pending in the Fresno courts. Government figures show that Martin paid Clifford C. Anglim, Collector of Internal Revenue, $13,784 in March of this year. In Fresno, Martin expressed surprise at the indictment, saying he had settled for all disputed amounts and that he never had endeavored to 'cheat' the Government." (San Francisco *Chronicle*, March 8, 1939.) (Previous entries, December, 1928, and February, 1939.)

"Retrial of Dr. David C. Long, chiropractor, on charges of violating the Medical Practice Act because he was the attending physician at a birth, was begun before Municipal Judge Charles P. Johnson as selection of a jury got under way. The defendant, who was said by Defense Attorney Max Gilmore to have successfully served in more than one thousand obstetrical cases, is specifically charged with attending Mrs. Wilton Whitehouse of 1224 Slauson Avenue. Prosecutor Everett Leighton, Deputy City Attorney, contends that obstetrical cases necessarily involve the use of instruments, which is denied chiropractors under state law. At a former trial held before Judge Leo Aggeler, the jury was dismissed after it reported it was deadlocked, with a reported 10 to 2 vote for acquittal." (Los Angeles *Herald-Express*, March 7, 1939.)

"In Superior Court yesterday, a young doctor, his brilliant mind shackled by a craving for narcotics, pleaded for a chance to rehabilitate himself and salvage his career. Dr. William J. Reed, standing before Judge Steiger, after admitting his guilt as a violator of the State Narcotics Act, made the impassioned appeal. . . . Joseph O'Farrell, State Narcotics Agent, confirmed the doctor's statement of his operations. And records supported the prisoner's medical claims. 'I am going to send you to the Spadra State Hospital for addicts,' Steiger said. 'Go there as a patient, not as a criminal. Let them help you.' . . ." (San Francisco *Chronicle*, March 7, 1939.) Investigation reports indicate that Reed had mailed packages of narcotics from Iowa to California and that he assertedly was taking six grains daily.

Investigation reports relate that Dick Smith, after being arrested on a charge of violation of the Business and Professions Code on February 10, 1939, pleaded guilty before Justice of the Peace Albert L. Mayer at Firebaugh and was sentenced to pay a fine of $150, with an alternative of seventy-five days in the county jail, and given a six months' floater out of Fresno County.

Fresh Blood Should Be Used for Hemorrhage Due to Jaundice.—Only freshly drawn blood should be used for transfusions to combat the tendency to hemorrhage in jaundice, Jonathan E. Rhoads, M.D., and Lillian M. Panzer, Philadelphia, state in *The Journal of the American Medical Association* for January 28.

In their comparative study of "bank blood" and fresh blood they found that the prothrombin content (antihemorrhagic factor) of "bank blood" was greatly reduced. Blood that has been in the "bank" a week or more is practically useless in the treatment of the hemorrhagic tendency in jaundiced patients unless, of course, they are also treated adequately with vitamin K and bile salts.

Actions Under New Drug and Cosmetic Law Provisions Increasing.—With the effective date of all the provisions of the Federal Food, Drug and Cosmetic Act now four months off, legal actions against dangerous drugs, cosmetics and devices have been mounting steadily, the Food and Drug Administration reports. Such dangerous items, by the terms of the new law, were subject to action immediately following the signing of the law on June 25, 1938. The other provisions will take effect on June 25, this year.

During January, two hair dyes were seized. They contained the highly irritating dye, paraphenylendiamin, and failed to carry in their labeling the cautionary statement prescribed by the law against use on the eyelashes and eyebrows and for making a preliminary skin test before use as a hair dye. The seizures involved thirty-eight packages of Madame Marva Hair Coloring, and seventy-six of Eau Sublime Instantaneous Hair Coloring.

Drug products seized because alleged to be dangerous under the conditions of use prescribed in their labeling were 10 bottles of Barmidon Tablets, containing aminopyrin; 23 bottles of Renton's Hydrocin Tablets, containing cinchophen; 92 bottles of Bad-Ex Salts, containing Tartar Emetic; and 1,107 ampuls of glucose solution, represented as sterile, but found to contain living bacteria and precipitated material.

Seizures of alleged dangerous devices involved five brands of nasal irrigation outfits, in these quantities: 119 of Nazoscope, 411 of Pen-E-Scope, 128 of Penetrex, 266 of Peranol, and 446 of Syn-O-Scope; and 3,078 nipple shields made of lead, a poisonous metal. . . .

Drug and medicinal items seized last month included 40 bottles of aspirin tablets, 129 bottles of cod-liver oil, and 52 tubes of corpus luteum tablets, all charged as below the claimed standards; 137 ampuls of phenobarbital sodium, 168 packages of cotton swab applicators, 2,605 packages of gauze bandages, 321 packages of absorbent cotton, and 587 sutures, all unsterile; 820 gross of defective mechanical prophylactics; 248 bottles of a "syrup of tar with extract of cod liver and menthol," found low in the vitamins of cod-liver oil.

These five patent medicines were seized on the charge that they bore false and fraudulent therapeutic claims in their labeling: 56 bottles of Dr. Eells' Vitalizing Blood Purifier, 74 bottles of Enrich, 45 bottles of McMillan's Nomoppin, 33 jars of Oxylin Greaseless Ointment, and 26 packages of Wyant's Eye-Bright.

Diet Relieves Obesity with Sugar in Urine.—A condition in which obesity is the principal abnormality and hyperglycemia excess of sugar in the blood) is secondary, is given a new interpretation by L. H. Newburgh, M.D., and Jerome W. Conn, M.D., Ann Arbor, Mich.

Their study of thirty-five obese, middle-aged persons with glycosuria—sugar in the urine—is reported in *The Journal of the American Medical Association* for January 7.

The study suggests that the occurrence of hyperglycemia and glycosuria in such persons depends on the excessive accumulation of fat in the liver, with a resulting impairment in its capacity to lay down glycogen (liver sugar) at the normally rapid rate.

After the weight of these patients has been reduced to normal by simple underfeeding, they remain without sugar in the urine, do not have an excess of sugar in the blood when they are placed on maintenance diets containing 10 ounces of carbohydrate and exhibit a normal tolerance to sugar.

Recurrence of the obesity is capable of reproducing the hyperglycemia and the delayed utilization of sugar. Subsequent reduction of weight again corrects the disturbance in the metabolism of carbohydrate.

VITAMIN D REQUIREMENTS

Journal of the American Medical Association, August 20th, 1938, Vol. 111: 703

> ". . . Tentatively the vitamin D requirement of the infant fed cow's milk may be stated as between 300 and 400 units daily, these amounts having been shown to be efficient in prophylaxis of rickets, in producing ample retention of calcium and phosphorus and in permitting excellent skeletal growth and dentition. This requirement is stated in terms of vitamin D of no greater concentration than is found in average high grade cod liver oil."
>
> ". . . 300 to 400 units daily as cod liver oil or as milk containing 400 units to the quart allows sufficient vitamin D to prevent rickets of clinical significance in both full term and prematurely born infants."

The above excerpts were taken from the article entitled, "The Human Requirement of Vitamin D," by Doctors P. C. Jeans and Genevieve Stearns of Iowa City.

For a very fine discussion on vitamin D requirements we recommend the reading of this entire article.

Special Morning Milk contains 500 units of vitamin D to the reconstituted quart (16 fl. oz. Special Morning Milk and 16 fl. oz. water). The vitamin D added to Special Morning Milk is obtained from the natural source—cod liver oil. However, there is no cod liver oil taste in the milk.

BECAUSE THERE IS NO COD LIVER OIL TASTE IN SPECIAL MORNING MILK, THE ADMINISTRATION OF VITAMIN D IS GREATLY SIMPLIFIED.

A successful fresh cow's milk formula for Infant feeding

Milk—1½ ounces ....
Water—1 ounce ....
HYLAC—1 measure ....
} PER POUND OF BODY WEIGHT

—and multiply these amounts of milk, water and HYLAC by the weight of the baby.

Example

Baby's Weight 10 lbs.	Baby's Weight 12 lbs.
YOUR PRESCRIPTION	YOUR PRESCRIPTION
15 ozs. Milk	18 ozs. Milk
10 ozs. Water	12 ozs. Water
10 measures HYLAC	12 measures HYLAC

(a 4-gram measure is contained in each can of HYLAC)

Result

	YOUR PRESCRIPTION	COMPARED WITH HUMAN MILK
Fat	3.0%	3.5%
Carb.	6.1%	6.5%
Prot.	2.0%	1.5%
Ash	.4%	.2%

Subscription prices, $5 ($6 for foreign countries); single copies, 50 cents.

Volumes begin with the first of January and the first of July. Subscriptions may commence at any time.

Change of Address.—Request for change of address should give both the old and the new address. No change in any address on the mailing list will be made until such change is requested by county secretaries or by the member concerned.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the Journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this Journal. New copy must be sent to the editorial office not later than the fifteenth day of the month preceding the date of publication.

Contributions—Length of Articles: Extra Costs.—Original articles should not exceed three and one-half pages in length. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—CALIFORNIA AND WESTERN MEDICINE has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested that contributors to this Journal write to its office requesting a copy of this leaflet.

CALIFORNIA MEDICAL ASSOCIATION ANNUAL SESSION: DEL MONTE MAY 1–4, 1939

Pre-Convention Bulletin and Program Supplement.—The Annual Session Program and Pre-Convention Supplement to this April issue of CALIFORNIA AND WESTERN MEDICINE presents a most interesting word picture, in part, of what may be expected when the doctors of medicine who compose the guild of licensed physicians in this State convene in Del Monte.

The scheduled sessions really begin on Sunday, and California Medical Association members who can do so should avail themselves of the opportunity to gather at the inviting Hotel Del Monte, to attend some of the informal meetings of the day preceding the regular session that begins on Monday, May 1.

In recent issues of the OFFICIAL JOURNAL considerable information concerning these forthcoming gatherings has been outlined, and the Program Supplement is now called to the attention of all Association members because of details contained therein. Even though you know that it may not be possible for you to attend, it will be worth your while to scan the pages of the Supplement, and note for yourself the nature of the scientific problems which several scores of colleagues have been studying, and concerning which they will give their tentative or other comments in the section meetings at Del Monte.

* * *

Pre-Convention Bulletin.—No less worthy of perusal are the reports, in the Pre-Convention Bulletin section, of officers and committees. These fellow members, the duly elected representatives of the State Association and its component societies, are the colleagues upon whose shoulders have fallen not only mantels of honor, but also burdens of heavy labor. For the profession they love, they have given of themselves the best service of which they are capable. Withal, they are most modest in speaking of both time and effort freely spent, their accounts being little more than epitomes of end results attained. Glance through the pages of the Pre-Convention Bulletin and observe the wide range of activities within the Association.

[†] Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

Other Reasons for Attending the Annual Session.—This year, it is especially desirable that there be a free interchange of opinion on some of the important issues challenging the medical profession. Certain proposed laws, now before the California Legislature, will, if enacted, change the whole background and character of medical practice in California. Why not, then, journey to Del Monte and exchange views with your fellows on these problems, and then acquaint your constituted representatives with your understanding of the issues involved? It will be as good, yes, better than an ordinary vacation; for, in fact, if certain proposed statutes are sanctioned by the Legislature, there may be, for some time to come, for many members of the profession fewer, if any, vacations. So, if at all possible, join with the others in this migration to one of the most delightful corners of California's garden world, and be present at Del Monte for at least one or more of the wonderful days.

"C. P. S."—CALIFORNIA PHYSICIANS' SERVICE*

Real Progress Has Been Made.—During the last several months, organized medicine in California has been making pioneer progress in a State-wide plan by means of which citizens belonging to certain lower income groups will be able in future, through periodic payments, to secure for themselves assurance of medical service and hospitalization that will speedily eliminate the justifiable fear so often associated with the matter of possible and burdensome costs which confront one in an experience with unforeseen and unpredictable illness. It is gratifying, therefore, to know that the response to the letters, inviting all doctors of medicine who are licensed to practice in California to register under this voluntary plan of California Physicians' Service, has been so generously prompt.

That, however, is not enough. It is desirable, more, it is important, that every doctor of medicine in the State should personally align himself with this movement. Wherefore, keep in mind that your colleagues, who have accepted the responsibility of serving as members of the Board of Trustees of the California Physicians' Service, have been giving hours and days of their time and best thought in the effort to set this C. P. S. in efficient operation. They are worthy of wholehearted coöperation. Fail not to send in your registration letter.

* * *

To Physicians Who Have Failed to Register. If, then, you who read these lines are among those who have not yet sent in your registration blank, may we not urge you to do so today!

If, however, you have, perchance, misplaced the letter that was mailed to you, write at once to California Physicians' Service, 602 Mills Building, 220 Montgomery Street, San Francisco, and request another blank. Then sign and remail it at once!

PROPOSED STATUTES: CALIFORNIA LEGISLATURE

Biennial Sessions Have Not Lessened Proposed Legislation.—When, some years ago, the California Legislature changed its sessions from an annual to the biennial type, one of the hopes expressed was that proposed legislation submitted in the biennial gatherings would be lesser in quantity and better in quality. In the March issue of CALIFORNIA AND WESTERN MEDICINE, however, on pages 172 and 213, attention was called to the fact that more than four thousand (4,000) laws had been submitted by the State Senators and Assemblymen now in session at Sacramento—an all-time, so it is said, high!

The many proposed statutes having relation to public health and medical practice were indicated in the comments given on pages 213–218, as taken from a preliminary draft made by the California Medical Association Committee on Legislation and Public Policy. That list should be inspected.

* * *

Extended Comment on Proposed Laws Not Possible.—To attempt to give extended comment on these many legislative endeavors, therefore, would require far more space than the OFFICIAL JOURNAL is able to allocate. It is suggested, however, that members who are interested may find additional and interesting comment in the Press Clippings columns of the News Department of each issue of CALIFORNIA AND WESTERN MEDICINE.

* * *

California Medical Association's Legislative Record in Former Years.—It is an interesting fact that, in spite of general opinion to the contrary, it has so happened—not only for this year, but for decade after decade, and from the time the first medical practice act was brought into being—that the medical profession of California, through its organized units, has presented to the State's statute makers for consideration comparatively few laws. It is also true that, although the medical profession itself proposed and led in the struggle to protect the health and lives of citizens, through laws that brought into being a medical practice act, in which decent standards of education and training for practitioners of the healing were demanded —and of a State Board of Health—with function to supervise the administration of sanitary and other statutes designed to promote the conservation of health and life—it may be stated without fear of contradiction that its legislative activities have otherwise been called into action only on occasions when onslaughts, devious or in the open, were being made against those statutory enactments which experience, in the different commonwealths of the Union, had proved to be necessary implements if the health and happiness of the states' citizens were to be properly safeguarded.

* * *

On Several Measures Now Before the Legislature.—At Sacramento, at the present time, animated discussions recurrently flare up when hearings, such as the following, are held on measures having to do with proposed legislation:

---

* For other items, see page 289.

Registration of nurses under a separate board, instead of under a bureau supervised by the State Board of Health;

Opening county hospitals to all citizens, be they indigent or not, and making provision for the admission of part and full-pay patients, as well as of indigent and near-indigent (medically indigent) groups;

On whether opticians, who grind lenses, and who practically came into vocational being under the tutelage of doctors of medicine who were specialists in diseases of the eye, should now come under the sole supervision of the State Board of Optometrists, instead of maintaining an independent relationship that will permit them to serve ophthalmologists without the introduction of optometric middlemen;

On certain proposed laws, submitted with the approval of the State Board of Medical Examiners, whereby qualifications of citizenship and proper certification of professional training would be necessary before California licensure could be granted; and last, but by no means least,

On whether the great State of California, with its six million citizens, a geographical domain of imperial range and economic, cultural and other characteristics that have set it apart as a conspicuous star in the galaxy of States of the Union, should now become the guinea pig for a compulsory health law, thrust forward, not by scientific medicine—as betokened in the representative body known as the California Medical Association—but by a strenuous group of lay propagandists who, with argument often fallacious, specious or otherwise faulty, have for the moment seemingly misled many well- and right-meaning citizens.

* * *

Legislature Will Continue in Session Through April and May.—Suffice it to say, that in the months of April and May, and until the time on which the California Legislature adjourns, members of the medical profession of California, both for themselves and for the public, will do well, each day, to scan the papers for press dispatches emanating from Sacramento, in order to be more alert and responsive to action that may be indicated.

* * *

No Need for Revolutionary Changes at This Time.—This year of years, officers and committees on legislation and public policy of component county medical societies have indeed a serious responsibility, both to their colleagues and other fellow citizens.

When, therefore, the call for united action comes, let there be no faltering. Everywhere, whether in urban or rural communities, the response must be one and the same. The issue at stake is the perpetuation of proved methods of medical advancement and service, by evolutionary methods having the support of the one group of citizens who know most about medical practice and needs—the doctors of medicine in California—whose services to the State in the past may be taken as the best indication that they will not be found wanting in the days to come. The organized medical profession of California has espoused a voluntary system of health service. That being the case, revolutionary plans of an experimental nature may well wait before being translated into legal enactments.

CALIFORNIA MEDICAL ASSOCIATION ROSTER: A NECESSARY IMPLEMENT IN MEDICAL ORGANIZATION

Rosters of Membership Are of Real Service and Value.—Membership rosters of an organization for many persons may have little reading allure; but such printed compilations are often useful adjuncts to efficient organization. And organization—militant organization—is much, very much needed by the medical profession at the present time.

Today in the press, coming from all kinds of sources, will be found communications without end, in which bias, prejudice, ignorance, and other elements may without difficulty be discerned. Why? How come?

* * *

Why Is Medicine Misunderstood?—Perhaps because members of the medical profession, as in years gone by, carrying on in altruistic manner, and giving generous service to all, without regard to class or economic status, and loyal to the code as handed down by Hippocrates, have been slow to discern radical social and economic changes rapidly going on. During many years, physicians have been giving to the world, without remuneration or request for any kind of reward, the many discoveries that, little by little, have permitted civilized man to subdue diseases which formerly scourged, and more than decimated, the human race—so that today the life span of man on earth has been increased, not by single years, but by several decades. These idealistic medical men have failed adequately to recognize the revolution that recent industrial mechanization and other influences have brought about, not only in modes of physical living, but in the mental outlook of mankind.

In other words, it may be said, perhaps, that medicine is misunderstood because physicians, carrying on in daily service, in that peculiar personal relationship of individual patient to individual doctor—so essential for the production of the best type of work in both the science and art of medicine—have neglected to note how, in almost all other lines of human activity, groups have become increasingly interdependent, the one upon another. And part of the misunderstanding may arise, likewise, because of failure by physicians to call the attention of laymen to the fact that healing-art practice is something very different from activities such as are evidenced in manufacturing or industrial plants; and that the coördination that makes for better mass output in such establishments would, in medical practice, lead only to disaster, both for the people to be served and for the profession whose members would be called upon to render the service.

* * *

Rosters Should Be Preserved for Future Reference.—A Membership Roster, therefore, is of real use, since it permits each physician to understand better the background of his local and state organization. Take the time to scan some of its pages. Also, keep the copy on your book shelf for use in the months to come. You may find such a roster a most handy aid on more occasions than one.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 285.

EDITORIAL COMMENT†

ZINC INSULIN CRYSTALS (CRYSTALLINE INSULIN)

An analysis of the comparative efficacy of unmodified, or regular insulin, protamin-zinc insulin and zinc insulin crystals, by a number of investigators interested in the treatment of diabetes mellitus, has led to the conclusion that zinc insulin crystals (in solution) has a definite place in the treatment of diabetes. Moreover, it has been shown that in certain cases therapeutic results with zinc insulin crystals have been more satisfactory than those obtained with unmodified insulin or with protamin-zinc insulin.

A recent study of the relative effects of regular insulin and the so-called long-acting insulins among a group of patients with uncomplicated diabetes, carried out at the Diabetic Clinic of the University of California Medical Center, culminated in the following results:

1. There was a definite reduction in the *average total daily dosage* among all patients who were changed from regular insulin to either of the long-acting insulins (protamin-zinc insulin or zinc insulin crystals). This reduction in dosage was greatest among those patients with severe or moderately severe diabetes, who were transferred to zinc insulin crystals. In patients with mild diabetes the reduction in dosage was not great, and was about the same for both types of long-acting insulins.

2. A reduction in the *average number of daily injections* also followed the change to long-acting insulins from regular insulin. This reduction in dosage was about the same for those patients who received either protamin-zinc insulin or zinc insulin crystals, except in those patients with moderately severe diabetes. In this latter group the reduction in the number of injections per day was greater, after changing from regular insulin to zinc insulin crystals, than was possible to accomplish by the use of protamin-zinc insulin.

3. *Better control of diabetes* followed the use of insulins with prolonged action. This was most outstanding among those patients who were transferred to zinc insulin crystals. Interestingly enough, improvement in the status of the diabetes was most pronounced in those patients with severe diabetes.

4. *No allergic reactions* were encountered in any of the patients receiving zinc insulin crystals.

Whereas the explanation for the prolonged hypoglycemic effect of protamin-zinc insulin seems to have been adequately made by its various proponents, no satisfactory rationale for this property of zinc insulin crystals has been offered until recently.

Lately, however, we have had the opportunity of discussing this matter with Doctor Sahyun of Detroit, who is responsible for the introduction of zinc insulin crystals. His opinions regarding the properties of this new therapeutic agent have shed considerable light on the subject.

According to Sahyun, zinc insulin crystals exhibit the reactions of a true protein and represent the actual hormone (insulin). Zinc insulin crystals possess an iso-electric point of about p^H 5.3, and are separated by the usual protein precipitants, such as tungstic acid, molybdic acid, etc. They are thrown out of solution by high concentrations of such salts as sodium chlorid and ammonium sulfate, are hydrolyzable in acid or alkali, and are attacked by proteolytic enzymes. Upon hydrolysis they yield the following amino-acids: cystin, histidin, lysin, tyrosin, leucin, arginin, prolin, phenylalanin, and glutamic acid.

Zinc insulin crystals occur in a rather fine form, seldom exceeding 0.01 millimeters in diameter. They do not possess a true melting point, but turn brown at about 210 degrees centigrade and melt with decomposition at about 225 degrees centigrade. The molecular weight has been estimated at about 35,000. A solution of zinc insulin crystals is levorotatory, but its specific rotation is dependent to a large extent not only upon the p^H of the solution, but also on the acid or alkali used for dissolving the insulin.

Zinc is necessary for the crystallization of insulin; it also acts as a protective agent, stabilizing its potency (physiologic activity). It was originally thought the zinc in crystalline insulin was responsible for its prolonged action. Sahyun feels, however, that this is not the case. He states that the zinc content in crystalline insulin within limits up to one milligram per 1,000 units does not prolong its action. He is also of the opinion that the presence of zinc in a concentration of one milligram per 1,000 units assures no greater stability of solution than the product now on the market, which contains only 0.2 to 0.4 milligram of zinc per 1,000 units (a requirement of the Insulin Committee in Toronto, Canada). However, it has been found possible to increase the prolonged action of crystalline insulin by the addition of zinc, but in quantities of 8 to 9 milligrams per 1,000 units.

---

† This department of CALIFORNIA AND WESTERN MEDICINE presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

Sahyun feels that solution zinc insulin crystals owe their prolonged action to a greater insolubility on the alkaline side of its iso-electric point than that possessed by regular insulin. Consequently, the prolonged hypoglycemic action is due to a delay in absorption and eventual utilization of the insulin (injected at a p^H of 3.0) by the body during its changes from an acid p^H to the slightly alkaline p^H of the tissue fluids.

Of importance is the fact that a pure crystalline product is available, which has a duration of action of at least twelve to fourteen hours. This duration may be considered to be more physiological than the prolonged hypoglycemic action of protamin-zinc insulin, whose tendency to an accumulative action in certain patients is undesirable. Furthermore, in the absence of extraneous proteins, the allergic hazard is confined to an inconsequential number of individuals who may be sensitive to the insulin molecule.

NAZI IDEOLOGY AND MEDICAL RESEARCH

The amount of physiologic research now being done in Nazi Germany is 33 per cent below that produced after the World War during the reign of democracy. This slump in internal German medical research, however, is more than counterbalanced by the 50 per cent increase in the productiveness of German-speaking physiologists living outside the Third Reich. These conclusions, currently reported by a leading American statistician[1] are based on a linguistic analysis of the papers presented before the thirteenth International Congress of Physiology (Boston, 1929) and the sixteenth Congress held last summer at Zurich.

English, French, German, and Italian are the official languages of these congresses. Nine years ago, 106 of the papers before the Boston meeting were in German. Of these, sixty-one (58 per cent) reported researches done in German laboratories, while forty-five (42 per cent) represented work done by the German-language group in Hungary (10), Czechoslovakia (9), Russia (9), Switzerland (6), Austria (5), Netherlands (4), and Esthonia (2). At the Zurich Congress last summer only 40 per cent of the German papers represented national contributions to medical science, while 60 per cent reported work done by German-speaking scientists living in Switzerland (21), Netherlands (13), Czechoslovakia (10), Hungary (9), Sweden (6), Austria (4), Palestine (3), Turkey (3), Poland (2), Italy (2), Belgium (1), and Esthonia (1). During the nine years, therefore, the relative amount of German physiologic research has decreased by one-third. Outside of Germany, the German-language group has increased its relative research output over 50 per cent.

The same statistics show that French and Italian physiologic research has not declined during the nine years. American and English physiologic researches have increased. If German medical research continues to decline at the same rate, the Third Reich will fall behind Czechoslovakia by 1970, and to the level of Palestine by the end of the century.

Totalitarian ideology *per se* is apparently not detrimental to medical progress, as shown by the sustained output from Fascist Italy. There is, evidently, some factor in Nazi ideology, however, that is detrimental to initiative, originality and intellectual fertility in medical science. In the long run, this handicap to scientific progress may be a dear price for Nazi Germany to pay for its growing military efficiency.

P. O. Box 51.

Stanford University.

Blindness Problems.—The International Association for Prevention of Blindness, which maintains a secretariat in Paris, will hold its next annual meeting in London on Wednesday, April 19, 1939.

The principal topic for discussion will be "The Application of the Crede Method for Prevention of Blindness in Various Countries." This refers to the use of a prophylactic solution in the eyes of infants at birth in order to prevent ophthalmia neonatorum, commonly known as "babies' sore eyes."

In the United States there has been a 75 per cent reduction during the past thirty years in the number of cases of blindness from ophthalmia neonatorum. How this was accomplished will be related at the international meeting by Dr. Conrad Berens of New York City, a member of the board of directors of the National Society for the Prevention of Blindness, 50 West Fiftieth Street, New York.

America will be represented also by Dr. Harry S. Gradle of Chicago, vice-president of the Illinois Society for the Prevention of Blindness, and Dr. Park Lewis of Buffalo, vice-president of both the International Association and the American National Society.

Fractures of Arm Just Above Elbow Are Most Difficult to Treat.—The most difficult fractures to treat are those of the arm, just above the elbow, George J. Garceau, M.D., Indianapolis, points out in *The Journal of the American Medical Association* for February 18.

The physician should consult with an orthopedic or bone surgeon in difficult cases of such fractures, Doctor Garceau says, basing his paper on an analysis of 133 fractures of this type. These fractures occur most frequently in children. Immediate reduction (alinement) of the fracture promises good results. Delay makes reduction more difficult because the soft tissues become hard and the muscles and tendons contract. With delay it may become necessary to open the elbow and reduce the fracture. This slows up the recovery.

When only one of the eminences is loose from the rest of the bone it is usually necessary to reduce it by open operation.

URINARY TRACT INFECTIONS*

FROM A GENERAL PRACTICE STANDPOINT

By H. C. Bumpus, Jr., M.D.
Pasadena

PART I

CHANGES in the treatment of urinary-tract infections have occurred with such rapidity during the past few years that urologists have found it difficult accurately to evaluate the various forms of therapy before they become obsolete. During this time the general practitioner has been literally swamped by the various drug houses with an apparently never-ending series of new urinary antiseptics; each one, not only claimed to be more efficient than its predecessor, but invariably proved to be more expensive.

The scope of the national advertising with which each of these new panaceas was launched invariably exceeded that of its predecessor, until the price of the product became so excessive as to arouse protest from both physician and patient. This was usually met with the assurance that their efficiency was in direct proportion to their cost: after all, first-class articles or services are usually expensive, and why should medicines prove any exception to that well-established rule? The possibility that a medicine might receive universal adoption on its merits alone seemed to occur to no one. It was taken for granted that a new urinary germicide, upon its presentation to the profession, would require as elaborate a build-up as that accorded the latest automobile model or movie star. That such a build-up might as frequently serve to hide the shortcomings of the product occurred to some of the more skeptical ones.

Such was the case when the efficacy as a urinary antiseptic of certain of the much-publicized azo dyes was demonstrated by the circulation of drawings and photographs of test-tubes and petre dishes. In the controlled test-tubes most of the noxious organisms commonly found in urine were seen to grow in great abundance, while in the culture media to which even minute amounts of the advertised dye were added growth was inhibited. Such an ocular proof of the antiseptic value of the product as that seemed beyond refutation; yet a graduate student named James Gillespie, presumably from Missouri, repeated the tests as described in the advertising matter, and in his thesis wrote: "Antisepsis in urine is quite different from antisepsis in water. Compounds which exert a striking bactericidal action in water may have this power greatly diminished or lost in urine. This well-recognized fact has excluded many drugs from the list of valuable urinary antiseptics. The value of every drug used for urinary antisepsis ought to be questioned until this antiseptic strength in urine can be experimentally demonstrated. Compounds, the antiseptic power of which is due to acid or basic properties, would become inert in the urine due to the buffer action of urinary salts. Other compounds containing silver become inert in the urine because silver is precipitated by the chlorids."

To demonstrate the correctness of these statements, he added a few drops of urine as well as the azo dyes to his culture media; and upon incubation the profusion of growth was as great in the tubes to which the dye had been added as in the controls. In the presence of urine, the much advertised germicidal action of these dyes for urinary infections was completely neutralized.

The beginning of this period of the active commercialization of urinary antiseptics dates roughly from the presentation of the first perfect germicide in the form of mercurochrome, which you will recall started as an intravenous drug, and after a rather colorful life has found its place as a popular substitute for iodin. The career of hexylresorcinol, alias capricol, has been similar. Starting as a urinary antiseptic par excellence at ten cents a capsule, it is now advertised as a tooth paste. It was during this period that the commercial laundries benefited, I believe, even more than our patients; for the amount of underwear that was stained by pyridium, serenium, and picrocain must have kept many an individual off the PWA rolls. In the meantime, that reliable friend of our early practice, urotropin, having changed its surname from hexamethynamin to methenamin had, like the aging wife, been abandoned and divorced while we philandered with these gayer and more colorful products. Like most such alliances, the younger consort proved fickle and inefficient, and we were then urged to become drug nihilists and combat our enemies in the urinary tract by diet, the ingestion of which, because of its high fat content, seemed impossible for any but an Eskimo, but which those in the temperate zone were expected to partake of for at least a fortnight if any lasting results were to be obtained. Yet the results of the ketogenic diet proved so illusory, except under the most rigid supervision, that it was soon abandoned, and the profession was assured that a similar but surer effect could be obtained by the administration of mandelic acid. Any of the profession who essays to take his own medicine in the form of the elixirs or syrups, in which form it is commonly dispensed, must agree that the ketogenic diet, difficult as it was to ingest, was preferable, and that the presence of a few pus cells and bacilli in the urine are much less disturbing to bodily comfort.

At the present time we are in the sulfanilamid stage. This drug seems destined to be the exception that proves the rule. It is cheap and, instead of being suddenly thrust upon us, we find that it has proved its usefulness gradually over a long period of time. Gelmo, working on the chemistry of azo dyes, was the first to mention this drug in 1908, while Dormack, director of the experimental pathologic laboratory of Elberfeld, Germany, was the first, in 1935, to point out its therapeutic possibilities.

SOME FUNDAMENTAL PRINCIPLES OF UROLOGIC PRACTICE

However, before discussing the efficacy of these various urinary antiseptics, it would seem pertinent to review briefly the diseases for which they are intended, and discuss some of the fundamental principles of urologic practice as they apply to infections of the urinary tract.

---

* Read before the Santa Barbara County Medical Society, December 9, 1938.

Someone has said that the chief function of the urologist is to insure the adequate and constant drainage of the urinary tract. This is certainly a basic principle and, with very few exceptions, no method of therapy will long prove efficient if the passage of urine from the renal papellae to the urethral meatus is in any way obstructed. Probably nowhere is this so well clinically demonstrated as in the case of pyelitis of pregnancy. Here, for some reason, upon the exact cause of which the authorities differ, there occurs a dilatation of the upper urinary tract associated with urinary stasis. If infection is added, the clinical picture may become very grave. In the majority of cases such infection occurs on the right side, and the institution of ureteral catheter drainage will, in a few hours, by emptying the renal pelvis, return the highest of temperatures to normal with complete abatement of the most extreme degrees of prostration. In most cases drainage is all that is required. Without such urinary drainage all germicides are of little value although, administered in conjunction with drainage, they prove beneficial. We must consider, therefore, adequate drainage as imperative before any form of germicide can be expected to prove effective.

QUANTITY OF URINE OUTPUT

Certainly the next most important factor in all cases of urinary infection is the copious output of urine. If this is not possible by oral administration it should be given by subcutaneous or intravenous means either in the form of normal saline or five per cent glucose. In recent years the intravenous method has largely replaced the subcutaneous due, I think, to the fact that the subcutaneous method, when it first came into vogue, employed large needles resembling trocars, and the fluid was allowed to accumulate in considerable amounts in the subcutaneous tissues to the great discomfort of the patient. If the subcutaneous administration of fiuids is given with multiple small needles, it may be run for days at a time with little discomfort and to great advantage. By this method, moreover, the possibility of embarrassing a faulty cardiac musculature is avoided, a risk that many believe to be associated with the intravenous method of administration. Certainly, any patient with an acute urinary infection should excrete in excess of 2,500 centimeters of urine daily; if the surrounding room temperature is high this will be difficult to obtain by oral administration. Furthermore, the ingestion of too great an amount of fluid by mouth upsets the gastro-intestinal tract, and the patient loses the benefits of adequate digestion and may develop so-called water intoxication, as described by Rowntree in his studies of the effect of pituitrin in cases of diabetes insipidus, with resultant serious pathologic changes in the nervous system.

Keyes has written that "the diagnosis of renal infection depends rather upon the arousing of the suspicions of the medical examiner to the fact that the patient may have a renal infection than upon anything else. Once renal infection is suspected, it can readily enough be diagnosed."

The reason for our neglect to more frequently recognized renal infection is due, I think, to the fact that we have come to associate pyuria with renal infection; the idea that one may exist without the other is seldom entertained, and yet clinical experience and painstaking study have demonstrated repeatedly that such may be the case. The fact that a carefully conducted physical examination frequently fails to indicate an involved kidney is also unquestionably responsible for our too frequent failure to have our suspicions aroused.

Although there are exceptions which, because of their rarity, may be disregarded, it is accurate to state that in the vast majority of cases renal infections occur either by the hematogenous or ascending route, and are apt to be associated with some form of urinary stasis either permanent or temporary.

RÔLE OF BACTERIA

A great variety of bacteria have been isolated, and reports vary as to the incidence of certain types. Thus, if the investigation includes many cases of pyelitis in children or during pregnancy, the incidence of Escherich's coli will be overwhelming; if such an investigation should be made in an institution like the Mayo Clinic, the colon organism will be far from the predominant one, though still in the majority.

Formerly it was customary, once having excluded the possibility of tuberculosis, to be satisfied with knowing merely if the infecting organism was a bacillus or a coccus. So rapidly has therapy progressed that today one can hardly be said to be carrying on the best type of attack unless he knows the organisms which he is attacking. At first this might seem to demand a bacteriological knowledge and equipment beyond the reach of most practitioners; but such is not the case, for urinary sediment stained by Gram's method generally proves sufficient, and only the more unusual types of bacteria need the assistance of a bacteriologist to correctly name them. In fact, the stained sediment is not infrequently more accurate than cultures, especially in the case of renal infections, as is shown by a recent study of Buchtel.

That bacteria can reach the kidney by the blood stream is self-evident, but fortunately few survive long enough to make the journey, and of those that do, the endothelial surfaces of the kidney tissues serve rapidly to annihilate the vast majority. The best clinical example of this is probably the so-called urethral chill following instrumentation, with a rapid rise of temperature to extreme heights associated with prostration of the patient, to be followed the next day by his discharge from the hospital apparently in the best of health. More frequent cases of hematogenous infection are those of the coccal type, which come from boils and carbuncles and which, either because of their increased virulence or repeated attacks, manage to become established in the renal parenchyma, and not infrequently lead to perinephritic abscess or carbuncle of the kidney. Closely associated with this group are the cases of coccal infection arriving from the upper respiratory tract during the course of acute respiratory infection. In these cases the urine excretion fails to show any pyuria, but if during the early course of the infection the urine specimen is centrifuged for a prolonged period of time and carefully stained, the presence of cocci will be demonstrable. Their presence will explain the fever and elevated pulse, which are usually out of proportion to the severity of the respiratory involvement. In such cases a careful physical examination will generally elicit a point of tenderness to palpation at the costomuscular angle, a finding which will leave the diagnosis beyond question. There are few conditions in which it is so difficult to correlate the clinical picture, the urinary findings, and the pathological conditions. The pathologist seldom sees kidneys of this type, for, fortunately, the condition is rarely fatal; and if it is, the pathologic changes have progressed far beyond those that were present at the onset of the condition. However, the numerous renal scars seen in the routine examination of autopsy materially attest to the accuracy of our clinical deductions.

Because the infection is principally in the cortex of the kidney, the urine does not contain any cellular elements, and investigation by intravenous urography will usually prove negative, as the infection does not produce abnormalities discoverable by these methods. Of considerable clinical importance is the regular early development of perinephritis, which produces the tenderness so characteristically found in the costomuscular angle.

With this group must be included the cases of pyelonephritis which are the result of focal infection. While the relationship between an abscessed tooth, infected tonsil, cervix or prostate is not as easily demonstrated either clinically or experimentally, the best opinion today seems to favor such a relationship. It may be possible as our knowledge advances we shall discover that these distant foci, instead of supplying the actual organisms that infect the kidney, produce a toxin which, by its chemical affinity for renal tissues, makes possible the continued growth of the infection either by neutralizing the natural immune processes, or so affecting the involved tissue as to make the site favorable for growth. Certainly, a careful review of experimental work along this line points in that direction.

(To be continued)

TISSUE CHANGES IN CHRONIC INTOXICATION OF BARBITALS*

By T. L. Schulte, M.D.
San Francisco

TISSUE changes have been reported several times in patients following acute fatal poisoning by barbital and its derivatives,[1-10] the main pathological changes being in the central nervous system, liver, kidneys, and skin. Somewhat similar changes have also been reported in experimental animals.[11-15] However, no one thus far has reproduced, experimentally, the dermatitis observed clinically in sensitive individuals using these compounds. In connection with another study, it was observed in this laboratory that dogs anesthetized repeatedly with pentobarbital developed a macular papular exanthem, accompanied by depilation, cracking and oozing, and resembling the clinical picture of barbital dermatitis. In the hope that this phenomenon might be reproduced which would permit an experimental study of the clinical manifestations of barbital idiosyncrasy, the following experiments were performed to study the phenomenon in more detail. In brief, there were carried out long-continued administrations to dogs and white rats of various members of the barbital group and histological examinations for possible alterations in skin and other organs.

PENTOBARBITAL AND AMYTAL IN DOGS

Pentobarbital.

Fifteen young adult dogs, fourteen males and one female, were used, three of the males serving as controls. The animals were fed a diet of commercially prepared dog food and water, and kept in the regular animal quarters. Food was withdrawn twice weekly for eighteen to twenty-four hours, then an intraperitoneal injection was given of pentobarbital † (sodium ethyl (methyl-propyl carbinyl) barbiturate), 50 milligrams per kilogram body weight, dissolved in three cubic centimeters of distilled water. Narcosis resulted in from thirty seconds to ten minutes and lasted from ten to twelve hours.

Four dogs died of intestinal perforation and peritonitis, following injection. Histologic examination of these animals showed cloudy swelling of the liver, kidney, spleen, and heart muscle, with septic infarcts and areas of necrosis in which bacilli were present. It is doubtful if these changes had any relationship to the effects of the drug. The remaining seven males developed patchy areas of depilation, and a macular papular erythematous exanthem of the entire body except the head, neck and saddle, in an average time of fifty days.

When the skin rashes appeared, an attempt was made to determine in each dog whether a specific dermal sensitivity was present which could be demonstrated by patch tests. Accordingly, the hair was shaved from the dorsolateral thorax bilaterally over an area 10 by 10 centimeters. Gauze squares, 3 by 3 centimeters, were saturated with solutions and applied to the shaved areas for twenty-four hours as follows: (1) pentobarbital in distilled water; (2) dog urine, obtained by catheterization of the bladder one hour after narcosis developed; and (3) distilled water. However, the patch tests were all negative in all the animals in the thirteen tests made.

The female dog developed ataxia of the hind legs after fifty days, and by the fifty-fifth day was completely ataxic, and had urinary incontinence. Sensation was normal as far as could be determined. However, these signs completely disappeared after the one-hundredth day. This animal became pregnant during the course of the experiment and gave birth to six pups. These were sacrificed when they were two weeks old; histologic examination of the skin and vital organs showed them to be normal.

Injections were continued over a period of two hundred days, during which time about sixty injections in each dog were made, and then the dogs were sacrificed. Histologic examinations of the skin, liver, kidney, spleen, and heart muscle showed them to be normal, in spite of the gross changes in the skin. The control animals showed no skin lesions on gross and microscopic examinations, and the vital organs were similarly normal.

---

* From the Department of Pharmacology, Stanford University School of Medicine, San Francisco.

† Supplied by Abbott Laboratories.

Amytal.

To test the specificity of this dermatitis for pentobarbital, two other dogs were similarly injected with sodium amytal* (sodium isoamylethylbarbiturate), using 50 milligrams per kilogram body weight, for 250 days, at which time they were sacrificed. Gross observation throughout, and histologic examination of the skin and vital organs at necropsy, revealed only normal tissues.

There was a possibility that the skin lesions observed in the first dogs were infectious, or resulted from the manner of handling the animals. Accordingly, an entirely fresh stock of dogs was obtained that had no contact with the previous animals. Three young adult male dogs were used, one being injected with physiologic saline solution (0.85 per cent NaCl) as a control. Otherwise the procedure was similar to the first group of dogs, *i. e.*, treatment with pentobarbital, 50 milligrams per kilogram, injected intraperitoneally twice weekly. The special feature of the fresh group was that the animals were placed separately in clean, padded cages after the injections, and, while narcotized, were protected from trauma to the skin as much as possible. These animals developed no skin lesions, and so were sacrificed on the seventy-fifth day. Histologic examinations of the skin and vital organs showed them to be normal. Therefore, it appeared probable that the dermatitis observed in the first group of dogs was due to some intercurrent infection, or to trauma from scratching during the recovery period.

Different Barbitals in White Rats.

However, a further test of the possibility of producing dermatitis was made in white rats. Forty-five young adult females were used, housed five to each cage, and fed Purina Dog Chow. One cage of these rats was used as a control and given injections of one cubic centimeter per kilogram of saline solution; a second cage of controls was injected with paraldehyd 1.2 cubic centimeter per kilogram, as a check on the effect of a nonbarbital depressant, and the rats of the other seven cages received various barbital derivatives, as follows: sodium barbital (sodium diethylmalonylurea) 150 milligrams per kilogram, sodium phenobarbital (sodium phenylethylmalonylurea) 70 milligrams per kilogram, sodium amytal (sodium isoamylethylbarbiturate)* 50 milligrams per kilogram, pentobarbital (sodium ethyl (methylpropyl carbinyl) barbiturate)† 30 milligrams per kilogram, phandorn (2, 4, 6 trioxy-s-cyclo-hexenyl-ethyl-pyrimidin) 120 milligrams per kilogram, pentothal† 80 milligrams per kilogram, and sedormid (allylisopropyl acetyl carbamid) 100 milligrams per kilogram. The injections were made subcutaneously, three times a week for thirteen weeks, at which time the rats were sacrificed and the organs examined histologically. No skin lesions appeared at any time after these barbitals. Histologically, normal skin, liver, kidney, spleen, and heart muscle were present in all the barbitalized rats and the controls.

COMMENT

The clinical reports in which necropsy revealed lesions in the liver and kidneys were in patients who had taken single massive doses of barbitals with suicidal intent. However, in some other similar cases no lesions in the liver and kidneys have been found. On the other hand, when a patient is sensitive to barbital or any of its derivatives, a single dose may be sufficient to cause a violent reaction. An exanthem following a single dose of phenobarbital has frequently been observed, and recently there has been reported thrombocytopenic purpura after the use of sedormid, apparently in sensitive patients.

The negative results in dogs and white rats obtained by me agree with those of Ravdin, Drobkin and Bothe,[11] Seevers and Tatum,[12] Holck and Kanan[13] and Swanson, Weaver and Chen.[15] The extensive dermatitis observed in the first group of dogs could not be reproduced under various conditions and, therefore, probably did not represent the same kind of dermal reaction seen clinically, but rather an intercurrent infection, or some manifestation of the experimental conditions other than the drug.

SUMMARY AND CONCLUSIONS

1. Skin lesions, manifested by depilation and a macular papular exanthem, were observed in seven dogs given pentobarbital intraperitoneally twice weekly for 205 days.
2. Repetition of this administration with pentobarbital and sodium amytal, in doses producing coma, did not furnish any histologic evidence of damage to the skin, liver, kidney, spleen, or heart muscle. Therefore, the skin lesions were probably due to scratching and purposeless movements made by the animals while emerging from narcosis, or they were infectious, since in other dogs placed separately into clean, padded cages following injection, no skin lesions developed.
3. Patch tests on these dogs, made with solutions of pentobarbital, urine and distilled water, gave negative results in thirteen experiments.
4. The following barbital derivatives or depressants injected subcutaneously into forty-five rats three times weekly over a period of ninety-one days, in doses producing coma, also caused no lesions in the skin, liver, kidneys, spleen and heart muscle, as determined by histologic examination: sodium barbital, sodium phenobarbital, sodium amytal, pentobarbital, phanodorn, pentothal, and sedormid. Control injections of paraldehyd and physiological saline solution also caused no pathological changes in the vital organs.

VARICOSE VEINS IN PREGNANCY*

By A. M. McCausland, M.D.
Los Angeles

Discussion *by Nelson J. Howard, M.D., San Francisco; E. M. Lazard, M. D., Los Angeles; Lyle G. McNeile, M. D., Los Angeles.*

THIS is a preliminary report from the Los Angeles Maternity Service on the treatment of varicose veins complicating pregnancy.

This frequent complication predisposes to all degrees of invalidism throughout pregnancy as well as in later life. Their distressing symptoms and sequellae have been recognized for centuries. Unfortunately, as always, pregnant women, being the last to enjoy the benefits of medical and surgical advance, have been led to believe that varicose veins were part of the price of motherhood.

From the time of Ambrose Paré, in 1579, the injection treatment of varicose veins in pregnancy has been discouraged and condemned. The use of taping, bandages and elastic stockings was recommended, and afforded some temporary relief to the lower leg, but proved of little value in varicose veins of the vulva and upper thigh, where they are often extensive.

In 1931, Dr. H. O. McPheeters, in what was thought to be a daring article, urged the prophylactic injection treatment of varicose veins during pregnancy. This was based upon a series of cases treated in the Minneapolis General Hospital. Since his report, several clinics in this country and one in Great Britain have reported gratifying results. Many of the principles advocated by Doctor McPheeters are now followed at the Los Angeles Maternity Service.

REASONS FOR TREATING THE COMPLICATION

A few of the reasons for treating this complication are as follows:

1. To relieve the distressing symptoms and disabilities especially in women whose economic status is such that they must do their own housework.

2. To prevent thrombophlebitis. Dr. C. A. Nicholas reports that in one hundred patients treated at the Margaret Hague Maternity Hospital none developed postpartum thrombophlebitis. However, during the prenatal period three patients refused treatment for marked varicosities, and each of them developed thrombophlebitis.

3. To prevent the danger of excessive hemorrhage from the rupture of vulvar varicosities at the time of delivery.

4. To eradicate varicose veins which may persist throughout life. The cosmetic effect is gratifying to the patients.

5. To obtain better results: since there is usually some involution of the veins following parturition, the injection of the varicose veins during pregnancy aids in the establishment of a closer contact of the vein wall about the thrombus.

ANATOMY

To be considered are:

1. Great saphenous vein.
2. Small saphenous vein.
3. External pudendal.
4. Superficial circumflex iliac.
5. Superficial epigastric.

All of these veins—superficial, deep, and communicating—have valves with cusps facing upward and inward. These are usually in relation to a tributary vein and distal to it. The valves may have one, two, or three cusps, but most of them are bicuspid.

PHYSIOLOGY

Three factors influence the normal venous flow up the legs:

1. The action of the leg muscles. This is a systolic and diastolic action, and is especially effective in the deep venous system.

2. Negative intra-abdominal pressure produced by the raising of the diaphragm during expiration, which tends to aspirate the blood from the lower extremities. This also has a systolic and diastolic phase.

3. Competent valves which prevent back flow in the veins.

ETIOLOGY

Etiologic factors to be considered include:

1. Hormonal. This seems to be the most important single factor known at the present time.

2. Valvular defects. These may be of infectious or congenital origin.

3. Weakened vein walls with dilatation. These, likewise, may be of congenital or infectious origin.

4. Heredity.

5. Pressure theory. This is no longer accepted as an important factor, since varicose veins develop early in pregnancy. It may, however, be a factor late in pregnancy because of a reduction in the negative intra-abdominal pressure.

PATHOLOGY

The superficial venous system is more frequently involved because of the lack of supporting musculature, and the normal function is disturbed. This change in function may be due to the previously listed etiologic factors, and Bernstein, McPheeters, Kilbourne, Burger, Holder, and others have proved that there is a reverse flow of blood in most varicose veins. Trendelenburg, by his clinical tests, has also proved this fact. This reverse pressure, especially in the long veins, aids in causing progressive destruction of valves, vein-wall dilatation, "spider bursts," and sacculations in which there may be the so-called "resting infections." It is also this reverse pressure which causes most of the patients' symptoms, and pathological changes in the tissue which the veins should drain.

---

* From the Department of Obstetrics and Gynecology, School of Medicine, University of Southern California, Los Angeles.

Read before the Obstetrics and Gynecology Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9–12, 1938.

DIFFERENTIAL DIAGNOSIS

Diagnosis must take into consideration:

1. Arteriovenous aneurysm.
2. Thrombo-angiitis obliterans (Berger's disease).
3. Arteriosclerosis.
4. Raynaud's disease and similar conditions.
5. Menopausal arthritis (symptoms often thought from varicose veins).
6. Flat feet (symptoms often thought from varicose veins).
7. Neuritis, diabetes, sciatica.
8. Compensatory veins, which are due to a true blockade of deep veins. These should not be injected.

* * *

DANGERS

Dangers include:

1. Pulmonary embolus, mortality rate 0.00754 per cent.
2. Phlebitis.
    (a) Infectious. May be due to poor technique or to "resting infection" present in the vein.
    (b) Chemical. As a rule not serious.
3. Sloughs. Due to poor technique.

* * *

CONTRAINDICATIONS

Contraindications for interference include:

1. The presence of infectious thrombophlebitis.
2. Debilitating conditions, such as cardiac and renal disease.
3. Accidents or injury demanding bed rest.

* * *

TRENDELENBURG TEST AND TECHNIQUE OF INJECTION TREATMENT

A method of procedure should be as follows:

1. Examination of patient.
2. Percussion pulse transmission test (P. P. T.).
3. Principle of injection therapy. In order to obtain the desired result, one must inject into a vein some solution of known concentration, and hold it in contact with the endothelial lining so as to partly destroy it, thus causing the formation of a thrombus. In order to do this, a certain area is trapped off by means of tourniquets or pressure bandages. Inject high!
4. Patient lying on a table, leg elevated to drain out large varices, and tourniquets put in place. This is often necessary to obtain desired concentration in the varicose vein.
5. Injection of vulvar varicosities; pressure bandages in place, held by assistant.

We have thus far treated only patients having a positive or double Trendelenburg. It is believed that by using this principle as our guide the danger of emboli is distinctly reduced.

TREATMENT AND RESULTS

Equipment Needed.

1. Solution used: Sodium Morrhuate 5 per cent.
2. Syringes: 5 cc.
3. Needles:
    - Short bevel G 23, 1½ inches long.
    - Short bevel B 26, ½ inch long.
4. Tourniquets: ⅜ inch rubber tube.
5. Bandages:
    - (a) Type used in our clinic (previously described).
    - (b) Elastic bandages.
    - (c) Ace bandages.
6. Rubber sponges.
7. Table and stool.
8. Alcohol 70 per cent.

* * *

PERIOD OF GESTATION WHEN VARICOSE VEINS TREATED

All cases were treated irrespective of the period of gestation. There were:

26 cases treated in the seventh month
10 cases treated in the eighth month
3 cases treated in the ninth month

* * *

SITES OF INJECTION

	Injections
Thigh (great saphenous)	191
Leg (small saphenous)	80
Vulva (external pudental)	18
Buttock (superficial circumflex iliac)	3

* * *

NUMBER OF INJECTIONS PER PATIENT

78 cases had 1 injection
33 cases had 2 injections
20 cases had 3 injections
12 cases had 4 injections
5 cases had 5 injections
1 case had 6 injections
1 case had 9 injections

The reason for the small number of injections per patient is that injections were given high.

* * *

REACTIONS

	Cases
No reactions (no subjective symptoms)	113
Chemical phlebitis (some subjective symptoms)	27
Incapacitated (bed rest)	3
Thrombophlebitis	1
Sloughs	0
Unknown (did not return to clinic)	6

(In all cases there must be a reaction—chemical phlebitis—in order to have a result; thus, in the 113 cases listed with no reaction, we mean no subjective symptoms.)

RESULTS

	Cases
Very good (symptom-free, all varicose veins collapsed)	89
Good (symptom-free, most of varicose veins collapsed)	41
Improved (symptoms improved, most varicose veins collapsed)	13
Poor (no change in symptoms or veins)	1
Unknown	6
Total	150

The five ulcer cases mentioned in this series all healed.

* * *

POSTPARTUM EXAMINATIONS

Number returned for six weeks postpartum examination		55
Very good results	46	
Good results	9	

Discoloration at site of injection.

Slight	16
Marked	2
None	37
Total	55

(Fifty-five of the one hundred delivered patients returned, and most of the remaining forty-five were not due for their six weeks' examination at the time this paper was prepared.)

CONCLUSIONS*

1. Varicose veins complicating pregnancy is an obstetrical problem which has been neglected in the past but can be readily cared for by the obstetrician.

2. Distressing symptoms and disabilities can be relieved with little difficulty and comparatively slight risk by the methods described.

3. The incidence of thrombophlebitis may be reduced by treating varicose veins during pregnancy.

4. The danger of hemorrhage from ruptured vulvar varicosities at the time of delivery may be minimized.

5. Better ultimate results are obtained by injecting varicose veins during pregnancy.

6. Hormones (especially progesterone) and heredity appear to be important etiologic factors.

7. In over 78 per cent of the cases, varicose veins appeared in the first trimester, and in over 80 per cent they developed during the first three pregnancies.

8. The dangers and discomforts of varicose veins often persisting throughout the patient's life may be eradicated.

9. There is a greater margin of safety if *only those patients* with a positive or double Trendelenburg are treated.

10. About one-third of the patients in this series were of the Android (dystocia dystrophy) type.

11. Better results may be obtained, and fewer injections are necessary, if the varicose vein is occluded in its most proximal portion.

12. Varicose veins may be treated in any month of pregnancy.

3780 Wilshire Boulevard.

DISCUSSION

Nelson J. Howard, M. D. (350 Post Street, San Francisco).—Doctor McCausland has presented an excellent survey of the varicose state in pregnancy. He has had the temerity to thrombose the varicose veins by injection during the gestational period, and, from the data presented, one would not hesitate to advise that such treatments be carried out in the pregnant woman presenting varicose veins. I rather doubt that, by and large, the postmortem thrombophlebitis of the deep veins of the leg may be prevented by antepartum injection, and such proof would only be forthcoming in a careful study of large groups of patients.

Dr. C. F. Fluhman informs me that in the Stanford Obstetrical Clinic service, vulvar varicosities have not proved either a source of alarming hemorrhage or of postpartem phlebitis. Nevertheless, I agree with Doctor McCausland that such varicosities should be injected early in pregnancy.

As to the hormonal etiology (supposed influence of progestin) in causation of varicose veins, I feel that more work should be done and carefully controlled before this factor is emphasized and completely accepted. It is just as likely that the increased cardiac output and enormously increased pelvic blood flow lead to not only increased flow through the lower limbs, but relative stasis on the venous side. The "uterine souffle" has the characteristic sound of an arteriovenous fistula, though lacking in intensity, and one might regard the pelvic circulation in pregnancy as a physiological arteriovenous fistula, accompanied by dilatation of the distal peripheral veins.

Although the patients treated by Doctor McCausland obtained in most instances relief of discomfort following injections, I am not at all optimistic of permanent relief, and feel that he will find those same patients in need of reinjection for recurrent varicose veins after the passage of several years, whether subsequent pregnancies occur or not. Doctor McCausland could pursue a worth-while investigation in following these same patients up after an interval of three years had elapsed.

⁂

E. M. Lazard, M. D. (1930 Wilshire Boulevard, Los Angeles.—Doctor McCausland's preliminary report of the work being done at the Los Angeles Maternity Clinic in the treatment of varicose veins in pregnancy is a most interesting and timely one. This condition has been temporized with too long, and any method which gives promise of obtaining such favorable and permanent results must arouse the interest of all obstetricians.

I would emphasize, however, (1) the necessity of careful selection of cases with especial consideration of the contraindications to minimize the chances of accidents occurring; and (2) the meticulous carrying out of the technique. His theory that the hormones (especially progesterone) is the most important single etiologic factor is also interesting, and reports of further work along this line are awaited with interest.

⁂

Lyle G. McNeile, M. D. (3780 Wilshire Boulevard, Los Angeles).—The late J. Whitridge Williams, in his discussion of the management of normal pregnancy, stated: "One of the few creditable achievements of American obstetrics is the development of so-called 'prenatal care.' The term has a wider application than the words imply, and may be defined as such supervision and care of the pregnant, parturient, and puerperal woman as will enable her to pass through the dangers of pregnancy and labor with the least possible risk, and to be discharged in such condition that she may fulfill her duties as mother and housewife with a minimal amount of invalidism."

There are few conditions in obstetrics which give rise to more minor symptoms, and to more annoying discomfort to the patient, than is occasioned by varicose veins. Doctor McCausland has shown the extremely high percentage of varicose veins in women which, apparently, are the direct result of pregnancy. Almost without exception, we have been taught, until very recently, that varicosities were caused by pressure during pregnancy; and there are few among us who have not warned our patients about the dangers of circular garters, and who have not told them that such garters were a major causative factor in the production of this condition.

It is now generally agreed, by those who are in a position to know, that pressure is a negligible factor, that circular constriction is of very little importance, and that the most probable etiological factor seems to be certain hormonal changes, the exact nature of which are not clearly understood. Only one single factor, which has been generally recognized in the past, is still unchallenged today. That one factor is the extremely high incidence of varicose veins during pregnancy, and the extreme discomfort which the condition causes.

---

* I wish to thank Dr. Lyle McNeile for granting me permission to use material from his department. Also, I should like to express my appreciation to Doctors Hanley, Reynolds, McBurney, and Baker for their assistance and cooperation in making this study possible.

The work done by Doctor McCausland at the Los Angeles Maternity Service has been conducted under the personal observation of the discussant. When we first decided upon the installation of a "Varicose Vein Clinic for Pregnant Women," we did so with the knowledge that, without exception, the authors of even the most recent textbooks on obstetrics warned against the procedure during pregnancy. I have, however, seen so many procedures condemned, and later given the whole-hearted endorsement of the medical profession, that I was not frightened. The results on the first 150 cases have been carefully analyzed by the author, and have far exceeded our most hopeful expectations.

The injection treatment of varicose veins during pregnancy has been recommended to our private patients, and the results have been as striking as those obtained in the clinic.

When judged by the viewpoints which have been held without change during the first thirty-eight years of this century, it is admitted the procedure is so new that it appears to be radical. It appears to the discussant, however, that a period of stagnation, characterized by the attitude that "it was good enough for my father, so it is good enough for me," apparently has passed and that, with increasing frequency, old ideas are being discarded, and increasingly effective therapeutic measures are being substituted for the old midwife treatment.

Many very valuable measures have been discarded in the past, because their improper use resulted in bad results. Many of us can remember the time when the manufacturers of pituitrin recommended its use in cubic centimeter doses to shorten the time of labor, and our memory of the number of ruptured uteri resulting from such treatment is still very vivid.

In order to obtain satisfactory results, the discussant feels it is essential that the physician heed the caution of Doctor McCausland, and use the injection treatment of varicose veins only when the Trendelenburg test is positive or double positive, when no contra-indications are present, and when the operator has thoroughly familiarized himself with all of the general principles involved. When these conditions are met, the treatment of varicosities by injection appears likely to add one additional achievement in our development of prenatal care.

PREVENTORIUM CHILD*

By Harold Guyon Trimble, M.D.
Oakland

Discussion *by Charles L. Ianne, M.D., San Jose; Carl R. Howson, M.D., Los Angeles; Chesley Bush, M.D., Livermore.*

OUR concept of tuberculosis in childhood has changed very materially in recent years. Up to the classical work of Opie and McPhedran,[1] published from 1926 to 1929, diagnosis was largely on a symptomatic basis. This concept was reflected in the care of this type of children, and summer camps were established to improve their general body condition. This summer camp period may be said to extend roughly from 1910 to 1920. It is interesting that in 1922, at the Washington meeting of the National Tuberculosis Association, a paper by Hubert Rich[2] of Detroit on "The Prevention of Tuberculosis in Childhood," presented in the Sociological Section, was summarized by the chairman as follows: "Any child that has any of these predisposing symptoms: the underweight, the undernourishment, or any of these postural defects, should be followed up with the greatest of care."

SUMMER CAMPS

About this time many people found that summer camps were of no permanent value, though they gave children a temporary boost. These children usually had insufficient medical attention; they were not carefully enough examined before being sent there, nor properly followed up on their return. This led to the development of the twenty-four-hour, every-day, all-year-round institution, limited to children with a positive tuberculin reaction, and frequently to cases of known contact with open cases of tuberculosis. This was called a preventorium. This phase lasted from approximately 1920 to 1935, and continues to some extent to date.

EARLY PREVENTORIA

A pioneer among preventoria was the Lymanhurst School for Tuberculosis in the City of Minneapolis, under the general direction of J. Arthur Myers of the University of Minnesota, a tuberculosis and public health man, and Chester Stewart of Minneapolis, a pediatrician. In November, 1932, they summarized their views. These have since been extended in articles and books,[3] though not materially changed. Chester Stewart,[4] in discussing the question of prognosis and treatment of resolving parenchymal tuberculosis of first infection in infants and children, brings out the facts that these infants and children quite uniformly tend to recover, if removed promptly from sources of infection and are subsequently protected from reinfection; that no special therapeutic measures have been developed for these children; that institutional care is not necessary, but that it is more feasible to keep the child in its own home or suitable foster home under adequate medical supervision. This was a profound reversal of opinion on their part, but is based on careful follow-up of a large series of Minneapolis children.

It so happens that in Alameda County, Ann Martin[5] had followed a similar group of children, though much smaller, and had come to the same conclusion.

VALUE OF PREVENTORIA

In 1935, in the Transactions of the National Tuberculosis Association at their Saranac meeting, and, subsequently, John B. Hawes, II,[6] of Boston, who for many years has supervised the Prendergast Preventorium there, discussed the question: "Are preventoria and summer camps worth while?" The conclusion that he reaches is that he "knows of no more effective way that our present knowledge of tuberculosis can be extended than through these means, provided active and practical measures are used to educate not only the children in principles of health and hygiene, but also parents and other members of the family, and general public; and particularly doctors, nurses, and social workers." Hawes has carried this general theme through subsequent discussions in various places.

Finally, in 1937,[7] at the annual meeting of the National Tuberculosis Association in Milwaukee, Stewart again summarized the position of the Lymanhurst group, and said: "Study of clinical characteristics, therapeutic requirements, and relative contagiousness of different clinical varieties of tuberculosis, supplies evidence which suggests the advisability of discontinuing the use of preventoria for the care of children with primary tuberculosis, and converting these institutions into hospitals for patients with serious and actively communicable reinfection forms of the disease." In other words, take the present preventorium buildings and convert them into hospitals for children or adults!

---

* Read before the Pediatric Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

We see that there has been a change in the general feeling with regard to what we have come to know as a preventorium. My own observation makes me subscribe to Stewart's views so far as the necessity for institutional care for the average type of child seen under preventorium conditions. I believe, however, that a different solution than entire change is the proper one, and in that respect Hawes is correct. Fundamentally, I think there is no real disagreement between these two physicians, but I think they are talking about comparatively different things. As a matter of fact, the Prendergast Preventorium in Boston has accommodated a comparatively large group of diabetic children, for their education in the technique of administering insulin, handling their diets, and training in health habits to improve general hygiene.

Lymanhurst Preventorium has changed its name to the Lymanhurst Health Center. When I last visited there a year ago, the beds, previously used for children with tuberclulosis, were caring for patients—with heart cases discovered in routine school examinations in the City of Minneapolis—that needed confinement to bed or limited regimens. Lymanhurst has always been an integral part of the public school system of Minneapolis.

CALIFORNIA ACTIVITIES

Let us now turn to California. In tuberculosis work, California in many respects has been the leader, and in practically all respects has kept well up with the leading developments, both in individual care and in the public health field. It has been interesting that, in connection with the care of children in the summer camp and preventorium groups, the medical responsibility has rested on the physician concerned primarily with tuberculosis. At times there has been a pediatrician called in as a consultant, but his responsibility has usually been nominal, and in many instances (I believe in most) pediatric advice has not been sought or utilized. The reason for this, is of course, clear. These institutions were started almost universally by the local tuberculosis associations out of seal sale funds. For the purpose of economy in administration, they were usually placed close to the local tuberculosis sanatorium, where one existed. The children went through the tuberculosis clinics, were examined routinely there, were not seen by pediatricians uniformly and, because of the financial interest by the tuberculosis association, the natural tendency was to turn to tuberculosis men. Because of the proximity of these institutions to the sanatoria, there has been a drifting away from the pediatrician's guidance even in the small degree that sometimes existed.

AUTHOR'S COMMENTS

I should like to emphasize that, due to the changing viewpoint with regard to the effectiveness of the preventorium, there are in many places splendidly equipped buildings with excellent physical facilities. Certain problems arise in the course of a pediatrician's practice in which the child does not need hospitalization, care in the child's home is not quite adequate, yet institutional care of a certain type is advisable. There are such places throughout California where adequate care has been given in a fairly well organized fashion for some years. I refer, among others, particularly to the Contra Costa County Preventorium and to the Alameda County Preventorium, a county institution, so-called Del Valle.

I should like to point out very forcibly, however, that, as far as tuberculosis associations are concerned, the use of seal sale funds for other than problems that bear very directly upon tuberculosis is not justifiable; that preventoria, if used for other purposes than that for which they were originally built, should be financed through other sources, preferably as county institutions.

CONTRA COSTA COUNTY EXPERIENCE

What types of children, then, would be suitable for care in a preventorium of a sort that I have in mind? Let me present to you, briefly, our own experience.

It came about in this fashion: In Contra Costa County this preventorium has for some years been almost entirely supported from county funds, but is under the supervision of the Tuberculosis Association. A good resident staff, carefully trained, exists, and ample facilities are available for care of children who are not ill, in the usual sense of the word. Some 600-odd children have been through the institution in the last ten years, and careful follow-up has been instituted. Due to the general drop in the incidence of adult tuberculosis throughout the country, as well as locally, and a careful follow-up of known contacts, the number of children becoming infected with tuberculosis seems to be less year by year, and there were not sufficient children available of the type for which the institution was originally set up to keep the beds filled. Some time previously it had come to our attention that many of the children with positive tuberculins, who had been cared for, had minor behavior problems which were not very well handled by us, and which had a distinct bearing upon their physical condition. A trained psychologist became available on a part-time basis, and with her help it was soon evident that a great deal could be done, even with comparatively meager facilities. Parents were contacted and led to visit the Preventorium, and consulted with the physician and the head nurse, as well as the psychologist. The family situation was gone into, and the cause of many of these minor behavior problems understood. After this, the follow-up reports showed more children were maintaining robust health than had previously been the case.

This stimulated interest still further, so that definite arrangements were made with the two psychologists in the county school department to supervise the Preventorium children. Children coming to preventoria were of school age, and had been known previously to these workers. This, of course, greatly facilitated matters. Many of these minor behavior problems had not been recognized at home, by the teacher or the school nurse. Under this arrangement more careful and more extensive work could be done. There were better arrangements for visiting the children's homes, and closer following up through the school nurse and the teacher. During the last three years practically half of the children to enter this Preventorium have been of this type.

OTHER PREVENTORIA IN CALIFORNIA

In most of the preventoria up and down the State, a large number of children not well, but with no organic disease of significance, are patients for from six months to a year or more. They are discharged often upon pressure from the parents, or upon pressure of a waiting list. There is no special effort made to correct other than purely physical problems. Their lack of general adjustment is reflected into their physical condition. More and more the local doctors have come to recognize this, and the preventorium is receiving these children. Many fall into the age group from six to eight years. It is when they first enter the school system that their lack of adjustment becomes evident, and this is increasingly reflected into the child's physical condition. Most of the time these children have had teeth repaired, tonsils removed and frequently some type of supervised rest plus heliotherapy. A large number of these children are improved by the work of the psychologist in the school, the nurse, and the teacher, together with midday rest. As a rule, they all have had careful and adequate physical surveys by their own family physician. These measures frequently suffice.

There is always a small residue, however, in which the parents need the demonstration of institutional care, of what can and should be done on their own child. A child who previously has been somewhat of a problem with regard to eating, with regard to bed wetting, with regard to study in school, with regard to frequency of colds, with regard to disposition, and with regard to play, within a few weeks is transformed into what is very obviously a normal, healthy, happy youngster. The institution or physician who brings this about is then in a position to speak very frankly and very definitely to the parents. As a rule the parents are interested. Occasionally one finds an entire disinterest on their part, more often a broken home, and then, of course, the problem becomes much more difficult.

A SPECIAL FUNCTION OF THE PREVENTORIUM

I must describe briefly an entirely different sort of problem, the care of which the preventorium is eminently fitted for; that is, bridging the gap between hospital and home in many different diseases. There are particularly the heart case, empyema, acute nephritis, osteomyelitis, burns, recurrent respiratory infections, and many other infections and diseases of less frequent occurrence. The preventorium technique, if I may call it such, is well adapted for this transition between the usual hospital care and home supervision. This has been particularly well developed in the Alameda County institution at Del Valle, and the long-time results are very satisfactory.

ECONOMIC PROBLEMS

I hesitate to enter into the controversial field of medical economics. Admission requirements must of necessity vary from county to county. A strict application of financial eligibility standards is, of course, necessary, for a county institution must conform to the law. Those institutions under a tuberculosis association or other private auspices are bound by no such legal requirements, and are more flexible when it comes to consideration of part-pay groups of patients. It would seem much better that parents pay something for the cost of their child's care, if at all possible. In Contra Costa County an attempt is made to have most of the parents pay something. While this amount may be very small, and may not begin to take care of the actual cost, we have found that this stimulates interest on the part of the parents. Something they get for nothing is frequently valued as just about that worth.

EDUCATIONAL VALUE OF THE PREVENTORIUM

There is great possibility in the preventorium as an educational institution for certain individual parents, for certain individual physicians, for many nurses and for the public at large. The preventorium has been in the hands of men who have done well, but whose interest is mostly in adult medicine and primarily in the field of diseases of the chest. Many important fundamental pediatric problems have not been recognized in these children. I should like to see the trend away from this, and to see pediatricians have more interest in the preventorium, as such, because a certain small but definite percentage of their patients will profit tremendously from such an experience.

The preventorium idea should not be abandoned. Our present institutions should be adapted for these new purposes, preferably under careful adequate pediatric supervision, to the end that the number of well-adjusted children with sound bodies may be greatly increased in our various communities.

IN CONCLUSION

Our concept of childhood tuberculosis has changed materially since 1920. During this time many structures have been erected for the care of children who were presumably pretuberculous. There is but little need in many areas for these structures, for the purpose for which they were originally intended. Such institutions can be used not only as educational centers, but also in specific cases in helping solve physical and psychological problems other than tuberculosis in individual children, as well as providing care, for a limited time, for a few selected cases of tuberculosis.

DISCUSSION

Charles L. Ianne, M.D. (Santa Clara County Hospital, San Jose).—Doctor Trimble has given us a concise and interesting history of the Preventorium Movement. He especially elaborates on the reason for its connection with Tuberculosis Sanatoria and why these institutions were manned by tuberculosis specialists.

My experience with preventorium work dates from the opening of the Del Valle Preventorium that Doctor Trimble mentions. I feel, like Doctor Trimble and Doctor Hawes, that these institutions have filled a great need in the antituberculosis movement. There are some who think that instead of spending money on these institutions, more emphasis should have been put on isolating the "carrier." I wonder how cognizant the public would have been of the "carrier" and his effect on children if preventoria had not been established.

Statistics are not always interesting, but doubting Thomases must be convinced; hence our experience at Sunnyholme Preventorium in Santa Clara County may be of value: In the interval between 1923 and 1933, 428 children had been discharged from the preventorium. A survey of this group was made between 1928 and 1933 (the ages then ranging between 9 and 20). This survey showed that only six patients had developed reinfection type of tuberculosis. One died owing to failure to coöperate in the follow-up, and the other five, after a short period of sanatorium care, returned to their homes in good health. On the other hand, in the same five-year period (1928-1933) 110 patients, of the same age group, who had not had preventorium care, were admitted to the Santa Clara County Sanatorium. Both groups came from the same social strata. Many had satisfactory homes where the source had either died or been removed to the sanatorium, the only difference being that the former group received the extra physical boost afforded by the preventorium and the advantage of concentrated health education. Perhaps the educational value to the community is the greatest benefit derived from the preventorium. The parents of the preventorium children become acquainted with the preventorium routine and purposes, and through the interest of the Parent-Teacher Associations and Service Clubs the community gradually becomes "tuberculosis-prevention" conscious.

Doctor Trimble mentions that Preventoria are gradually enlarging their field to include the care of convalescents from other diseases; that they are being staffed by pediatricians and other workers trained in childhood psychology. He emphasizes the importance of the teaching value of these institutions in training doctors, nurses, public health workers, and parents.

In my talks to lay audiences I always refer to the Preventorium as the "farm center" where the community may learn better methods for the growth and development of its most important "crop"—the next generation.

* * *

Carl R. Howson, M. D. (1930 Wilshire Boulevard, Los Angeles).—Doctor Trimble has set forth very clearly what, to my mind, is the best thought regarding the status of the preventorium.

Originally, the preventorium was designed for the care of the pretuberculous child. As time went on we found that the pretuberculous child was nonexistent; that children falling into such a classification did not develop tuberculosis with any greater frequency than did the average group of children.

When the increasing use of the x-ray revealed the lesions of first infections in the lungs of young children, we were appalled at the extent of the apparent pathology. Many years of observation were necessary before we could be convinced of the relatively innocuousness of these infections and the amazing manner in which the lung fields eventually cleared, leaving the familiar Ghon tubercle. A most striking demonstration of this was the work of Myers and Stewart at Lymanhurst, to which Doctor Trimble refers.

In the swing of opinion away from our former concept there is sometimes a tendency to overlook one qualification made by these investigators in regard to these primary infections: they stress the good prognosis, "if the child is removed promptly from sources of infection and subsequently protected from reinfection." If these children are of the types outlined by Doctor Trimble, the need for institutional care still exists.

In view of the frequency of the finding of tubercle bacilli in the stomach washings of children with primary parenchymal lesions, it is obvious they should be segregated, preferably in separate buildings or institutions.

Full utilization of the value of institutional care can be obtained only when the home conditions are studied carefully and corrections made when indicated. Psychological study and treatment of many of the children are needed; and perhaps even more necessary is similar treatment for one or both parents.

* * *

Chesley Bush, M. D. (Livermore).—When we see on the screen a picture of long-coated Southerners with shotguns, prohibiting passengers from New Orleans alighting from the cars because they came from a city infested with yellow fever, we laugh; and laugh because we now know that is not the way to control yellow fever.

We now know, also, that putting malnourished children into summer camps and preventoria is not the way to control tuberculosis; but the old ideas of 1920 are still predominant in many parts of our country, and the newer knowledge has not yet caught up. Money that should be expended in institutionalization and treatment of the adult source of infection is being spent in the more dramatic and inspiring care of children.

What shall we do with our "preventoria"?

In Alameda County we have an eighty-bed preventorium. In 1939 we would have difficulty in finding eighty children with positive tuberculin tests who come from tuberculous families, and who are under par. We have had difficulty in finding thirty children with active tuberculous disease to fill our sanatorium children's department for the past five years. So we have closed this department as a children's sanatorium and made it available for adult patients. We have consolidated all children's work in Del Valle—making one isolated unit for primary active tuberculosis of childhood; one ward for the convalescent care of any pediatric or surgical condition; and one ward for the type of child mentioned by Doctor Trimble.

In Alameda County today, with six hundred thousand population, we have fifteen cases of bone and joint, and primary lung tuberculosis, among young children hospitalized at Del Valle. Tuberculosis is becoming a rare disease among children of the two to twelve age group in our community.

Let us abolish any connection between the word "preventorium" and tuberculosis. A "preventorium," if we must preserve the word, is a "children's health school."

* * *

H. G. Trimble, *Closing.*—I should like to thank the discussants for their kind treatment. It is interesting that we all agree so closely on what has been a controversial subject. California has long been among the leaders in putting into effective action, on a wide scale, modern advances in the general health field, including tuberculosis.

I can only hope that the ideas expressed may soon bear fruit, encouraging institutions of the general type known as preventoria to make their programs more effective and fulfill the needs in the child health field for which they can so readily be adapted.

SCABIES*

ITS TREATMENT WITH BENZOYL BENZOATE, AS COMPARED WITH SODIUM THIOSULPHATE PLUS HYDROCHLORIC ACID

By Arne Ely Ingels, M.D.
San Francisco

Discussion *by Henry J. Templeton, M.D., Oakland; C. Russell Anderson, M.D., Los Angeles; Harry E. Alderson, M.D., San Francisco.*

"THE seven-year itch," or scabies, has deserved its name on account of the lack of response to methods in use up to the last few years. This may have been due, in part, because the regimen employed during a cure would often neglect important factors, like contamination from other members in a family and disinfecting measures. Thus reinfections would often run a year-long cycle.

DANISH OINTMENT

Danish ointment was the merited cure for scabies since reported by E. Ehlers, in 1921.[1]

Modifications of this, containing Balsam of Peru and precipitated sulphur, have been in use since Caesar Boeck's days.

Arthur M. Greenwood and Margaret Reilly[2] report the successful treatment of 2,582 cases of scabies by the so-called Danish method at the Massachusetts General Hospital. This method was used for ten years, with particular attention to the accurate formula, preparation and regimen. No detailed case reports, however, are given.

Anyone who has used the Danish method will know the untoward reactions, like dermatitis venenata, and distressing itching conditions which may develop.

OTHER METHODS

A great advance in treatment was the employment of the combined "cure," with 40 per cent sodium thiosulphate and 4 per cent dilute HCl (by Raveant and Mahien).[3] The active principle is H_2S, which is liberated when HCl comes in contact with the sodium thiosulphate. The sodium thiosulphate was rubbed into the skin and allowed to dry, whereupon the diluted HCl was applied and also allowed to dry. The same procedure was repeated the next day when, after a bath, the patient was told not to repeat the application without permission. From last-mentioned and other reports, wherein modifications of this method were employed, it seemed justified to draw optimistic conclusions. G. V. Kulchar and W. M. Meininger treated fifty cases of scabies according to this method, showing satisfactory results.[5]

Thirty patients treated by me according to the above system, at Stanford University Hospital and in my private practice, showed persistence of the scabies lesions in four cases. Five cases showed a mild dermatitis venenata. A great number complained of aggravated or distressing itchy sensations, which betrayed the peculiar tenacity characteristic of a sulphur dermatitis. However, instructions seemed to have been followed accurately, and the druggist's product was checked in instances where there was doubt. The patients were selected from all age groups, free from secondary infections and other skin manifestations. Where such were present, the itching and smarting in the days following were severe enough to lead one to abstain from the scabies treatment until the other manifestations had been alleviated or cleared up.

A repetition of the cure, with or without the physician's consent, aggravated the symptoms considerably. Two cases were hospitalized four to six weeks for the dermatitis venenata, which had developed in this manner. Altogether, the relatively complicated regimen, and the nature of the remedies employed, made it imperative to check the unintelligent patient and the accurate filling of the prescriptions.

KISMEYER'S REPORT

In 1937, A. Kismeyer[4] reported eight thousand cases treated with benzoyl benzoate, sapo mollis, and iso-propyl alcohol, 75 per cent, each equal parts, at the "Kommune Hospital" in Copenhagen. After soaking the patient for ten minutes in a bath, the mixture was brushed into the skin for five minutes. After drying, another application was brushed in. Twenty-four hours after, a bath was taken, and underwear and bedding changed.

The active principles would be (1) benzoyl benzoate, which is a balsam of Peru distillate; (2) the keratolytic soap; and (3) isopropyl alcohol.

AUTHOR'S SERIES

This same schedule was applied in my series of ninety cases, excepting the brushing, and that plain 75 per cent alcohol was employed in half of the cases. In the first twenty cases, the solution was rubbed in with a soft brush. In the subsequent cases, the mixture was rubbed in with the flip of a washrag, or with the hands only. This last seemed easier, simpler, and served the purpose.

Only cases without secondary infection, or eczematous conditions, are included. All ages and all types of skin were represented. The ninety cases cleared up promptly without a repetition of the "cure." No case of dermatitis venenata developed. One case of severe itching, but without visible skin changes, developed in a person who had been using soap and water in excess, after the "cure," and only a few cases showed mild itching. Oiling the skin, and refraining from soap and water a few days, promptly alleviated the symptoms.

I might add that three patients who showed recurrence after the sodium thiosulphate plus hydrochloric acid "cure" cleared up promptly after the benzoyl benzoate "cure."

An additional, smaller series of scabies, with impetiginous lesions and secondary dermatitis, responded under the benzoyl benzoate cure, with healing of both scabies and the impetigo. Subacute dermatitis, from prolonged scratching, faulty application or filling of the prescription, seemed to stand the method well, whereas analogous cases treated with sodium thiosulphate plus hydrochloric acid showed accentuation of the condition in question. Thus the injured skin showed much sharper reactions subjectively and clinically. It was further observed that the safety margin, or therapeutic latitude, showed very favorably with benzoyl benzoate. For example, when the cure had been repeated once or several times, intentionally or by misunderstanding from the patient, the worst consequence was only increased itching and only a mild dermatitis venenata. In a patient who had been applying the benzoyl benzoate for one week, mild dermatitis venenata developed. With sodium thiosulphate dermatitis venenata was frequently seen in repeated cases. I might, finally, add that in all the cases the diagnostic landmarks were the appearance of the typical scabies lesion, with the burrow and their distribution, and nocturnal itching, in addition to the demonstration of the acarus scabiei when it was possible.

For both systems, the usual scabies regimen was employed, paying particular attention to scabies in the family, etc.

All the "cures" were started with thorough bathing and cleaning with soap, change of underwear, bedding, and possibly dry cleaning of clothes. Each patient received an instruction sheet and was told to report.

COMMENT

It is noteworthy that a second "cure" was unnecessary with the benzoyl benzoate method. I shall not count one case where, without my knowledge, the course was repeated three days after the finish of the first course. Even the experienced dermatologist would be unable to judge the final result after three to four days. For example, it is a known fact that the chronic scabies papule, with reactive inflammation in the skin, often takes weeks to involute, particularly on the shaft of the penis.

Discussion.—In interpreting various reports it is interesting to notice the good results with the Danish cure, reported by Greenwood and Reilly. However, accurate data are not supplied in the statistics, and no mention made of individual cases.

The sodium thiosulphate plus hydrochloric acid method is undoubtedly a great improvement over the last. Its enthusiastic reports should not be doubted. Disadvantages, amongst which the observed redness, or dermatitis venenata, of the skin and grave itching are the most obvious, justifies a search for further perfection.

The reported series of ninety cases treated with benzoyl benzoate-sapo mollis-alcohol, compared with an approximately equal number of aforementioned, justifies optimistic conclusions.

CONCLUSIONS

1. The benzoyl benzoate cure was the most effective in these two series.
2. It is simple and cheap.
3. Secondary effects, like dermatitis venenata, were absent, itching negligible.
4. Impetinginized scabies lesions, which responded strikingly with the benzoyl benzoate cure, were protracted or aggravated with sodium thiosulphate plus hydrochloric acid.
5. The safety margin of benzoyl benzoate "cure" has a great advantage over that of the sodium thiosulphate cure, particularly where "misunderstandings" have occurred.
6. In a few cases, the "one application" method with benzoyl benzoate has been promising, and is being tried out.

DISCUSSION

Henry J. Templeton, M. D. (3115 Webster Street, Oakland).—The old orthodox treatment of scabies by means of sulphur ointment is open to several objections. As pointed out by Kingston,[1] it occasionally fails to kill the acari even after proper application. I have noted this same drawback in a number of cases. Next, it produces a fairly high incidence of sulphur dermatitis, and, lastly, it is "messy" and time-consuming.

The method described by the author would seem to materially simplify the treatment of scabies. I have used it in about a dozen cases in my private practice, and with considerable satisfaction; but many more cases must be treated and results appraised before we finally can evaluate it.

⁂

C. Russell Anderson, M. D. (1930 Wilshire Boulevard, Los Angeles).—Any improvement in the treatment of scabies is welcome, and I am sure that every physician will appreciate the points brought out in Doctor Ingels' study.

He mentions the tenacity of sulphur dermatitis, whose duration at times varies from four to six weeks in spite of all types of soothing applications. Pyrethrum ointment has been used with success by some physicians. Although sulphur dermatitis is then avoided, many dermatologists hesitate to use it for fear of producing a pyrethrum sensitivity, which would be disastrous in view of the widespread use of pyrethrum in insecticides.

The short period of treatment with the benzyl benzoate mixture, the simplicity of application, the uniformly good results, and the relative freedom from treatment dermatitis, merit the attention of every physician who has occasion to prescribe for scabies.

⁂

Harry E. Alderson, M. D. (490 Post Street, San Francisco).—I am glad that Doctor Ingels mentioned the difficulty that one experiences in obtaining complete coöperation on the part of the patient and family. Such a little oversight as that of failing to clean the toilet seats thoroughly may account of recurrences. I believe that the spread of scabies in schools is often due to contamination of toilet seats. The tendency for sulphur dermatitis to develop promptly in some patients increases our difficulties. Many patients, before consulting a dermatologist, have already tried various neighborhood and drug-store remedies containing sulphur, and, of course, promptly feel the bad effects of further sulphur medication.

The sodium thiosulphate and acid combination is quite useful, but we see too many recurrences, or, shall we say, failures to achieve a complete cure by this method.

The benzoyl benzoate treatment has proved its usefulness, but even that method is not 100 per cent effective. In some countries plain balsam of Peru has been used, having the patients anoint completely the entire body, and good results thereby are obtained; but frequently renal irritation has developed. The benzoyl benzoate, a derivative of balsam of Peru, might be expected to produce toxic effects, but so far I have not observed any. I believe the method is quite valuable, and shall continue using it in cases where good coöperation can be obtained, but I expect also to have to use sulphur in some cases.

ROENTGEN DIAGNOSIS OF DISEASES OF THE ILEOCECAL REGION OF THE GASTRO-INTESTINAL TRACT*

By Joseph Jellen, M.D.
Los Angeles

Discussion *by Charles M. Richards, M. D., San Jose; Henry Snure, M. D., Los Angeles.*

PART II†

NONSPECIFIC ULCERATIVE GRANULOMAS (REGIONAL ILEITIS)

SINCE the description of regional ileitis in 1932 there has been an active interest in the subject of benign inflammatory granulomas. In a previous communication[3] the writer presented a detailed study of the clinical, pathological, and roentgen

---

† Part I of this paper appeared in the issue of March, 1939, on page 188.

findings in a series of fifty cases, and the reader is referred thereto for a comprehensive discussion of the subject. Pathologically, the disease is characterized by a cicatrizing inflammatory process, which produces extensive stenosis of the intestinal lumen. There is a definite predilection for involvement of the terminal ileum in a large majority of the cases. However, the disease may involve other portions of the gastro-intestinal tract. A similar pathological process has been noted in the jejunum and in the proximal portions of the ileum. In some cases there is extension of the granuloma from the terminal ileum into the colon. In other instances the granuloma of the ileum is associated with a nonspecific ulcerative colitis. External and internal abdominal fistulae are often present. The disease is most often seen in young adults. Abdominal cramps, diarrhea, and loss of weight are the most frequent symptoms. At times the symptoms are minimal, and consist of mild abdominal discomfort. On physical examination, a palpable mass is often found, usually in the right lower quadrant of the abdomen. On all suspected cases, special study of the small intestine is advisable. A satisfactory procedure is to take films at two, four, six, and eight hours after the ingestion of the barium meal. The essential roentgen finding is the demonstration of a narrow and stenotic segment of intestine. The treatment of these inflammatory granulomas is surgical, and resection of the diseased intestine is indicated. This procedure usually results in a cure.

SECONDARY INFLAMMATORY GRANULOMAS

Inflammatory granulomas secondary to appendicitis, typhlitis, and diverticulitis have been described in the literature. Donchess and Warren [4] reported a granuloma involving the cecum and ascending colon, which apparently developed from appendicitis. They mentioned twenty-four cases of granulomas involving the cecum and colon. In seven of these the ileum was also involved. In these secondary granulomas, there is usually thickening and induration of the cecum, pericecal adhesions, and enlargement of the regional lymph nodes, all of which contribute to the palpable mass which is often present clinically. There is usually no mucosal ulceration, a point which differentiates them from a primary nonspecific granuloma, such as regional ileitis. Clinically, these patients complain of recurrent abdominal pain or the presence of a mass in the abdomen. The roentgen examination reveals cecal irregularity, with narrowing of the lumen. At times a semilunar filling defect in the cecum is noted, resulting from pressure of the adjacent inflammatory mass.

PERI-INTESTINAL GRANULOMAS

Granulomas of the intestine which develop secondary to slowly perforating lesions of the bowel are usually caused by a foreign body, such as a fishbone or toothpick. These inflammatory masses are peri-intestinal, and do not encroach on the intestinal lumen. There is no mucosal ulceration. Clinically, these cases present themselves with a palpable mass in the abdomen. Because of the absence of intramural involvement of the bowel in this type of granuloma, the barium meal and enema are usually negative. Occasionally, there is persistent spasm of the intestine adjacent to the lesion. At operation these granulomas resemble malignancy. On examination, however, they are found to be benign inflammatory masses. The etiologic foreign body is often found imbedded in the granuloma.

LYMPHOBLASTOMA

Hodgkin's disease, lymphosarcoma, and follicular lymphoblastoma are all considered in the group of lymphoblastoma. These tumors may involve various parts of the gastro-intestinal tract. They are most commonly found in the ileocecal region. Grossly, the lesions appear as annular, polypoid, or subserous growths. In lymphosarcoma there is a rather characteristic tendency to aneurysmal dilatation of the lumen of the involved segment of intestine. Stenosis of the bowel, when present, is usually due to pressure from metastatic glands in the mesentery. The gastro-intestinal symptoms are not charcteristic. When the growth is of the polypoid type, a mass may be palpable in the abdomen. The clinical picture is often that of acute or chronic intestinal obstruction. There does not appear to be any characteristic roentgen appearance. In some cases with a polypoid growth there is a filling defect in the involved area. In others, where the disease is infiltrative, there are irregular areas of constriction and dilatation in the intestine. The presence of a localized dilatation of the intestine, associated with a palpable mass, is suggestive of lymphosarcoma. When the cecum is involved, thickening and distortion of the mucosal markings may be noted. Coincident lesions of the stomach and intestine suggest the possibility of lymphoblastoma. In a series of 107 cases of gastro-intestinal lymphoblastoma, associated lesions of the stomach and intestine were found in 28 per cent. In many cases of suspected lymphoblastoma, the diagnosis is facilitated by the presence of generalized glandular or splenic enlargement. In others the presence of an associated mediastinal tumor makes the diagnosis evident. At times the diagnosis may rest on the biopsy of a palpable lymph node.

APPENDICEAL INFECTIONS

The diagnosis of a chronic appendicitis is occasionally offered by the roentgenologist. Fixation of the appendix, associated with definite localized tenderness of the visualized appendix, constitute the most valuable signs. In addition, kinking of the appendix, irregular narrowing of the lumen, segmentation of the barium shadow, and stasis of barium in this organ, offer additional evidence of a diseased appendix.

We have observed a moderate number of cases of calcified appendiceal fecaliths. These were seen on the flat plate of the abdomen, taken on suspected cases. They are noted as small calcific shadows present in the right lower quadrant of the abdomen. They measure up to one centimeter in diameter. Occasionally they are almond-shaped, and at times a laminated structure can be demonstrated.

In cases of appendiceal abscess, there is usually a tender palpable mass present in the right lower quadrant of the abdomen. This is demonstrated on the roentgen examination by the presence of a smooth semilunar, pressure defect on the medial aspect of the cecum. It is occasionally associated with displacement of the terminal ileum by the adjacent mass.

INTUSSUSCEPTION

Intussusception is occasionally present in the proximal portion of the colon, and may be of either the ileocecal or cecocolic type. Approximately one-third of the cases are associated with a neoplasm, which is more often benign than malignant. Cases of acute intussusception are usually not referred for roentgen examination, whereas chronic intussusception in adults is occasionally observed. Very often there is a palpable mass present in the abdomen, and blood may be noted in the stools. The roentgen aspects of subacute and chronic intussusception are quite characteristic. There is obstruction to the passage of the barium, demonstrated either by barium meal or enema. A filling defect is noted at the sight of the obstruction. In addition, a characteristic crecentic compression of the mucosal folds in this region is apparent, produced by the invagination of the bowel.

DIVERTICULITIS

Diverticulae are occasionally present in the cecum and ascending colon. In some cases there are solitary; more often there is generalized diverticulosis of the colon. Diverticulae of the cecum and ascending colon without symptoms, are sometimes found as coincidental lesions in gastro-intestinal cases. When there is an associated inflammatory process (diverticulitis), definite symptoms are usually present. To date, approximately twenty cases of primary solitary diverticulitis of the cecum have been reported in the literature.

MESENTERIC ADENITIS

Enlargement of the mesenteric glands is most often encountered in children. The condition may be secondary to various conditions. At times it is associated with acute respiratory infections. In some cases it is secondary to inflammatory ileitis. In tuberculous adenitis the process may progress and end in caseation. If healing occurs, calcification is often the end-result. Patients with mesenteric adenitis are often asymptomatic. At times there is a history of intermittent abdominal pain, and if seen during an acute attack the clinical picture simulates acute appendicitis. Golden[5] has described changes in intestinal physiology associated with calcified mesenteric adenitis. Localized spasm and delay in motility have been noted in adjacent intestinal segments.

LOCALIZED ULCERATIVE COLITIS

Ulcerative colitis may be localized and confined entirely to the proximal portion of the colon, without radiological or sigmoidoscopic evidence of generalized colitis. Amebiasis and tuberculosis are the most common specific causes of proximal colitis. In many instances the condition is apparently nonspecific. In some cases there is retrograde extension and involvement of the terminal ileum. As in generalized colitis, abdominal pain, diarrhea, and bloody stools are the most common complaints. Localized hyperplastic ulcerative colitis, involving the proximal colon, has been described in the literature. In these cases the ulceration is associated with polypoid changes in the mucosa and thickening of the wall of the colon in the involved area. A mass is often palpable clinically. The roentgen examination reveals contraction and narrowing of the cecum and ascending colon, associated with marginal irregularity. In addition, localized irritability and hypermotility are usually present, with distortion and obliteration of the normal mucosal pattern. The changes are more extensive than those seen in malignant disease, and usually are not confused with it.

COMMENT

In view of the large number of disease entities which affect the ileocecal region, it should be recognized that this portion of the gastro-intestinal tract is just as important as the stomach and duodenum, where most of the attention is focused during the routine gastro-intestinal examination. Unless detailed study is made of the ileocecal region, many lesions will pass unrecognized. Many of the hyperplastic lesions are characterized by the presence of a palpable mass in the right lower quadrant of the abdomen, which is usually of obscure origin, and often erroneously designated as carcinoma. It is only after a careful consideration of all the possibilities, coupled with a study of the clinical history and laboratory findings, that one can hope to arrive at the proper diagnosis. It is the writer's opinion that diseases of the ileocecal region offer more difficulty in roentgen diagnosis than any other topographical branch of gastro-enterology.

DISCUSSION

Charles M. Richards, M.D. (303 Medico-Dental Building, San Jose).—The roentgen examination of the cecum and terminal ileum is too frequently passed over in a more or less perfunctory and routine manner. When the clinical history, which should be provided for the roentgenologist, points to symptoms in this region, the examination deserves to be made with painstaking care.

Doctor Jellen has given us a very comprehensive review of the pathological conditions commonly met with in this region, and some of the less frequent ones. Even a glance at this impressive list should give the roentgenologist reason to give this region its due share of consideration, and the clinician could also study it with much profit to his patients.

A few points concerning pathology in the ileocecal region stand out as particularly important in my mind. First, we, as roentgenologists, must be impressed with the importance of taking the extra pains sometimes necessary to observe the course of the barium meal at odd intervals so as to catch the optimum time for examining the ileum in its relation to the cecum and other contiguous structures. This extra care will occasionally be rewarded by the discovery of signs of great importance.

It used to be the habit of most of us to pass over, with little or no consideration, the discovery of calcified mesenteric lymph nodes. It has been shown us by some investigators, and I have had occasion to corroborate the fact that chronically or acutely inflamed mesenteric lymph nodes may be at the bottom of a train of symptoms for which too often a fruitless appendectomy has been performed.

One other observation which has many times impressed me, and which Doctor Jellen has not stressed, is that the large, hypotonic, sagging, poorly drained cecum, so often seen, which, due to the fact that it is seldom, if ever, fully emptied, becomes chronically irritated and remains to plague the patient with a painful right lower quadrant long after the removal of an appendix is supposed to have eliminated the source of trouble.

If Doctor Jellen had done no more than compile the classified list of pathological conditions to be found in the ileocecal region, he would have done us all a real service.

⁂

Henry Snure, M. D. (333 South McCadden Place, Los Angeles).—Lesions of the ileocecal region, as the author states, present a difficult problem in diagnosis even with the aid of a roentgenologic study, particularly when pain and palpable mass in the lower right quadrant are present. If the case is a chronic one, ample time for the complete roentgenologic study may be available and the correct diagnosis arrived at. Too often in hospital work the patient is admitted as an emergency with a request for a scout film of the abdomen to rule out obstruction and is in no physical condition for a prolonged roentgen study; many times a prompt exploratory operation is advisable rather than any further roentgenologic examination which may or may not provide a correct answer as to the type of pathology present.

Several years ago I made films of an infant, showing free air in the abdomen. Autopsy later showed a pin-point perforation of the cecum, the cause of which could not be determined. In this case operation was promptly done, but did not save the patient's life nor establish definitely the cause of perforation.

Doctor Jellen lists some forty types of lesions that may be present in the ileocecal region; fortunately some of these lesions occur rather infrequently, thereby reducing the percentage of possible errors in diagnosis. One point that should be emphasized is that the lymphoblastomas give no characteristic roentgenographic appearance. The diagnosis is usually made by biopsy at the time of operation.

I was glad to hear Doctor Jellen state that the diagnosis of chronic appendicitis is only occasionally offered by the roentgenologist; the various changes in the roentgenographic shadow of the appendix are of little value, location of pain point over the appendix and that shifts with the appendix is of value. He also states that the roentgenographic appearance of an appendiceal abscess is usually a smooth pressure defect on the mesial side of the cecum. However, I have occasionally found an irregular defect of the cecal outline laterally in appendiceal abscess that suggested carcinoma.

The author deserves credit for the very thorough and comprehensive manner in which he has presented the lesions of the ileocecal region.

VITAMIN-DEFICIENCY STATES: THEIR RECOGNITION AND TREATMENT*

By Dwight L. Wilbur, M.D.
San Francisco

Discussion *by William C. Boeck, M. D., Los Angeles; Albert H. Rowe, M. D., San Francisco.*

PART II†

DEFICIENCY OF P-P FACTOR (VITAMIN G, B_2, NICOTINIC ACID?)

Symptoms.

Deficiency of this factor leads to the development of pellagra, the characteristic symptoms of which are three D's—diarrhea, dementia, and dermatitis—but these occur simultaneously in severe cases only. Perhaps the most characteristic feature is the dermatitis, without which the diagnosis is questionable. The cutaneous lesions consist of a dermatitis suggesting sunburn; a reddened, dirty brown skin, parchment-like, rough and scaling and affecting principally the exposed surface, especially the backs of the hands, wrists and forearms, usually in a symmetrical fashion. The face, neck, genitalia, and legs may be similarly affected. Gastro-intestinal symptoms which accompany pellagra are variable, although severe glossitis and diarrhea are the most common. The stomatitis may consist of a brick-red color of the tongue, gums and cheeks, or there may be, in addition, considerable edema, ulceration, and exudation. Diarrhea may be intractable. Anorexia, vague abdominal distress and, at times, constipation may be present. Loss of weight is common, as are also nervous symptoms such as those of peripheral neuritis or of neurasthenia, namely, exhaustion, lassitude, and insomnia. The occurrence of any of these symptoms, accompanied by dermatitis of the type mentioned, should suggest the possibility of pellagra.

Diagnosis.

The diagnosis of pellagra depends entirely on the symptoms. While diagnostic and laboratory tests have not been developed, therapeutic test with nicotinic acid is proving of considerable diagnostic value.

Mild degrees of deficiency of the P-P factor are not clear-cut and little is known about them. The occurrence of otherwise unexplained glossitis, or vague gastro-intestinal symptoms with diarrhea, with or without symptoms referable to the nervous system, have been thought by some observers to be due to early pellagra or deficiency of vitamin G, (B_2). The therapeutic effect of nicotinic acid in such cases may be of considerable diagnostic value if psychic influences can be controlled.

Treatment.

The daily requirement of the P-P factor or of nicotinic acid is unknown; nevertheless, the treatment of pellagra has become very effective, largely as a result of the work of Spies and his associates. It has been shown that the effective measures in treatment are a diet high in calories, proteins and vitamins (3,500 to 4,000 calories), supplemented by nicotinic acid in doses of 500 to 1,000 milligrams, by thiamin chlorid in doses of 20 to 50 milligrams, by powdered brewers' yeast in doses of 75 to 150 grams, or by dilute liver extract in doses of 25 to 75 cubic centimeters daily. Early in the course of the treatment the vitamin supplements may be administered parentally to those patients who, because of a sore mouth or vomiting, cannot tolerate an adequate diet. Bed rest, good nursing care and symptomatic treatment, consisting of sedatives, antiseptic solutions (such as potassium permanganate 1:5000 applied to the skin, and tincture of opium in large doses to control diarrhea), are also valuable adjuncts in treatment.

Since pellagra of the secondary type occurs not uncommonly in association with organic lesions in the gastro-intestinal tract, particularly with those which produce obstruction and with malignant disease of the stomach and colon, it is important to exclude gastro-intestinal disease before dismissing the patient.

Anemia—Abnormalities in the Gastro-Intestinal Tract.

Little is known of the etiologic factor or factors leading to the development of a macrocytic anemia, which is commonly observed in pellagra, beriberi, and other cases of deficiency of the vitamin B complex. The relation between this type of anemia and that of pernicious anemia is also not clear. How-

---

Mild (Preclinical?)	Uncertain Above in milder form	Unknown	

ever, some factor in the vitamin B complex, but not thiamin, seems responsible for the macrocytic anemia of pellagra, beriberi and similar deficiency states.

Apparently gastro-intestinal symptoms, such as anorexia, glossitis, achlorhydria, hypomotility and hypotonicity, particularly of the small intestine, and diarrhea, are commonly associated with deficiency of the vitamin B complex. In some patients the clinical picture is characteristic of pellagra, in others it is not. Whether deficiencies of thiamin and of nicotinic acid will explain all of these symptoms is not clear.

VITAMIN C

Symptoms.

The most readily appreciated symptoms of deficiency of the antiscorbutic vitamin have to do with hemorrhagic phenomenon. This is due to the fact that the fundamental pathologic change in vitamin C deficiency is in the intercellular substance, particularly of the blood vessels, with softening of this substance which leads to hemorrhage into the subcutaneous, subperiosteal, gingival and other tissues. It has been observed that the intercellular substance, which ordinarily exists as a solid or gel, under circumstances of vitamin C deficiency may soften and become a liquid. Consequently, there has been much discussion of the possible rôle of vitamin C deficiency in acute and chronic hemorrhagic phenomena of the so-called "essential" or idiopathic type, and as to whether vitamin C deficiency may be a contributing factor in leading to hemorrhages in cases of peptic ulcer, menorrhagia, essential hematuria, subdural hematoma, and so forth. (Table 7.)

Vitamin C deficiency has also been connected with dental caries, anemia, and with increased susceptibility to infections. Most patients with infections require vitamin C in larger than usual quantities if normal levels are to be maintained in the blood and if normal quantities are to be excreted in the urine. Most observers are inclined to the opinion that this is due to the increased demand for vitamin C as a result of the infection, while others are inclined to the belief that a state of partial vitamin C deficiency may have predisposed to the development of the infection.

Diagnosis.

The clinical diagnosis of scurvy is relatively simple in a well-developed case. However, the clinical diagnosis of latent or preclinical scurvy is not so easy, although it may be suspected in patients who have unexplained hemorrhages of any type or in any situation, who have long-continued infections, or who have considerable dental caries. It is exceedingly important to emphasize that such conditions do not establish the diagnosis of vitamin C deficiency, but only suggest the possibility of it.

Fortunately, we possess better methods of determining the presence or absence of partial deficiency of vitamin C than of any other vitamin. These methods include the capillary resistence test, roentgen-ray studies of bones, intradermal test, studies of the levels of vitamin C in plasma and of the excretion of the vitamin in the urine, and vitamin C tolerance tests.

One simple method of performing the capillary resistance test in the office is to mark an area on the skin, 60 millimeters in diameter, in the anticubital fossa of one forearm. Following this, venous stasis is produced for fifteen minutes with a sphygmomanometer cuff at a pressure of 50 millimeters of mercury. If more than eight petechiae develop on the marked area the test is positive; if less than five develop, it is negative. Although this test is not specific, it is suggestive, and if positive in a case in which vitamin C deficiency is suspected, it should lead to studies either of vitamin C saturation or to treatment with vitamin C.

Methods of determining the vitamin C content of the plasma and the urine depend on the titration of these fluids with the indicator, 2–6 dichlorophenolindophenol. The titration of the urine is relatively simple and may be done in the physician's office if proper precautions are taken to preserve the urine in a dark bottle containing 10 per cent by volume of glacial acetic acid. The amount of vitamin C excreted in the urine by the normal individual in twenty-four hours is approximately 20 to 30 milligrams, while the vitamin C content of the blood plasma of the normal individual is in the neighborhood of 0.7 to 1.3 milligrams per hundred cubic centimeters of blood.

The most satisfactory method of determining vitamin C deficiency is in a measure of these levels and in an estimation of the tolerance of the patient to a test dose of vitamin C.

The diagnosis of very mild states of vitamin C deficiency depends entirely on such a chemical determination because clinical symptoms are lacking in these cases. There has been considerable discussion of the real clinical significance of such abnormal tests, for, as Finkle has pointed out, a fairly large proportion of the population suffers from an undersaturation of vitamin C. He believes that as yet there is no evidence to justify the conclusion that vitamin C deficiency has a causal relation to any pathologic condition other than scurvy.

Treatment.

Vitamin C deficiency may be avoided by intake of a diet adequate in fresh fruits, particularly of the citrus variety, and vegetables. The minimal intake necessary to prevent signs of deficiency is

TABLE 8.—*Vitamin D Deficiency*

Degree of Deficiency	Clinical Signs	Incidence	Tests
Marked	Rickets Osteomalacia	Common Rare	1. X-ray of bones
Moderate	Rickets Dental caries Inadequate mineralization of bone Tetany	Common (50-90 per cent of infants)	2. Blood phosphatase 3. Therapeutic
Mild (Preclinical?)	Uncertain (Above in milder forms?)	Unknown	

not certain, but probably approximates 20 to 40 milligrams daily.

In the treatment of deficiency the diet should be high in its content of the above-noted foods, which may be supplemented by the administration of vitamin C in synthetic crystalline form, by mouth or intravenously, in doses of from 50 to 200 milligrams. In cases with hemorrhage in which rapid saturation of the tissues with vitamin C is desired, larger doses, such as 1000 milligrams, may be given daily for two to three days and then reduced to levels of from 100 to 300 milligrams daily until the therapeutic response is complete.

VITAMIN D DEFICIENCY

Symptoms.

Vitamin D is the antirachitic vitamin which plays an essential rôle in the metabolism of calcium and phosphorus, and has to do in particular with the retention of calcium and phosphorus in the body, in the deposit of these substances in bones and, perhaps, in the concentration of these elements in the blood. (Table 8.)

Rickets is such a widespread condition in infancy (50 to 90 per cent of infants are stated to have it) that it may be classified as probably the most common deficiency disease. Vitamin D deficiency in adults may lead to osteomalacia, which is very rare in the United States. It is probable also that certain forms of osteoporosis, of tetany, and possibly of dental caries, are the result of vitamin D deficiency, either because of an inadequate diet or because of interference with absorption of the vitamin or of calcium from the intestine.

Diagnosis.

The diagnosis of rickets is usually simple. When the classical symptoms are present, the diagnosis is obvious clinically. In cases in which the symptoms are less clear-cut, the diagnosis may be suspected clinically and confirmed by roentgenologic studies of the bones. Further confirmatory evidence may be obtained by determination of the blood phosphatase, which usually is increased in rickets. The therapeutic test with the administration of vitamin D may be helpful in establishing the diagnosis.

States of partial deficiency of vitamin D may be suspected if persons have dental caries, tetany, frequently occurring fractures or osteoporosis of the bones. During pregnancy or lactation, and among patients who are jaundiced or who have abnormalities of intestinal absorption such as occur in celiac disease and sprue, deficiency of vitamin D is most likely to be present. Whether the deficiency in such cases is the result of deficiency of calcium or phosphorus, or of abnormalities in function of the parathyroid glands may be difficult to determine. The administration of vitamin D may be helpful in distinguishing osteoporosis which is on a basis of deficiency from other types of osteoporosis, but a satisfactory response does not necessarily prove that the osteoporosis is attributable to vitamin D deficiency alone.

Treatment.

While there are at least ten different sterol derivatives which exhibit the properties of vitamin D, only two of these are known to be of prime importance in medicine. These are activated ergosterol or calciferol, which is the vitamin D of viosterol, irradiated yeast and yeast milk, and 7-dehydrocholesterol, which is the chief sterol of animal fats.

Rickets may be prevented by supplying the infant each day with one of the following: (1) two standard teaspoonfuls of cod-liver oil, which meets the requirements of the New and Nonofficial Remedies (1936); (2) one quart of milk containing 400 U. S. P. units of vitamin D to the quart; (3) five drops of viosterol (1.125 U. S. P. units); (4) irradiation of the skin with ultraviolet light.

In the treatment of rickets, a dose of twenty drops of viosterol (4500 U. S. P. units) or a similar number of units of vitamin D in another form is effective. Vitamin D may be supplied also in the

TABLE 9.—*Vitamin Deficiencies*

Vitamin	Average Daily Requirement		Average Daily Therapeutic Dose	
	International units	Milligrams	International Units	Milligrams
A	4,000-10,000		25,000-75,000	
B_1	200-500	1.0-2.0*	3,300-13,000	10-40
C	800-2,000	40-100	1,000-20,000	50-1,000
D	400-1,500 [1] 4,500 [2] Unknown [3]		3,000-4,000	
G (B_2)			300-500 milligrams nicotinic acid 10-100 grams brewer's yeast 10-75 cubic centimeters dilute liver extract	

* Mg. of synthetic HCl [1] Average full-term infant [2] Premature infant [3] Child and adult

Table 10.—*Protective Foods Which Serve as a Foundation for a Normal Diet (Daily Quantities)*

Meat, fish or fowl	1 serving (about 2 ounces)
Butter	1 tablespoonful

form of fish-liver oils, or irradiated yeast, milk and cereals, of milk to which a concentrate of vitamin D has been added or by irradiation of the skin.

In adults with senile osteoporosis, ten drops of viosterol three times daily in conjunction with four drams of calcium lactate or tribasic calcium phosphate three times daily often will relieve symptoms.

DEFICIENCIES OF OTHER VITAMINS: VITAMIN E

At least three substances possess the effect of vitamin E, but as yet it has not been clearly demonstrated that any of them is required by man for normal health or in reproduction. Of principal clinical interest is the possible etiologic rôle of deficiency of vitamin E in threatened and spontaneous abortion, and of an excess of the vitamin in malignant disease. It is difficult to obtain proof that vitamin E is of value in the treatment of sterility and habitual abortion in human beings, and much more evidence is greatly needed to establish the usefulness of vitamin E in abnormal human reproduction.

VITAMIN K

Apparently the antihemorrhagic factor, known as vitamin K, may play some rôle in the production of prothrombin, for in certain species of animals deficiency of vitamin K leads to a decrease in the prothrombin content of the blood. In considering the possible therapeutic use of vitamin K in patients with jaundice it has been suggested that it is of value because the prothrombin deficiency of such patients may be due to deficiency of vitamin K, since vitamin K is fat-soluble and there is frequently interference of absorption of fat in patients with jaundice. Vitamin K is not available on the market, but substances rich in it are green vegetables, pig-liver fat, hemp seed, and alfalfa.

USE OF VITAMINS

Use of Vitamins in Persons Who Are Chronically Fatigued, Rundown, Underweight, Below Par or Subject to Frequent Infections.

The diagnostic and therapeutic problems presented by patients who fall into this group are often very difficult to solve. It goes without saying that great care must be used to exclude the presence of an underlying organic disease when these symptoms are present, and adequately to treat it. It is probable that, of the patients who fall into this group, a certain number will present no distinguishable organic disease. Some of this latter group of patients may be benefited by administration of vitamins while other patients may not, depending on whether or not in a particular case the symptoms are due to vitamin deficiency and depending to some extent on psychic influences.

How is one to tell which patients will do well and which poorly on vitamin therapy? There is no clear-cut way to distinguish between these groups at the present time. However, the history of an inadequate diet, the presence of symptoms or findings of mild deficiency states or the occurrence of abnormal responses to some of the diagnostic tests previously mentioned may be helpful in determining the patients who may benefit from vitamin therapy.

It is important to recall that the conditions we discussing are symptoms rather than diseases, and that it is essential to treat any underlying cause of them. It is no more sensible to give vitamin therapy to all such patients and to expect good results than it is to give aspirin to all patients with headache, codein to all who cough, or opium to all who have diarrhea.

COMMENT

Finally, too much stress cannot be placed on the importance of an adequate diet in the prevention and treatment of deficiency diseases. It has been well said that the grocery store is more important than the drug store in the prevention and treatment of these conditions. In the treatment of some deficiency states, crystals and concentrates of some of the vitamins are available and, while these products are extremely useful, they should always be supplemented by vitamins in the natural state, *i. e.*, in foods, yeast, cod-liver oil, and so forth, not only because this is the way in which vitamins ordinarily are obtained by normal persons, but especially because there are present in foods certain essential substances which have not only not been synthesized or concentrated, but of which at present we are only vaguely aware. (Tables 9 and 10.)

490 Post Street.

DISCUSSION

William C. Boeck, M. D. (2210 West Third Street, Los Angeles).—I agree heartily with the substance of Doctor Wilbur's excellent paper on the very timely subject of vitamin-deficiency states.

I have been led to look upon vitamin-deficiency states of two kinds, namely, (1) clinical and (2) subclinical or "preclinical," depending upon the degree of deficiency that exists.

Clinical vitamin-deficiency states comprise the well-known group of avitaminoses with their classical, characteristic symptoms, signs and pathology. In this group we recognize such avitaminoses as xerophthalmia and hemerolopia (vitamin A deficiency); beriberi (vitamin B_1); scurvy (vitamin C); rickets (vitamin D), etc.

The suspicion that these conditions might exist in a given patient comes from a good history of an inadequate intake or absorption of food rich in the specific vitamins. These deficiency states, the clinical avitaminoses, are not difficult to diagnose, since each has its own characteristic syndrome and pathology, but there is a feeling that vitamin-deficiency states of mild degree exists, which are often not clear syndromes of symptoms and signs. These comprise the "subclinical," or, as Doctor Wilbur calls them, "preclinical" vitamin-deficiency states.

We read of the protective action of vitamins A and C against infections in general, in pneumonia, myasthenia, and treatment of rheumatoid arthritis, to immunity processes, hemorrhage, purpura, anemia, dental caries, etc.; the relation of vitamin B_1 to such conditions as anorexia, cardiac irregularities, atonic constipation, diarrhea, edema, low-serum proteins, fatigue and asthenia, anemia, lactation, growth, etc.; the relation of vitamin D to nervous irritability, asthenia, to tubercular resistance and other infections, calculi, caries, etc.; and the relation of vitamin E to sterility, impotence, miscarriage, asthenia, loss of vigor and weight, muscular atrophy, etc. One could go on almost indefinitely enumerating many other conditions which have been attributed to vitamin deficiency, until one might be almost convinced that all body ills are due to vitamin deficiency. Since the major portion of our population possesses some of the disturbances mentioned as characterizing some degree of vitamin deficiency, it is not surprising to learn that vitamin products rate fourth in value among drugstore sales, and that we appear to be in an era of a new fad—that of vitamins.

Obviously, the status of vitamins in this preclinical group of deficiency states has led to considerable confusion because of lack of (1) correct diagnosis, very often of the underlying cause, since the clinical improvement or cure which has been often erroneously attributed to the vitamin therapy, in these cases, may actually be due to some other corrected condition; (2) lack of uniform treatment of these conditions with vitamin-containing products has led to further confusion because the vitamin therapy has been variable as to method of administration, source of the vitamins used, and dosage employed in different standardized units.

That considerable confusion results from an incorrect diagnosis of the underlying functional or pathological disturbance is apparent at once. All cases of hemerolopia, or night blindness, are not due to vitamin A deficiency, for, as Frandsen and later Yudkin have pointed out, it occurs in persons with neurasthenia and hysteria, in poisoning from quinin, alcohol, nicotin, in retinitis and choroiditis, retinitis pigmentosa, glaucoma, excessive myopia, and many other conditions. Therefore, in considering treatment of persons showing hemerolopia by the biophotometer, the underlying cause must be determined.

It will do no harm to give vitamin A, since it is a food factor; but if improvement is noted it may not always be due to dietary treatment given. The ophthalmologist should also be called in to treat any underlying pathology or disturbance in visual acuity.

Again vitamin B_1 deficiency, as Cowgill states, does not explain all cases of anorexia, atonic constipation, edema, cardiac enlargement, fatigue, anemia, etc. To administer it in all such cases does no bodily harm, but it does not answer the question as to the etiology of the symptoms. One could go on with instances regarding the other vitamins, C and D, and B_2 as well, and come to realize that a correct diagnosis is the primary essential to an understanding of these cases before we can conclude they are always due to a preclinical state of vitamin deficiency.

We are handicapped in recognizing the mild states of vitamin deficiency because the clinical tests for vitamins A, B, C, and D are not available to everyone, and are based mostly on animal-growth observations, which admit of much variability at their best. There are, as yet, no well-recognized standards of value for the presence and excretion of these vitamins in normal human beings to serve as a dependable guide or basis for comparability. All this needs more investigation.

The treatment of vitamin-deficiency states, both clinical and preclinical, has caused more confusion: first, as to method of administration, by mouth as part of the diet rich in the particular vitamin, or parenterally by use of the purified product. For example, from 10 to 100 milligrams daily of thiamin chlorid have been used to cure polyneuritis of B_1 deficiency, but no one has shown how much is necessary; and large doses, while effective, may be too expensive at present for many patients.

The confusion has been added to by the fact that all vitamin products on the market, while purporting to represent so many units per gram, or cubic centimeter or tablet, are often deficient when subjected to animal-assaying procedures of standardization. This may be due to factors that are uncontrollable because animals are used, and because the United States Pharmacopeia reference standards may not yield all the vitamins they are supposed to yield. The purified vitamins will, doubtless, prove to be better reference standards in the future, but Williams feels that in the case of vitamin B_1 it will be difficult to find a satisfactory method of chemical assay, since it possesses no known physical property which is adopted to delicate testing. Better United States Pharmacopeia reference standards to determine vitamin units would also do away with the confusion still existing in reference to the labeling of these vitamin concentrates in different kinds of units; this practice, however, is becoming less prevalent.

May I summarize by stating: (1) That the clinical types of vitamin deficiency, the classical avitaminoses, are not difficult of diagnosis and treatment, because of their characteristic symptoms, signs, and pathology, although the matter of correct dosage is still obscure; and that (2) the "preclinical" types are difficult of diagnosis, because the symptoms are also those of other functional or pathological disturbances, and hence vitamin concentrates may be given, but often unnecessarily. This leads to confusion, but produces no bodily harm, although the patient may suffer an unnecessary financial relapse since vitamin products are expensive. (3) It is hoped that the future will provide beter methods for the detection of these preclinical vitamin-deficiency states, since the present methods of detection are not available to all, and are not based upon accurate standards. Then experimental and therapeutic procedures will be far more comparable, and therefore more valuable, because of uniformity of the source, dosage, and administration of the vitamin products. (4) Let us all keep in mind the substance of Doctor Wilbur's Tables 2 and 3, which afford a most excellent guide to the question of when we may suspect a state of vitamin deficiency, because if this guide is followed much unnecessary vitamin administrations will be avoided.

⁂

Albert H. Rowe, M. D. (490 Post Street, San Francisco).—The various manifestations and possible results of a deficient vitamin intake, so well discussed by Doctor Wilbur in his article, necessarily should be in the minds of all physicians in the study and treatment of patients, for avitaminosis is possible in any individual. Doctor Wilbur's emphasis of the mild or subclinical results of deficient vitamins is especially timely. The fact that absorption of vitamins naturally occurring in food, and of those administered orally, may not be adequate for metabolic requirements, must be appreciated. Because of this, the increasing accuracy of clinical and laboratory tests, discussed by Doctor Wilbur, which reveal probable deficiencies in the important known vitamins in the body, offers valuable information which makes possible proper dietary adjustments and indicated supplemental vitamin therapy. In the endeavor to protect all patients against vitamin and other dietary deficiencies, every history should contain information concerning the past and present habits of diet. In such dietary history, the average amounts of foods of all kinds and types taken during previous decades, and during the past few years, allow a rough, though clinically valuable estimation of the intake of necessary vitamins throughout life, and the likelihood of protein or mineral deficiencies which may have contributed to chronic or present symptomatology. Such a diet history, moreover, should record detailed information concerning possible food dislikes or idiosyncrasies which suggest possible mild or more severe food allergies.

Of great help in the determination of the vitamin content of a diet is the tabulated number of units of vitamins A, B_1, B_2, C, and D in 100-gram amounts of most foods assembled by the United States Department of Agriculture in 1937, as reported in Bulletin A-275. The units of the various vitamins have been determined by many investigations and experimental studies, and offer approximate though practical information. With the daily average requirements of the vitamins known, as listed by Doctor Wilbur and as published elsewhere, it is usually possible to arrange the diet so that proper amounts of ordinary foods can satisfy the vitamin demand of the body. Frequently, additional vitamin therapy, especially with vitamin D, is required, especially if long-existing deficiencies have been present. Such assurance of adequate vitamins in the diet, as well as of minerals and proteins, is especially necessary when the diet must be modified because of metabolic, allergic, gastro-intestinal, or other diseases. This is particularly important in the use of elimination or test negative diets for the study or control of food allergy, in which absolute assurance of adequate vitamins, proteins, minerals, and calories to satisfy the patient's nutritional requirements is mandatory.

THE LURE OF MEDICAL HISTORY†

TRUTH OVERTAKES "DOCTOR HUNTER"

By A. W. Meyer, M. D.
Stanford University

PART III*

WILLIAM'S MEDICAL COMMENTARIES

While in the Army Medical Library some months ago, I had opportunity to consult a reference in William's *Medical Commentaries* to which my attention had been directed by our departmental secretary, Miss Miner, who had found it in Haller. The page to which Haller referred carried a footnote, which would have required more than a page of space if printed in the same-sized type as the text, and accompanied a discussion "Of Absorption by Veins." In this note, William wisely emphasized a certain unreliability of injection methods, but, nevertheless, seemed to feel that they were entirely dependable in his hands and in those of Noortwyck, as contrasted to those of the Monros—*primus et secundus.* Before proceeding with the footnote it is well to recall the following comment from Paget about the Commentaries:

> . . . In 1762, the year John was in the Peninsula, William Hunter published his "Medical Commentaries. Part I": surely one of the strangest books that a physician or a surgeon ever wrote. From beginning to end, it is an incessant attack on those who discovered what the brothers also discovered; every device of italic type, notes of exclamation, and long quotations, interrogation and interjection, heavy sarcasm, charges of stupidity, falsehood, and flagrant theft—all these things make the book, and there is nothing else in it, hardly one line that is quiet. It was the method of controversy fashionable in his time, full of sound and fury. The points at issue lay between the brothers on the one side, and the Monros of Edinburgh on the other side; and to these disputes was added a controversy with Percivall Pott. The claims and counterclaims must be put here; but this is not the place to decide, even if it were possible, between the disputants.[15]

It is quite incorrect to say that there are nothing but disputations in the Commentaries. The footnote on page 52 alone shows this, and had Paget not overlooked or disregarded it he could not only have given a juster statement of the "claims and counterclaims," but would have settled a matter so long and so painfully at issue.

It was to the above page (52) that Haller had wisely referred when considering the idea of William, regarding the distinctness of the utero-placental circulations; for, instead of finding confirmation of this idea there, exactly the opposite is maintained in words that are truly surprising. The following is a verbatim copy:

> Anatomical injections have certainly improved physiology, and yet they have sometimes led anatomists into great blunders. From the simplicity of the art of injecting, any man who can fix a pipe and melt wax, may set about experiments of that kind, and may draw conclusions about the delicate and complex operations in the living body, from the event of a blundering experiment made upon a dead one. If his wax breaks through the vessels at any part, it will be a *direct proof* that there was a natural passage; and if by escaping at this *ready outlet*, it does not run into the smaller vessels, it proves clearly that no such small vessels exist, and that those anatomists who have seen them, and who have injected them, must have mistaken one thing for another. Our young Professor is one of those who make bold injections and bold conclusions. His father has the same pretensions to injections, and has the same knack of going on in the argument, whether the wax stops or runs. I shall give a specimen. He twice, in a bitch, injected the uterine vessels with mercury, and found that he had not thereby filled any vessels in the *placenta*; thence he concludes that in that animal the uterine vessels do not ramify through the *placenta*: and yet I find it as easy to prove by injections that they do, as that the mesenteric vessels go into the coats of the intestines. Having in this way established his supposition, that the uterine vessels do not in the human subject pass into the placenta and chorion, he afterwards found it would be necessary in support of his opinion to take off Noortwyck's authority, and therefore tells us that Noortwyck must have made *a mistake,* and is persuaded he will alter his opinion, *when the mistake is pointed out to him*; and, what is still better, concludes that Noortwyck *has afforded him a very pretty proof of there being no anastomosis between the vessels of the uterus and fecundines.* Professor Monro would only have you suppose that Dr. Noortwyck had mistaken the *uterus* for the *placenta* and membranes, and, in order to give his argument some plausibility, he has *egregiously misrepresented* the Doctor by substituting *one* word for *another* of a quite different meaning, in two of his quotations, and in a third has *coined a whole sentence* for him; etc. etc. Now the fact is, that Noortwyck was not mistaken, and is, we may presume, of the same opinion still, as it is impossible he should not believe his own eyes. I have seen his preparation, and can vouch for the truth of the greatest part of what he advances, not only from having seen that preparation, and from having conversed with him upon the subject, but *from my own experiments and observations on the human uterus, and those often repeated.*[16]

COLE'S COMMENTS

Here, then, is William in 1762 still insisting that the fetal and maternal circulations are continuous, yet as Cole said:

> In the description of his plates of the gravid uterus, published posthumously in 1794, William Hunter states he first injected the vessels of the fœtal placenta from the navel string in 1743, but it was only when the plates were first issued in 1774 that this experiment was described. He says that he injected the placenta with wax of different colours—the uterine arteries red and the veins blue, but none of the injection mass passed into the vessels of the navel string. In the 1794 publication further details are added. The placenta of man and quadrupeds, he remarks, is composed of two parts intimately blended—a fœtal element, which is the continuation of the umbilical vessels of the fœtus, and a maternal, which is an "efflorescence of the internal part of the uterus." . . . When the second Monro and William Hunter were students, it was still believed that the maternal blood circulated through the fœtus by the navel-string, and returned to the parental vessels, in spite of the positive demonstration to the contrary by the first Monro. Hunter's belief in injection methods was deeply strengthened by his visit to Albinus in 1748, when the beautiful preparations of the Leyden Professor fired the imagination of the Scots anatomist.[17]

WILLIAM HUNTER'S CONTENTIONS

Since William claimed that he had discovered the discontinuity of these circulations by injections made before 1754, it must surprise everyone that he now (1762) believed that they were continuous not only because of what he had seen of Noortwyck's injections but ". . . *from my own experiments and observations on the human uterus, and those often repeated,*" apparently made before 1754.

† A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

* Part I of this paper appeared in the issue of February, 1939, page 120, and Part II in the issue of March, 1939, page 199.

[15] *Ibid.*, pp. 56, 57.

[16] Hunter, William: Medical Commentaries. Part I. Chapter on "Of Absorption by Veins," p. 52.

[17] Cole, F. J.: The History of Anatomical Injections. Studies in the history and method of science, edited by Charles Singer. Pp. 333, 334. Oxford, 1921.

How very confusing this whole situation has been to those not familiar with this footnote is well illustrated by Teacher's (1900) statement that ". . . it is unreasonable to suppose that they [the injections] were figured then [1750], yet only understood in 1754,"[18] and by Garrison's statement that William's ". . . special discovery of the . . . separate maternal and fetal circulation, in which his brother had a part, is the foundation of modern knowledge of placental anatomy."[19]

One, unfortunately, cannot plead forgetfulness in defense of William. Although eighteen years had passed between the publication of the above footnote in the *Medical Commentaries* and the writing of his letter to the Royal Society, the topic long had been a live one. If it be true, as Cole implied, that William came to London believing in the unity of the uteroplacental circulations, the footnote of 1762 suggests that he probably continued to hold this view up to then. This is in accord with John's claim and also with the lecture notes of professed students of William. Moreover if, as stated to the Royal Society, William gave John "... all the little anatomical knowledge I could communicate" and that he actually had always treated the idea as his discovery in his lectures, John would have been aware of it and William could not have expressed himself as he did in 1762. However, he must have changed his mind between 1762 and 1766, although the "Gravid Uterus" of 1774 is ample proof that he did not even then care to assert what he so stoutly maintained in 1780 he had discovered before 1754!

I have always had the highest regard for William's abilities and accomplishments. His two excellent lectures on the history and value of anatomy, introductory to his last course, can well serve as a timely lesson to young men who wish to enter the field of surgery today. That he once thought well of Monro, Senior, is attested by words from his letter to his brother "Jamie." According to Paget (p. 40), he wrote: " . . . I cannot learn why you throw Monro out of your scheme. I really think his a good course, and so fit for you that I would by no means have you neglect it, except you cannot otherwise attend enough to pharmacy and surgery which are truly the chief points." But one is amazed to learn that he is said to have declared " . . . most philosophers, most great men, most anatomists, and most other men of eminence lie like the devil." He, himself, apparently did in one instance, and much to the discomfiture of John and the confusion of others. If his conduct will remind those who have followed in his errant footsteps that some time, somehow, Nemesis may yet catch up with them also, his sad example may continue to bear good fruit.

Paget said that one looks in vain for "some sort of an excuse" for John's ". . . astonishing communication to the Royal Society . . . and finds only such gossip as makes it worse. . . . We are still left wholly unable to see why he waited twenty-six years and then, when he was fifty-two years old, raised a storm over a dissection that he had made when he was twenty-six"; and, according to Garrison (1921): "Later in life, for some private or personal reason, he picked a public quarrel with the brother who had formed him and made a man of him, basing the discussion upon a quibble about a priority entirely unworthy of so great an investigator." John obviously did not raise a storm over a dissection, but over a discovery, and such a criticism in a deservedly popular history of medicine as that of Garrison not only blots the character of John and calls truth-telling quibbling, but publicizes and perpetuates untruth. Is it not possible that John, fully aware of William's true opinion as stated in the footnote of 1762, continued to believe that it was he who had made the discovery and, hence, felt that he owed something to the truth? Certainly everyone who values facts must be grateful to him for his candor, for otherwise we are forced to conclude that, after all, history is nothing but "bunk" as a well-known industrialist is reported to have said, or "lies" as a foremost American historian had previously declared.

John's claim not only has been distrusted but his delay in advancing it publicly has been criticized adversely. It should be recalled that he came to his brother as an untutored and unsettled lad, when the former was an accomplished anatomist and physician of high standing, only six years before the time John claimed to have made the discovery. Since the announcement of it to William was received by the latter with raillery, John may well have hesitated to make a public declaration at that time, out of deference to the opinion of his learned brother. Although John himself may not have attended the lectures of William in those years, he must have been greatly perplexed and perturbed by what those who did attend then reported and recorded regarding his brother's attitude on the question of the uteroplacental circulation. It is obvious that the time was right for action by John after William had written the footnote of 1766, but since John knew that the *Gravid Uterus* had long been in preparation, he may have felt constrained to await its publication because his brother might reiterate his erroneous idea there or else credit him with having advanced the correct one in 1754. The great acclaim accorded the publication of this unsurpassed atlas clearly made that time inopportune, but when a few years later the health of William began to fail, it was necessary for John to act in order to escape the onus of making his claim posthumously. Hence his communication, "On the Structure of the Placenta" to the Royal Society in 1780, only three years before the end of his brother's life and thirteen before his own.

IN CONCLUSION

I have called attention to this footnote not merely to exonerate John, but to reveal the truth as contained in the words of William, himself. It is perplexing how words which so seriously indict him and so effectively nullify his contention could have been overlooked or disregarded so long. Surely, "Une page de l'histoire ne doit pas être salie," and since William was the first so to soil it, it is fortunate that the page can be restored definitively by his own words.

Department of Anatomy.

CLINICAL NOTES AND CASE REPORTS

A TRANSFIXATION PIN FOR CANCELLOUS BONE

By F. Harold Downing, M.D.
Fresno

A SIMPLE and easily constructed transfixation pin is here reported which proved very useful in a fracture of the lateral condyle of the femur with upward and backward displacement.

The need for an open reduction in this type of fracture is well recognized, for only by an accurate replacement of the articular surfaces is it possible to obtain a perfectly functioning knee. Various screws, nails, bolts, etc., have been advocated in the past for fixation of this displaced fragment; however, it was not until recently that one was able to secure these in a metal that would not produce a foreign body reaction when buried in the tissues. Because of the closeness of this fracture to the joint, this factor is very important.

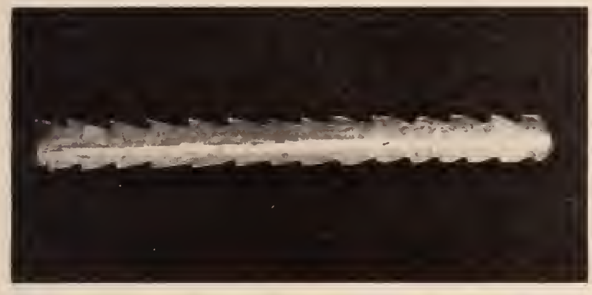

Fig. 1

Fig. 1.—Right angle stainless steel pin used in this case, photographed after removal.

"Eighteen and eight" stainless steel has been proved to be well tolerated by the tissues, and is now universally used in fracture work. With this knowledge, and because of the difficulty in obtaining the desired type of transfixation pin in this metal, the author was compelled to construct one himself. This was easily accomplished by obtaining a sheet of twenty-six gauge "eighteen and eight" (stainless steel) from the local sheet-metal shop, cutting off a strip about two and a half inches long and three-eighths of an inch wide, and bending this lengthwise at a right angle. The edges were then notched with a small triangular file. The end was slightly pointed and sharpened. A very sturdy pin resulted which, by its shape, could easily be driven into cancellous bone without much displacement of it and which, due to its right-angle surfaces, would make impossible rotation of the fragments upon each other, with the irregular edges preventing the pin from slipping backward. (Fig. 1.)

REPORT OF CASE

Case 1.—F. M., male, age twenty-four. Referred from Dr. Charlie M. Mathias of Tulare for a fracture of the lateral condyle of the left femur. Open reduction was performed on February 14, 1938, the fragment being exposed by a posterior lateral incision. The joint was opened and the lateral condyle of the femur was found to be pushed upward and backward. The external semilunar cartilage had been displaced medially into the joint, and its mid-portion was lying between the fragments. The semilunar cartilage was excised. The fragment was then replaced and the described transfixation pin driven through it into the opposing bone structure until the base of the pin was even with the bony surface. The fragment was found to be then solidly fixed into the desired position. The wound was closed in layers and a knee plaster applied. The postoperative convalescence was uneventful. Postoperative x-rays did not show, at any time, evidence of a reaction about the fixation pin. At the end of four months, the pin was exposed through an incision one and a half inches long and removed without difficulty by grasping its edge with a pair of pliers. The tissues showed no reaction about the pin, and the pin itself was as "shiny" as when it was inserted. The postoperative recovery was uneventful. Preoperative and postoperative x-rays are illustrated. (Figs. 2 and 3.)

SUMMARY

A simple and easily constructed, nonirritating transfixation pin is reported which proved to be of value in a fracture of the lateral condyle of the femur.

SUBPERIOSTEAL CALCIFICATION AND BONE-CHANGES IN EARLY SCURVY*

By Carl D. Benninghoven, M.D.
San Mateo

Early scurvy is sometimes confused with a suspected fracture by the clinician, but can be differentiated readily by x-ray films of the long bones. Most of the typical changes have been described in the monograph by Park, Guild, Jackson, and Bond.[1] These early classical roentgen signs are (1) a dense calcified lattice, (2) a zone of decalcification proximal to the lattice, (3) a cleft or crevice at the distal corners of the shaft, and (4) slight bagging at the distal margins of the shaft. These authors consider subperiosteal calcification a late roentgen sign of the disease. They also point out that these early roentgen signs are best demonstrated in postero-anterior studies of the wrists and knees, and lateral studies of the ankles. The distal ends of the ribs show the changes first; but these areas are difficult to x-ray satisfactorily.

The three cases presented show early clinical and roentgen signs of scurvy. The first case is atypical because of extensive subperiosteal calcification prior to the development of typical early roentgen signs in the diaphyses of the long bones. All three cases demonstrate the delay in the clinical relief of symptoms while under adequate antiscorbutic treatment, the delay of weeks before the bone changes due to scurvy are healed, and of several months before new bone has replaced the subperiosteal calcification.

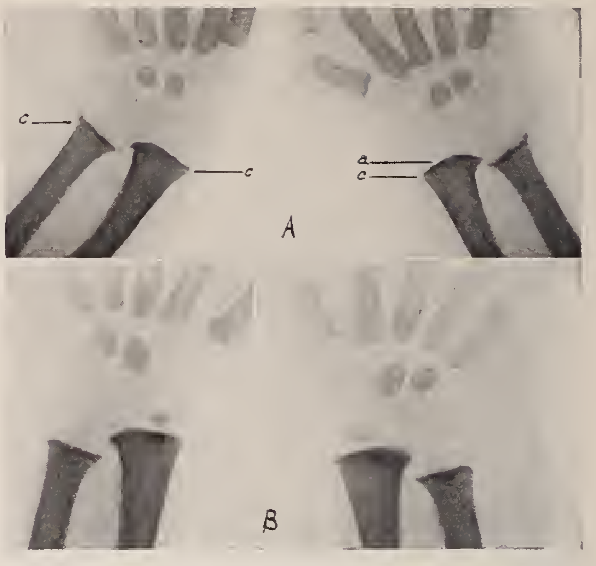

Fig. 2 (Case 2).—*A*, wrists; *a*, dense calcified lattice; *c*, clefts at distal ends of shafts. *B*, six months later, normal.

REPORT OF CASES

Case 1.—W. C., a white, well-nourished male infant six months of age, who was referred on August 19, 1937, for examination of his left forearm for question of fracture. No fracture was seen in the x-ray films. The subperiosteal calcification and mottling in the cortex of the ulna suggested periostitis and osteomyelitis. The arm was put at rest, but the swelling and pain increased. On August 26, 1937, the subperiosteal calcification had increased and the temperature was 101 degrees rectally. The blood count was 24,850 white cells, with polymorphonuclear neutrophils 54 per cent, small lymphocytes 34, large lymphocytes 3, myelocytes 5, eosinophils 1, red blood cells 4,930,000, and hemoglobin 60 per cent. The ulna was needled, but only blood was withdrawn. This blood was negative for bacterial growth on culture media. On August 27, 1937, a purplish swelling developed under the left eye. A day later the right infra-orbital space was purplish. A blood culture was negative. At this time x-ray films of the left radius and left femur showed subperiosteal calcification and typical signs of scurvy at the ends of the diaphyses. A diagnosis of scurvy was made. The vitamin C of the blood as

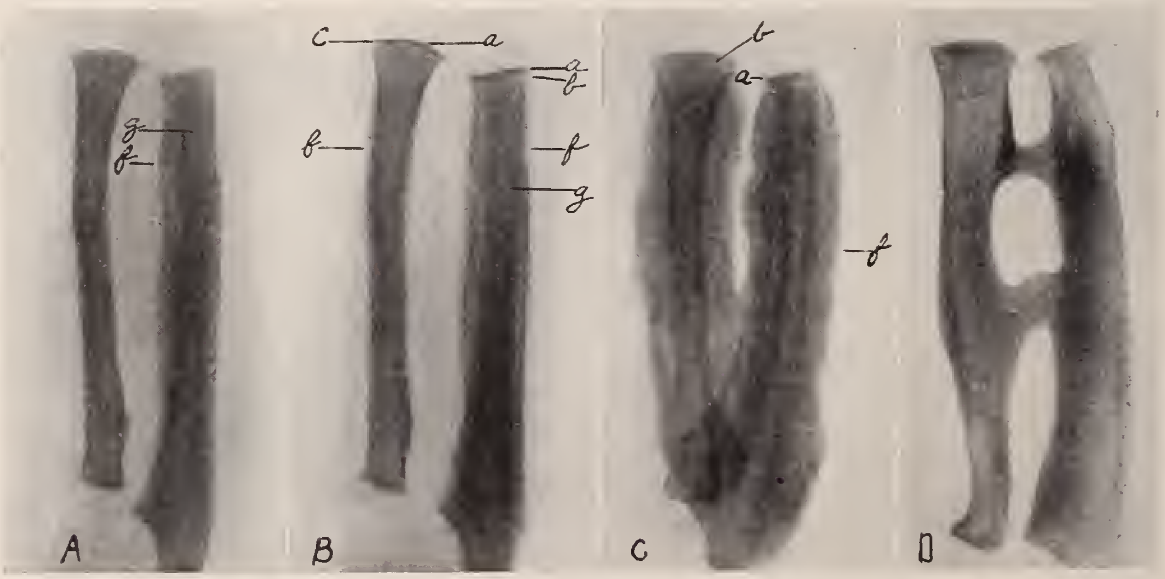

Fig. 1 (Case 1).—*A*, left forearm on August 19, 1937; *g*, cortex thin and granular; *f*, subperiosteal calcification. *B*, seven days later; *a*, dense calcified lattice; *b*, zone of decalcification; *c*, cleft at distal end of shaft; *g*, cortex thin and granular; *f*, subperiosteal calcification. *C*, twenty days later, subperiosteal calcification has increased, the zone of decalcification is less prominent and the calcified lattice is less dense. *D*, four months later, the cortex is thickened and a synostosis is present between the radius and ulna.

[1] Park, Guild, Jackson, and Bond: "The Recognition of Scurvy, with Especial Reference to the Early X-ray Changes," Archives of Diseases in Childhood, 9-10:265-294, 1934-1935.

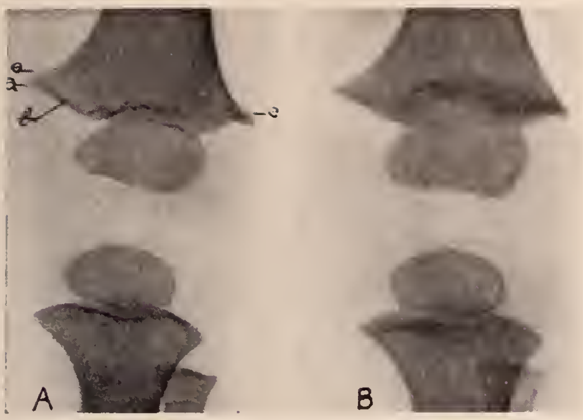

Fig. 3 (Case 3).—*A*, right knee; *a*, dense calcified lattice; *b*, zone of decalcification; *c*, bagging at margins. *B*, right knee normal four months later.

reported by Dr. James F. Rinehart was 0.24 milligram per cent. The leukocyte count remained between 24,000 and 36,000, and the temperature remained between 100 and 102 degrees rectally. Orange juice and 150 cubic centimeters of cevitamic acid were administered daily without improvement. The cevitamic acid in the diet was increased to 300 cubic centimeters daily. After sixteen days of vitamin C therapy the patient's symptoms improved. The x-ray films showed an increased amount of subperiosteal calcification. The calcified lattice was still present, and the decalcified area proximal to the calcified lattice was easily recognized. The cortex was thin and granular. As symptoms subsided, the appearance of the bone changed. The cleft or crevice was repaired. The calcified lattice became less prominent. The subperiosteal calcification decreased in amount and density. A line of increased density remained in the shaft indicating the period of arrested bone growth. The cortex remained thicker than normal.

* * *

Case 2.—N. L. A., a well-nourished Italian girl, eight months of age. The patient was referred because of pain in her left femur on motion. The parents stated the child had fallen from a bed a few days previously. X-ray films were interpreted as showing moderately early roentgen signs of scurvy. A calcified lattice was clearly defined. There was a decalcified area proximal to the lattice, and a cleft or crevice at the margin of the diaphysis. No subperiosteal calcification was present. Symptoms disappeared in seven days, with a diet of orange juice. X-ray films made four months later were interpreted as showing improvement, but not complete disappearance of the roentgen signs of scurvy. There was some question as to faithfulness in administering the orange juice. Six months later the bones were normal in appearance.

* * *

Case 3.—J. R., a well-nourished white female, one year of age. The patient was referred because of pain in her leg, which was thought to be due to a fracture. Interpretation of the x-ray films of her legs showed the typical calcified lattice at the ends of the shafts, the zone of rarefaction at the distal margins, and the slight bagging at the lateral distal margins. The clinical symptoms disappeared after a week's feeding on orange juice. Films taken three months later were interpreted as showing complete disappearance of the roentgen signs of scurvy.

CONCLUSIONS

1. X-ray is a positive early method of diagnosis in infantile scurvy, and a method of differentiating suspected fracture.

2. Subperiosteal calcification may precede typical scurvy changes in the diaphyses of the long bones.

3. Several days to weeks are required before symptoms of scurvy are controlled by adequate antiscorbutic diet.

4. Several months must elapse before the subperiosteal calcification is completely absorbed or formed into new bone.

Mills Memorial Hospital.

The author wishes to express his appreciation to Drs. Erma Macomber, Ernest W. Cleary, Milton Novotny, and F. Holmes Smith for the loan of the clinical data.

THE GRAD FROM TIMBUCTOO [*]

The medical texts are covered with dust,
Neglected and musty they stand;
And the compound 'scope is red with rust,
And the journals mold, near at hand!

Time was when the favorite texts were new
And the 'scope had its daily water;
'Twas then that the Grad from Timbuctoo
Left school—and put them there.

"You'll be right here when I've time," he said,
"And after my rounds are through!" . . .
Then he hurried off, at last, to bed
And dreamt that his plans came true.

But as he was dreaming, an urgent song
Woke the Grad from Timbuctoo . . .
The work came thick, and the money fast,
He had all that he wished to do.

And always waiting, right close at hand
While the dust and the rust grew more,
Were texts and journals and microscope
With the latest of medical lore.

Aye, faithful to Timbuctoo they stood
Each in its given place—
Just waiting the touch of a searching mind,
And the smile of a willing face.

They wondered as waiting the long years through
In the dust, without any care,
Why that Grad from Timbuctoo
Ever got them and put them there!

Then gradually, as the years slipped by,
The Grad felt his prestige fall,
And he realized with a sudden pang,
That he hadn't "kept up" at all;

He looked askance at the rust and dust
And the stack of journals high,
And he knew in his heart he'd never catch up
No matter how hard he'd try!

Are *you* like the Grad from Timbuctoo
Who failed in its standards high?
Will you, as the years go racing along,
Let the chance to "keep up" slip by?

If so, you'll wonder, while sitting alone
In the dear old office chair,
Why other doctors are busy as heck
And you are just sitting there!

Unsafe Rabies Vaccination Method.—The single injection method of vaccinating dogs against rabies is unreliable and should not be depended on, Benjamin F. Hart, M.D., and Elwyn Evans, M.D., Winter Park, Fla., report in *The Journal of the American Medical Association* for February 25.

They cite a patient of theirs, a white man, aged 41, who was bitten on the upper lip by a neighbor's dog while attempting to retrieve his own dog during a fight. Because both dogs had been vaccinated against rabies six months previously, by the single inoculation method, he did not consult a physician.

Twenty-two days later the symptoms of rabies appeared and twenty-four hours later a physician was called because of a "mild digestive upset with vomiting and a generalized headache." Since there is no known specific drug for clinically developed rabies, sulfanilamid was tried but it did not halt the progress of the disease. The man died.

Kerr, M.D., of San Francisco, in his postprandial talk on postgraduate training, at the one hundredth semi-annual meeting of the Southern California Medical Association, added to the entertainment of the dinner guests by giving these verses, penned by a member of his family, Dorothy Fisk Kerr.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

ENURESIS

ETIOLOGY

Charles Pierre Mathé, M. D. (450 Sutter Street, San Francisco).—Enuresis has received many definitions. It consists of involuntary or unintentional nocturnal or diurnal urination, usually not associated with uropathy. We prefer to define enuresis as an incontinence of urine which, as a rule, is functional in origin, but sometimes associated with general disorders, neurologic disturbances, pollakiuria and pathologic lesions of the genito-urinary organs. The age at which a child learns to control micturition varies with training, mentality and heredity. Diurnal incontinence of urine is usually considered to be normal up to the age of one, and nocturnal incontinence up to the age of two years, after which vesical control should have been accomplished.

The etiology is ordinarily psychic in nature; however, it may accompany general disorders, severe illnesses, neurologic disturbances of the reflex-nerve centers of the cord, or pollakiuria, or may be due to congenital and acquired pathologic lesions of the genito-urinary tract. The presence of blood, pus and organisms in the urine calls for a complete urologic examination. Urologic investigation is indicated in patients in whom symptoms persist longer than three months, despite medical care consisting of psychotherapy. In a large percentage of these cases the underlying pathologic lesion of the genito-urinary tract will be disclosed, permitting the physician to institute proper treatment and thereby obtain permanent relief.

In order to understand the etiology of enuresis it is well to review briefly the complex mechanism of normal urination. When the bladder is filled with urine increased intravesical tension sets up rhythmic contractions of the bladder wall which send afferent impulses to the centers of urination in the sacral cord. These stimuli excite contraction of the bladder wall and relaxation of the sphincter. This is a simple automatic reflex and exists in all infants up to the age of two or three years. After this age the afferent impulses going to the cord also ascend to the cerebrum, and the individual either performs the act of urination voluntarily or inhibits the act by contracting the external sphincter. In voluntary urination there is synchronization of muscular action of the bladder which consists of contraction of the bladder muscle and relaxation of the sphincter. In addition, urination is augmented by contraction of the abdominal muscles. In enuresis the inhibiting cerebral action is lost and micturition takes place by simple spinal reflex through visceral afferent impulses.

The etiology of enuresis has received considerable attention since the days of antiquity, and we find the names of Paulus Aegineta, Galen and Avicenna and, in later years, those of Cooke, Trousseau, Guyon, and many others associated with it. In recent years many writers restrict the term enuresis to the so-called uncomplicated psychic cases in which no organic etiology is demonstrable. We concede that a greater percentage of patients presenting enuresis are medically negative; however, there is a certain group of patients in whom involuntary discharge of urine, after the second year of life, is due to pathologic diseases of the genito-urinary tract, to general disorders, to severe illnesses, to neurologic disturbances and to pollakiuria. Most internists, pediatricians and psychoanalysts emphasize the psychologic type; urologists who are called upon to solve the etiologic mystery, when suggestion, training and other methods of treatment have failed, often find a pathologic lesion of the genito-urinary tract which is responsible for incontinence. It is our purpose to consider all the etiologic factors present, thereby enabling the general practitioner to more intelligently study this condition and institute adequate treatment.

1. *Psychic Type of Enuresis.*—This is by far the most common type. It is the consensus of opinion that the psychic group comprises 95 per cent of children presenting enuresis (Mowrer and Mowrer). Most children acquire vesical control during the day at the end of the first year, and control during the night at the end of the second or third year. After the third year the strictly reflex subcortic neural mechanism of automatic emptying of the bladder persists. In this type heredity plays a great factor, and one often observes enuresis in many members of the same family. It is worse in cold weather and during periods of excitement. It is not uncommon to observe enuresis develop in children in whom the urinary control had previously been established during the second year. In these recurrence takes place between the ages of four and eight; in some cases the child begins to wet the bed earlier, in others, later. Incontinence may be intermittent, but it rarely occurs after the age of ten. Psychologists explain this psychic phenomenon on the basis of behavior patterns. The child may feel that he is being neglected and, therefore, revenges himself on his parents by wetting the bed in order to attract attention. These children often twitch, refuse food, steal, run away and sometimes also present fecal incontinence. Some of these children deliberately ingest water before bedtime in order to induce enuresis. Psychologists point out the rôle of urethral irritation due to masturbation, and even go so far as to claim that in some patients a

certain amount of libido is experienced in the act of urination. If the psychic type of enuresis is unarrested, it may lead to psychopathic pollakiuria in later life.

2. *Enuresis Accompanying General Disorders.* One can readily understand why incontinence occurs in patients presenting diabetes, in whom increased urinary secretion requires more frequent emptying of the bladder. Enuresis sometimes accompanies typhoid fever, pneumonia and other debilitating infectious diseases. It is not uncommon after trauma. I recall a small Chinese boy who fell from the roof of a two-story building and, although no severe injury was sustained, the little patient developed enuresis which lasted for considerable time. This type of enuresis, associated with general disorders, develops after vesical control has been established at the usual age of two or three.

3. *Neurological Type of Enuresis.*—Enuresis is caused by certain diseases of the spinal cord in which there is a lesion of the afferent and efferent nerves concerned in the reflex act of urination, such as injury to the cord in the region of the reflex urinary center, spina bifida, cord tumor, transverse myelitis, hematomyelia, etc. It is interesting to note in passing that a patient, who had suffered from enuresis due to long-standing spina bifida occulta, was relieved by resection of a band of fibrocartilagenous tissue which compressed the dural sac of the nerves of the cauda equina. Many have devoted attention to atony of the external sphincter that is often present. This is ascertained by the passage of a bougie à boule into the bladder and, failing through that procedure, to encounter the usual resistance due to the constricting action of the external sphincter. Many of these patients sleep quite soundly, and it is even difficult to arouse them with an alarm clock. In these deep-sleeping patients the intercommunicating inhibiting action of the medullary centers is lost, contraction of the external sphincter does not take place, and immediate emission of urine results. In ascertaining the etiology of enuresis one must always bear in mind the possibility of congenital and acquired neurologic lesions of the cord as a cause of paralysis of reflex-micturition sensibility.

4. *Etiologic Rôle of the Pathologic Lesions of Genito-Urinary Organs.*—Congenital and acquired diseases of the genito-urinary tract are responsible for enuresis in a greater percentage of children than is usually conceded. In a recent review of 249 children, subjected to a complete urologic study, in whom enuresis had not been relieved by medical treatment including psychotherapy, Campbell disclosed underlying organic disease in 60 per cent. The importance of genito-urinary disease as an etiologic factor is well understood by the urologist, as he is called upon to solve the etiologic problem when medical treatment has failed. It is unfortunate that many medical men underestimate the rôle of uropathy as an etiologic factor of enuresis; for it is found to accompany cystitis, pyelitis, nephritis, vulvovaginitis, and urethritis. Thomas called attention to the rôle of verumontanitis, and reported relief by fulguration of the enlarged and congested verumontanum. It is also associated with tuberculosis, vesical calculus and, more rarely, with tumors of the bladder. In these infectious lesions, careful examination of the urine will reveal the presence of pus, blood and the infecting organisms, and when these are encountered one should proceed with a complete urologic investigation. Balanitis, phimosis, and adherent prepuce have been considered as etiologic factors. However, their rôle is doubtful, as questionable results have been obtained by circumcision. Then we have the congenital anomalies which play a great rôle in enuresis, *e. g.*, congenital stricture of the meatus, hypospadias, epispadias, ectopic kidney, anomalous ureteral orifice, megalo-ureter, hydronephrosis, diverticulum, etc. Valves of the posterior urethra, and congenital and acquired median bar, often cause incontinence on account of retention that they produce.

5. *Enuresis Associated with Pollakiuria.*—Many years ago Dieulafoy coined the word "pollakiuria" to describe frequent, urgent and painful urination. In patients suffering from this type of irritable bladder, no definite organic abnormality is encountered. Enuresis accompanying pollakiuria occurs in childhood as well as at all ages. This syndrome is unusually resistent to treatment, and symptoms often continue on through adult life.

* * *

SYMPTOMATOLOGY AND PATHOLOGY

Adolph A. Kutzmann, M. D. (1930 Wilshire Boulevard, Los Angeles).—Enuresis may be said to exist when a child has failed to acquire control over the act of urination after his second year. It is unintentional and, as a rule, the unconscious voiding of the large amounts of urine, occurring usually during sleep and in the absence of organic disease of the nervous or genito-urinary systems. Enuresis, more definitely, should apply only to purely functional cases. Since daytime incontinence, found usually during the afternoon nap in about 10 per cent of enuretic children, enuresis and bed wetting have as a rule been considered synonymous. Children who always wet the bed or their clothes have been considered as belonging to the purely functional group. Present-day examinations, especially urologic, have revealed that some type of organic disease exists in about one-half the cases not helped by psychologic or medical treatment. It has been necessary, therefore, to consider that enuresis, as commonly diagnosed, may be (1) a purely functional disturbance (90 to 95 per cent of all cases); and (2) caused by an organic lesion (5 to 10 per cent). The clinical picture may be similar in both types. Campbell has classified enuresis cases as follows:

1. Nocturnal only (80 to 90 per cent).
2. Diurnal only (2 to 4 per cent).
3. Nocturnal and diurnal (8 to 12 per cent).

Any conception of pathologic micturition is necessarily based on a knowledge of a normal physiology of the bladder. The desire to urinate has been found to be dependent more upon intracystic pressure than upon fluid volume. Increased intracystic pressure stimulates the sensory nerve endings in the bladder wall and, by the strength of its contraction, expresses the tonus of the detrusor muscle. The intracystic pressure can be influenced not only by the fluid volume and the voluntary desire to void, but also by irritative, psychic and peripheral reflex stimuli, such as inflammation, running water, or exposure to cold. In eight to ten-year-old children the initial desire to void is felt between 9 to 11 centimeters water pressure, with the fluid volume varying from 80 to 122 cubic centimeters. With normal adults it is 15 to 16 cubic centimeters water pressure, with 140 to 180 cubic centimeters fluid volume. The average physiologic capacity of the bladder is about 100 per cent greater than the volume at which the first desire to void is felt. Since the desire to void depends chiefly upon the intracystic pressure, local irritative or inflammatory, or extracystic reflex stimulations are likely to provoke voiding at a low volume. With voluntary urination the external sphincter is relaxed (or inhibited), probably through cerebral impulses. The functional importance of the pudic nerve has been stressed in this connection. The internal sphincter is opened by a contraction and shortening of the trigon, which pulls open the vesical orifice, and with the simultaneous voluntary contraction of the detrussor, and usually the abdominal muscles as well, the bladder is emptied. Cerebral or voluntary control of urination is normally acquired in childhood. Occasionally the cerebrospinal or peripheral centers remain highly irritable and, with loss of cerebral control by deep sleep or excitement, reflex urination or functional enuresis occurs. Urination is a lower reflex arc function in infants, and is believed to operate through the autonomic extraspinal centers, the bladder emptying with the first stimulus of the desire to void. The age at which voluntary vesical control is acquired varies to some degree. Normally, it may be acquired between the second and third years. In the third year urine should be retained during sleep for eight to nine hours.

Symptomatology may be a varied one. Enuresis usually persists from infancy in most cases. It may suddenly appear months or even years after continence has been established, and last for only a few weeks. There may or may not be identified an immediate antecedent etiologic factor, such as illness, accident or fright. Wetting may occur several times nightly, or a few times a month, or it may be of a relapsing type, with a dry interval of some weeks. Urinary incontinence appearing only at night is called enuresis nocturna. Day wetting is known as enuresis diurna, while in some instances there may be wetting both day and night, or so-called total enuresis. The time of wetting may vary even in the same child, and usually occurs during the early sleeping hours, although it can be delayed until early morning. The child rarely wakes until sometime after the wetting has occurred. Day wetting seldom appears until night wetting is well established. Children who wet the bed at night may commonly suffer with frequency and urgency during the day. Some observers have thought of frequency and urgency as initial symptoms of enuresis. The symptoms are often induced or exaggerated by exposure to cold or undue excitement. Campbell's analysis of symptoms in 532 cases of enuresis revealed the following distribution among the cases: frequency, 532; night wetting, 527; urgency, 361; day wetting, 324; pyuria (hazy urine), 91; dysuria, 87; abdominal pain, 55; intestinal upsets, 29; hematuria (usually due to ulcerated meatus), 19; burning on urination, 12; and loin pain in 9.

Any attempt to search or discuss the element of pathology immediately presents an elusive subject. No true or comprehensive explanation has been made in true enuresis cases. There is no known pathology nor any known factor other than age; it is not a true neurosis, nor is it the result of any known mental or physical defect. It is not adequately explained as a real loss of inhibition. We are really dealing with a child who must urinate at once, because, despite his best intentions and self-control, the trigone through its nerve innervation is pulling the vesical orifice open—or may have already done so—causing the child great urgency and to urinate spontaneously. The fact remains that so many associated factors have been blamed, yet none has consistently been proved. There have been many causative conditions found by urologic study. In this group have been found strictured meati, phimosis, urethral stricture, congenital valves of the posterior urethra, verumontanitis, prostatitis, trigonitis, bladder neck obstructions, neuromuscular bladder disturbances, calculus, tuberculosis, and others.

Urologic examination may be undertaken whenever necessary, especially after the age of four years. The urine is carefully examined for pus and organisms indicating an infection, and for epithelial desquamation and leukocytes indicating inflammation of the urethra and bladder. The bladder is checked for residual urine along with cystometric studies to determine whether the neurologic element is of hypertonic (inflammatory or parasympathetic) or hypotonic (sympathetic imbalance). The usual urologic finding in enuritic girls is urethrotrigonitis, commonly associated with a tight canal, and involving the posterior rim of the urethra and anterior trigon. This resembles the so-called "irritable bladder" in women. In boys the usual picture is a low-grade posterior urethritis and verumontanitis. Some observers have classified these cases in several groups. The first is the atonic form characterized by a low sensitiveness of the mucosa of the urethra and bladder. The second group consists of cases with atonic sphincters, but with increased mucosa sensitiveness. The third group has such cases as show increased bladder irritability, frequent and urgent urination, and mucosal hyperesthesia. The presence of a widely varying degree of therapeusis is proof of an equal varying consideration of etiology, physiology, and pathology. All factors must be carefully weighed, and the case considered from a pediatric, urologic and psychologic point of view.

PROGNOSIS AND TREATMENT

E. W. Beach, M.D. (1127 Eleventh Street, Sacramento).—Because the term enuresis is often loosely employed in medical parlance, it has developed a considerable degree of ambiguity. It seems necessary, therefore, at the outset, before venturing to consider either treatment or prognosis, to contrive an accurate definition of this term in order to form a clear concept as to its denotation. Enuresis per se is neither a disease nor disorder, but constitutes one symptom of a morbid entity. It usually signifies an essential form of incontinence manifested by involuntary micturition with normal structure. Moreover, the urine is always passed in a stream and most often in copious amounts. Enuresis must be clearly differentiated from true, false and paradoxical forms of urinary incontinence. Again, enuresis must not be confused with imperative urgency, nor with so-called bladder atony contingent upon postpartum or postoperative sequelae. As commonly used, the word enuresis is almost synonymous with bed wetting (80 to 85 per cent of cases are nocturnal) and applies to a temporary dysfunction likely incident to the persistence of infantile bladder automatism. Enuresis may be, however, entirely diurnal (2 to 4 per cent of cases) or both night and day in 8 to 12 per cent of cases. Etiologically speaking, most cases fall preponderantly into the functional group (no organic lesion discoverable); but at times enuresis may be predicated upon some definite organic change or lesion in the urogenital tract or anent its subjective innervation.

The Functional Group.—Perhaps 90 to 95 per cent of cases may be segregated under this caption. In this group the enuresis, which is usually nocturnal in type, represents a developmental anachronism and harks back to nursing days when the act of micturition was spontaneous, unconscious, automatic or entirely uncontrolled by the will. In fine, micturition comprises in this epoch a reflex act in response to certain stimuli, and is usually consonant to the degree of bladder distention.

Early training forestalls the persistence of this infantile characteristic—reflex micturition—the latter being replaced by the voluntary mechanism. Discipline soon achieves diurnal results, which gradually become effective during sleep regardless of the depth. Training should be undertaken as early as the seventh, and never delayed beyond the twelfth month. Fluids should be restricted after 6 p. m.; the child should urinate before retiring; he should be aroused about 10 p. m. to be placed on the toilet, and so soon as he awakens in the morning he should be again placed on the toilet. This routine should pay handsome dividends (dry nights) early in the third and certainly by the fourth year.

When enuresis persists beyond the fourth year, a careful and detailed general study of the child should be undertaken by the attending physician. Physical defects, both in the urinary tract and elsewhere, must be sought for and corrected or ruled out. An overly tight urinary meatus is very common—a phimosis with resultant smegma accumulations may be a formidable source of constant irritation. The presence of pinworms as an aggravation must not be overlooked. In certain instances enuresis appears to be somewhat of a family trait, reappearing with almost monotonous regularity in the lineage. Many of these enuretic children are born of discordant parents, and consequently inherit a strong neuropathic taint. These children frequently have a deep sense of physical inferiority, and crave attention or sympathy. They are often irascible, peevish, high-strung, emotionally unstable and yet extraordinarily active. Moreover, because of this shortcoming, these unfortunate children are often kept in a constant state of insurrection by the mother, who makes a battleground of the toilet issue: she alternatingly cajoles, pities, sympathizes, scolds, threatens, intimidates and punishes the little personality, but all to no avail. A spirit of antagonism, helplessness, futility, panic, fear, insubordination, hostility or self-pity, as the case may be, is aroused in the child, all of which conspire to defeat the desired objective.

Having made certain there exists no apparent anatomic or morbid basis for the enuresis, the understanding physician will then attempt (1) to improve the patient's general health and (2) adroitly to manage the psychic complexion of the sufferer. He will at the outset reassure the little patient that he can and will be cured. He will guard his patient against undue emotional turmoil, particularly just before retiring. He will, with the help of the mother, arrange rest periods, supervise play hours, restrict fluid intake after supper, eliminate all condiments from the diet and arouse the child to void at regular intervals during the night. He will advise and wisely counsel the mother and family, so that a new psychic horizon with regard to the child and his habit is fashioned. No discussion of the child's misfortune or "weak kidneys" is permissible in the presence of the child. Inquisitional methods—mechanical gadgets such as strings or clamps about the penis—are absolutely taboo. Hope, optimism and confidence are engendered in the child by the attitude of both the mother and physician working in collaboration with reward for success (as a gold star on banner days), but no mention of failure. A copious dose of suggestion is always beneficial: much reassurance on the part of the physician is helpful, and especially if amplified by some supplementary maneuver such as a sterile water hypodermic often suffices for cure. Patience is required, and often it is mandatory, although extremely difficult to separate the mother and child temporarily in order to achieve the desired result. At times a week or two in the hospital for the child is ample for this purpose; but sometimes it is necessary for the child to become intimately associated with other children in an institution, such as a boarding school, etc. Much ado is made therein as to behavior conformation and his exemplary conduct. Medication.

Many remedies have been advocated, but few are helpful, and none specific nor even certain. The barbiturates, as well as atropin and belladonna, have all been lauded. At times a change in the reaction of the urine is of value. In certain instances endocrin preparations have proven meritorious.

Minor Surgical Procedures.

In many of these discordant little personalities, masturbation is conspicuous. The concomitant posterior urethritis, prostatitis, verumontanitis may require topical applications of silver instillations or the use of sounds. In others meatotomy and circumcision are prerequisites.

Prognosis.

The outlook for the cure of functional enuresis is usually excellent. It rarely persists beyond the age of ten. While the outlook is better when the habit begins before the tenth year, yet in almost every case, even though the habit persists into adult life, cure is certain. Should enuresis prove adamant to the usual medical treatment and psychotherapy for two or three months, it demands a complete urological examination. In this instance enuresis may presage definite organic uropathy. A comprehensive urine study is meritorious with determination as to the absence or presence of residual urine.

The Organic Group.—It is well to remember the enuretic criterion: the patient voids a stream of urine. At times, other forms of incontinence (particularly the type dependent upon congenital or developmental errors, as for instance the ectopic ureter) may be erroneously diagnosed enuresis.

Over half of the therapeutically resistant cases of enuresis show notable organic uropathy. Almost any pathologic condition may exist, viz., tuberculosis, stone, upper urinary tract infection, all grades of cystitis, urethrotrigonitis, seminal vesiculitis, prostatitis, neuromuscular deficiencies, vesical diverticuli, congenital valves in posterior urethra, contracture of vesical neck, polyps in the posterior urethra, urethral strictures, etc. The treatment depends, of course, upon the etiological factor and especially upon its detection. Herein enters the value of accurate urologic diagnosis. The prognosis again depends upon the type and extent of the lesion at hand. Anent neuromuscular disturbance conditions most frequently mentioned are spina bifida occulta and myelodysplasia. Conceivably a relaxed vesical sphincter may result from parasympathetic imbalance. At other times the vesical sphincter may be partially paralyzed or involved in certain neurogenic disorders. It is well to recall, in this connection, that in certain of the acute exanthems the neuromechanism may be implicated secondarily. Fortunately, this type of enuresis is uncommon; it appears suddenly and ends almost as abruptly. The urologic picture in myelo-encephalitis is obviously not that of enuresis.

In conclusion, while it is true that enuresis is usually functional, it behooves the alert physician to guard against pitfalls in the realm of actual uropathy. Therapeutically resistant cases should all be subjected to a comprehensive and painstaking urologic examination, because about 60 per cent in this group show gross morbid deviation. Cure in this group hinges upon the detection of these lesions and appropriate treatment.

Pneumonia.—Pneumonia, fourth in 1937 among the causes of death in the United States, strikes with the greatest frequency in the lower income groups, according to National Health Survey figures recently made public by the United States Public Health Service. The pneumonia case rate among relief families was over twice the rate of that among families in the upper income groups. There was also an excess in the rates among families who were not on relief, but whose incomes were less than $125 per month.

Pneumonia, which disables more than five persons out of every thousand in urban communities during the course of a year, is most prevalent among children and old persons. The annual frequency rate of pneumonia among children under 3 years of age was 18 per 1,000 persons and among persons 65 years and over 11 per 1,000, while the rate among youths and young adults (15 to 44) was only 3 per 1,000.

Men, from birth to old age, are more likely to have pneumonia than are women. For males, the annual frequency rate was found to be 6 per 1,000 persons, while it was only 4.9 for females.

The average duration of nonfatal pneumonia cases was observed to be forty-two days and of fatal cases nineteen days. For all pneumonia cases—fatal and nonfatal—the average period of disability was thirty-nine days. Earlier bulletins from the Health Survey give durations for acute illnesses (disabling for a week or longer) as forty-six days for accidents, twenty-four days for infectious diseases and nineteen days for all respiratory causes. The Survey director points out that a comparison of these figures shows that pneumonia ranks among the most severe acute diseases.

In issuing this report the United States Public Health Service warned that early diagnosis, with prompt and continuous medical care, is recognized as extremely important if the severe course of pneumonia is to be lessened and death prevented. While the services of a doctor are indispensable in the proper treatment of pneumonia, the Federal health authorities also pointed out the important rôle of proficient bedside nursing in the management of this disease and the necessity of hospital care for some cases. Earlier Public Health Service reports have stressed the need for wider and speedier application of serum therapy but have also called attention to the high cost of treatment, whether it includes serum or not. Conclusions from the Health Survey are that those in the upper income groups were given a relatively high degree of care, regardless of the size of the city in which they lived, while those in the lower income groups were less well cared for in the smaller communities than in the larger.

The data gathered by the Survey covered a period (1935–1936) when the death rate of pneumonia was neither unusually high nor low, in comparison with the averages for the years 1921 to 1937. Death rates for pneumonia during this seventeen-year period ranged from 69.1 per 100,000 in 1933 to 108 in 1923. The rate for 1937 was 84.3.

The National Health Survey was conducted by the United States Public Health Service with the aid of financial grants from the Works Progress Administration. The resulting reports are based on a house-to-house canvass of some 800,000 families, including 2,800,000 persons in eighty-three cities and twenty-three rural areas in nineteen states. The Survey was made during the winter (largely from November to March) of 1935–1936.

The total surveyed population was so distributed as to give a sample which was, in general, representative of cities in the United States according to size and region. In large cities (100,000 and over) the population to be canvassed was determined by a random selection of many small districts based on those used in the United States Decennial Census of 1930. In the smaller cities selected for the study, the population was enumerated completely.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

COUNCIL OF THE CALIFORNIA MEDICAL ASSOCIATION

Minutes of the Two Hundred and Seventy-Second (272nd) Meeting of the Council of the California Medical Association *

The meeting was held in Room 209, Sir Francis Drake Hotel, San Francisco, Saturday, February 25, 1939, at 9:30 a. m.

1. **Call to Order.**—The meeting was called to order by Chairman Schaupp. The following councilors were present: Doctors William Roblee, Charles A. Dukes, Howard Morrow, Karl Schaupp, T. Henshaw Kelly, Calvert L. Emmons, A. E. Anderson, Louis A. Packard, O. D. Hamlin, F. N. Scatena, H. A. Rogers, Harry H. Wilson, William H. Kiger, P. K. Gilman, J. B. Harris, G. G. Reinle, George H. Kress. Also present were General Counsel Peart and Mr. Hassard; and (by invitation) John H. Graves and Edward M. Pallette.

Absent: Doctors Carl Howson, A. L. Phillips, C. O. Tanner, and Lowell S. Goin.

2. **Minutes.**—It was moved by C. A. Dukes, seconded by Howard Morrow, that the minutes of the two hundred and seventy-first meeting of the Council be approved. Carried.

3. **Legal Aid.**—After full discussion of a court case of particular interest to medicine, it was moved by William Roblee, seconded by William Kiger, that the Chairman of the Executive Committee, the Chairman of the Legislative Committee, and the Chairman of the Council, with the advice of the General Counsel, be placed in charge of the matter, with full power to act. Carried.

4. **Repayment of Loan.**—The Secretary reported that the California Medical Association, on January 30, 1939, had repaid to the Trustees Of The California Medical Association the sum of $5,000, borrowed from the Crocker National Bank, on a note dated December 13, 1938.

5. **Committee on Public Policy and Legislation.**—Due to the increased work of the Committee on Public Policy and Legislation, and with the approval of the Chairman of the Auditing Committee, it was voted, on motion of William Roblee, seconded by P. K. Gilman, that the Committee on Public Policy and Legislation be allowed, for the time being, the increased requested.

6. **Indemnity Defense Notes.**—It was reported that, in the accounts of the Indemnity Defense Fund there were still outstanding notes to the amount of $330, signed by physicians who had given such notes shortly before the Indemnity Defense Fund was discontinued. The auditors, Ernst & Ernst, had asked that these uncollectible notes be written off through official action.

It was moved by William Roblee, seconded by P. K. Gilman, that uncollectible notes outstanding to the amount of $330, be written off the books and the record closed. Carried.

7. **Publicity.**—The Secretary reported that, in accordance with the mail vote of the Executive Committee, authorized by Chairman Kelly, regarding participation of the California Medical Association in the publicity regarding the opening of the Golden Gate International Exposition, a majority of the Executive Committee having approved the expenditure, contracts had been entered into with the Examiner, Chronicle, Call-Bulletin, San Francisco News, and the Post-Enquirer of Oakland.

Doctor Kress stated that, after the appearance of the advertisements, coöperation for like publicity had been solicited by the Sacramento Bee and the Tribune of Oakland.

It was moved by Charles Dukes, seconded by Louis Packard, that the Oakland Tribune and the Sacramento Bee each be granted a complimentary announcement on the basis of the amount granted to the other Oakland newspaper. Carried. Doctors Roblee and Morrow voted in the negative.

8. **Animal Experimentation.**—Discussion was had of the present provision governing pounds. Doctor Harris and Doctor Gilman outlined the necessity for better regulation, stating that a bill had been prepared by the California Society for the Promotion of Medical Research.

It was moved by William Roblee, seconded by William Kiger, that the Special Committee on Animal Experimentation, in coöperation with the Committee on Public Policy and Legislation, proceed with the enactment of legislation to provide for better regulation of pounds. Carried.

9. **Hospital Legislation.**—Doctor Packard reported that the proposed hospital bill had been introduced in the Legislature, and it was believed that only minor amendments would be necessary. Also, that the future action regarding the legislation should be placed in the hands of the Committee on Public Policy and Legislation.

10. **Nurses' Legislation.**—It was pointed out that, until the Nurses' Bill contained definite minimum standards of

† For complete roster of officers, see advertising pages 2, 4, and 6.

* The minutes of the two hundred and seventy-first (271st) meeting of the Council of the California Medical Association were printed in the February, 1939, issue of CALIFORNIA AND WESTERN MEDICINE, on page 136.

training, consideration by the California Medical Association and its Legislative Committee was inadvisable.

11. **Free Choice of Physicians.**—An amendment to Section 402.5 of the Penal Code, relating to the free choice of physicians, was discussed, and was referred to the Committee on Public Policy and Legislation.

12. **Pacific Coast Medical Executives Conference.**—The Secretary reported that, at the last Conference of the Executive Officers from the State Association of the Pacific Coast, a permanent organization had been established through the organization of the Pacific Coast Medical Executives Conference, and that an agreement had been made that each state medical association would contribute the sum of $10 for postage, stationery, etc., to cover routine expenses between the annual meetings.

It was moved by Charles Dukes, seconded by Louis Packard, that the California Medical Association contribute $10 to the Pacific Coast Medical Executives Conference. Carried.

13. **California Physicians' Service.**—A resolution adopted by the Council of the Alameda County Medical Association at its recent meeting was presented. Since the resolution requested action which was not within the jurisdiction of the Council of the California Medical Association, and which was properly the business of the Board of Trustees of the California Physicians' Service, the entire matter was referred to the California Physicians' Service.

The Secretary was instructed to inform the Alameda County Medical Association of the action taken by the Council.

14. **Legal Services.**—Statement of legal services rendered to the California Medical Association in connection with the medical service plans of the California Medical Association, pursuant with instructions of the Council at its meeting, held November 12, 1938, up to the date of the caucus meeting of Trustees of the California Physicians' Service held on January 28, 1939, and in the amount of $2,626.07 was presented by General Counsel Hartley Peart.

It was moved by Charles Dukes, seconded by Axcel Anderson, that the bill of the legal counsel to the California Medical Association in the amount of $2,626.07 be approved. Carried.

15. **Foreign Graduates.**—It was moved by William Roblee, seconded by Calvert Emmons, that Assembly Bill 449, relating to citizenship of physicians, be referred to the Legislative Committee, with the approval of the Council, that the recommendation do pass. Carried.

16. **Retired Members.**—The Secretary reported that requests for retired membership had been received from the governing bodies of respective county societies for members who had retired from active practice, and who complied in other respects with the provisions of the by-laws governing retired membership.

It was moved by Charles Dukes, seconded by Howard Morrow, that retired membership in the California Medical Association be granted to John C. Neilsen, San Diego County; Angeline Martine, San Diego County; E. W. Bathurst, Siskiyou County; Timothy Lyman, Sacramento County; James Hunt O'Connor, San Francisco County; H. A. Brown, Alameda County; and J. J. Tully, San Joaquin County. Carried.

17. **Kern County.**—The General Counsel reported on activities of a member of a component county society relative to legal action taken following expulsion.

It was pointed out that expense up to the sum of $500 had been authorized, but no demands had been made upon the allocation to date.

18. **Stenographic Legal Expense.**—The Secretary reported that, in compilation of the Auditing Committee for a Budget of Expenses, which would be approved at the next annual session by the House of Delegates, the item of stenographic legal expense had been eliminated, and asked for instructions as to the payment of such expense in the interim of January, 1939 to May, 1939.

It was moved by T. Henshaw Kelly, seconded by Harry Wilson, that the payment of $75 monthly to the Legal Counsel for legal stenographic expense be continued until May, 1939. Carried.

19. **Adjournment.**—The Council then adjourned, to permit its members to take part in the proceedings of the Third Annual Joint Conference of State Association officers and Committeemen with the Secretaries of the Component County Medical Societies.

George H. Kress, Secretary.

Attest:
Karl L. Schaupp, *Chairman.*

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†*

ASSEMBLY BILL 2172 AND SENATE BILL 1128: ("COMPULSORY HEALTH INSURANCE BILLS")

The Public League of California recently sent out an interesting digest of the compulsory health bills (Assembly Bill 2172 and its companion measure, Senate Bill 1128). We have inserted subheads in italics to emphasize the text. The analysis is worthy of careful consideration by every Doctor of Medicine in California.

* * *

Assembly Bill 2172 and its companion, Senate Bill 1128, are said to be "Administration" Bills. According to the newspapers, these bills are sponsored by and supported by Labor's Non-Partisan League and "a number of liberal organizations."

Use of Existing California "Unemployment Fund."

They establish a system of health insurance within the system of unemployment reserves. There is now $130,000,000 reserve in the Unemployment Fund, contributed by employers and workers as a sacred trust against unemployment. Does this new scheme plan to tap this unemployment reserve fund and use it for health insurance?

Employees Included.

The bills regiment every worker earning up to $3,000 per year. Employing units which at any time during the year have any individual in employment come under the plan. See Section 155.

Deduction from Wages of Employees; Tax on Employers; Levies on State Funds.

In addition to the amounts already being deducted from the worker's pay check for Federal and State reserves, there will be deducted from ½ per cent to 1½ per cent from their wages. The employer will have to contribute up to 2 per cent, which is added to his already heavy taxes. Beginning with July, 1941, the State must contribute as high as 1 per cent. This will add a large sum to our taxes. In 1941 the total payroll contributions for Federal Security plans, State unemployment reserves, and health insurance will reach 9 per cent.

Regimentation of Wage-Earners, Physicians, Surgeons, Dentists, Nurses, and Hospitals.

Not only are all workers earning up to $3,000 per year regimented, but physicians and surgeons, dentists, nurses, and hospitals will be regimented. Every worker must select a physician and surgeon to supervise his health at all times.

If he fails to make such selection, one is arbitrarily assigned to him.

No Definite Remuneration Provided for Doctors of Medicine.

There are no provisions for the amount of remuneration the physician is to receive, and Section 304 even gives the State the authority to fix the number of patients he may serve. An influential doctor might be assigned five thousand patients.

Specialists (Such as Are Appointed) to Work in "Diagnostic Health Centers."

X-ray, laboratory services, and specialists and consultants' services will be rendered in public centers or let under contract at rates fixed by the State.

"Chain Drug Stores" May Handle the Entire Drug Business Involved.

Drugs and medicines may be purchased from any pharmacy which has agreed to sell them at prices fixed by the governing authority. It would be possible for a large chain to contract with the State at prices that would force the thousands of independent pharmacies out of business.

A "Governing Authority" Would Have Supreme Control.

The governing authority has full power to fix remuneration for nursing, hospitalization, dentistry, etc. See Section 306.

No Guarantees as to Amount of Service to Be Rendered.

The worker is given no guarantee as to what length of service he is to receive and is at the mercy of the governing authority. See Section 235.

A "Bureau of Medical Service" to Be Established as an Adjunct to the Unemployment Phases.

The scheme sets up a new State Bureau, known as the Bureau of Medical Service, and places full administration of the health of all workers in the State earning up to $3,000 per year and all doctors serving them in the hands of a medical director.

Kind of "Medical Advisory Board" to "Advise" the Medical Director.

Although medical men are presumed to be best fitted for advising on health administration, and medical societies have been studying this problem for many years, they *are not* represented on the Advisory Council which assists the Medical Director. This Council is made up of three representatives of labor and two representatives of employers. When this Council acts in an advisory capacity to the Bureau of Medical Service, two physicians are added, but no physicians are on the Council when it assists the director in administering this vast scheme.

A New California Bureaucracy, and for What?

Careful reading of the bills will bring out many more points which are of serious concern to all citizens of the State.

These bills would set up another new bureaucracy, add additional tax burdens to workers, employers, and all citizens in general and embark California on an untried scheme of social insurance. It is impossible to estimate the hundreds of millions of dollars that such a scheme will collect from workers, employers, and general taxpayers.

Proposed Laws Are Ill-Advised and Unnecessary.

These bills are unnecessary because the physicians of the State have already voluntarily established a plan to provide hospital and medical care on a proper actuarial basis at reasonable rates.

SOUTHERN CALIFORNIA MEDICAL SOCIETY

In the March issue, on page 227, was given the program of papers presented at the one hundredth semi-annual meeting of the Southern California Medical Association—which until the Medical Society of the State of California was reorganized under American Medical Association sponsorship in 1901, was almost equal in influence in the southern portion of California.

On Wednesday evening, March 15, at the California Club, a formal dinner was sponsored, in commemoration of the event.

The program follows:

Address of Welcome.—John C. Ruddock, M.D., President.

Edward M. Pallette, M.D., Toastmaster

Guest Speakers

The Campaign Against Rheumatism.—Philip S. Hench, M.D., Associate Professor of Medicine, Mayo Foundation, University of Minnesota, Rochester, Minnesota.

Then and Now.—William W. Roblee, M.D., President of the California Medical Association, Riverside.

Postgraduate Training.—William J. Kerr, M.D., Professor of Medicine, University of California, President of American College of Physicians, President of American Heart Association, San Francisco.

Remarks.—Donald C. Balfour, M.D., Professor of Surgery, Mayo Foundation, University of Minnesota, Past President of American College of Surgeons, Regent of American College of Surgeons, Rochester, Minnesota.

Medical Problems of the Day.—Rock Sleyster, M. D., Medical Director of Milwaukee Sanitarium, President-Elect of American Medical Association, Wauwatosa, Wisconsin.

Informal addresses were also made by Howard Morrow, M.D., President of the California State Board of Public Health, San Francisco, and by George H. Kress, M.D., Secretary of the California Medical Association, San Francisco.

* * *

The officers of the Southern California Medical Association for the year 1939 are:

John C. Ruddock, Los Angeles, president; P. A. Gray, Santa Barbara, first vice-president; Milo K. Tedstrom, Santa Ana, second vice-president; John B. Doyle, Los Angeles, secretary-treasurer.

Councilors—Robert W. Langley, Los Angeles; Merrill W. Hollingsworth, Santa Ana; William H. Barrow, San Diego; John C. Ruddock, ex officio; John B. Doyle, ex officio.

Board of Governors—F. M. Pottenger, Los Angeles; Egerton L. Crispin, Los Angeles; Joseph K. Swindt, Pomona; Charles T. Sturgeon, Los Angeles; Paul E. Simonds, Riverside; Raymond G. Taylor, Los Angeles; Fred B. Clarke, Long Beach; Carl R. Howson, Los Angeles; Bon O. Adams, Riverside; H. Douglas Eaton, Los Angeles; Frank R. Nuzum, Santa Barbara.

CANCER COMMISSION PATHOLOGIC CONFERENCE

The usual semi-annual Microscopic Conference of the Cancer Commission of the California Medical Association will be held at the Hotel Del Monte on Sunday, April 30, 1939, at 9:30 a. m. This meeting will be conducted in the same manner as in the past; case histories being presented and slides passed out for diagnosis by each attendant. A very interesting group of cases has been assembled, and it will be necessary for each attendant to bring his own microscope.

The meeting will consist of morning and afternoon sessions, and will be conducted by the following committee: Dr. Paul Michael (chairman), Dr. Jesse Carr, and Dr. Alvin Cox.

Please make reservations with the chairman of the committee at 434 Thirtieth Avenue, Oakland; or with Dr. Otto H. Pflueger, Secretary of the Cancer Commission, 384 Post Street, San Francisco.

C. M. A. POSTGRADUATE COMMITTEE

Clinical Conferences in Prospect.—The California Medical Association Committee on Postgraduate Activities has received reports from, and is carrying on correspondence relative to prospective postgraduate conferences with the County Societies listed below. At the time of this writing, it is not possible to give places and dates of meetings, or names of topics and of guest speakers. Mention is made of the plans under way, in the hope that other component county societies will also take up a consideration of postgraduate conferences. The items of transportation expense, and of amount of time demanded of guest speakers are important, since there is a very definite limit in these matters.

County societies that have taken up active consideration of postgraduate work include the following:

Fresno, Humboldt, Los Angeles (Monrovia, Long Beach), Monterey, Orange, Placer, Riverside, San Diego, San Joaquin (has a definite postgraduate plan of its own), San Luis Obispo, San Mateo, Santa Barbara (with Kern, Ventura and San Luis Obispo counties), Siskiyou, Sonoma, Stanislaus, Yuba-Sutter.

POSTGRADUATE CONFERENCES ON MATERNAL CARE

Tentative Schedule of Harold W. Teel, M. D., Assistant Professor of Obstetrics, Harvard Medical School, and Attending Physician to Boston Lying-In Hospital.

Courses to Be Under the Joint Sponsorship of the Committee on Postgraduate Activities of the California Medical Association and the Bureau of Child Hygiene of the California Department of Public Health.

The California Medical Association Committe on Postgraduate Activities calls the attention of component county medical societies to a series of clinical conferences on maternal care to be given in the cities listed in the tentative schedule which appears below.

Professor Teel is in the State on a special teaching assignment at the University of California, where he gives lectures on Tuesdays and Wednesdays of each week.

On other days, in association with representatives of the California State Board of Public Health, he will be in position to hold clinical conferences in the places scheduled. The dates and places are tentative, but are submitted as a preliminary notice of the plans now being formulated.

Professor Teel is well known as a teacher, and in each place to be visited will be glad to talk on those phases of obstetric and allied work in which the physicians who attend may have special interest. In addition, his professional services will be available as a consultant (no fee being charged) with any physicians who may wish to confer with him on problem cases.

Through the local representatives of the Bureau of Child Hygiene of the California Department of Public Health, efforts will be made, through consultation with county society officers and members interested, best hours and places for the conferences. These naturally must fit in somewhat with the transportation facilities of the guest speaker. If use of place of meeting must be paid for, this expense should be borne locally.

For additional information, write to California Medical Association Postgraduate Committee, 450 Sutter, San Francisco. Suggestions are welcomed.

POSTGRADUATE CONFERENCES

A postgraduate conference of the third councilor district (Santa Barbara, Kern, San Luis Obispo, and Ventura counties) was held on Saturday and Sunday, March 18 and 19, at the Mar Monte Hotel in Santa Barbara.

The scientific sessions convened in the Bissell Auditorium and Cottage Hospital.

*California Maternal Care Lectures—Tentative Schedule**

Conference Number	Trip No.	Date 1939	County	Town	
1	I	April 11	Yolo	Woodland	....
2		April 12	Fresno	Fresno	April 13—a. m.
3		April 13	Kern	Bakersfield	April 14—a. m.
4		April 14	Kern	Taft	April 15—a. m.
5		April 17	Kings	Hanford	Date not decided
6		April 18	Contra Costa	Martinez	Date not decided
7	II	April 19	San Joaquin	Stockton	April 20—a. m.
8		April 20	Tulare	Visalia	April 21—a. m.

* As stated in text description, consultations may also be arranged.

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA

Top row, left to right: Frederick W. Didier, M.D., Wheatland; John MacLean, M.D., Los Angeles; Percival Dolman, M.D., San Francisco; Charles E. Schoff, M.D., Sacramento; Lionel Brown, Esq., Deputy Attorney General, San Francisco; Fred R. DeLappe, M.D., Modesto, and Ralph Sollars, Court Reporter.

Seated, left to right: George Thomason, M.D., Los Angeles; Clark L. Abbott, M.D., Vice-President, Oakland; William R. Molony, M.D., President, Los Angeles; Charles B. Pinkham, M.D., Secretary-Treasurer, San Francisco; and William H. Geistweit, Jr., M.D., San Diego.

The Woman's Auxiliary to the Santa Barbara County Medical Society sponsored a no-hostess luncheon and drive on Saturday.

The program of the Clinical Conference follows:

Saturday, March 18, 1939

9:00 a. m.

Clinico-Pathological Conference.—Dr. P. A. Gray, Jr., and Dr. Clark E. Brown.

9:45 a. m.

Nephritis.—Dr. T. Addis.

10:45 a. m.

Head Injuries.—Dr. D. G. Dickerson.

11:30 a. m.

Drugs and Therapeutics: Sterol Drugs, Vitamins, Sex Hormones, Cardiac Glucosides.—Dr. Chauncey Leake.

12:30 p. m.

Luncheon in the Cottage Hospital.

2:00 p. m.

Blood Dyscrasias.—Dr. Madeleine A. Fallon.

3:00 p. m.

Autonomic Drugs.—Dr. Chauncey Leake.

4:00 p. m.

Injuries of the Hand.—Dr. Nelson Howard.

2 to 5 p. m.

Ear, Nose, and Throat Round Table.—Dr. McKenzie Brown.

* * *

On Saturday evening a dinner was given at the Montecito Country Club, at which the speaker was Dr. Leo Eloesser, his topic being "The War in Spain."

Dinner was followed by dancing, after ten o'clock.

On Sunday, March 19, the program continued:

10:00 a. m.

Abdominal Hemorrhage.—Dr. Charles Phillips.

11:00 a. m.

Tumors of the Breast.—Dr. Nelson Howard.

12:00 noon

Menstrual Disorders.

* * *

The attendance was excellent, and the members who were present, some ninety or more, adopted plans for the next conference of the series.

CALIFORNIA PHYSICIANS' SERVICE*

Informative Bulletins

I. Bulletin of March 6, 1939

California Physicians' Service, a plan to provide the benefits of medical, hospital and surgical care to wage-earners at the lowest possible cost, was launched today when more than 10,000 licensed doctors of medicine in the state received application blanks for membership.

California Physicians' Service, a nonprofit corporation, soon will offer the public a group payment plan whereby employed or other groups of persons, by making small monthly payments, can have medical, surgical and hospital bills paid. It is the outgrowth of ten years of study by the California Medical Association.

State headquarters have been opened at 220 Montgomery Street, San Francisco. District headquarters throughout the state will be opened as rapidly as organization can be completed.

Similar plans, successfully operated in the United States during recent years, were studied by a committee which reported the California Physicians' Service plan as embodying the best provisions of each.

---

* Address: 220 Montgomery Street, San Francisco. Telephone: Exbrook 3212.

So that residents of California becoming beneficiary members may receive professional services by the physicians of their choice, application blanks were delivered to all licensed doctors of medicine in the state. Arrangements are progressing with existing nonprofit hospital associations, which have offered coöperation, to permit personal choice of hospitals by patients.

The House of Delegates of the California Medical Association, by overwhelming vote, caused formation of and authorized advance of money to start the movement. California Physicians' Service, however, is not a part of the California Medical Association. All doctors who become professional members of the Service will elect the administrative members.

The first board of trustees and officers are: Dr. Ray Lyman Wilbur, President of Stanford University, who is president; Dr. C. Kelly Canelo, San Jose, vice-president; Dr. Lowell S. Goin, Los Angeles, vice-president; Dr. Alson R. Kilgore, San Francisco, secretary-treasurer; Dr. T. Henshaw Kelly, San Francisco, assistant secretary-treasurer; Dr. Samuel Ayres, Jr., Los Angeles, and Dr. W. Earl Mitchell, Berkeley; Dr. Morton R. Gibbons, Sr., San Francisco, medical director. Allen W. Widenham is general manager.

* * *

II. Bulletin of March 13, 1939

Applications from licensed doctors of medicine in California for membership in the California Physicians' Service are numbering better than five hundred per day. This has advanced the time at which this new group prepayment medical, surgical and hospital service can be offered the public, it was announced today by . . .

The Service, which permits wage-earning groups voluntarily to pay small sums monthly, in return for which the members receive care by the doctors and hospitals of their own choice when needed, was launched officially only a week ago. Trustees of the Service today expressed gratification at the prompt support by doctors.

"The first requirement of this plan is a state-wide organization of the doctors and hospitals invited to professional membership," said . . . "The prompt response of the doctors, which is in excess of our anticipations, will permit completion of our organization much sooner than expected. In consequence, we shall be able to proceed to the next step—the enrollment of beneficiary, or patient, members very shortly." . . . revealed today that the California Physicians' Service is based on the same plan that has been in successful operation in King County, Washington, and elsewhere, for several years.

"Much of the experimental work in voluntary group medical, surgical and hospital care has been done by the King County service, with headquarters in Seattle, and in other Northwest cities," he said. "As a result, we sent a delegation North to study their several plans, and we are able to offer a service to Californians, with the customary trial-and-error methods eliminated. We have included the best provisions of all plans studied in our service."

Both patients and physicians in King County are highly pleased with results, the delegation learned.

Present headquarters for the California Physicians' Service are at 220 Montgomery Street, San Francisco, but additional offices will be rapidly established throughout the state.

* * *

III. Bulletin of March 20, 1939

Membership by licensed doctors of medicine in the California Physicians' Service now represents every section of California, Dr. Ray Lyman Wilbur, president of the new monthly prepayment plan for medical, surgical and hospital care, said today.

Because of the immediate state-wide response to the invitations to licensed doctors of medicine to become professional members, it will be possible to make up the first list of professional members who will provide medical and surgical services. The list will be sent to the printer on April 1, Doctor Wilbur said.

Many letters from doctors seeking additional details of the California Physicians' Service plan have been received. Doctor Wilbur today urged all doctors desiring additional information on specific points to communicate with state headquarters of the Service at 220 Montgomery Street, San Francisco.

The plan represents ten years of study of existing plans in this and other countries by leaders in the medical profession of California. The coverage to be offered will include the good points of the plans studied. Professional membership is open to all licensed doctors of medicine in good standing in California. California Physicians' Service is an independent, nonprofit corporation, not connected with any other association.

Individual beneficiary, or patient, members will make nominal monthly payments to their group representative, who in turn will remit in a lump sum to the California Physicians' Service. When medical, surgical or hospital care becomes necessary, the beneficiary member will select the doctor and hospital of his or her own choice from among the professional members and hospitals covered by the Service.

* * *

IV. Bulletin of March 25, 1939

Election of leaders in both medical and nonmedical fields in California as administrative members of the California Physicians' Service, the new monthly prepayment plan for low-cost group medical, surgical and hospital service, was announced today by President Ray Lyman Wilbur.

Those added to the board of present administrative members in Los Angeles included: Glenn Myers, president of the California Hospital Association; Monsignor Thomas J. O'Dwyer, vice-president of the Western Conference, Catholic Hospital Association Southern Council; E. Manchester Boddy, publisher of the Los Angeles *Daily and Evening News*; Carl Erickson, vice-president of the Zenith Oil Company; John Anson Ford, Los Angeles County supervisor; and Reverend Ernest Caldecott, pastor of the First Unitarian Church of Los Angeles.

Elected from San Francisco and Northern California were: Daniel E. Koshland, member of Executive Committee, San Francisco Community Chest; Dr. Tully C. Knoles, president of the College of the Pacific; and Ernest Sloman, dean of the College of Physicians and Surgeons' Dental School.

"Additional nonmedical as well as medical administrative members will be appointed," Doctor Wilbur said. "This procedure will give California Physicians' Service the best obtainable in nonmedical as well as in medical advice and will insure full representation of the public, to which this service is dedicated. It will make certain a most complete and satisfactory service."

Professional membership in California Physicians' Service has been acquired by more than half the licensed doctors of medicine in actual private practice in California to date, Doctor Wilbur said. Invitations to membership were issued on March 6, and acceptances continue to arrive at state headquarters, 220 Montgomery Street, San Francisco, at a rate of more than one hundred a day.

* * *

V. Bulletin of March 29, 1939

Support by every citizen of California for the California Physicians' Service, the new monthly prepayment plan for group medical, surgical and hospital care, was urged today by Monsignor Thomas J. O'Dwyer, Vice-President of the Western Conference, Catholic Hospital Association, Southern Council, who has just been elected an administrative member of the Service.

"The doctors of California deserve the highest commendation for being the first state group in the United States to initiate a sound plan of voluntary health care," Monsignor O'Dwyer said. "There is nation-wide interest in their plan. California Physicians' Service deserves the support of every citizen of the state. I am happy to be able to participate in an advisory capacity in this movement."

Daniel E. Koshland, for many years a member of the Executive Committee of the San Francisco Community Chest, and a member of the Advisory Committee of the Insurance Association of Approved Hospitals, who is another new administrative member of California Physicians' Service, said:

"I am convinced the group hospital plan is working. The addition of medical and surgical care completes the plan. Steps have been taken quietly, steadily, and soundly. I am glad to be one of the group of business men to assist California Physicians' Service. I believe participation by business and hospital representatives will be of great aid to the doctors in making this fine service successful."

* * *

News Items: C. P. S.

Applications for professional membership have been received to date from 3,731 physicians. It is estimated conservatively that this is well over 50 per cent of the total number of physicians available for private practice. (Of the 10,000 licensed, the number who are retired and in full-time teaching, public health, state hospital and other institutional positions, internes and residents in general hospitals, etc., is very large.) From 100 to 200 applications are coming in daily. That California Physicians' Service has the support of the profession is abundantly apparent.

* * *

The election, completed on Friday, added nine new administrative members: Mr. E. Manchester Boddy, Publisher of the Los Angeles *Daily and Evening News*; Rev. Ernest Caldecott, Pastor, First Unitarian Church of Los Angeles; Mr. Carl R. Erickson, Vice-President of Zenith Oil Company, Los Angeles; Mr. John Anson Ford, member of Board of Supervisors of Los Angeles County; Dr. Tully C. Knoles, President of the College of the Pacific, Stockton; Mr. Daniel Koshland, member of the Executive Committee, San Francisco Community Chest; Glenn Myers, M.D., President of the California Hospital Association; Monsignor Thomas J. O'Dwyer, Vice-President of the Western Conference, Catholic Hospital Association, Southern Council; Ernest Sloman, D.D.S., Superintendent of the College of Physicians and Surgeons' Dental School.

It is with gratification and sincere appreciation that we welcome these public-spirited men to the administrative group.

* * *

The amendment to the by-laws, increasing the trustees from seven to nine, was passed and it is expected that the two vacancies thus created will be filled as soon as the necessary legal forms have been signed.

* * *

Dr. E. Vincent Askey has accepted appointment as assistant medical director, with headquarters at Los Angeles.

* * *

Los Angeles offices will be opened in the Pershing Square Building, 448 South Hill Street, on April 1.

* * *

District organization will be undertaken by the trustees at the next meeting, scheduled for this week-end in Los Angeles. In the appointment of deputy medical directors, every effort, by previous conferences and consultations, will be made to secure the services of men whose appointments will be satisfactory to the professional members of the respective districts.

Substantial agreement on a uniform hospitalization contract has been reached by the three nonprofit hospital associations and we expect to announce shortly the signing of definitive contracts for hospitalization of California Physicians' Service beneficiaries. As soon as this is done we shall be ready to negotiate contracts with beneficiary groups.

* * *

For purposes of negotiating contracts with groups of beneficiary members (which we hope to do in April) it is necessary that we have a printed list of professional members. The task of checking, indexing and arranging alphabetically, and by counties, 4,000 or 5,000 physicians' names is a large one. To have such a list ready for use in April we shall have to send copy to the printer as soon after April 1 as it can be prepared. A courtesy notice by postcard was, therefore, mailed to all licensed doctors of medicine approximately ten days ago, announcing that such a list of professional members would be prepared as of April 1. Printing a list of this size is expensive, as you can well appreciate.

* * *

In the establishment of rates, etc., your trustees have kept constantly in mind that the California Physicians' Service plan is one which must be kept financially solvent. We cannot fall back on the taxpayers of the state to make up deficits.

The following policies have been developed so far:

Rates.—Standard average monthly dues of $2.50 per member for groups with average income of under $3,000 annually, for full coverage (without "deductible clause"). In so far as possible, in negotiating contracts with groups, an attempt will be made to adjust a sliding scale, according to income, to make the average $2.50.

In addition, various other contracts will be offered, *e. g.*, contracts with "deductible" clauses covering from $1 to $10 or more of the cost of initial service, at average rates ranging from $2.25 per month down to less than $2 per month.

As soon as group service has been well started we expect to offer coverage for the *families of members* and also for *individuals,* the latter at somewhat higher rates (due to the greater expense of administration) and after examination. In the meantime, hospitalization contracts for families will be available at once through the hospital associations.

* * *

Fee Schedule.—For our purposes the fee schedule is to be a measure of the *relative* compensation to be paid for various procedures in practice. It is in no sense a guarantee of rates of compensation. These will be determined on the "unit basis." The committee in charge of development of the schedule has been holding conferences with physicians in the various specialties involved and is finding it no simple matter to arrive at a schedule satisfactory to all. However, the trustees expect to announce shortly a schedule with which operations can be started. This schedule will be subject always to adjustment as experience dictates. It should be borne in mind that your trustees are handicapped by the usual human frailties and limitations. Not being prophets, they do not expect to foresee every contingency that may arise in the operations of a plan of the magnitude of California Physicians' Service. They expect that fee schedules, contracts, rules and organizational details will require modification in the light of experience. Attention may be again directed to the fact that the California Physicians' Service plan is not based upon legislation. It will be subject to the control of its members through the trustees and advisory committees representing the beneficiary members served and others interested. Changes can be made as they appear desirable. And if the trustees do not change unsatisfactory matters, the members can change the trustees.

COUNTY SOCIETIES

PLACER COUNTY

The Placer County Medical Society held its March meeting at the Freeman Hotel in Auburn on March 4, with a dinner meeting commencing at 6:30 p. m. In the absence of President Miller and Vice-President Empey, Past President Robert H. Eveleth presided.

There were present the following members and visitors: *Members:* Doctors Barnes, Dunievitz, Eveleth, Foster, Hirsch, Kindopp, Lewis, Lundegaard, Padgett, Peers, Rood, and Russell. *Visitors:* Dr. F. N. Scatena (Councilor for the Eighth District), Dr. F. F. Gundrum, and Dr. Paul Guttman, all of Sacramento; Dr. Robert Stewart Peers of Oakland, and Dr. W. J. Perry of the C. C. C., Camp Bradley, Auburn.

All correspondence since the previous meeting was read, among which were the following:

Correspondence from Association Secretary Kress relative to Postgraduate Clinical Conferences. Dr. F. F. Gundrum, a member of the Committee on Postgraduate activity being present, discussed the subject of *Postgraduate Courses for Placer County Members.* It was agreed that the members of the Placer County Medical Society would coöperate and would attend such conferences when held in neighboring counties.

Letter from Dr. John H. Napier, Jr., District Superintendent and Director of the Placer Union High School and the Placer Junior College, asking that the Placer County Medical Society make a study of the Placer Union High School and Junior College with the view to making recommendation for a thorough-going health department in these institutions. It was the sense of the members that President Miller and Secretary Peers consult with Doctor Napier and report back to the Society.

Secretary Peers then took up with the Society the California Physicians' Service. He reported on the meeting of February 25 of the county secretaries with the Council and officers of the California Medical Association and the members of the various committees, at which time a number of addresses on the California Physicians' Service were given. The Secretary stressed the importance of having as many members as possible make application for professional membership. Doctor Scatena, spoke at length on the same subject, urging that each member of the Society take out membership in the California Physicians' Service, and stated that it is particularly important that succh membership be acquired immediately so that it may become known that the medical profession has a going organization, ready to furnish medical care on an insurance basis. There was general discussion, and Doctor Scatena answered many questions by the members. It was moved by Doctor Hirsch, seconded by Doctor Dunievitz, that the Placer County Medical Society endorse the California Physicians' Service and that the Secretary be instructed to write every member, urging prompt registration. Unanimously carried.

The application for membership in the Placer County Medical Society of Dr. Frederick Harry Benteen of Grass Valley was read for the first time, but as Doctor Benteen has not practiced the required six months in the district, no action was taken.

Following this, Doctor Eveleth introduced Dr. Paul Guttman of Sacramento, who addressed the Society on *Newer Methods of Typing in Pneumonia.* The address was illustrated by lantern slides. Doctor Guttman discussed the various organisms involved in the production of pneumonias, giving the approximate percentages of the different bacteria, and described the various types of pneumococci which have been isolated, giving the approximate percentages of the different varieties in the order of their importance. Also the various methods of typing, particularly the Neufeld method, which is now used mainly to the exclusion of other methods, and spoke also of sera used in the treatment of various types of pneumococcus pneumonia.

Dr. F. F. Gundrum of Sacramento, being called upon, spoke on *The Newer Methods of Treatment in Pneumonia.* Doctor Gundrum reviewed the various methods of treatment which had their vogue the past few decades, showing that over a period of time the death rate was approximately the same irrespective of the type of treatment. He then discussed the use of sera, the dosage and methods of administration. He also commented on the recent use of sulfanilamid and also spoke briefly on the more recent member of the sulfanilamid group, sulfapyridin.

The discussion was opened by Dr. Robert Stewart Peers of Oakland, who gave a history and showed x-ray films of a cast of pneumonia in a middle-aged Italian woman in whom the diagnosis was made within twenty-four hours of commencement of the attack. Specific serum was used with rather spectacular results. Doctor Peers also spoke on the different types of pneumococci. Following this there was very general discussion in which all members present took part.

Robert A. Peers, *Secretary.*

⁂

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society was held in the Medico-Dental clubrooms, Stockton, March 2, at 8:30 p. m. It was preceded by the customary supper meeting, held at the Hotel Wolf, at which thirty-one members and guests were present. The paper of the evening was presented by Mr. Lee Hixson, Pharmacist, who talked on *Pharmaceutical Problems That Are Common Both to the Physician and Pharmacist.*

The regular meeting was called to order by President Neill P. Johnson at 8:30 p. m. A report on the application of Dr. J. J. Tully for retired membership was made by the Secretary, with a statement that it had been referred to the California Medical Association after a telephone vote of the Board of Directors. Dr. Dewey Powell then reported on the progress of the California Physicians' Service. Questions were answered by both Doctor Powell and Dr. Karl Schaupp, who was present as a speaker. Doctor Broaddus then presented certificates to newly elected members of the Medical Academy of Graduate Study.

A fee schedule of the Metropolitan Life Insurance Company for medical services to their representatives was presented by the Secretary. This schedule received a general approval.

The speaker of the evening was Dr. Karl Schaupp of San Francisco. Doctor Schaupp talked on *Analgesia in Labor and on the Cause and Treatment of Leukorrhea.* Both papers were short and of real practical value.

The members of the Society were urged by President Johnson to sign up as close to 100 per cent as possible to the California Physicians' Service. It was explained to them that it was extremely necessary. The members were also urged to pay their dues.

There being no further business to come before the Society, the meeting was declared adjourned at 10:30 p. m., and refreshments were then served.

G. H. Rohrbacher, *Secretary.*

⁂

SAN MATEO COUNTY

The meeting of the San Mateo County Medical Society was held in the banquet room of the Benjamin Franklin Hotel on Wednesday, February 22. Dr. Carl Benninghoven presided.

The Chairman announced that Dr. G. Franklin Shiels of Redwood City had been elected to honorary membership.

Doctor Benninghoven also mentioned the bill for Certification of Social Service Workers and announced that a report concerning the approval by the Society would be submitted upon word from the Legislative Committee of the California Medical Association.

The Secretary made an announcement concerning the immunization of children in the San Mateo schools and referred to the work of the Public Health Committee in the preparation of a satisfactory school health program for San Mateo County. The Secretary suggested that until this program is under way, and in view of the present emergency in connection with the smallpox outbreak in Redwood City, it might be best for the County Society to approve the previous method of immunization among school children and provide voluntary workers to carry out such immunization at a minimum schedule. He further announced that with the consent blank, which would be sent to the parents, a form would be submitted, consisting of educational propaganda directed toward emphasizing the importance of preschool immunization, and mentioning the possible harm that might result if the general public were to wait until the children were of school age to have immunization done.

In connection with the Postgraduate Conference, a list of various subjects was submitted to the Society to indicate its preference concerning subjects of first, second, and third desirability. The following subjects received the greatest number of votes, in this order: blood dyscrasias, endocrine problems, deficiency diseases and allergy. The Secretary announced that he would submit this information to the Committee on Postgraduate Conferences.

In connection with the prenatal and premarital tests for syphilis and gonorrhea, a motion was made, seconded and unanimously passed, that the endorsement of the program contained in the bill introduced into the Legislature by the Southern California Medical Society, for the control of syphilis and gonorrhea, be determined by the attitude of the California Medical Association.

An announcement was made concerning the availability of a piece of property in Burlingame for a combined office and residence for a physician.

The Secretary made a brief report on the question of health insurance and mentioned the propaganda that was being indulged in by the proponents of the Compulsory Health Insurance Bill, and the importance of a united front among the doctors: on the one hand, in support of the California Medical Association plan; and on the other hand, in opposition to the Compulsory Health Insurance measures. In connection with our own tactics, the Secretary referred to the distribution, which is to be made, of the Walch pamphlet, "On the Witness Stand," and also the advisability of a Speakers' Bureau of the county society, to provide speakers for public and organization meetings. The Secretary further announced, in this connection, that the membership of the Society would shortly be solicited by the California Physicians' Service for professional membership and urged that every doctor coöperate by taking out such membership.

The Chairman then introduced Dr. John W. Brown of the California University Medical School, who presented a very interesting discussion on the subject of *Pneumonia*, with special reference to serum therapy. Dr. L. B. Coblentz, a member of the Pneumonia Control Committee of the California Medical Association, was then introduced. He presented a paper on *Eleven Cases of Pneumococcic Pneumonia Treated with Sulfapyridin*. While he emphasized the fact that the results were not conclusive, the remarkable response to this type of therapy suggested a very considerable advance in the treatment of this disease. The Society enthusiastically expressed its appreciation to Doctor Brown and Doctor Coblentz for their exceptional presentations.

J. Garwood Bridgman, *Secretary*.

⁂

VENTURA COUNTY

The regular monthly meeting of the Ventura County Medical Society was held at the Saticoy Country Club on Tuesday, February 14. Eighteen members and three guests were present.

Former Judge Henderson spoke on *Common Medical-Legal Problems*. This was followed by a good discussion.

The applications of Dr. E. R. Sizor of Camarillo for membership, and Dr. H. F. Galbraith of Ventura for transfer from the Los Angeles County Medical Society were presented for the first time.

The following communications were read: From Dr. C. A. Dukes expressing his appreciation of the large attendance and good dinner at the special meeting. From the Cancer Commission in regard to the pathologic and x-ray conference, which was held on the Sunday before the State meeting. Letter from the Pneumonia Control Committee. Letter announcing the third mid-year conference of the secretaries. Letter from Doctor Schaupp, acknowledging our request for a unit of California Physicians' Service. From the committee in charge of a movement to install an iron lung in the Ventura County Hospital. From Mrs. T. E. Shelton, announcing the opening of the Shelton School in Ojai for children who need special care. From Café Royale in Ventura, inviting us to inspect their new clubroom.

The need for an iron lung at the County Hospital was discussed, but it was the consensus of opinion of the members present that there was less need for a machine of this type than for other equipment.

The local Tuberculosis Association asked what the attitude of the members would be in regard to helping with another survey of twelfth-grade pupils for tuberculosis. No definite action was taken in answer to this question, but it was felt by the majority of members present that this was either a problem for the School Board or the communities in general, and that physicians should not be asked to do this work without some compensation. It was suggested that the Tuberculosis Association approach the School Boards in those districts which do not have a full-time or part-time physician.

Mr. Whittaker of the Ventura Adjustment Company requested permission to form a medical-dental collection bureau, which would be sponsored by the Society. It was moved by Doctor Coffey, and seconded by Doctor Hendricks, that this request be tabled. Carried. It was brought out in discussion that the members felt that collections should be an individual problem and that the Society, as such, should not become involved.

The following Board of Censors was appointed: Doctors Coffey, Nielson, and Osborn.

Doctor Morrison was reappointed to the Public Health Advisory Committee.

A. A. Morrison, *Secretary*.

⁂

YUBA-SUTTER COUNTY

The regular meeting of the Yuba-Sutter County Medical Society was held at the Hotel Marysville on March 7 at 8:30 p. m. Dinner preceded the business and scientific part of the evening.

Members present were: Doctors Higgins, Miller, Hamilton, Wisner, Parkinson, Loomis, Swift, Thunen, Linstrum, Whitney, and Morris; associate member present, Doctor Richards. Visitors present: Dr. George M. Uhl of the

Department of Public Health Bureau of County Health Work and Dr. Paul J. Moses of San Francisco.

President P. E. Thunen called the meeting to order about 9:30 p. m.

Following the reading of the minutes and the reports from standing committees, Dr. Paul Moses of San Francisco presented a paper on *Voice and Speech Disorders.* He supplied each member present with an outlined copy of his talk. He illustrated his paper by the use of his own voice, and various instruments he had brought with him. An interesting discussion followed, showing that his subject was very well received.

President Thunen reported on the plan of a full-time public health unit, submitting correspondence from various county medical societies giving their opinions, reactions, and criticisms.

Dr. George M. Uhl discussed and replied to questions pertaining to the activities of a full-time public health unit. He advised a full-time public health unit for Yuba and Sutter counties, to be under the direction of a local physician trained in public health work. He stated that funds are available to assist the local counties in setting up a full-time public health unit.

The basic unit would consist of: full-time public health officer; public health nurses; sanitary inspector; and clerk.

The public health officer would be responsible directly to the County Board of Supervisors and be appointed by them according to law, but would work in coördination with the local medical society.

It was moved by Dr. Neal M. Loomis, and seconded by Dr. J. W. Lindstrum, that the Yuba-Sutter County Medical Society go on record as endorsing the establishment of a full-time public health unit to serve the whole of Yuba and Sutter counties. The motion carried.

President Thunen requested the public health officers of both counties to meet with the various clubs and organizations and influence them to favor the establishment of a full-time public health unit.

Dr. Leon M. Swift gave a report on the California Medical Association Secretarial Conference, which he attended in San Francisco on February 25, and discussed briefly the *California Physicians' Service,* and strongly urged each member to sign and mail his application immediately.

It was moved by Dr. Neal M. Loomis, and seconded by Dr. A. Lucian Hamilton, that we incorporate in the present fee schedule a minimum fee of $50 for one year well-baby service, exclusive of illness when physician is called to the home. The motion carried.

President Thunen informed Doctors Wisner and Linstrum, Sutter and Yuba county health officers, respectively, that the Yuba-Sutter County Medical Society has endorsed the establishment of a full-time public health unit.

President Thunen appointed Dr. Neal M. Loomis as the Postgraduate Committee.

Leon M. Swift, *Secretary.*

In Memoriam

Bathurst, Edwin William. Died at Etna, March 9. 1939, age 85. Graduate of Cooper Medical College, San Francisco, 1877, and licensed in California the same year. Doctor Bathurst was a retired member of the Siskiyou County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✢

Lumley, Clinton Grant. Died at Huntington Park, February 17, 1939, age 77. Graduate of Northwestern University Medical School, Chicago, 1889. Licensed in California in 1929. Doctor Lumley was a member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

✢

Scheier, Ralph Bartholomew. Died at San Francisco, February 25, 1939, age 59. Graduate of College of Physicians and Surgeons, San Francisco, 1908, and licensed in California the same year. Doctor Scheier was a member of the San Francisco County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✢

OBITUARIES

George Benjamin Henke

1884–1939

At four o'clock on Wednesday afternoon, January 25, 1939, Dr. George Benjamin Henke died suddenly from coronary occlusion at his home, 1458 North Euclid Avenue, Ontario.

In 1913 Doctor Henke settled in Ontario, and for twenty-five years had been active in the affairs of the community. He was a member of the San Bernardino County Medical Society, State Medical Association, the American Medical Association, the Southern California Medical Association, and of the board of directors of the San Antonio Community Hospital.

Doctor Henke led a very active life. His forceful personality, unusual diagnostic ability and timely advice endeared him to all who were privileged to know him. He was untiring in his devotion and service to his patients, and few men have ever enjoyed the loyalty, esteem and affection of their patients as did Doctor Henke. In his passing his patients have lost a real friend and family physician, and the community has lost a much beloved and highly respected citizen.

Robert C. Nichols, M. D.

✢

William Allan Taltavall

1858–1938

Dr. William Allan Taltavall was born on November 28, 1858, in North Shields, Northumberland, England, of Spanish and Scotch parentage. The family, including four small sons, came to the United States in 1863 and settled in Cleveland, Ohio.

Doctor Taltavall entered Harvard University in 1877, but failing health forced him to leave in his sophomore year. He spent some time recuperating in the South, and entered the College of Physicians and Surgeons at Columbia University in 1881 and was graduated from it in 1884.

He began the practice of medicine in New York City, and was later associated with the Rockefeller Institute. Married in 1885, he removed to Redlands, California, in 1903, on account of his wife's failing health. She died here in 1904, and their only daughter in 1907.

Doctor Taltavall's profound knowledge of pathology and medicine was always an inspiration, and his ability in laboratory procedures was recognized all over the state. His sterling qualities as a man and his unflinching steadfastness as a true friend were truly appreciated by all of us who knew him.

His passing, on December 21, 1938, makes one more break in the ranks of the men who made early medical history in the county of San Bernardino, and leaves a deep heartache for his loss in those of us who were privileged to be his friend.

Carlos G. Hilliard, M. D.

✢

Ralph B. Schier

1880–1939

At the age of fifty-nine years Doctor Schier was taken from our midst after a year attended with great suffering combined with unusual fortitude.

Doctor Schier was graduated from the University of California Medical School in 1908, following this with a few years of general practice. He then prepared for the specialty of diseases of the lungs, and founded the Canyon Sanitarium in Redwood City, of which he was medical director until his death. He was one of the first to make it possible for people of moderate circumstances to have institutional care. Many patients will testify as to the financial, physical and moral help they received through his cheerful personality and professional care. Many of his colleagues will miss his staunch friendship and the stimulating character of his conversation. He is survived by his widow, and a son and daughter.

Lawrence H. Hoffman, M. D.

✢

Edwin W. Bathurst

1854–1939

Edwin W. Bathurst was born in Australia on April 30, 1854, and died following a cerebral accident on March 9, 1939.

He had his preliminary education in Australia, and entered a French hospital on the island of New Caledonia, in the South Seas, and became much interested in medicine there. He then came to San Francisco, California, entering Stanford University, graduating in the class of 1877. He started practice at Sawyers Bar, California, at the time when it was a gold camp. Practice was on horseback, and he went through several severe diphtheria epidemics before antitoxin was known, and at a time when a crude tracheotomy set was a much used instrument in every physician's saddlebag. Calls two days long were a common thing in that mountainous country. In 1882, Doctor Bathurst moved to Etna, Siskiyou County, California, where he carried on an active practice until his death. He was a charter member of the original Siskiyou County Medical Society in 1888, and has been an active member in the same society since. He played an active part in the civic improvement of his district, serving as school board president, mayor of Etna, and a member of the County Board of Supervisors. In his sixty-two years of practice, Doctor Bathurst spanned the time from the period when the germ theory disease was a controversial point and antiseptic surgery was unknown to the period of modern medicine, and kept abreast during that entire period. He understood the art of the practice of medicine. He was a loyal friend to his patients, and leaves a place in his community that will be difficult to fill.

V. W. Hart.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

MRS. CLIFFORD A. WRIGHT..................................President
MRS. FRED H. ZUMWALT..............Chairman on Publicity
MRS. FRANK H. RODIN..Assistant Chairman on Publicity

News Letter

Dear Auxiliary Members:

The 1939 annual convention of the California Medical Association and the Woman's Auxiliary will be held in beautiful Del Monte from Sunday, April 30, to and including Thursday, May 4.

The rates for accommodation were published in the February issue of California and Western Medicine.

It is hoped that you have already made reservations and are planning to attend the session; if not, please do so at once.

The convention committee has been busy planning for your entertainment, comfort and interest, and its members are waiting to welcome you. Please come—you will enjoy every minute of your visit.

Sincerely yours,
Mrs. Frank H. Rodin.

Component County Auxiliaries

Alameda County

The Woman's Auxiliary to the Alameda County Medical Association met for luncheon on Friday, March 17, at the Clairmont Country Club. The president, Mrs. Frank Baxter, presided.

Mrs. I. O. Church, Program Chairman, introduced Mr. Claud A. Shaull, President of the San Francisco Motion Picture Council and a member of the faculty of the San Francisco State College, who spoke on *Society's Stake in Motion Pictures.*

Mr. George U. Wood, Manager of the Peralta Hospital, showed a motion-picture film, entitled *Behind the Scenes in a Modern Hospital.*

The hostess of the day was Mrs. Thomas A. Clark, a former president of the Alameda County and California State Auxiliaries.

Mrs. Grant H. Ellis, *Publicity Chairman.*

⁂

Fresno County

The annual public health meeting, sponsored by the Woman's Auxiliary to the Fresno County Medical Society, was held on March 10 in the Administration Building of the Fresno public schools.

Mrs. J. R. Walker, Chairman of Public Relations, introduced Dr. William N. Anderson, heart specialist of Los Angeles, who spoke on *Living with a Damaged Heart.*

There was a very good attendance, and the audience was intensely interested in the subject.

Mrs. Charles H. Ingram, *Publicity Chairman.*

⁂

Los Angeles County

The members of the Woman's Auxiliary to the Los Angeles County Medical Society met on February 28 in the beautiful Gothic dining room of the Pacific Coast Club, overlooking the ocean in Long Beach. One hundred and forty-two members and guests attended the luncheon and meeting. In the absence of the president, Mrs. William H. Leake, the vice-president, Mrs. William Boeck, presided.

Mrs. Ralph B. Eusden, Program Chairman, introduced Dr. Lowell S. Goin, Speaker of the House of Delegates of the California Medical Association. Doctor Goin spoke on the *Health Insurance Plan of the California Medical Association.*

Mr. Ben Read, Executive Secretary of the California Public Health League. spoke on *Legislation Affecting Medicine,* and emphasized the fact that there were 203 measures pertaining to medicine before the Legislature in Sacramento this year. Mr. Read asked the members to study Assembly Bill 2172 and Senate Bill 1128 on Compulsory Health Insurance.

Dr. Charles Debby of Kansas City, Missouri, spoke on the *Federal Plan for Health Insurance* and pointed out his reasons for opposing such a plan.

Mrs. Karl Von Hagen, *Publicity Chairman.*

⁂

Marin County

The Woman's Auxiliary to the Marin County Medical Society met for dinner on February 23 at the Sleepy Hollow Country Club.

The Board members met a short time before the dinner hour and took up the matter of the State convention in Del Monte.

After dinner the president, Mrs. B. J. Conroy, introduced the guest speaker, Dr. Frederick A. Fender of San Francisco, whose subject was *Neurosurgery.* Doctor Fender's talk was instructive and interesting, as he described operations for brain tumors and those necessitated by injuries.

Mrs. C. A. DeLancy, *Publicity Chairman.*

⁂

San Diego County

The annual benefit bridge party given by the Woman's Auxiliary to the San Diego County Medical Society was a great success, both financially and socially. It was held on Valentine's Day, February 14.

Seven homes throughout the city were opened for the occasion, with an attendance of three hundred members and guests. Tables and tallies, as well as the delicious desert of raspberry ice cream and white merangues, carried the Valentine motif.

The funds collected will be used for health education for the public in the community and for philanthropic activities.

The hostesses were Mesdames Frazer MacPherson, Charles W. Brown, David Higbee, James Reeves, W. C. Cooke and Lloyd Meyers of San Diego, and Mrs. W. L. Garth of La Jolla.

Mrs. H. K. Albertson, *Publicity Chairman.*

⁂

San Luis Obispo County

The members of the Woman's Auxiliary to the San Luis Obispo County Medical Association met for dinner on February 18. The president, Mrs. Charles P. Kennedy, presided, with eight members and two guests in attendance.

Mrs. Kennedy reported on her visit as a guest to the State Board meeting of the Woman's Auxiliary held in San Francisco on February 17. Three new members were welcomed to the Auxiliary.

The members expressed deep sympathy at the death of Dr. A. H. Giliahan, who passed away on February 15. Doctor Giliahan was a close friend of the Auxiliary, having assisted with its organization, and was a member of the first Advisory Committee.

The County Health Department requested the aid of the Woman's Auxiliary in the clinic to be held for crippled children. It was voted that the members will assist in every way possible.

Mrs. Charles Kennedy, *President.*

---

† As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Frank H. Rodin, Assistant Chairman of the Publicity and Publications Committee, 2457 Bay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Rodin and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

Santa Barbara County

Mrs. Harold G. Trimble of Oakland, State Chairman of *Hygeia*, was the honored guest at a special luncheon meeting held by the Woman's Auxiliary to the Santa Barbara County Medical Society on February 27 at the El Paseo.

After luncheon, Mrs. Trimble spoke of *The Importance of the Hygeia Health Magazine*. She also presented ways and means for developing a large circulation in the community.

During the short business meeting that followed, the membership voted to send $5 to the *Courier*.

MRS. C. W. HENDERSON, *Publicity Chairman*.

⁂

Santa Clara County

The members of the Woman's Auxiliary to the Santa Clara County Medical Society met at the Sainte Claire Hotel for luncheon on March 6. The president, Mrs. Morgan D. Baker, presided.

The guest speaker was Mrs. Theodore Lee of Berkeley, who gave a most interesting talk on *Medicine in Other Times and Places*. Beginning with her childhood recollections, many years ago, in Western Pennsylvania, Mrs. Lee told of the doctor making calls on horseback, carrying his meager equipment in leather saddlebags, and traveling over lonely trails that connected the sparsely settled community. Then to a small town in Utah, giving a vivid picture of the life among the Mormons and the difficulty the doctors had, because the Mormons at that time did not believe in medical care. And, in conclusion, compared the medicine of the present day, its specialization, and modern equipment. Mrs. Lee also told of medical work done by members of her family in far-off Persia.

May 10 is the date set for the silver tea to be given at the home of Mrs. R. S. Kneeshaw. The funds collected are to be used to send as many children as possible to camp this summer.

Mrs. Leslie Magoon will be in charge of arrangements for a barbeque to be given at the Los Altos Country Club, at which time the husbands will be the guests of the Auxiliary members.

MRS. CHARLES MOORE, *Publicity Chairman*.

⁂

Santa Cruz County

The Woman's Auxiliary to the Santa Cruz County Medical Society met for luncheon at the Pasatiempo Country Club on February 27. The president, Mrs. Alfred L. Phillips, presided.

Mrs. F. P. Shenk reported on the cancer control meeting held in San Francisco. Upon the advice of the Advisory Committee, the members will give publicity to the importance of medical care in cancer control, but will not join at present.

Mrs. N. Sullivan presented a paper on *Socialized Medicine*, and Mrs. A. Pederson described the plans for health insurance as offered by the California Medical Association.

MRS. R. C. ALSBERG, *Publicity Chairman*.

Proposed Amendment

The following is the proposed amendment to Section 1 of Article 9 of the Constitution of the Woman's Auxiliary to the California Medical Association:

SECTION 1

For the years 1939 and 1940 to 1941 the Nominating Committees, each consisting of five members, shall be appointed at the annual meeting held in May, 1939. Each committee shall consist of five members, two of whom shall be elected by the Board of Directors, and three to be members-at-large, elected by the House of Delegates. The members elected by the Board of Directors shall be elected at the regular meeting held previous to the annual meeting, while the members elected by the House of Delegates shall be elected at the first session of the annual convention. The Board of Directors shall designate the chairman of each committee. The Nominating Committee so elected for 1939 to 1940 shall present its report of nominees as soon as possible. The nominating committee so elected for 1940 to 1941 shall meet sixty days prior to the annual meeting of 1940 and prepare its report and submit the same at the first session of the annual meeting in 1940.

Beginning with the annual meeting in 1940, and annually thereafter, the Nominating Committee shall be appointed each year in advance and shall consist of five members, two elected by the Board of Directors and three to be members-at-large, elected by the House of Delegates.

It shall be the duty of the Nominating Committee to nominate and present in the regular order of business, candidates for the following offices: president-elect, first vice-president, second vice-president, recording secretary, treasurer, and four councilors-at-large to serve for one year or until their successors assume office.

ESTHER TRIMBLE.
(Mrs. Harold G.)

Carditis.—An aid in determining the duration of convalescence and the diagnosis of active carditis (inflammation of the heart) following attacks of rheumatic fever was recently described by the United States Public Health Service in its weekly bulletin, *Public Health Reports*.

The observations reported in the study, according to Dr. Mark P. Schultz, surgeon, and Edythe J. Rose, associate bacteriologist, "were made with the object of determining the significance of alterations in the 'formol-gel reaction' in febrile diseases, particularly rheumatic fever." Only blood serum from patients is required for the reaction, they pointed out, and the test may be performed several days after the specimen is collected.

Rheumatic fever, chief cause of heart disease in children, is frequently a chronic and insidious process. The most effective treatment known is complete rest in bed until the inflammation in the heart has completely subsided.

"Notwithstanding the several diagnostic criteria available, however," said the researchers, "it is often very difficult for the physician to decide when, during the long period of convalesence, activity of the disease terminates. There is the possibility, on the one hand, that the child will be kept flat in bed needlessly for months; on the other, that he will be allowed to get up prematurely and thereby incur serious damage to his heart."

The experiments described by the authors would imply that an additional aid in making the decision with respect to the ocurrence of complete recovery may be available. If a drop of formaldehyde solution is added to a small amount of blood serum from the patient and no change takes place in the liquid during the next twenty-four hours, suggestive evidence is provided that activity of the disease has subsided. If, however, the serum becomes "jellied" or cloudy, it is a definite indication that rest in bed should be continued.

Of the seventy rheumatic fever patients used in these experiments, thirty-three developed strongly positive formol-gel reactions during the course of observation. In the remainder, only negative or faintly positive reactions were obtained, and these for the most part were mild cases.

"These observations suggest," the authors conclude, "that the reaction may be a valuable additional aid in determining the presence of active rheumatic carditis in patients known to be suffering from rheumatic fever. Strongly positive reactions in children, or in adults without arthritis, suggest the presence of active carditis; negative results, on the other hand, indicate the absence of severe carditis, and are of favorable diagnostic import."

There are two things in life that a sage must preserve at every sacrifice, the coats of his stomach, and the enamel of his teeth. Some evils admit of consolations, but there are no comforters for dyspepsia and the toothache.—Bulwer.

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, St. Louis, Missouri, May 15 to 19, 1939. Olin West, M. D., Secretary, 535 North Dearborn Street, Chicago, Illinois.

California Medical Association, Hotel Del Monte, May 1 to 4, 1939. George H. Kress, M. D., Secretary, 450 Sutter Street, San Francisco.

Nevada Medical Association, Reno, September 22 and 23, 1939. Horace J. Brown, M. D., Secretary, P. O. Box 689, Reno, Nevada.

Medical Broadcasts*

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of April is as follows:

Saturday, April 1—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, April 6—KECA, 10:45 a. m., The Road of Health.
Saturday, April 8—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, April 13—KECA, 10:45 a. m., The Road of Health.
Saturday, April 15—KFI, 8:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, April 20—KECA, 10:45 a. m., The Road of Health.
Saturday, April 22—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, April 27—KECA, 10:45 a. m., The Road of Health.
Saturday, April 29—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.

Postgraduate Courses on Maternal Care.†—The Committee on Postgraduate Work of the California Medical Association, in coöperation with the State Department of Public Health, announces that Dr. Harold Teel will be in California for a period of six weeks during April and the first part of May. One of the chief purposes of Doctor Teel's visit will be to conduct a course of lectures at the University of California. In addition, county medical societies will be given an opportunity to arrange for lectures on recent developments in maternal care.

Doctor Teel is a Californian, having taken his undergraduate work at the University of California. He received his degree of doctor of medicine from the Harvard School of Medicine, where he is now an assistant professor of obstetrics.

Besides his teaching and experience in private practice, Doctor Teel has been associated with Dr. Harvey Cushing. The visiting lecturer is at present on the staff of the Lying-In Hospital, Boston. He is also a Fellow of the American Medical Association.

Since Doctor Teel's stay in California will be of short duration, those county medical societies desiring to avail themselves of the opportunity of hearing Doctor Teel should communicate at once with the secretary of the California Medical Association, 450 Sutter Street, who is also secretary of the California Medical Association Postgraduate Committee, so that proper arrangements for a clinical conference may be made.

Alpha Epsilon Delta.—The Nevada Alpha Chapter of Alpha Epsilon Delta, honorary premedical fraternity, observed National Social Hygiene Day by holding an open meeting for the student body of the University of Nevada. Dr. B. H. Caples, Director of the Division of Venereal Diseases, opened the program by enumerating a few of the statistics on syphilis and gonorrhea for the State of Nevada. Dr. Lawrence Parsons, chief pathologist of St. Mary's Hospital, gave a direct and educational talk concerning the control and treatment of syphilis and gonorrhea. Dr. Peter Fransden closed the meeting by urging all students to take the Wassermann tests which were being conducted at the state hygiene laboratory, under the sponsorship of the Nevada chapter of Alpha Epsilon Delta.

The National Health Council.—The reëlection of Ira V. Hiscock, Professor of Public Health in the Yale University School of Medicine, as president of the National Health Council for 1939, has been announced by Thomas C. Edwards, Assistant Secretary of the Council.

Other officers of the National Health Council, with headquarters at 50 West Fiftieth Street, New York City, all of whom have been reëlected, are: Vice-President, Dr. Walter Clarke, Executive Director of the American Social Hygiene Association; secretary, Miss Dorothy Deming, General Director of the National Organization for Public Health Nursing; treasurer, Mr. Frederick Osborn, Secretary-Treasurer of the American Eugenics Society.

The following new members have been elected to the Board of Directors for a three-year period: Dr. Thomas Parran, Surgeon-General, United States Public Health Service; Dr. Martha M. Eliot, Assistant Chief, United States Children's Bureau; Dr. Edmund P. Fowler, President, American Society for the Hard of Hearing.

Premarital Legislation.—Twenty-six states have enacted laws in an attempt to protect the marital relationship from the ravages of venereal disease.

Connecticut, Illinois, Michigan, Wisconsin, New Hampshire, Kentucky, New York, Rhode Island, Oregon, and New Jersey require that both male and female applicants for marriage licenses must present medical certificates showing that both are either entirely free from syphilis or, in some states, free from infectious syphilis. Certain states of this group (Illinois, Kentucky, and Michigan) require that applicants be free from all venereal disease. In all ten of these states, laboratory tests are required.

Alabama, Louisiana, North Dakota, Texas, and Wyoming require only the male to present a medical certificate stating that he is free from all venereal disease. North Dakota and Wyoming specify that the disease must not be in a communicable stage.

California, Delaware, Indiana, Maine, Nebraska, North Carolina, Oklahoma, Pennsylvania, Utah, Vermont, and Virginia do not require medical certificates, but require personal affidavits from both male and female applicants of their freedom from all venereal disease; or they try in various other ways to discourage the marriage of those venereally infected. These states do not specify medical examination as a prerequisite to obtaining a license.

New York, New Jersey, and Rhode Island require that all doctors and midwives make or cause to be made a blood test on every pregnant woman who comes to them for prenatal care.

---

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

† See tentative program of places and dates of clinical conferences on page 288.

University of California Medical School to Hold Charter Day Clinics.—The seventy-fifth Charter anniversary of the University of California was observed on Wednesday, March 22, by the University Medical Center by an Alumni Day, in which physicians and surgeons from all parts of the state participated.

The morning was given over to demonstration clinics by the medical, surgical and pediatrics staffs and operative clinics in surgery, obstetrics and gynecology.

In the afternoon the meeting departed from the usual routine of lectures and provided the visitors with a sightseeing tour of the medical school campus, with senior students acting as guides.

Popular Medical Lectures: Stanford University.—The Stanford University School of Medicine announces the fifty-seventh course of Popular Medical Lectures (illustrated), to be given at Lane Hall, north side of Sacramento Street, near Webster, on Friday evenings, on April 7, April 21, May 5, and May 19, 1939, eight o'clock sharp.

The subjects follow:

April 7—Pneumonia and Its Treatment by Recent Serums and Drugs, by Edwin L. Bruck, M. D.

April 21—Electrical Engineers Come to the Aid of the Hard of Hearing, by Harold A. Fletcher, M. D.

May 5—What Are the Movies Doing to the Emotional Stability of Our Children? by Claude A. Schull, M. A.

May 19—Emotions and Physical Diseases, by Paul A. Gliebe, M. D.

All interested are cordially invited to attend.

Smallpox Situation.—The Department of Public Health of the City and County of San Francisco, in a bulletin dated March 14, 1939, stated:

> In 1933–1937, a period of five years, only one case of smallpox was reported in San Francisco that might have received the infection locally. If the infection occurred locally, it was because of contact with another case that came from outside sources.
>
> During the same period, eleven cases occurred in San Francisco which received their infection from outside sources and may be considered "imported cases."
>
> In 1938 a similar condition occurred, in which three cases were reported in San Francisco, two being acquired locally and one receiving its infection from outside the city.
>
> To summarize: In the period of six years, three cases received the infection from local sources and twelve received infection from outside sources, or were "imported" cases into San Francisco.
>
> In the matter of smallpox in 1939, however, it appears that a definite increase in cases may be expected. For instance, in the State of California in 1936 there were reported 1,266 cases, but since January 1, 1939, the number of cases reported have been 219. It could be assumed from these figures that smallpox is increasing within the state. Counties adjacent to San Francisco are reporting definite outbreaks of smallpox. The County Health Officer of San Mateo County, Dr. Charles Gans, reported eighteen cases to date, presumably in the Redwood City area. Sacramento County reports sixty-four cases to date, the majority of cases being confined to itinerant groups which are wandering throughout the state. Therefore, the Department of Public Health of the City and County of San Francisco is urging increased smallpox vaccination in the schools, increased vaccination against smallpox in all child health centers; increased vaccination against smallpox in every medical clinic in San Francisco, including the Central Medical Bureau. Lastly, it is urged that the practicing physicians of the city and county of San Francisco increase vaccination against smallpox and observe very carefully every rash that appears in order that the possibility of smallpox be completely eliminated. All superintendents of hospitals are requested to check carefully vaccination status of their patients. Likewise, all epidemiologists of the Department of Public Health must check every reported case of chickenpox for final diagnosis.
>
> Although San Francisco may be considered singularly free of cases of smallpox at this time, and likewise be a highly successfully vaccinated community, it is necessary that all precautions be taken to avoid an increase of this disease.

University of California Medical School: Invitation to Clinics.—Physicians visiting the Golden Gate International Exposition will be welcomed at the University of California Medical School, Parnassus and Fourth avenues, San Francisco. Department rounds are open to them. Except during the summer vacation, May 13 to August 21, these are held at nine o'clock in Toland Hall, first floor, University Hospital, as follows: Tuesdays, gynecology and obstetrics; Wednesdays, medicine; Thursdays, pediatrics; Fridays, surgery. Visitors are also invited to use the Crummer Medical History Library and the other facilities of the School.

Western Branch, Society American Urological Association.—The Western Branch, Society American Urological Association will hold its annual meeting for 1939 at Del Monte, on April 27, 28, and 29.

Under the presidency of Dr. George G. Reinle, the Society will present perhaps the best rounded-out program in its history.

There will be a symposium on the new sex hormones, with special reference to testosterone propionate, in which scientists and clinicians from the East will participate; there will also be one on renal calculi. Hyperpyrexia will be discussed. A résumé of the urological literature for 1938 will be presented.

There will be a comprehensive scientific exhibit of slides, specimens, and x-rays; and also a technical exhibit showing the newest developments in drugs, appliances, and furniture, of interest to urologists.

The meeting will be open to all members. Nonmembers are invited to make application for guest cards at the registration desk.

Family Relations Center.—From time to time physicians refer patients to the library of the Family Relations Center at 1200 Hyde Street, San Francisco, Telephone ORdway 9976, for books relating to marriage and sex education. To assist the busy physician in making recommendations to his patients, the Center suggests a few titles of what it believes to be the best and most readable volumes now available.

For married persons or those preparing for marriage, Oliver M. Butterfield's book, "Sex Life in Marriage," and Millard S. Everett's "Hygiene of Marriage," are reliable, and lay readers have found them very satisfactory. "Sex Life in Marriage" is the simpler and more easily read of the two, while "Hygiene of Marriage" is superior where the physician wishes to suggest a single volume on marriage, embodying an adequate discussion of contraception. "Emotional Adjustment in Marriage," by Dr. LeMon Clark, serves as an excellent companion to either Butterfield or Everett. It is probably the best present-day book dealing with the emotional aspects of marriage.

For the adolescent, "Life and Growth" by Alice Keliher, explains both the physiology and psychology of sex and adolescent development more satisfactorily than any other volume. It is published by the Progressive Education Association as a textbook for use in high schools. "The Story of Sex" by Helena Wright is a simply written explanation of sex and reproduction which may be helpful to those who would not read a textbook like "Life and Growth."

Perhaps the best thing available for the very young child is "Growing Up," by Karl de Schweinitz. It tells the story of reproduction simply for the child from five to eight years of age. "Being Born" by Frances Strain is an excellent book of the same type for children from nine to twelve.

For parents who find it difficult to discuss questions pertaining to sex and reproduction with their children, "New Patterns in Sex Training" by Frances Strain, and "Sex Education of Children" by Mary Ware Dennett, are reliable and helpful volumes.

Fungus Disease.—A study of the causative factor of coccidioidal granuloma is being made in the department of dermatology of the University of California Medical School, under the direction of Dr. Robert A. Stewart. Through the study it is hoped to determine enough of the nature of this disease to aid in the development of more satisfactory treatment than exists at the present time. Only the most drastic methods can now be employed in combating the disease and, despite these, the known mortality is in excess of 50 per cent.

The disease was first reported in Buenos Aires in 1892 and in this country four years later. It was first identified by Dr. Emmett Rixford, a San Francisco physician, working in coöperation with Doctor Gilcrist of Johns Hopkins. The causative organism was found to be a fungus or mold, instead of the more familiar protozoan or animal type of organism. In 1928 it was shown that the fungus was present in cattle and sheep. From this finding Doctor Stewart was enabled to determine that the Coccidioides grows and flourishes on grass, potatoes, carrots, cactus, and pieces of decayed wood.

When first reported, the disease had a mortality of 100 per cent, but the identification of a milder form was made later.

Society of Medical Friends of Wine.—Seventy-eight members of the medical profession of San Francisco have organized a society for an objective new to the United States—the study and appreciation of wine. The new organization is named "The Society of Medical Friends of Wine," and officially began its existence with an inaugural dinner held at the St. Francis Yacht Club, San Francisco, on February 24.

It is described officially as follows:

"The object of the Society of Medical Friends of Wine is to stimulate scientific research on wine, develop an understanding of its beneficial effects, and encourage an appreciation of the conviviality and good fellowship that are part of the relaxed and deliberate manner of living that follows its proper use."

Officers chosen to serve during the coming year are as follows: Dr. Charles P. Mathé, president; Dr. Thomas F. Mullen, vice-president; Dr. Randolph G. Flood, secretary; Dr. Marcis A. Francoz, treasurer. Executive Committee: Doctors Harry E. Alderson, Rae E. Ashley, Lloyd B. Crow, Marius A. Francoz, Chauncey D. Leake, Salvatore P. Lucia, Charles P. Mathé, Herbert C. Moffitt, Thomas F. Mullen, Langley Porter, and Rodney A. Yoell.

The inaugural dinner exemplified the purposes of the Society, by devoting the principal discussions to the foods and wines especially selected for the menu. California wines of various vineyards were served. Dr. Edward W. Twitchell, Professor of Psychiatry of the University of California Medical School, addressed the dinner on "How the Doctor Looks at Wine."

Dr. Maynard A. Amerine, Assistant Professor of Enology of the University of California, Department of Viticulture, informally explained the various wines served and answered numerous questions asked by the attending physicians.

Honored guests of the Society were: Dr. Enrique Finochietto, Professor of Surgery, University of Buenos Aires, and Dr. Jorge Mulcahy, Chief Surgeon, Hospital Britanico, also of Buenos Aires.

While the Society is new to America, it follows a precedent set many years ago in France, where, under the leadership of Dr. Georges Portmann, Professor of Medicine of the University of Bordeaux, members of the medical profession have a number of such societies. International congresses of European physicians interested in wine have been held under the title of "Congres International des Médecins amis du vin."

Malarial Inoculation for Syphilis: California Department of Institutions.—In a large percentage of cases of syphilis—more particularly those in which there has been failure of early diagnosis and prompt and thorough treatment—the infection involves the brain and other parts of the central nervous system. Such cases often lead eventually to incurable mental disease. Nearly 7 per cent of all admissions to the mental hospitals of California consist of cases of syphilitic brain disease—for the most part the disease known as paresis. In actual numbers, between 400 and 500 such cases are admitted to the state hospitals annually.

The splendid work that is now being done on a rapidly expanding scale by our federal, state, county, and municipal health departments along the lines of venereal disease control should soon yield demonstrable results in the form of reduction of our admission rates of cases of syphilitic insanity. There is, however, one preventive measure that has heretofore not been adequately provided for, namely, the fever treatment (by malarial inoculation) for those cases of syphilis in which there is evidence of involvement of the central nervous system and in which there is, therefore, a danger of the eventual development of paresis unless the fever treatment is instituted before the mental deterioration sets in, which is due to destruction of nervous tissues accompanying the progress of the syphilitic brain disease.

The Department of Institutions of the State of California, through its director, Aaron J. Rosanoff, announces that henceforth treatment by means of malarial inoculation will be available for all suitable cases in the following State hospitals: Agnews, Camarillo, Mendocino, Napa, Norwalk, Patton, and Stockton.

Patients referred to any of these hospitals by any health officer or, through a health officer, by a private physician, as requiring a malarial inoculation may receive such inoculation at the hospital. Thereupon, such patients may immediately return to their homes, or to private hospitals or sanitariums, there to remain under the care of their private physicians during the course of their fever. Patients who cannot afford private care will be admitted to the State hospitals, for the fever period, upon their voluntary application. In many cases of syphilis, timely fever treatment alone can prevent the eventual development of paresis.

California Pharmaceutical Association.—This association, with offices in the H. W. Hellman Building, 356 South Spring Street, Los Angeles, in its Bulletin of March 15, 1939, printed the following:

> *Medical Service Benefit Associations May Enter Orgy of Cut-Rate Competition*
>
> The doctors may suffer and muddle through an era of the same type of cut-throat competition which has harassed druggists for a quarter century. Because the druggist sells merchandise so intimately connected with public health, he has, after years of struggle, succeeded in passing laws limiting competition to a plane of ordinary decency.
>
> In this respect the doctor is handicapped, since he sells only his service, and the lessening or increase of the quality of service being an intangible thing, legislation to place a minimum price upon service would be difficult. That the doctors have long realized this and were forced, as a defensive measure, to establish a code of ethics to preserve for themselves a modicum of fairness in competition and the assurance of a reasonable recompense for their services, is well understood.
>
> They have merely attempted, through self-regulation, to do for themselves what legislative action could not do. Now, because of that, they are accused of being a trust, of being callous to public welfare and, by one publication of wide distribution, of being "hogs." It is to be noted that the loudest accusers of organized medicine are the types of organized group practitioners who, themselves, profit extensively from the operation of benefit associations and who, under the pious proclamation of "Social Good," pillory the profession which they have let down, to go into the cut-rate business.
>
> There is an analogy quite similar to that existing in the drug business. The cut-throat predatory seller sold stand-

ard drugs at ridiculous prices to get them into his store and then, from the contacts established, gave the customer the "works," holding the established pharmacist up to ridicule as a hold-up artist, when in reality he was giving value received in the practice of real pharmacy and doing a splendid job as a health service center in his community.

If the doctors are to be declared a trust and their heretofore defense ethics thrown overboard, and because theirs is a service profession where legislative protection against unfair competition is difficult, it may be that they will have to enter a period of severe competition, a period of such bitterness that the public itself, although in most instances a patron of the predatory seller, will be forced to call a halt and seek to restore "ethics" in the profession.

The pharmacists' interest and sympathy definitely allies itself with the physician in the struggle to commercialize and prostitute the profession through the use of multiple red herrings bearing such euphonious names as "Social Welfare," "Care of Underprivileged," "Ill Nourished," etc. If the cacophonous antonyms were applied to these same red herrings, they would bear such labels as: "Privileged Classes," "Private Welfare," "Political Power," etc.

Doctors, the pharmacists are ready to work with you to preserve the practice of medicine. Give them the opportunity to do so.

The Seventy-First Charter Anniversary: University of California.—Seventy-one years ago, under the stimulus of the Morrill Land Grant Act, and influenced by the counsel of the trustees of the earlier-established College of California, the Legislature of this State chartered the University of California to provide higher education for the sons and daughters of a pioneer community.

With each passing decade the State of California grew larger and its educational needs more complex, and the University, reflecting that development, has become one of the major institutions of its kind in the world. Through gifts to the state and appropriations from the Legislature, its oldest campus at Berkeley has steadily expanded its offering to meet the needs of twentieth century civilization; and many additional centers have been established to serve special fields of knowledge and new population areas.

On Mount Hamilton there was created an Astronomical Department and Lick Observatory. At San Francisco the Medical Center, comprising the Medical School, College of Dentistry, College of Pharmacy, and Training School for Nurses, has steadily developed. At Davis there has been provided a College of Agriculture and University Farm. At Riverside a Citrus Experiment Station was established. Finally, and most important of all, in 1919 there was created a second general campus of the University which has grown to be the University of California at Los Angeles, thirteenth largest campus in America in its own right.

Supplementing the services offered by these seven major centers are certain affiliated institutions, Hastings College of the Law, and the California School of Fine Arts; a number of research stations; and the University Extension Division and the Agricultural Extension Service which carry the offerings of the University to every county in the state.

For this Seventy-first Charter Anniversary, which falls, also, in the twentieth anniversary year of the University of California at Los Angeles, these various campuses and stations join in a series of commemorative programs for the benefit of the citizens of the state.

Lane Medical Lectures.—The twenty-seventh course of Lane Medical Lectures will be delivered by Thomas M. Rivers, M.D., Sc.D., Director, Hospital of The Rockefeller Institute for Medical Research, on the evenings of May 22, 23, 24, 25, and 26, 1939, at 8:15 o'clock in Lane Hall, Stanford University School of Medicine, Sacramento Street, near Webster, San Francisco. The medical profession, students, teachers, and research workers in medicine and allied sciences are cordially invited to attend.

The Lane Medical Lectures were founded in 1896 by the late Dr. Levi Cooper Lane, and have been given as follows:

1896. Surgery of the Brain.—Sir William Macewen, M.D., Regius Professor of Surgery, University of Glasgow.

1897. Congenital Malformations, Aneurysm, and Other Surgical Topics.—Christopher Heath, F.R.C.S., England, Professor of Clinical Surgery, University College, London.

1898. Diseases of the Heart.—Sir Thomas Clifford Allbutt, M.D., F.R.S., Regius Professor of Physics, University of Cambridge, England.

1899. Topics in General Surgery.—Nicholas Senn, M.D., Ph.D., LL.D., Professor of Surgery, Rush Medical College.

1900. History of Physiology.—Sir Michael Foster, K.C.B., D.C.L., Professor of Physiology, University of Cambridge, England.

1901. Social Aspects of Dermatology.—Sir Malcolm Morris, F.R.C.S., Edinburgh, M.R.C.S., England, Surgeon, Skin Department, St. Mary's Hospital, London.

1902. Diseases of the Rectum.—Sir Charles B. Ball. M.Ch., F.R.C.S., Ireland, Regius Professor of Surgery, University of Dublin.

1903. Dislocations and Fractures Involving Larger Joints. —Oscar H. Allis, M.D., Philadelphia, Pennsylvania.

1904. Infection and Immunity.—William H. Welch, M.D., LL.D., Professor of Pathology, Johns Hopkins University, Baltimore.

1905. Tropical Diseases.—Sir Patrick Manson, K.C.M.G., F.R.S., School of Tropical Medicine, London.

1906. Practical Hygiene, Epidemics, and Preventive Medicine.—John C. McVail, M.D., D.P.H., Cambridge, Glasgow.

1910. A Consideration of Some Features of the Lymphatic System.—Reginald Heber Fitz, M.D., LL.D., Hersey Professor of Theory and Practice of Medicine, Harvard University, Boston, Massachusetts.

1911. The Importance of Ophthalmology in Its Relation to Systemic Diseases.—Ernest Fuchs, Professor of Ophthalmology in the University of Vienna.

1913. Internal Secretion.—Sir Edward A. Schafer, LL.D., Sc.D., M.D., M.R.C.S., F.R.S., Professor of Physiology in the University of Edinburgh.

1915. Focal Infection.—Frank Billings, M. S., M. D., Professor of Medicine in the Rush Medical College, Chicago, Illinois.

1917. Physical Basis and Present Status of Specific Serum and Drug Therapy.—Simon Flexner, M. D., LL. D., Director of Laboratories, Rockefeller Institute for Medical Research, New York City.

1919. The Feeding of the Nations at War.—Alonzo Englebert Taylor, Professor of Physiological Chemistry, University of Pennsylvania, Philadelphia.

1921. Growth and Nutrition.—L. Emmett Holt, M.D., ScD., LL.D., Emeritus Professor of Pediatrics, College of Physicians and Surgeons, Columbia University, New York City.

1924. Selected Topics in Pathology.—Ludwig Aschoff, M.D., Professor of Pathology, University of Freiburg, Germany.

1925. Selected Topics in Orthopedic Surgery,—Vittorio Putti, M.D., Professor of Orthopedic Surgery, University of Bologna, Director Rizzoli Institute of Bologna, Italy.

1928. Bacteriophagy.—F. d'Herelle, M.D., Professor of Bacteriology, Yale University, New Haven, Connecticut.

1929. Selected Topics in Pharmacology.—Walther Straub, M.D., Ph.D., Professor of Pharmacology, University of Munich, Munich, Germany.

1930. Constitution.—Charles R. Stockard, M. D., Ph. D., Sc.D., Professor of Anatomy, Cornell University Medical School, New York City.

1933. Biochemical Studies of Nutritional Problems.—J. C. Drummond, Sc.D., Professor of Biochemistry, University College, University of London, London, England.

1935. Regulation of the Cardiovascular System.—G. V. Anrap, M. D., Sc. D., F. R. S., Professor of Physiology, Egyptian University, Cairo, Egypt.

1937. Mechanism of Heat Loss and Temperature Regulation.—Eugene F. DuBois, M.D., Professor of Medicine, Cornell University Medical College, New York City.

In the 1939 Lane Lectures, Doctor Rivers will give the following:

Lecture I, May 22—Lymphocytic Choriomeningitis.

Lecture II, May 23—Pathology of Virus Disease.

Lecture III, May 24—Immunological and Serological Phenomena of Virus Diseases.

Lecture IV, May 25—Nature of Viruses.

Lecture V, May 26—Treatment and Prevention of Virus Diseases.

Press Clippings.—Some news items from the daily press. on matters related to medical practice, follow:

Fight on Budget Opens*

Sacramento, March 29.—Governor Olson's $557,000,000 state budget for the 1939-1941 biennium became the center of bitter controversy today when the Assembly began debate upon the budget bill. . . .

The budget debate will be resumed tomorrow. One item under fire tonight when the session ended was that for $200,000 for the compulsory health insurance program. Republican Assemblyman Melvin I. Cronin, San Francisco, and his colleagues of the minority party, contend that this item does not belong in the budget bill. They insist that the Legislature should first express itself on the compulsory health insurance question.

"The Ways and Means Committee," declared Cronin, "doesn't know how this item was arrived at and nobody else seems to know it either. This is the opening of a backdoor assent to the passage of a bill not yet before us and probably will need a million dollars if the program is approved. . . .

The minority report was signed by Assemblymen Gerald C. Kepple, Whittier, Charles W. Lyon, Los Angeles, and Clarence R. Walker, Westmoreland.

Without a substantial increase in taxation or a reduction in expenditures it is possible the state will face an estimated general fund deficit as of June 30, 1941, of at least $76,000,000," the minority report declared in urging cuts in the budget.

"The budget presented by the Governor to the Legislature proposed expenditures amounting to $629,272,874, of which $557,163,355 is to be financed through direct state resources, and $72,109,519 is to be financed through Federal grants," they declared.

The minority group outlined various proposed reductions in the budget, including cutting out the $500,000 for a proposed new psychiatric hospital on the property owned by the University of California adjacent to its medical school in San Francisco.

"We believe that departmental expenditures should be checked," the three Republicans reported.—San Francisco *Chronicle,* March 30.

* * *

Olson Budget†

Examiner Bureau, Sacramento, March 29.—Governor Olson's $557,000,000 budget, calling for the largest spending program in the history of California, was given a baptism of fire late today when the Assembly, sitting as a committee of the whole, opened official debate on the supporting appropriation bill.

Republican members of the bipartisan economy bloc led the onslaught on the budget.

One-Man Job

They drew from Democratic Ben Rosenthal, Chairman of the Ways and Means Committee, these significant admissions:

"1. The budget is strictly a one-man document, and Governor Olson is the sole author. He is the only man who holds all the threads, the only man whose advice was heeded by the committee in sending out the bill with a do-pass recommendation.

"2. The committee made no change in the record-high budget asked by the new executive, and for the first time in California's history, sent a budget to the floor of the Assembly without the reduction of so much as one cent.

Study Limited

"3. The committee spent a total of only thirty-three hours in studying the budget—an average of nine minutes for each of the maze of separate items. Many department heads, whose departmental expenditures run high into the millions, never appeared before the committee to justify or explain their budget requests.

"4. With only a few exceptions that could be counted on the fingers of one hand, every department asked and received an increase, some running as high as 494 per cent."

After two hours of debate, Democratic Floor Leader Alfred W. Robertson moved that the discussion be closed until a later date, and the motion was passed. The entire time today was spent in going over the budget, item by item, with Assemblyman Rosenthal and Fred Links, head of the budget division of the Department of Finance, trying to answer legislators' questions. . . .

Typical of the debate today was an interchange between Rosenthal and Assemblyman Melvyn I. Cronin of San Francisco.

Governor Says So

Cronin sought enlightenment on a $200,000 item set up for the initial financing of a compulsory health insurance program—a "must" item on the Administration's docket. A bill providing for such insurance is now pending, but no action has been taken. Cronin wanted to know why the $200,000 was included in the budget.

"The Governor appointed a committee of citizens to conduct a study of this question, and we will hold a hearing on April 20 on the bill," replied Rosenthal.

"But who appeared before your committee in support of the bill and told you $200,000 was needed?" asked Cronin.

"It was explained in the Governor's budget," said Rosenthal. "Isn't that enough? This is the amount he says is needed to get it going. If the bill falls, we can't touch the $200,000."

"I still cannot understand how this money could be set up in the budget under any safe or sane policy," Cronin insisted. "I don't believe you know, or the Governor knows, or anybody else knows, whether $200,000 or any other sum was needed."

Through Back Door

Pinned down for a definite answer, Rosenthal had no explanation other than that "the Governor set the amount down in the budget." Rosenthal admitted he could not say whether any California physician or surgeon had been consulted about the plan.

"This is a back door to legislation of which we may not approve in the final test," Cronin charged.

Prelude to Battle

"I think it ought to be taken out of there, and attached to the compulsory health insurance bill itself if that bill passes. If I understand the opinion of members of the Legislature, the compulsory health insurance bill will not pass."—San Francisco *Examiner,* March 30.

* * *

Attack on Budget Which Brought $200,000 Reduction.*

Sacramento, March 30.—Governor Olson soon will order a shakeup in the State Relief Administration. . . .

This is the word that went the rounds of the Capitol tonight, following a dinner caucus between the Governor and members of his official family and the Democratic majority members of the Assembly.

The dinner, at which those present were pledged to secrecy, was held at the Del Paso Club two hours after the Governor's lieutenants in the Assembly had made their first concession to the Republicans, fighting to reduce the $557,000,000 state budget, by agreeing to lop off a $200,000 health insurance program item from the budget bill.

Stand Is Changed

The Governor previously had notified the Democratic majority he wanted "no change" in the budget. . . .—San Francisco *Chronicle,* March 31.

Clinic Plans to Be Discussed

Legislation to Check Communicable Diseases Also Will Be Studied Saturday

Plans for the new San Francisco venereal disease clinic will be discussed on Saturday by Lawrence Arnstein, health advisory board, and Dr. George Becker, director of communicable diseases, at a meeting of the Northern California Public Health Association in Sacramento.

Legislative bills requiring physical examinations, including blood tests before marriage, will be discussed by Dr. Nathan C. Hale, Sacramento physician, and Miss Eloise Hafford, executive director of the Southern California Society for the prevention of syphilis and gonorrhea. Public health workers in central and northern counties will also attend the meeting.

Other speakers will be W. F. Higby, secretary, Western States Division, American Social Hygiene Association; Dr. N. N. Ashley, Oakland city health officer; Dr. Philip Condit, state physician; Dr. H. C. Pulley, state physician; and Dr. Malcolm H. Merrill, Chief, Bureau of Venereal Diseases, State Department of Public Health, who will also be chairman of the meeting.—San Francisco *News,* February 23.

School Named for Doctor Widney

New Structure to Honor Medical Dean

The Board of Education last night gave the name "Dr. Joseph Pomeroy Widney High School" to the Crippled Children's High School, located on the grounds of Polytechnic High School, Twentieth Street and Grand Avenue.

The structure was completed last year at a cost of $100,000.

The late Doctor Widney was the founder of the old College of Medicine of the University of Southern California, was the dean, and later, president of the University. He was also the motivating spirit among the founders of the Los Angeles County Medical Association.—Los Angeles *Times,* March 10.

Cut Sought in San Francisco's Municipal Health Service Cost

With a view to increasing efficiency and cutting costs of the Municipal Health Service, Cameron King, President of the Board of Directors, today planned to confer with Dr. J. C. Geiger, Director of Public Health.

The meeting was arranged after a conference with Chief City Administrative Officer A. J. Cleary, when King said more space for clerical help was needed and suggested room might be found in the Health Center building.

$18,000 Deficit

King moved to reduce overhead, now running about 14 per cent, when audits of service funds disclosed an $18,000 deficit for January, and a survey of clerical procedure showed low efficiency and much overlapping of duties.

"While I cannot act in an official capacity, I am ready and willing to coöperate with this service. I hope that it will prove a success and I see no reason why it should not succeed," Cleary said.

King announced that the $18,000 deficit will necessitate a cut of about 50 per cent in January payments to physicians.

"Brighter Outlook"

"February outlook is far brighter," King announced. "There will be no increase in deductions from salaries paid by members.

"Summer months will create surpluses and the outlook is that all physicians will eventually receive their full unit payments."—San Francisco *Call-Bulletin*, March 10.

* * *

Doctors Get $20,000 From San Francisco City Health Plan

Checks totaling around $20,000 were mailed out to San Francisco doctors last night by the city employees' Health Service System in payment of January bills.

Because of the prevalence of colds and other ailments in that midwinter month, bills were above revenues from employees' pay deductions and were paid on a 50 per cent basis, it was said.

Under the unit plan agreed to by the 1,100 doctors on the System's panel, administration expenses, hospital and laboratory expenses are paid in full, then the remainder funds may be distributed among the doctors in proportion to the number of units of service given members.

A unit is normally one dollar's worth of service. During the first three months of operation of the System the doctors were recompensed in full, at the rate of $1 per unit. When January bills began coming in, it was recognized that the Board would have to resort to its right to make pro rata payments under the unit plan.

Toward the close of January, Dr. Walter B. Coffey, Medical Director of the System, addressed a letter to all members of the medical staff asking their coöperation in keeping bills down by eliminating unnecessary calls on patients. As a result of that letter and improved health conditions, February bills are expected to be paid at a much higher rate per unit, if not in full.

Shortages in payments to doctors for any month may be made up in succeeding months, according to the plan agreed to by the employees' board and the medical staff. At the end of a year, it was agreed, there could be a review of results to ascertain if there should be any changes in fee schedule for doctors or contributions by members.

Members now pay $2.50 per month for adults, $1.25 for a single minor dependent in a family, $1 each where there are more than one. Except for certain exemptions, membership in the System is compulsory, or a condition of employment, for city employees, voluntary for dependents.

Detailed figures on operations during January are to be released by the Board within a few days. The Board met in special session Thursday to authorize the 50 cents per unit payment of January bills.—San Francisco *Chronicle*, April 1.

Doctor's Ruling Balks Nazis

Adolf Hitler's political edict last September 30, revoking medical licenses of Jewish doctors in Germany, will not bar emigrant Jewish doctors who began their interneships in California prior to the decree, from obtaining California medical licenses.

Attorney-General Earl Warren made this ruling today in an opinion requested by Dr. Charles B. Pinkham, Secretary of the California Board of Medical Examiners.

"A political edict is no bar," Warren ruled, "if the applicants comply with other requirements."

Doctor Pinkham announced he would seek another ruling from the Attorney-General on doctors who began their interneships after the decree went into effect.—San Francisco *Call-Bulletin*, March 10.

Precaution—Any Method to Curb Dope Traffic Is Good

Pending in the Legislature is a measure which is aimed at making it more difficult for narcotic addicts to obtain dope by forging physician's names to prescriptions.

It is encouraging to learn the number of addicts in the United States has decreased in recent years. This reduction of victims of narcotics is due largely to the enforcement by State and Federal authorities of the laws against the illicit sale and use of drugs, and to the institutions established by the Federal Government and by such states as California to cure addiction.

But the vicious habit must be eradicated entirely.

Since the bill presented by Assemblyman Edward F. O'Day of San Francisco, providing that prescriptions be issued in triplicate, has the support of Paul Madden, Chief of the State Division of Narcotic Enforcement, the State Board of Pharmacy and the California State Medical Association, the Legislature should pass it unanimously.—San Francisco *Examiner*, March 17.

New Physicians' Service Soon to Be Ready

Doctors Sign Up Rapidly, President Wilbur Reports

Registration of licensed doctors of medicine at the rate of more than 500 a day for the new California Physicians' Service is reported by Dr. Ray Lyman Wilbur, president of the service, which is being organized as a result of action taken recently by the State Medical Association.

This response has advanced the time at which this group prepayment medical, surgical and hospital service can be offered the public, Doctor Wilbur said today. "It exceeds our anticipations," he added, "and we will be able to proceed to the next step, the enrollment of beneficiary, or patient, members very shortly."

The service, which permits wage-earning and other groups to pay small sums monthly, in return for which the members receive care by the doctors and hospitals of their own choice when needed, was launched officially only a week ago, when invitations to become professional members were sent to all doctors of medicine in the state.

Doctor Wilbur points out that the California Physicians' Service is similar to plans successfully operated for several years in Seattle and in Oregon.

Present headquarters are at 220 Montgomery Street, San Francisco, but additional offices will be established in Los Angeles and elsewhere throughout the state.—Palo Alto *Times*, March 13.

Comments and Cacophony

The medical profession is not getting a square deal from the public. Just when the surgeons and the doctors arrive at the point where they can find out what's the matter with us—and cure it—along comes the politicians and begin their campaign for state medicine, to take the profit out of the profession. When I was a lad, you died of almost anything except chills and fever—and with that, you wished you could die.

Anything inside of you was as much of a mystery to the doctor as the contents of a can of sardines. Doctors could give you a hypodermic to ease the pain and a dose of calomel to "open the bowels"—and then "salivate" you if you happened to eat something containing too much acid—but if you got smallpox, it was luck if you got through, and if you had gall-stones or appendicitis, nobody knew what it was, or, if they did, very few knew what to do about it.

Nowadays, if you have any of these ailments and others too hard to spell, all they do is hold a consultation over you, put you to sleep with an anesthetic if you have a good heart or administer a "local" if the heart's not so good, and relieve you, and you generally get well and if you don't "live happily ever after" you usually live long enough to pay the bill, and your share of taxes.

You are now successfully inoculated or vaccinated against smallpox, diphtheria, scarlet fever and other ills and ailments that used to make life a dreadful lottery and keep humans forever wondering if a new "symptom" was but a prelude to a funeral.

Yellow fever and malaria have been outlawed by getting rid of the mosquitoes, and even the South's "poor white trash" no longer keeps out of work by pleading "chills and fever."

Altogether the doctors have contributed more for the enjoyment of life and to the progress of humanity than any other class of people, and, while they may give a prescription for a little chocolate-colored water occasionally to a chronic complainer, it's because he or she insists on attention and would go somewhere else to get it if not accommodated and charged for it.—Lompoc *Record*, March 10.

County Physicians Vote Medical Plan

New Service Endorsed by Large Group

Ten Thousand Doctors May Help Wage Earners

Without dissent, the Orange County Medical Association at a regular meeting in the chapel of Orange County Hospital, last night, voted to endorse and accept the California Physicians' Service, a plan to provide at the lowest possible cost the benefits of medical, surgical and hospital care to California wage earners.

The plan was endorsed by the California State Medical Association at a special meeting in Los Angeles last December and is the outgrowth of ten years of study by that body.

The plan was launched Monday when more than 10,000 licensed physicians in California received application blanks for membership.

At last night's meeting the county association voiced disapproval of any politically controlled system operated by governmental agencies, in the belief that such a plan would provoke an unusual increase in the tax burden on employees and employers and eventually on the property owner.

Personal choice of physician and possibly of hospital are provisions of the plan which, to facilitate organization, will at first be offered to employed groups, and later to individuals whether employed or not. Industrial accidents already provided for by the industrial commission will be excluded.

The service will be available for approximately $2.50 per month per individual and will be payable to the California Physicians' Service with headquarters at 220 Montgomery Street, San Francisco. The Service is a voluntary, nonprofit corporation.

Allen W. Widenham is general manager of the Service and Dr. Morton R. Gibbons of San Francisco is medical director. The president is Dr. Ray Lyman Wilbur of Stanford University.—Fullerton *News-Tribune,* March 8.

Doctors Irked by Union Rule

Film Projector Men and Convention Officials in Mixup

St. Louis, March 25 (AP).—If the country's medical men refuse to "play ball" with the unions—and the doctors have their dander up—there may be neither movies nor music at the American Medical Association convention here in May.

Restrictions laid down by the Moving Picture Operators' Union have brought loud protests from professional men who are planning scientific exhibits.

Union Demands

The Association has notified members that motion pictures may not be shown in booths unless the projector is operated by union men at $1.50 an hour in four-hour shifts.

The only way an exhibitor could show his own pictures would be to display them in the general assembly hall, two stories above the exhibit room.

Ordinarily, the doctor who uses a film for demonstration has taken it himself, and shows it himself because he is familiar with the subject matter.

"Insane Condition"

One Medical Association officer declared it is the first time they have run into such a "perfectly insane" condition.

The union has suggested the various noncommercial films be "pooled" and run off together.

"The union is always ready to stretch a point on educational films," said Clyde Weston, business agent.

But this arrangement is not at all satisfactory to the doctors.

Public Benefit

They point out such meetings are exchanges of the latest information ultimately for public benefit, and that more and more scientists are relying on motion pictures to impart complex advances more clearly and accurately than long technical papers.

The Medical Association also has crossed swords with the Musicians' Union, which objects to plans for having a school band and choral group appear before the convention. During the past few months this group has interceded at a number of local functions and refused to let any musicians perform unless union bands were hired.—Los Angeles *Times,* March 26.

Doctor Brinkley Tells Income Loss in Suit

Del Rio, Texas, March 24 (AP).—Dr. John R. Brinkley testified today in his $250,000 libel suit against Dr. Morris Fishbein that his gross income dropped from around $1,100,000 in 1937 to about $810,000 in 1938 after publication of an article in the American Medical Association's journal, of which Doctor Fishbein is editor.

The specialist, who testified he performed about 5,000 goat-gland operations before he abandoned the use of animal glands in his sex rejuvenation medical treatments in 1933, was called as the first witness by the defense.

The bearded doctor began his testimony after a motion by Doctor Fishbein's attorneys to dismiss the case on a technicality was overruled by Federal Judge R. L. McMillan.

On direct testimony, Dr. Brinkley testified: "As far as I know, I am the man who originated the goat-gland operation." He said he performed the first operation at Milford, Kansas, in 1917.

He said before he began to advertise his operations recommending the implantation of goat, sheep, and monkey glands in impotent men, he was a member of the American Medical Association.

Subsequently he built a hospital at Del Rio, Texas, and moved from Kansas. He now operates two hospitals at Little Rock, Arkansas.

He said he formerly took the glands of three weeks old goats and implanted them in men, but since 1933 a commercial glandular preparation had been placed on the market and that he purchased it now.—Los Angeles *Evening Herald and Express,* March 24.

Doctors Rap Health Bills

Proposals by State Called Socialistic at Association Meeting

Vigorous opposition to compulsory health insurance bills pending in the California Legislature which they hold will introduce a socialistic and European health system was voiced last night by speakers before an emergency meeting of the Los Angeles County Medical Association.

The meeting, called by the Association Council, headed by Dr. Ralph B. Eusden, was held in Polytechnic High School auditorium and brought out a record attendance of two thousand medical leaders.

Rising Vote

In a rising vote, called for by Dr. Lowell Goin, Speaker of the House of Delegates of the California Medical Association, an estimated two thousand physicians and surgeons registered their disapproval of the two pending measures.

The bills under fire are Senate Bill No. 1127 and Assembly Bill No. 2172. Dr. Samuel Ayers, Jr., who attacked the asserted bureaucratic powers which would be placed in the hands of laymen under the compulsory plan, said:

"Compulsory medicine, as provided in these bills, would result in perfunctory, unscientific, slap-dash services rendered by harried and underpaid doctors in crowded offices.

Unhappy Picture

"Increased taxes and the political spoils system would complete the unhappy picture.

"State control of medicine would be only the forerunner of state control of dentistry, then law, then the press, and, finally, labor. Then the picture of totalitarianism is complete.

"These bills are in no sense progressive legislation and have no place in the program of a progressive administration. It is unadulterated racketeering at the expense of an honest profession."

Steps Already Taken

Allen W. Widenham, general manager of the California Physicians' Service, said that organized medicine already has taken steps to provide adequate medical care in California.

He referred to the medical service sponsored last December by the California Medical Association, which is a voluntary health prepayment plan.

Dr. William H. Daniel, president of the Los Angeles County Medical Association, declaring the proposed legislation "vicious," said it would force on California an inferior grade of medicine, as has been the experience in Europe.

Interference Scored

He said:

"We, as an organized body of medical men, demand that we be allowed to continue the practice of medicine as it has been done, without any third party coming in between doctors and patients."—Los Angeles *Times,* March 24.

Governor's Committee of Twenty-One

Sacramento, March 23 (AP).—Governor Olson today announced that C. J. Haggerty, State President of the A. F. L., and Phillip M. Connolly, State President of the C. I. O., have accepted places on his committee to study compulsory health insurance proposals.—Los Angeles *Times,* March 24.

Five Hundred Doctors Daily Joining California Physicians' Service

Prepayment Plan to Be Offered to Public Soon

Registration of licensed doctors in the newly formed California Physicians' Service is proceeding at the rate of more than five hundred per day, and the new "group prepayment medical, surgical and hospital service" will soon be offered to the public.

Dr. Ray Lyman Wilbur, President of the Service, made this announcement yesterday. The Service will permit wage-earners and other groups to pay small sums monthly in return for care by doctors and hospitals of their own choice when needed.

"The Service was launched only a week ago, when all doctors of medicine in the state were invited to become professional members," Doctor Wilbur said. "The response has been so enthusiastic we will be able to complete our organization sooner than expected and will soon proceed to the next step, the enrollment of beneficiary or patient members."—San Francisco *Examiner,* March 14.

Nursing Bill Approved by Assembly Unit

Heated Debate Marks Capitol Hearing on Plan to Set Up State Board of Examiners

Examiner Bureau, Sacramento, March 17.—A bill to establish a state board of nurse examiners was recommended favorably today by an Assembly committee on medical and dental laws after a hearing marked by frequent clashes between opposing interests.

Acrimonious debate on the measure at times reached a pitch which brought hoots and boos from the hearing crowd, which included representatives of 27,000 registered nurses, favoring the proposal, and practical nurses, opposing it.

Spokesmen for chiropractors joined the practical nurses in fighting the bill, introduced by Assemblyman Melvyn I. Cronin of San Francisco.

State Nurses Approve

Support of the bill was led by Mrs. J. W. Gardner of Davis, representing the California State Nurses' Association. She explained the measure would create a board of five members under the jurisdiction of the State Department of Professional and Vocational Standards. All the members would be licensed nurses, and would be appointed by the Governor. Wide powers would be given the board to regulate the nursing profession, grant licenses to nurses, and accredit approved schools of nursing.

She declared that the prevalence of "correspondence school nurses, laxity in the present California law, numerous abuses in the name of the profession, and widespread exploitation of the public" make the bill necessary.

Stormy Session

At times, nurses who packed the hearing broke into demonstrations which forced Chairman Hugh M. Burns of Fresno to rap loudly for order.

Principal opponent of the bill was Maxine Alberts, president of the American Trained Association of Nurses, who declared the measure would "discriminate unfairly against trained practical nurses."

Dr. Junius B. Harris of Sacramento, head of the California Medical Association's legislative committee, presented seven suggested amendments to the bill. He accused the registered nurses of attempting to "tear down the whole edifice of nursing by trying to raise the standards of the profession too high, to a point where the average person would be unable to afford a nurse."

J. Vernon Burke of Labor's Non-Partisan League appeared to defend the bill, while Dr. W. Franklin Morris, representing the National Affiliated Chiropractors, declared it would throw hundreds of girl office attendants in chiropractors' offices out of work.—San Francisco *Examiner,* March 18.

Health Service

Editor:—A few days ago there appeared in The San Francisco *News* a report of an interview with the undersigned on the subject of health insurance.

The interview opened with the declaration that the speaker was in favor of the supply of medical service to those of moderate means, no matter what form of financing was used. Through no fault of the interviewer, the meanings of these sentences were insufficiently expanded and clarified. The statement was intended to imply that any law covering the subject of so-called health insurance might advantageously provide for several forms of insurance financing. For instance: (1) A compulsory system financed on a capitation plan; (2) a voluntary system such as that proposed by the California Medical Association, financed on a fee system, or if it was preferred by the sponsors, on a capitation system; (3) an insurance carrier system financed to provide cash indemnity and nothing else, and there are others which might advantageously be considered before the legislation is finally passed.

In a free economy, such as ours, no harm can come from a democratic inclusion of various ideas. Unquestionably, as has happened in England, the more practical plans in time will dominate to the exclusion of others.

The writer makes no claim to authority in this field; his only excuse for writing is an interest which has lasted for twenty-five years. His opinions are merely opinions. However, he is convinced that nothing could be more damaging to the public health than legislation which would impair the financial independence and the social authority of practicing physicians.—Langley Porter, M. D.—San Francisco *News,* March 6.

New Bill to Curb Dope Sale Fraud

Wholesale Forgery of Prescriptions Revealed

Examiner Bureau, Sacramento, March 14.—Strong legislative safeguards were in process of preparation tonight following disclosures of wholesale forgeries of physicians' narcotics prescriptions.

Paul Madden, Chief of the State Division of Narcotics Enforcement, and Assemblyman Edward F. O'Day of San Francisco, serving his first term in the Legislature, took the lead in the legislative campaign to cut off this virtually uncontrolled source of supply to dope addicts.

Madden, appointed as successor to William G. Walker a month ago, said his investigations turned up "a situation where a tremendous amount of forged prescriptions on legitimate doctors were being passed to legitimate pharmacies."

"It is serious enough to demand immediate attention and legislative action," he explained.

Although the investigation is barely under way, Madden said one of a Los Angeles chain of pharmacies was discovered to have filled fifteen forged prescriptions. Both Madden and the Federal Narcotics Bureau have sent operatives to Los Angeles to continue the investigation.

"Heretofore, narcotics were issued by pharmacists on the strength of ordinary physicians' prescriptions," Madden explained. "It was comparatively simple for addicts to steal a pad of prescription blanks and obtain drugs almost at will.

"We have even found cases where the addict was having his own prescription blanks printed."

The measure O'Day will submit to the Legislature within a few days will provide for issuance of numbered prescription blanks by Madden's office. The blanks will be in triplicate form. One will be kept in the book by the issuing doctor and two will be turned over by the purchaser to the pharmacist, who will send one of the copies to the division, Madden said.

"This way, both the pharmacist and the physician will be given protection and the addict will be cut off," he said.

Madden said O'Day's bill will carry the unanimous backing of the State Board of Pharmacy and the Medical Association.

It will probably provide a misdemeanor penalty, with physicians or pharmacists subject to license revocation for violation of the law.—Los Angeles *Examiner,* March 15.

Doctors Hold One Hundredth Session

Strides in Southland Medicine Discussed

For the one hundredth time in fifty years, the Southern California Medical Association convened yesterday to discuss advances that Southland medicine has made in the past six months.

The Los Angeles County Medical Association's headquarters at 1925 Wilshire Boulevard, was the site chosen for this semicentennial celebration of the doctors. The two-day session will close tonight at 8 o'clock with a joint meeting of the Southland and county medical groups.—Los Angeles *Times,* March 16.

* * *

American Medical Association Head Denies Medical Monopoly

Five hundred physicians and surgeons returned to their Southland homes today after hearing a stinging indictment of the government's proposals for compulsory health insurance and socialized medicine delivered by Dr. Rock Sleyster at the concluding session of the joint semi-annual conference of the Los Angeles County and Southern California Medical Associations.

Doctor Sleyster of Wauwatosa, Wisconsin, is President-elect of the American Medical Association. Emphatically he denied that the American Medical Association is seeking to maintain a medical monopoly and charged that the Government's move toward compulsory health insurance and socialized medicine was prompted by propagandists.

"Proponents are trying to create the impression that one-third of our population is without medical care and that through this breakdown there exists an emergency requiring further centralization at Washington," Doctor Sleyster declared.

"Reports of the United States Public Health Service and life insurance companies show the absurdity of these unsupported claims, appealing to the emotions and intended as a build-up for the adoption of European schemes which have all but wrecked medicine abroad."

The speaker denied that the medical profession is opposing plans to provide prepayment for medical care.

"Nothing could be farther from the truth," he declared. "More than three hundred different plans are now being tried out in this country with the full approval of the medical profession."

Concluding sectional meetings at the joint conference, held at 1925 Wilshire Boulevard, were devoted to the uses and dangers of the new drug, sulfanilamide. Papers on the topic were submitted by Dr. A. G. Bower, Chief of the Communicable Disease Division at Los Angeles General Hospital, and his associate, Dr. William J. Mitchell, Jr.—Los Angeles *Evening Herald and Express,* March 17.

United States Health Program Flayed

American Medical Association Leader Calls Plans Communistic

In case anybody thought the American Medical Association had bowed before the inevitable and was now ready to accept a nation-wide program of compulsory health insurance, he should have another think today.

For Dr. Rock Sleyster, President-elect of the American Medical Association, appeared before a Los Angeles medical audience last night and rang the same old tocsin.

Washington's plans for providing medical care to "one-third of a nation" which is not only ill clothed, ill housed and ill fed but also ill doctored or not doctored at all, are, in Doctor Sleyster's opinion, "socialistic and communistic doctrines."

The administration—a "political agency which has failed utterly to bring about prosperity"—is "threatening" to foist upon America "such a European political panacea as has all but wrecked medicine in those countries."

Doctor Sleyster spoke before some five hundred members of the Los Angeles County Medical Association and California Medical Association.

He told them that there was no breakdown of medical service in the United States, that there was no need for compulsory health insurance, that "absurd and unsupported claims, appealing to the emotions, are being used as a buildup for further centralization in Washington."

He said United States public health service records and life insurance records would show for 1938 the lowest mortality and lowest incidence of illness for the United States of any country at any time in history. "The medical profession is not, however, necessarily opposed to prepayment plans for medical care," he added . "More than three hundred different plans are being tried out with full approval of the medical profession.

"We do oppose plans which take away from the patient his American right to a free choice of physician. We oppose plans which will tend to create commercial groups each offering a little more for a little less—for this can only lead to an inferior quality of medical service—and cheap service is expensive service."

Dr. John C. Ruddock, President of the Southern California Medical Association, presided over last night's meeting. During the morning and afternoon sessions eight doctors read papers on recent advancements in medical science.—Los Angeles *Evening News,* March 17.

Leading Biologists to Meet at Stanford

Stanford University, March 19.—Four leading European biologists, including a Nobel prize winner, will participate in a conference marking the centennial of the cell theory here, starting June 5, it was announced today.

They are A. von Szent-Gyorgyi of Szeged, Hungary, awarded the Nobel prize in 1937 for having isolated vitamin C; Hugo Theorell of Stockholm, Sweden, noted for his work on the molecular structure of enzymes; J. D. Bernal of the University of London, England's greatest authority on the study of vitamins, viruses and proteins by x-ray methods, and A. J. Kluyver of Delft, Holland, prominent for revolutionizing scientific ideas about the role of oxygen in microorganisms.—San Francisco *Chronicle,* March 20.

Health Conference

Dr. W. M. Dickie to Attend Meeting in Washington

Dr. W. M. Dickie, State Director of Public Health, will leave San Francisco next month to attend a conference in Washington called by Miss Katherine F. Lenroot, Chief, United States Children's Bureau, and Dr. Thomas Parran, United States Surgeon-General.

The conference, called to devise a national program for the extension of medical and health services, will be held April 20 to 25. Subjects for discussion will include proposed broadening of public health services, the merit system for public health employees, nutrition and diet deficiencies and the crippled children services of the Social Security Act.—San Francisco *News,* March 13.

* * *

Pediatricians From Nine States to Attend Sessions in Oakland

Pediatricians from nine western states, Hawaii, Alberta and British Columbia will convene at Hotel Leamington, Oakland, April 6-8 for the annual meeting of Region VI of the American Academy of Pediatrics.

The academy, comprised of 1,257 child specialists in the United States, Canada and Hawaii, was founded in 1929.

An important aspect of the work of the doctor members is to coördinate child health services in each state and to act in an advisory capacity to Government agencies dealing with child welfare.

Chairmen of the local committees arranging for the meeting are Dr. Clifford Sweet, Oakland; Dr. Clarence B. Hills, Berkeley; Mrs. Lawrence R. Jacobus, Oakland; Dr. Robert S. Leet, Oakland; Dr. Henry E. Stafford, Oakland; Dr. A. L. Gleason, Oakland; Dr. Hubert E. Long, Berkeley, and Dr. Edith M. Meyers, Oakland.

School Principals to Meet Here

The state convention of the Association of California Secondary School Principals will be held here, April 3, 4 and 5, according to Harry G. Hansell, Secretary.

The meeting will be concurrent with the state conference of elementary school superintendents and principals in Oakland.—San Francisco *Chronicle,* March 20.

Roosevelt to Receive Report on Problem of California's Migrants

Representatives' Committee Declares Housing, Health, Education of Dust Bowl Refugees Transcends State Lines

A statement that the burden of caring for nearly a half-million migratory farm workers in California should be placed in Federal hands will be laid before President Roosevelt within the next few days, advices from Washington revealed today.

The report, prepared by a committee of California representatives for a subcommittee named by Mr. Roosevelt, declared the problems of housing, health and education of migrants transcends state lines and is of great importance to the nation at large.

The California members of the House gave unanimous approval. The report was released locally through the Farm Security Administration of the Department of Agriculture.

The report stresses the committee's belief that California should not be required to sacrifice its present high standards of wages, relief or old-age pensions by assuming more than its share in what is basically a great national problem.

Ready to Do Share

California stands ready to do its share, but despite the excellent work done by the Farm Security Administration and other agencies, the Federal Government has not yet assumed its fair share of the burden, the report declared.

A seven-point program arrived at by the special committee under the chairmanship of Representative Alfred J. Elliott, aided by Representatives Jerry Voorhis and Thomas F. Ford, has been passed on to a subcommittee appointed by President Roosevelt.

The presidential group includes Dr. Thomas Parran, United States Public Health Service; Dr. Will W. Alexander, Administrator of the Farm Security Administration; Arthur J. Altmeyer, Social Security Board, and A. D. Hollenbeck, United States Employment Service. W. P. Lawson, WPA Administrator for Northern California, will serve as an ex-officio member of the committee, which in turn is expected to submit further recommendations for the solution of the migratory labor problem.

The department heads have the report ready for submission to Mr. Roosevelt. It was whipped into shape at a meeting in Colonel Harrington's office Monday.

Rumors have been heard that the report will recommend additional WPA funds for California to put ten thousand more residents on rolls, in exchange for which the state would be asked to aid migrants. An alternative proposal was for legislation providing that unemployed persons anywhere in the Southwest might be employable on any projects there.

Number Increasing

Despite the marked decline in the number of families of dust bowl refugees that have poured into California's great central valleys seeking agricultural employment during the past few years, the report reveals that "we probably have in the neighborhood of 150,000 to 250,000 floating families in our state who will remain there from now on. We also know, that in spite of anything that can be done, more people will come in the future."

In the San Joaquin Valley alone, the report estimates, that there are probably 25,000 people living in tents, old boxes, and every sort of improvised structures.

To meet the problems that the migratory workers have created, the report suggests an expansion of the Farm Placement Service so that migratory agricultural workers could be constantly in touch with employment opportunities and that they might be warned where there is an oversupply of farm labor in the fields.

FSA Expansion Urged

The expansion of the FSA program of settling people on small plots of land in regions where seasonable labor is available should also be furthered, the report recommends.

Health conditions were found to be "deplorable" among the migratory workers as studies during the past year revealed that there were 18,000 cases of undernourishment among the migrant children.

The steadily increasing load on local and county hospitals could be curtailed, the report suggested, through the expansion of the Agricultural Workers Health and Medical Association and further grants from the FSA, its parent organization.

The report likewise suggested that the establishment of clinics and emergency hospitals at the existing Federal camps for migrant workers would take a load from the shoulders of the small-town doctors and hospitals.

As a means of bringing immediate aid to undernourished migrant children, the report suggests that the Surplus Commodities Corporation furnish a balanced ration of foodstuffs to the State Relief Administration or to the FSA for distribution to the needy.

The combination of the FSA program for building camps for the migratory workers and the increased housing facilities supplied by the farmers has done much to help solve the housing problem of migrant workers, the report acknowledges, but it points out that the Federal camps should not only be built in California but in all sections of the nation where migratory agricultural labor is an important factor.

Admitting that the problem of educating the growing children of the wandering migratory workers is one of the most vexing and complicated ones that faces the authorities, the committee suggests a Federal bill to aid the children be passed.—San Francisco *News*, March 7.

Free Venereal Service Given 52,040 Monthly

California Second to Massachusetts in Providing Treatment

Medically indigent patients were given an average of 52,040 treatments for venereal disease each month during 1938 in California clinics and state institutions as part of the State Department of Public Health's venereal disease control program, department statistics showed today.

This placed California second among all the states in providing treatment for venereal disease patients who are unable to pay the cost of medical care. Massachusetts was listed as first by the United States Public Health Service in the number of clinic treatments, with a monthly average of 79,170, while New York came third with 51,746.

San Francisco Second to Los Angeles

In San Francisco, 125,124 clinic treatments were given last year. San Francisco was second only to Los Angeles, of California cities. Los Angeles gave 245,935.

In addition to the 624,450 treatments given last year in the clinics of California, Dr. W. M. Dickie, state health director, estimated that private physicians gave patients 1,580,000 treatments for syphilis and gonorrhea.

Free Drugs Given Doctors

Doctor Dickie pointed out that the State Department of Public Health distributes free antisyphilitic drugs to private physicians for the treatment of patients who are able to pay only part of the cost and for those who do not live near clinics.

At 680 Howard Street the San Francisco Health Departmen clinic for the diagnosis, treatment and prevention of syphilis was opened yesterday.—San Francisco *News*, March 7.

State Secretary Talks to Medics

Approval of California Physicians' Service Is Expressed in Talk

The background of organized medicine was described last night by Dr. George Kress of San Francisco, Secretary of the California State Medical Association, before thirty members of the Stanislaus County Medical Association meeting in Hotel Hughson.

Doctor Kress expressed himself highly in favor of the California Physicians' Service, a new voluntary health insurance program.

Quotes English Authority

The speaker quoted an English authority who said, following an extensive visit to this country, that socialized medicine could not work here because of the contrast in conditions in this country as compared with England and other parts of Europe.

Dr. A. E. Anderson of Fresno spoke briefly about the new medical program and outlined a county hospital bill, which is to come up before the State Legislature.

Will Form Auxiliary

During the business meeting it was decided by the members to organize a Woman's Auxiliary to the County Medical Association. An organization meeting will be held between now and May 1 so as to enable delegates from the auxiliary to attend the annual convention at Del Monte.

An Advisory Committee was appointed to supervise the organization of the Auxiliary, including Dr. R. Stewart Hiatt, Dr. E. R. McPheeters, Dr. Ernest G. Allen of Patterson, Dr. Marion Collins of Turlock, and Dr. Hoyt R. Gant of Modesto. Mrs. Gant was appointed to handle organization details. Modesto *Bee* and *News Herald*, March 11.

* * *

Flea Laboratory Baffles Plague

San Francisco Scientific Center, With Tests Given Rodents

On the hillside back of the University of California Hospital yesterday was opened, completely without ceremony, a little concrete building which might be called a monument to the flea.

It's a pretty grim monument, however, for of all the thousands of fleas already dwelling in it, and of all the hundreds of thousands which will enter it later, not one will emerge alive.

The building is dedicated to the halting of the sylvatic plague.

War on Disease

The sylvatic plague is a blood cousin to the bubonic plague, the dread "black plague," which one time spread a blanket of death over a huge portion of the civilized world, and even after the turn of this century, claimed literally millions of lives in the Orient.

The bubonic plague, modern science has learned, was spread by the flea, carried by rats. The sylvatic plague, too, is spread by fleas. In America, cases of infection have been rare, but the percentage of mortality after infection is perilously high.

But to bulwark against the day when the plague might rise up and strike down thousands, and to cut down the chances of that occurrence to the lowest possible fraction, medical science is making elaborate preparations.

Scientific Research

With the opening of the Hooper Foundation's "flea laboratory," made possible by a $24,000 gift of the Rosenberg Foundation for research. San Francisco yesterday became the scientific center of the world in point of sylvatic plague lore.

Within the two-story concrete building are dozens on dozens of cages, containing every form of rodent from every spot in Western United States where plague has been found among the animals.

From the fur of these animals the fleas are industriously combed, deposited in covered jars and buckets, and allowed to live freely until their day of doom arrives.

Serum Made

On that day, the ill-fated flea is pulled from his habitat by a suction pump, killed and placed on a slide under a microscope. There, scientists skilled in the ways and looks of fleas can tell at a glance whether their subject be a human flea, dog-and-cat flea, squirrel flea or guinea pig flea.

Then this flea, with a crew of his luckless cronies, is mashed up and cooked into a serum, which is injected into a guinea pig. If the guinea pig comes down with the plague, it is a scientific triumph, for the experimentor, by consulting his case history, can tell what animal carried the flea, and where he came from.

This procedure, now in its infancy as applied to fleas and their "host" animals, will go forward swiftly in this new ultra-modern laboratory. The result will be that very shortly, the Hooper Foundation scientists will be able to draw an accurate map of plague occurrence in the United States, point out precisely what agencies carry the disease, and take direct steps to eradicate the carriers.

And meanwhile, the flea is being given a degree of attention he never received before, in his escape-proof prison of which even the windows are double and rubber-sealed.

All Sterilized

What happens if a plague-bearing flea gets loose in the laboratory? He hasn't a chance. Everybody that comes out of the laboratory must strip, bathe, and put his clothing through a sterilizer. The floors and walls are gleaming white, to enable detection of any stray bug. And in event of real danger, the whole place can be shut off and poisonous vapor injected through vents in the heavy doors.

In this little scientific wonderhouse, almost any day from now on, you'll be able to find Dr. K. F. Meyer, head of the Hooper Foundation; Dr. Charles M. Wheeler, entomologist; Professor Maurice A. Stewart of the Agriculture School at Davis, and a couple of other specialists, all plotting the demise of the plague-bearing flea.—San Francisco *Examiner*, March 22.

* * *

Mistakes in Social Security Law Told

With many groups clamoring for "freezing" or lowering of Social Security pay-roll taxes, the House Ways and Means Committee is now hearing testimony of experts in preparation for a decision on this issue, and expansion of the law. Future cost of the old-age annuity plan is one of the major problems being studied.

Washington, March 21.—Disclosure that serious errors were made by experts advising Congress when the far-flung Social Security Act was enacted, today raised pending revision of the law to the status of a major congressional issue.

While friends of the system declared that, even if errors were made in charting the future cost of the plan, it still is sound, its critics called for a complete reëxamination of the entire system.

The House Ways and Means Committee, following recent testimony of Dr. E. E. Witte of Wisconsin University, chief administration witness when the law was enacted in 1935, planned further investigation into future costs of the old-age annuity plan which affects more than 30,000,000 people.

Foresee General Levy

When the old-age annuity plan was adopted, with both worker and employer paying pay-roll taxes to build up a reserve fund out of which to pay pensions to those over 65, it was estimated that the plan would be self-sustaining for at least thirty years.

Payroll taxes, beginning at 1 per cent each and rising to 3 per cent each in 1949, were levied to finance the system. The basis of the actuaries, according to Doctor Witte, is now shown to be in error.

A general levy of government taxes to help support the system, it is now estimated, may come much earlier than was expected. Eventual cost of old-age pensions is expected to equal a pay-roll tax of 10 to 13 per cent.

Errors of Experts Listed

Errors of actuarial experts listed by Doctor Witte, executive director of the Committee for Economic Security, which recommended the Social Security Act, included:

1. Whereas actuaries estimated 6,000,000 would draw benefits in 1980, new estimates indicate that 13,000,000 will be eligible for pensions.
2. The national birthrate is declining much more rapidly than was shown in figures on which experts based estimates. This means greater proportion of old people in the future.
3. People will live longer than the figures of from 10 to 15 years ago indicated for the future.
4. Old-age annuity pay-roll taxes were based upon an average wage of $1,100 a year. In 1937 the average was only $867.
5. Error was made in calculating the number of persons in exempted occupations who would work part of time in covered occupations, and thus become eligible for benefits.

All of these factors, it was explained, mean that the future cost of old-age annuities will be far greater than was anticipated.

May Have to Levy Taxes

The result is that, unless pay-roll taxes are increased, the government may be confronted in the future with the necessity of levying taxes to support the aged, which will either cause collapse of the system or interfere with the credit of the government.

The situation was cited by various congressional groups to push their own plans of revising the Social Security Act. Administration leaders declared that testimony of Doctor Witte, who vigorously defended the Social Security Act, shows the necessity of keeping the present pay-roll taxes and letting the future increases go into effect. They insist that it wipes out the Republicans' claim that the huge reserve fund being built up in the early years of the law is unnecessary.

Rep. Jenkins, Republican of Ohio, a member of the Ways and Means Committee, declared that the disclosure shows "the fallacy of the present plan and that Congress must adopt a pay-as-you-go policy." — Los Angeles *Evening Herald and Express*, March 21.

* * *

"Man on Street" May Get Aid When Sick Under New Health Bill

Washington, March 21 (AP).—The man on the street, who seldom thinks about his health until he gets sick, may find the state and federal governments looking out for his interests if Congress approves a bill of Senator Wagner, Democrat of New York.

Wagner's measure, introduced after President Roosevelt advocated study of the nation's health needs, would authorize an appropriation of $92,000,000 next year for grants to states. The states would be required to match the federal funds on a ratio varying with their financial resources.

Senator Wagner explained today that it would be up to the states to decide who would get medical and hospital care and how much—whether such aid should be limited to the indigent or whether all could share in it on a contributing basis.

Draft Own Rules

Under the broad terms of his bill, states must comply with certain regulations to obtain federal aid. Beyond that, however, they could draft their own rules.

If a state wished to institute a health insurance program, under which workers could contribute a specified amount each week toward the cost of obtaining medical or hospital care when they need it, the state would be at liberty to do so.

If, on the other hand, the state desired to extend such aid only to the poor, it would have that right.

The bill would broaden the program of maternal and child health functions now carried on under the Social Security Act. It would supplement existing appropriations for the medical care of crippled children.

Enlarge Health Service

Public health services would be enlarged, especially in rural and slum areas. States would receive grants to expand hospitals and health centers. Funds for state payments of disability compensation would be authorized.

In effect, Wagner explained, this would call for establishment of "sickness insurance," by which a worker could obtain funds to defray medical and hospital costs while he was ill.

The method of establishing such insurance, like other proposals in the bill, would be left largely to the discretion of the states.

Delay Consideration

Wagner said that under no circumstances would the federal government "go into the business of furnishing medical care or interfere with the states in the licensing of medical or other practitioners."

The American Medical Association has approved the broad objectives of the health report which Roosevelt submitted to Congress, but has criticized some of the details.

Congress has shown no disposition to act quickly on the Wagner bill, and in some quarters it was believed that consideration might be deferred until next year.—Los Angeles *Evening Herald and Express*, March 21.

* * *

Drive Against Infantile Paralysis Nets $126,504 for Southland

Southern California raised $126,504.97 for the 1939 infantile paralysis drive just ended.

This was revealed by Joseph M. Schenck, general chairman for California, in submitting his report at a luncheon tendered to the advisory committee at the Twentieth Century-Fox studios yesterday.

Contributions for 1939 were 65 per cent above last year's campaign, with Los Angeles County going 79 per cent above last year, the chairman's report showed.

Special praise was given to the campaign conducted in Los Angeles County, for which Sheriff Biscailuz was county chairman, and to Joseph Scott, Southern California chairman. A total of $107,707.68 was raised in this county. Los Angeles County will have as its share to spend during the coming year the sum of $47,974.21, and $56,346.69 will be turned over by the Southern California committee to the National Foundation for Research, Medical Supplies and Reapportionment of Local Relief.

Mr. Schenck also announced that the advisory committee will have complete authority in the administration of infantile paralysis relief funds in this county.

Members of this advisory committee are Norman Chandler, Mrs. James K. Lytle, Victor H. Rossetti, Joseph Scott, Dr. Harlan G. Shoemaker and Bishop Bertrand W. Stevens. F. L. Metzler, treasurer of the fund, also was present at yesterday's luncheon.

The work by drive leaders in other Southern California counties also was lauded, with Mr. Schenck announcing that checks will go forward immediately to the chairmen of the various other Southern California counties for the proportionate share raised in those counties. Aside from Los Angeles County, where the advisory committee administers relief funds, county chairmen will have charge of relief disbursements in their districts, it was stated.—Los Angeles *Times,* March 16.

Second Jury Disagrees in Chiropractor Case

Whether a chiropractor may attend a woman in childbirth is still a moot point in California jurisprudence.

After deliberating for two days, the second jury trying Dr. David C. Long, a chiropractor, on a charge of violating the Medical Practice Act, reported that it was deadlocked, 6 to 6. The jury was dismissed and Municipal Judge Harold P. Landreth ordered Doctor Long to trial again on April 14.

At the first trial the jury was deadlocked 10 to 2 for acquittal.

The case against Doctor Long is based on delivery of a child to Mrs. Wilton Whitehouse of 1224 West Slauson Avenue.

The city attorney's office contends *delivery of a child constitutes surgery, which chiropractors are forbidden to practice in California.*

Doctor Long contends that such treatment is not surgery and produced numerous chiropractors who testified that they attended women in childbirth and always had considered such treatment within the realm of chiropractors. One chiropractor testified that he had delivered 1,000 children without the death of a child or mother.

The case is attracting much attention among chiropractors because the decision will determine whether or not they are permitted to attend expectant mothers.—Los Angeles *Herald and Express,* March 15.

American Plan of Federal Aid Needed

The national health program prepared by the Interdepartmental Committee to Coördinate Health and Welfare Activities, and submitted to Congress by the President with a recommendation for "careful study," seems in most part to be soundly conceived.

Its objective, as the President stated it, is "to make available in all parts of our country and for all groups of our people the scientific knowledge and skill at our command to prevent and care for sickness and disability."

To accomplish this, the committee (again in the words of the President) "does not propose a great expansion of Federal health service. It recommends that plans be worked out and administered by states and localities with the assistance of Federal grants-in-aid."

The President correctly foresees that the country, in entire agreement with the objective of the program, would draw back from only one threatened phase of it.

That is the danger of another enormously expensive and enormously inefficient and enormously wasteful and extravagant arm of bureaucracy being attached to the body of government.

Of course, all the people, regardless of means, ought to have the full benefit of the full resources of medical science.

Of course, there ought to be a sufficient number of competent doctors and adequate hospital facilities in every community to maintain public health.

Of course, communities unable to support adequate health facilities must have assistance.

And of course, the Federal Government ought to give such assistance.

Public health is inseparable from public welfare, and the Federal Government can no more be indifferent to inadequate health facilities than it could be negligent in the face of invasion or disaster or any other menace to public safety and security.

But the necessity for a national health program should not be an excuse for setting up new bureaucratic agencies of waste and extravagance, of money-plunder and job-plunder.

It should not be an excuse for starting out on another socialistic or communistic experiment.

Too many Federal experiments have started out with good intentions and objectives, only to turn into socialistic and communistic failures.

Too many of them get out of the hands of people with good intentions and into the hands of people with fantastic theories and selfish purposes.

The national health program has apparently been launched on a sound, helpful American course and should be kept on that course.

The desire of the country is not socialized medicine, but Americanized medicine.

The desire of the country is expansion of health services and facilities, as the President says, "to all groups of our people," not socialistic regimentation of either doctors or the sick.

Through well ordered and well planned Federal grants-in-aid, as the committee suggests, no American community need be without competent health services and adequate health facilities, and no part of our people need be denied their rightful chance for health.

Reveal 50,646 Age Pensioners in County

According to a report made public today by the California Taxpayers Association, old age aid was extended to 50,646 persons in Los Angeles County last December. In dollars and cents, the aid to the needy aged in the county for that month totaled $1,633,490, which amounted to an average payment per individual of $32.25 for the month, the report stated.

Over California as a whole, old age assistance payments were granted to 125,270 aged persons during December. This, the association stated, represents approximately 27 per cent of the population in the State more than 65 years of age and amounted to a total aid extended for the month of $4,062,915, or an average of $32.43 per person aided.

The cost of old age in California for 1938 will total nearly $50,000,000, the association declared, pointing out that this represents about a tenth of the total cost of State and local government. The cost, according to the Taxpayers Association, for 1938 will be divided $20,607,341 from Federal funds, $20,464,769 from the State, and $8,464,769 from the counties.

Since July, 1930, the number of persons receiving old age assistance in California has increased steadily from 2,542 to the 125,270 aided in December, 1938, the association stated. Average aid per person went from $22.08 for 1930 to $32.33 for 1938, and the cost of the total aid granted went from $641,102 for 1929–1930 to an estimated $49,536,879 for 1938–1939. The causes for these tremendous increases, the association declared, are the liberalizations made in the eligibility requirements and the increases in individual benefits.—Los Angeles *Evening Herald and Express,* February 27.

Lowest Rate of Sickness Is Cited

Doctors Praised by Dr. Rock Sleyster, President-Elect of American Medical Association

Hits Compulsory Medical Plans

As in grandfather's day, the "family doctor" remains the best consultant for the average man, and his good work has done much to make America the healthiest of all nations, in the opinion of Dr. Rock Sleyster of Wisconsin, President-Elect of the American Medical Association, who is a winter guest at the Huntington Hotel.

Twelve Years of Service

Doctor Sleyster, who lives in Wauwatosa, Milwaukee suburb, is a former president of the Wisconsin Medical Association. He takes office as president of the American Medical Association, whose 120,000 members embrace all branches of medicine, at the Society's St. Louis convention in the spring. He was honored with the presidency of this large organization after serving twelve years as chairman of its Board of Trustees.

A man of lively intellect and great charm of manner, Doctor Sleyster today, in an interview, discussed current views of orthodox medicine and his own viewpoint on moot questions involving the profession.

"We are opposed," he said, "to national socialized medicine or compulsory health insurance and believe that the problems of the cost of medical care for the low-income groups and indigents can best be solved by arrangements in different localities.

He understood, he said, that the California Medical Association had a very good plan.

"Politics" Opposed

Objections to medical service administered by government was that it would develop "political doctors" and that the spirit and initiative of the medical profession would be impaired.

Doctor Sleyster also stated that medical costs often are needlessly excessive, because people demand so much, and that this tendency has helped promote the notion that all medical servic costs too much.

"You know we have become rather spoiled as a people; everybody demands the best, and as much as possible of that," he said. "The best way for the average American family to keep the cost of sickness down is to consult the family doctor. Notwithstanding the rise of specialists, he remains the backbone of the medical profession. He is a good man, a neighbor, and he can tell what should be done. He will not incur extra expense for the family unless it is absolutely necessary."

Help Spread False Idea

Yet there are some people—and a great many of them can afford it—who demand all the tests and treatments modern medical science has evolved; even those who shop around from office to office. These well-to-do hypochondriacs have helped spread the idea that medical service costs too much, he said.

But it was true, said Doctor Sleyster, that use, when necessary, of x-rays and other scientific equipment and hospitalization did make sickness an economic hardship for many families in low-income groups, and for their benefit the medical profession was eager to work out plans whereby costs could be minimized.

Doctor Sleyster was, however, indignant at "propaganda" being disseminated against the medical profession as now constituted by proponents of compulsory health insurance, socialized medicine and kindred plans.

"The charge of propogandists that last year 40,000,000 Americans had to go without medical care because they had no money is utterly ridiculous," said Doctor Sleyster. He was particularly hurt by it not only because the figure was absurd, but because no account was taken of the millions of hours of time and service contributed, free, by doctors in every community, to poor.

Cites Low Death Rate

"The absurdity of such propaganda may be judged," he continued, "by the fact that the statistics of two great health fact-finding bodies, the United States Public Health Service and the Metropolitan Life Insurance Company, showed that the year 1938, in the United States, showed the lowest incidence of sickness in the whole history of any nation; also the lowest death rate. Moreover, the average death rate of sixty-two years showed the biggest step yet in advancing man's span of life."

Doctor Sleyster admitted that it was ironical that the sciences of medicine and sanitation had made human beings live longer, only to have them pose a new economic problem. "We have so much agitation over old-age pensions because we have so many more old people than we used to have," he remarked.

To Speak to Doctors

The new leader of the medical association is scheduled to talk before the Los Angeles County Medical Association on March 15. His topic will be "Socialized Medicine."—Pasadena *Star-News*, March 1.

Would Change System of County Hospitalization

County hospitals in California should be opened up to all classes of citizens, Mrs. T. N. Price, state chairman of the Farm Home Department of the Farm Bureaus, informed the directors of the San Luis Obispo County Farm Bureau in session Saturday.

Seeking the enactment of legislation affecting hospitals and state medicine, Mrs. Sims said the Farm Bureaus of the state wanted the county hospitals open to indigents who cannot pay, to citizens who can partially pay, to citizens who can totally pay. Mrs. Sims said the Farm Bureaus also wanted full-time superintendents to be appointed to devote all their time and attention to the hospital and not engage in private practice. These superintendents, she said, should either be under the direction of the county boards of supervisors or county welfare boards. Patients, she explained, should, however, be able to select their own favorite physicians to treat them in the county hospitals.

Mrs. Sims also said the Farm Bureaus were interested in the compulsory health insurance proposals, specifically one that provides for cash benefits as well as hospitalization.—San Luis Obispo *Independent*, March 3.

LETTERS

Subject: Hospital facilities in the United States.*

(COPY)

Chicago, Illinois, March 16, 1939.

To the Editor:—There are 1,272 counties without general hospitals registered by the American Medical Association. Of these 1,272 counties, approximately 250 have general hospitals not registered by the A. M. A.

Of the 1,196 counties without a registered hospital of any variety, 659 counties are entirely within a radius of thirty miles of a registered general hospital in neighboring counties.

There are only twenty-seven counties no part of which is within thirty miles of a registered general hospital. The population of these counties is 181,484.

Five hundred and ten counties lie in part within and in part without a circle of a thirty-mile radius surrounding existing registered general hospital facilities. Assuming that the population of these 510 counties is, on the average, half within and half without the thirty-mile radius, we have 2,691,288. Adding to this the 181,484 in the twenty-seven counties previously mentioned, we have 2,872,712 persons, or 2.2 per cent of the total population of the United States living more than thirty miles from a registered hospital.

In a like manner, in California the counties of Alpine, Mono and Lake, without a registered hospital within their borders, have approximately 4,500 persons more than thirty miles from a registered hospital.

We are assembling further material and shall forward it as soon as it is ready. Also, for your further information, I am enclosing a copy of "The Health of Forty Million People."

535 North Dearborn Street.

Sincerely yours,

R. G. Leland, M. D.,
Director, Bureau of Medical Economics.

Subject: Foreign medical school graduates in California.

Department of Professional and Vocational Standards
Board of Medical Examiners
State of California

San Francisco, California,
March 11, 1939.

To the Editor:—Enclosed please find Attorney-General's Opinion NS-1508, dated March 9, 1939, re foreign medical school graduates, which we think will be of interest to readers of California and Western Medicine.

With kindest personal regards, believe me

Very truly yours,

C. B. Pinkham, M. D.,
Secretary-Treasurer.

* * *

(COPY)

San Francisco, March 9, 1939.

Charles B. Pinkham, M.D.
Secretary-Treasurer
Board of Medical Examiners
515 Van Ness Avenue
San Francisco, California

Dear Sir:

In your communication of December 27, 1938, you refer to an applicant for medical licensure who, you state, graduated from Frederick-Wilhelm University in Berlin, Germany, June 6, 1919, and who filed, on February 1, 1938, with the California State Board of Medical Examiners, form numbers 172 and 173, said forms indicating such applicant's intention to qualify under existing California law for admission to written examination for physician's and surgeon's certificate following completion of the interneship required of foreign graduates pursuant to Section 2193 of the Business and Professions Code.

---

* In reply to a letter from the Editor.

You recite that your records indicate the successful completion of 75 per cent of the required interneship as of November 14, 1938. You further recite that in checking the applicant's credentials you are advised by the American Consul at Berlin that the applicant's license to practice in Germany "expired" on September 30, 1938, and that you have since been informed that such so-called expiration was in accordance with a decree issued by the German Government canceling as of said date the medical licenses of all German Jewish doctors. You further recite that several prospective applicants are in the same position as the applicant involved, and you ask the opinion of this office as to whether the decree canceling all medical licenses issued to German Jewish doctors will prevent those German medical school graduates who started interneship in compliance with Section 2193 of the Business and Professions Code prior to the date of said decree, from being admitted to written examination on completion of said interneship. This question, you state, was raised "because of the requirement of the California Medical Practice Act that, in addition to other credentials, graduates of foreign medical schools seeking admission to a written examination for a California physician's and surgeon's certificate must hold a license to practice in the country wherein is located the medical school wherein they pursued their medical education."

In reply, please be advised it is the view of this office that the decree of the German Government to which reference has already been made will not prevent German Jewish physicians and surgeons who started interneship prior to September 30, 1938, from being admitted to written examination on completion of said interneship.

Subdivision (c) of Section 2193 requires that an applicant show "he has been admitted or licensed to practice medicine and surgery in the country where the institution in which he has pursued his medical course of professional instruction, is located."

There is no question but that the applicant referred to by you showed at the time of filing his certificate of commencement of interneship the fact that he had been admitted or licensed to practice medicine and surgery in Germany. There is, likewise, no question that he possessed every qualification at said time required of applicants for licensure, save and except that of completion of an interneship.

Under such circumstances, and in view of the fact that the deprivation of the applicant's foreign license is based only upon a political decree and was not due to any disqualification arising from any illegality or inefficiency in practice or any mental, moral or physical deficiency, it is our opinion that subdivision (c) of Section 2193 of the Business and Professions Code should be liberally construed and held to apply to the end that the Board of Medical Examiners should admit such applicants to written examination upon the satisfactory completion of their interneship.

Very truly yours,
Earl Warren, *Attorney-General.*
By Lionel Browne, *Deputy.*

Subject: Reserve assets and dividends of California State Compensation Insurance Fund.

(copy)

March 21, 1939.

To the Editor:—Material gains over the results of previous years were noted in the 1938 report of the State Compensation Insurance Fund as submitted to George G. Kidwell, Director of the Department of Industrial Relations and Chairman of the Industrial Accident Commission.

John C. Stirrat, Manager of the State Compensation Insurance Fund, reported that premium income from 45,000 California employers representing one-third of the insured payroll in the state amounted to $9,603,381.03.

Accident prevention activities and safety programs sponsored by the Fund eliminated a great amount of human suffering and economic loss. The consequent savings combined with a low administrative expense of only 13.80 per cent of the premiums, resulted in substantial savings to policyholders. *Dividends totaling $3,276,836.08 were returned during 1938.**

Admitting assets, the largest ever held by the Fund, totaled $16,861,968.07, an increase of $1,049,765.39 over the previous year. Under the California law an employee who is permanently and totally disabled receives a pension for life. Employees injured in 1914 and each succeeding year are still receiving compensation from the Fund. The reserve set aside for future benefit payments to employees injured prior to December 31, 1938, was increased to $10,573,866.76. This, both by statutory requirement and a check of individual claims, is sufficient to pay all deferred benefits to injured workers or their dependents.

The Fund is one of the largest taxpayers in the state. It is taxed on the same basis as a private insurance company. Over $2,500,000 has been paid in taxes to the state as a result of the insurance business transacted by the Fund. The Fund is not subsidized by the state in any way, owning its home office building, paying rent for its branch office quarters, telephone service, and for all other items of expense usually furnished other state departments.

In addition to a reserve of $2,350,000 for dividends accrued, but not yet due for payment, the Fund has a surplus of $1,685.061.68 to provide for catastrophe losses or other emergencies.

This surplus and reserves invested in high-grade securities are evidence of the Fund's financial ability to meet all its obligations to policyholders and their employees, and to meet any contingency which may arise.

The efficient operation of the Fund, manned by a staff of expert men and women, has caused this department to be accepted throughout the nation as an outstanding workmen's compensation carrier.

John C. Stirrat, *Manager.*

Subject: United States Public Health Service leaflets on syphilis.

(copy)

United States Public Health Service

Washington, February 27, 1939.

To the Editor:—You will recall that last spring the United States Public Health Service published Venereal Disease Folder Number One, "Syphilis—Its Cause, Its Spread, Its Cure." It was designed to provide the facts about syphilis for the layman, and to keep patients in treatment. It has proved effective. More than 800,000 copies already have been sold.

Now a companion folder has been published. It is called "Syphilis and Your Town" and outlines the essential points of a community control program. Copies of both folders are enclosed. The two folders together tell the whole story of syphilis for the layman. The disease, the treatment, the facilities each town needs to find and treat syphilis are outlined clearly and concisely.

Your interest in syphilis control has been active. "Syphilis and Your Town," with "Syphilis—Its Cause, Its Spread, Its Cure," can make your efforts more effective. Both folders have deliberately been made as inexpensive as possible in order that wide distribution may be attained. They may be obtained for one dollar per hundred copies from the Superintendent of Documents, Washington, D C.

---

* Italics are our own.—Editor.

Respectfully,
R. A. VONDERLEHR,
Assistant Surgeon-General,
Division of Venereal Diseases.

Subject: Examinations for internes.

STATE OF CALIFORNIA
STATE PERSONNEL BOARD
Sacramento, March 2, 1939.

To the Editor:—The California State Personnel Board is anxious to recruit the best qualified persons for student interne and senior interne. To accomplish this we ask your help in publicizing Civil Service examinations for these positions.

There is no residence requirement for these examinations and no written test will be given. Applicants will be rated on education, experience, and appraisal of scholastic record. Applications may be filed at any time during 1939 and will be rated immediately. If a candidate's qualifications, after investigation, are acceptable, his name will be placed on the list of those eligible for employment in accordance with his rating.

An announcement in your journal about these examinations would, we feel sure, secure the interest of many qualified people who ordinarily would not hear about these openings. We are sending you a bulletin which gives pertinent information about the tests.

Your help in calling these examinations to the attention of medical students and internes will be invaluable to us.

1025 P Street.

Yours very truly,
LOUIS J. KROEGER,
Executive Officer.

* * *

(COPY)

FACTS CONCERNING EXAMINATIONS

Filing of Applications.—Applications filed at the office of the State Personnel Board must be filed not later than the close of the business day, December 30, 1939. Applications filed by mail must be addressed to the State Personnel Board, 1025 P Street, Sacramento.

Purpose of Examinations.—To obtain eligibles to fill anticipated vacancies at the various state institutions.

Location of Employment.—Vacancies may occur at any of the various state institutions located throughout the state.

Note.—Applications may be filed at any time during 1939 and will be rated as soon as they are received by the State Personnel Board. If a candidate's rating on education, experience, and fitness is high enough to qualify him in the examination, his name will immediately be placed on the eligible list in accordance with his rating.

Senior Interne

Duties.—Under the general supervision of a staff physician, to assist with the medical work in a state institution for the mentally diseased or deficient, by performing routine medical tasks, including making rounds of wards with a physician and assisting him in giving medical treatment to patients or inmates, giving first-aid treatments, assisting with minor and major surgical operations, giving anesthetics, tube-feeding patients, attending clinics and staff meetings, recommending to physicians therapeutic treatments for patients or inmates, doing pathological and x-ray laboratory work, keeping records and preparing histories of cases under observation and treatment.

Entrance Salary.—Fifty dollars a month and maintenance for self and family. Employees maintaining an efficiency rating of 80 per cent or better may receive, subject to availability of funds, annual salary increases of $10 until a maximum of $90 a month is reached.

Student Interne

Duties.—Under the immediate supervision of a staff physician, as a medical student, to assist with medical work in a state institution for the mentally diseased, by performing routine medical tasks, including making rounds of wards with a physician and assisting him in giving medical treatment to patients, giving first-aid treatments, assisting with surgical operations, tube-feeding patients, attending clinics and staff meetings, observing the treatment of special case assisting with pathological and x-ray laboratory work, keeping records and preparing histories of cases under observation and treatment.

Entrance Salary. — Twenty-five dollars a month and maintenance. Employees maintaining an efficiency rating of 80 per cent or better may receive, subject to availability of funds, annual salary increases of $5 until a maximum of $45 a month and maintenance is reached. . . .

Subject: The American Board of Internal Medicine, Inc.

Madison, Wisconsin,
March 8, 1939.

To the Editor:—The American Board of Internal Medicine would appreciate it very much if you will give publication in your next issue to the date of the next written examinations of the American Board.

1301 University Avenue.

Very sincerely yours,
THE AMERICAN BOARD OF INTERNAL MEDICINE, INC.
William S. Middleton, M. D.,
Secretary-Treasurer.

* * *

AMERICAN BOARD OF INTERNAL MEDICINE, INC.

Written examinations for certification by the American Board of Internal Medicine will be held in various sections of the United States on the third Monday in October and the third Monday in February.

Formal application must be received by the Secretary before August 20, 1939, for the October 16, 1939, examination, and on or before January 1 for the February 19, 1940, examination.

Application forms may be obtained from Dr. William S. Middleton, Secretary-Treasurer, 1301 University Avenue, Madison, Wisconsin.

Subject: Medical refugees.

San Francisco, March 20, 1939.

To the Editor:—As it was felt that much misinformation concerning the number of refugee physicians who have been licensed to practice medicine in California is current, the San Francisco Committee for Service to Émigrés asked me to procure authentic data on this subject.

A representative of the committee searched the records of the State Board of Medical Examiners, which were generously placed at our disposal by Dr. Charles B. Pinkham, the secretary of the Board, for the years 1933–1938, inclusive, *i. e.,* for the six years since the inauguration of repressive decrees in Germany. For the sake of completeness, all of those countries were included from which it was thought that refugees may possibly have come, i. e., Germany, Austria (1938), Hungary, Italy (1938), Czechoslovakia, and Poland. The figures for the countries other than Germany are, as can be seen from the data given below, negligible.

The physicians holding degrees and licenses from Germany who have been licensed in California are:

1933	2
1934	5
1935	17
1936	3
1937	16
1938	17
Total for six years	60

The figures for the other countries mentioned, considered for the entire six-year period, are:

Hungary 3, Austria (1938) 3, Italy (1938) 2, Czechoslovakia 1, and Poland 0. The numbers from these countries who have been licensed in California during these years are so small as to make them, as was stated above, negligible.

The sixty physicians licensed from Germany, even if all of them are considered as refugees, constitute less than two-thirds of one per cent of the 9,785 physicians registered in the state in 1938.

Of the sixty physicians registered from Germany, the distribution is: Los Angeles 17, San Francisco 25, other localities 17, unknown 1.

Very truly yours,
Medical Refugee Control Committee of the Western States.
Sol Hyman, M.D., *Executive Secretary.*

Subject: Proposed legislation on narcotic enforcement.

(copy)

Division of Narcotic Enforcement

San Francisco, March 18, 1939.

California Medical Association
450 Sutter Street
San Francisco, California

Gentlemen:

Following a survey that was made by the State Narcotic Enforcement Division of conditions surrounding the dispensing of narcotics by members of your profession, we found that there were numerous cases of forged prescriptions where the name of the prescribing physician had been used fraudulently on blanks provided for him by pharmacies.

Particularly in the southern part of the state, where these prescriptions were presented to chain-store druggists, no effort was made, on the part of the dispensing pharmacist, to check the authenticity of the prescription.

Naturally, I know, that if every narcotic prescription was to be checked by the pharmacist before dispensing the same, a great inconvenience would be caused to the patient and a great annoyance would be occasioned by the physicians; so, in view of these facts as were disclosed, it became imperative that something be done to stop this imposition by narcotic addicts and peddlers on innocent physicians and pharmacists.

With this in mind, I talked with Edward F. O'Day, Assemblyman from the Twenty-fourth District, and, with the coöperation of Dr. Charles B. Pinkham, Secretary of the Board of Medical Examiners, and Mr. John Ramsay, President of the Board of Pharmacy, a system was devised by which this evil could be corrected.

PROPOSED LEGISLATION

We propose that the State Narcotic Enforcement Division provide books to all persons legally entitled to prescribe narcotic drugs—the same to contain one hundred prescriptions, in triplicate form—the original of which would bear the official seal of the State of California watermarked on the back thereof. The prescribing physician would make all three copies at one time; the original and duplicate would be given to the patient, to be taken to the pharmacy to be filled, and the triplicate would be retained in the book and would be the permanent record of the prescribing physician. The pharmacist would note on the original the date on which the prescription was filled and retain this copy for his permanent record; the duplicate, on which he would note the same facts, would be sent, at the end of thirty days, to the State Narcotic Enforcement Division, at San Francisco.

In order to avoid any embarrassment that might be caused to a patient because of the fact that these forms might indicate to the patient that narcotics were being prescribed, it was decided that no mention would be made on the form relative to the nature of the prescription, but would be undisclosed in a phrase of this type: "This prescription is issued pursuant to Chapter ——— and ——— of the Statutes of 1939, and across the face of it, in large print, would be the words "non repetatur." We felt that this would remove any embarrassment between the physician and patient.

The book of prescriptions which will be supplied by this department, free of charge, will be of a convenient size that will readily fit into the pocket of the doctor.

In the case of an epidemic, or sudden or unforeseen accident or calamity, a prescription may be written upon a form other than the official prescription form.

Violations of the provisions of this Act are punishable as a misdemeanor.

The great amount of good to be derived from this system is that the State Narcotic Enforcement Division will, every thirty days, have a complete report of the narcotics dispensed, and can readily remedy any infractions of the medical code by cautioning the violator, thus preventing serious consequences to the violator. This would prevent the necessity of criminal action in most cases and its attendant notoriety.

I firmly believe that our State Division was never intended to police the medical, dental, and other professions concerned with the dispensing of drugs, and it is for this reason that, in sponsoring this act, the coöperation of the Medical Association, the California Dental Association, the State Board of Medical Examiners, the State Board of Osteopathy, the State Board of Pharmacy, and the State Society of Veterinarians have been asked to coöperate in supporting this greatly needed legislation.

In supporting this bill your Association would be doing a great public service in that it would permit our Division, which is seriously undermanned at the present time, to devote its entire time to the illicit narcotic traffic.

156 State Building.

Paul E. Madden,
Chief, Division of Narcotic Enforcement.

Subject: Constitutional limitations upon power of legislature to restrict or abolish State Board of Public Health.

(copy)

San Francisco, March 20, 1939.

J. B. Harris, M.D.
Medico-Dental Building
Sacramento, California

Dear Doctor:

At the recent meeting of the Committee on Public Policy and Legislation, we were requested to examine the California Constitution and applicable judicial decisions in order to determine whether or not it is within the power of the legislature either to abolish or greatly to restrict the powers of the State Board of Public Health.

It is our understanding that there are several bills now pending before the legislature which, if enacted, would either abolish the State Board of Public Health or greatly restrict its powers and duties with respect to public health.

Article XX, Section 14, of the California Constitution provides that: "The legislature shall provide, by law, for the maintenance and efficiency of a State Board of Health."

Article I, Section 22, of the Constitution states that: "The provisions of this constitution are mandatory and prohibitory, unless by express words they are declared to be otherwise."

The foregoing section has been held to mean that the word "shall" in any provision of the constitution renders that provision mandatory. *Chenoweth* vs. *Chambers*, 33 Cal. App. 104.

It has further been held by the California Supreme Court that the provisions of the constitution which are mandatory are binding upon every department of the state government—legislative, executive, and judicial. (*People* vs. *California Fish Co.*, 166 Cal. 576.)

Hence, it must be concluded that it is mandatory upon the legislature to provide, first, for the maintenance, and second, for the efficiency of a State Board of Health. Under the decision in *People* vs. *California Fish Company, supra,* it is clear that the mandatory language in Section 14 of Article XX is binding upon the legislature as well as upon other branches of the state government.

Hence, it is necessary to conclude that any legislative enactment abolishing the State Board of Public Health would be in conflict with the mandatory provisions of the constitution because any such legislation would be contrary to the constitutional requirement that the legislature must provide for the maintenance of a State Board of Health.

Further, it is necessary to conclude that any legislative enactment unduly restricting the powers and duties of the State Board of Health would likewise be in conflict with the constitution because, under the constitutional provision, the legislature is obliged to provide for the efficiency of the State Board of Public Health

There are no California decisions directly construing Article XX, Section 14, of the Constitution. However, Section 15 of Article XX, which relates to mechanics' liens, contains language very similar to Section 14. By Section 15 the legislature is required to "provide, by law, for the speedy and efficient enforcement of mechanics' . . . liens." It is to be noted that the language of Section 15 is practically identical with that of Section 14 in so far as imposing duties upon the legislature is concerned.

A number of California cases have construed Article XX, Section 15. It has been held that the section is self-executing (*Miltimore* vs. *Nofziger Bros. Lumber Co.*, 150 Cal. 790) and that "the remedy expressly authorized by the organic law cannot be frittered away by any legislative action or enactment." (*Young* vs. *Shriver,* 56 Cal. App. 653, at 655-6).

It is thus apparent that the courts have held that any legislative enactment tending to impair the right to mechanics' liens would be unconstitutional because of the self-executing nature of Article XX, Section 15, and because of the mandatory injunction upon the legislature to provide by law "for the speedy and efficient enforcement of such liens."

Since Section 14 contains the same language as Section 15, it is reasonable to suppose that it would be construed by the courts in the same manner as Section 15. If this should be the case, then it would undoubtedly be held that any legislative enactment "frittering away" the powers, functions, and duties of the State Board of Health would be considered unconstitutional because in conflict with the self-executing and mandatory provisions of the constitution requiring the legislature to provide by law for the "maintenance and efficiency of a State Board of Health."

We believe that the foregoing answers the inquiry submitted to us in regard to the powers and duties of the legislature with respect to the State Board of Public Health.

111 Sutter Street.

Very truly yours,
Hartley F. Peart
Howard Hassard

Know, or hearken to him who knows. You cannot live without knowledge, either your own, or borrowed, but there be many who do not know that they know nothing, and others who think that they know, but know nothing; such deformities of the mind are incurable, whence it is that the ignorant do not know themselves, thus failing to discover what they lack. Some would be wise, if they did not believe that they were, and so it comes to pass that even though the oracles of wisdom are few, they live in idleness. because none consults them; it does not dwarf grandeur, nor argue against capacity to seek advice, yea, to seek advice brings credit; better to debate in the mind. to avoid combat with misfortune—Baltazar Gracian, 1653.

MEDICAL JURISPRUDENCE†

By Hartley F. Peart, Esq.
San Francisco

Legal and Ethical Protection Given to Facts Made Known to a Physician in Confidence

In many instances a physician acquires knowledge of facts personal to his patient, which information the physician is bound never to disclose. However, since other information coming into his hands from a patient need not be kept inviolate, the question often arises as to which category particular facts belong. The Principles of Medical Ethics of the American Medical Association include the following:

> Chapter II. Section 1.—Patience and delicacy should characterize all the acts of a physician. The confidences concerning individual or domestic life entrusted by a patient to a physician and the defects of disposition or flaws of character observed in patients during medical attendance should be held as a trust and should never be revealed except when imperatively required by the laws of the state. There are occasions, however, when a physician must determine whether or not his duty to society requires him to take definite action to protect a healthy individual from becoming infected, because the physician has knowledge, obtained through the confidences entrusted to him as a physician, of a communicable disease to which the healthy individual is about to be exposed. In such a case, the physician should act as he would desire another to act toward one of his own family under like circumstances. Before he determines his course, the physician should know the civil law of his commonwealth concerning privileged communications.

The California Business and Professions Code, Section 2379, reads:

> The wilful betraying of a professional secret constitutes unprofessional conduct within the meaning of this chapter.

Other sections of the Code provide for the revocation of a physician's license upon proof of unprofessional conduct.

It can be seen that not only the ethics of the profession. but the civil law as well, has recognized a relationship of trust between a physician and his patient. The rules for admission of evidence in judicial proceedings recognize this fact, and to insure confidence and willingness on the part of the patient to lay before his physician all facts which might in any way assist in the treatment which the physician must render, extend a privilege to confidential communications between a patient and his physician. This privilege gives the physician the right to refuse to testify about such subjects, unless his patient consents to his doing so.

The physician-patient privilege has not always been extended. In the early English common law, confidential communications between attorney and client were protected to enable the attorney to obtain from his client a complete recital of facts, but such protection was not extended to the physician and patient relationship. California, however, by express Code provision, establishes a physician-patient privilege. Code of Civil Procedure, Section 1881, Subdivision 4, states that a physician cannot, without the consent of his patient, be examined in a civil action as to any information acquired in attending the patient, which was necessary to enable him to prescribe or act for the patient. However, the section makes the following exception to the general privilege: (1) Where a patient sues for damages for personal injuries, any physician who "prescribed for or treated" him may testify. (2) Where a patient is dead, and the executor or administrator, surviving spouse or children sue for wrongful death, the patient's physician may testify. (3) Where the patient is dead and his will is contested.

---

† Editor's Note.—This department of California and Western Medicine, presenting copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

(4) Where the patient is dead and an action is brought involving the validity of any instrument transferring real or personal property claimed to have been executed by him, in which case the physician may testify as to mental condition, and disclose any such information.

In addition to the statutory exceptions, many other elements have been held to affect the privilege. First of all, the privilege does not extend to criminal proceedings. Secondly, the information must be received in a professional capacity. Thirdly, the privilege only extends to information received in the actual treatment of a patient, not to information received during mere examination, unless the patient believes that the examination is being made for the purpose of treatment.

The privilege has also been held not to extend to various other matters, for example, family matters incidentally spoken of or overheard or observed by a physician while professionally attending a patient. Thus it was held in one case that a physician could testify in an action by a niece against the estate of her deceased aunt for services rendered the latter in whose home she had resided since early infancy, to statements made to him by the aunt who was his patient to the effect that she wanted to compensate plaintiff for such services. In another instance, it was held that a physician who had attended a testator could testify in a will contest as to the testator's expressed opinion as to his daughter's mental condition, she being the contestant of the will.

Probably the most important factor which a physician must keep in mind is that the patient may often be deemed to have waived the privilege. Thus, in making an attending physician a subscribing witness to his will, a deceased has been held to have waived the privilege and invited a full and proper examination of the matters and facts with respect to which the physician's lips would otherwise have been sealed. Again, if the patient permits the physician to give testimony without making any objection, or makes the physician a witness or voluntarily testifies to communications between himself and the physician, he is deemed to have waived the privilege. Once there is a waiver, the patient cannot later revoke it.

Another possible cause of waiver is the presence of a third party at the time the patient gives the physician the information sought to be protected. It is often held that the presence of the third party destroys the confidential nature of the conversation and that both the physician and the third party are released from any duty to refrain from later commenting upon the communications received. Nurses and professional assistants are treated somewhat differently from other types of third parties. If a nurse's presence is necessary to effect treatment, then her presence will not waive the privilege as to the physician. As to whether or not the assistant can speak, is an issue yet unsettled in this state.

Finally, it should always be remembered that it is the patient who is entitled to the benefit of the privilege, the physician being allowed to assert it only in the absence of assent by the patient. Thus, there is no privilege when the patient waives the privilege expressly or by implication as set forth above.

It is of interest to note that the privilege extended to communications between a physician and his patient are not extended to communications between a patient and one whose profession is curing by means of faith. (*Estate of Mossman,* 119 Cal. App. 404).

There is still an immense amount to be learned about health, but if what is at present known to a few were part of the general knowledge, the average expectation of life could probably be increased by about ten years—J. B. S. Haldane.

PNEUMONIA CONTROL*

A Report by the California Medical Association Committee

Your committee has carefully examined the pneumonia problem in the State of California and submits the following findings:

The death rate per hundred thousand population from all forms of pneumonia and from influenza in this state is 75.5. For the registration area, it is 102.5. From lobar pneumonia alone, the death rate in this state is 29.9.† In the registration area, it is 42.7. California, therefore, has a relatively low death rate from the pneumonias, and particularly from lobar pneumonia when compared with the other states. Nevertheless, we average about four thousand deaths a year from pneumonia, more than half of which are probably due to the pneumococcus. Recent improvements in diagnosis and therapy make it seem probable that a considerable percentage of deaths from pneumococcus pneumonia can be prevented.

Regarding total deaths from lobar pneumonia only for the six-year period, 1930 through 1935, this state lost an average of 1,862 persons a year. Forty-two per cent of these deaths occurred in Los Angeles and San Francisco counties. Fifty-four per cent of the deaths occurred in the northern counties of the state, and forty-six per cent occurred in the southern counties. Eighty-one per cent of the deaths occurred in only thirteen counties of the state as follows:

	Per Cent		Per Cent
Los Angeles	30	Fresno	3
San Francisco	12	San Bernardino	3
Sacramento	7	Imperial	2
Alameda	6	Kern	2
San Joaquin	5	Riverside	2
San Diego	5	Orange	1
Santa Clara	3		

It will be noted that, for the most part, these are the counties having reasonably adequate medical and hospital facilities.

Seventy-one per cent of these total deaths occurred under the age of sixty-five, showing that lobar pneumonia is not primarily a disease of old age.

There is considerable variation in the death rate per hundred thousand according to counties, ranging from Sacramento County with the highest death rate of 91.3 and San Joaquin with a death rate of 79.1, to San Mateo and Santa Barbara counties with a death rate each of 19.8. There appears to be a tendency for lobar pneumonia deaths to be commonest in certain of the valley counties, particularly Sacramento, San Joaquin, Madera, Tulare, and Imperial counties. The reason for this has not been determined as yet, but it is suspected that it may be related to the distribution of the transient population during the pneumonia season.

At the beginning of its work your committee found that the Neufeld rapid typing method, and the prompt administration of specific antiserum were not in general use by physicians throughout the state except in the larger metropolitan areas. Laboratory facilities for rapid typing were generally lacking and there was an inadequate supply of serum throughout the state. There was, likewise, a general lack of appreciation on the part of the practicing physicians of the state, of the newer scientific advances in this field. There was a decided tendency on the part of the general public to call a physician late in the course of the disease when serum therapy, even if available, would be less effective. One large life insurance company estimates that 50 per cent of its policyholders who die of lobar pneumonia have failed to call the physician before the fourth day after onset. This presents a serious problem in health education of the public to which your committee has given careful attention.

---

* Report of the Committee on Pneumonia Control, subcommittee to Committee on Health and Public Instruction. Read at the Conference of California Medical Association Officers and Committees on February 25, 1939. See also report in Pre-Convention Bulletin Supplement.

† Average deaths per one hundred thousand population, 1930–1935, inclusive.

Another problem has been the fact that pneumonia deaths are reported to the State Board of Health on a pathologic basis—that is, as lobar or broncho—rather than on an etiologic basis. From the standpoint of therapy it is most important to differentiate those pneumonias due to the pneumococcus and those due to the streptococcus or other bacteria or viruses, regardless of the pathologic distribution of the lesion in the lung tissue.

To summarize the problem in this state as your committee now sees it:

1. Although more fortunate than most states, there is enough pneumonia in California to present a serious problem.
2. Many lives can be saved by the general acceptance on the part of both the physician and the public of modern methods of pneumonia diagnosis and treatment.
3. Physicians of the state are willing and anxious to apply these new methods, and are entitled to all the assistance their state and county medical societies can give them.
4. Laboratory facilities, while generally lacking outside the larger cities, can be made more accessible and more generally available.
5. The supply of specific antiserum is now adequate to supply the needs of the physicians of the state.
6. Pneumonia deaths should be reported on an etiologic, rather than a pathologic, basis.
7. There is great need for mass education of the public concerning the seriousness of pneumonia and the importance of calling a physician early in the course of the disease.

With these findings at hand, your committee has proceeded to attack the problem as follows, bearing in mind two fundamental principles which were unanimously agreed upon early in the course of the committee's deliberations: (*a*) The pneumonia control program should be conducted by existing agencies, for the most part, rather than through the organization of any new agency; (*b*) pneumonia control need not be hampered by differences of opinion concerning the treatment of the indigent or the determination of those who are not indigents, and a satisfactory result can be accomplished through the individual practicing physician without destroying any of his rightful prerogatives.

Since the individual physician who is treating pneumonia can best be helped by his own local county medical society, a letter has been addressed to each county society in the state, calling their attention to the seriousness of the problem and offering the assistance of this committee and of the Committee on Postgraduate Activities to each society interested in the subject.

The Committee on Postgraduate Activities has included in its program of courses offered county medical societies a section on pneumonia, and is working with this committee in compiling a list of competent clinicians available to address county medical societies on this subject.

The State Board of Health and the various local health departments throughout the state have been contacted, local health officers being urged to work in close coöperation with their local county medical society. The State Board of Health has been requested to prepare a list of laboratories throughout the state which are considered competent to do Neufeld rapid typing. The State Board of Health has also been requested to change the system of reporting pneumonia deaths from a pathologic to an etiologic basis. If this can be done, your committee will attempt to use the facilities of the California Medical Association to bring about compliance with this new regulation by all physicians in the state.

The four medical schools in the state have been addressed on this subject and requested to include appropriate courses in their undergraduate teaching, as well as to assist this committee with postgraduate teaching where and when necessary. The California State Nurses' Association has been addressed, calling their attention to the seriousness of the pneumonia problem and the fact that skilled nursing is essential in pneumonia therapy. It has been suggested to them that they appoint a special committee on the subject to work with this committee in assisting their members.

Considerable time has been given to the subject of educating the general public. As fast as local medical societies and local health departments have become interested in the problem and willing to have a public education campaign carried on, they have been put in touch with various agencies to accomplish this purpose. Thus, in San Francisco, one of the newspapers carried a series of articles prepared by the Pneumonia Committee of the Western Branch, American Public Health Association, on the subject of pneumonia, pointing out to the public the importance of calling a physician early in order to take advantage of the newer methods of therapy. Some months later a popular film on pneumonia treatment was introduced into the neighborhood theaters of San Francisco, and this has been shown to a total audience of sixty thousand.

In Los Angeles County the Fox-West Coast Theater chain and the Independent chain have shown a popular film on pneumonia to total theater audiences of eighty thousand. The attention of all county medical societies has been called to the importance of conducting some form of popular education on this subject in their respective localities.

Full use has been made of the facilities of the office of the secretary of the California Medical Association, and the valuable assistance of the secretary and his staff are highly appreciated.

A scientific exhibit on pneumonia control will be planned and conducted by the members of this committee.

With your approval the committee will continue along the lines outlined above. In addition to this, and as soon as possible, your committee will attempt to collect and tabulate the experience of various hospitals throughout the state in an effort to determine the types of pneumococcus pneumonia which are most prevalent; and we shall also attempt to collect experience on the use of oxygen therapy and the newer sulfanilamid preparations in drug therapy. For this purpose it would be most helpful if the committee might have a small budget, not to exceed $250, to permit the assembling of a quorum, either in San Francisco or Los Angeles, at more frequent intervals than has been possible in the past.

Roy E. Thomas, M.D., *Chairman.*

ILLNESS AND TIME LOSS FROM OCCUPATION

The time loss from disabling illness and accidents is about three times greater in the population of working ages on relief than in selfsustaining families above the $1,500 income level, according to findings of the National Health Survey of the United States Public Health Service, announced by George St. John Perrott, director of the survey.

"Adults between 25 and 64 years of age in relief families were disabled for 21 days per capita in the survey year, while the rate at these ages in families receiving $1,500 and over was six to seven days per capita," Mr. Perrott stated.

The aged (65 years and over) in relief families experienced disabling illness aggregating about eight weeks per capita, compared with three to three and one-half weeks per capita for old persons in upper income families. It was pointed out by directors of the survey that these figures represent minimum rates because they take into account only the days of disability accruing from illnesses disabling for a week or longer.

Disability caused by sickness and accidents has serious implications for adults between 25 and 64 years of age because this group represents largely the working population of our country, including housewives and men and women workers outside the home. The results of the survey show that the excess in the amount of disability among persons of these ages in low income families is especially high from the chronic diseases. This constitutes an added economic burden because many of the chronic diseases are "high-cost" illnesses, requiring extensive diagnostic facilities and specialized medical treatment.

Included in this chronic group are the so-called degenerative diseases. These diseases disable people of the working ages (25 to 64 years) in relief families almost four days per capita annually while the rate is two days per capita for the nonrelief groups receiving less than $1,000, and only about one day per capita for the economic groups receiving $1,500 a year and up, according to Health Survey findings.

Disability from rheumatism in the 25 to 64 age group causes about two days of incapacity per person in a 12-month period in relief families, one day per capita for the $1,000 and less nonrelief group, and about one-half day per capita for those receiving $1,500 and up. In this same age group, nervous and mental diseases, excluding cases in institutions for a year or more, cause two days' loss per capita in a year in the relief families; about one and one-half days for nonrelief families receiving less than $1,000; and about six-tenths of a day, for the families above the $1,500 income level.

The survey shows that disability rates from respiratory diseases, including such diseases as pneumonia, influenza, and colds, for adults of the working ages (25-64) are two and one-half times higher in the relief group than they are in families receiving $1,500 a year and over.

Accidental injuries and orthopedic impairments resulting from accidents and disease also affect especially the working ages from 25 to 64, and wide differences are noted in the amount of disability from those causes in the low and high income groups. Accidents account for three times as much disability per capita among relief families, and about twice as much in the low-paid nonrelief families as they do in the families which have incomes of $5,000 a year and over.

The contrast in disability rates for orthopedic impairments is even more pronounced. Persons in relief families have disability rates for orthopedic impairments five times as high as the rates for families receiving $3,000 and over a year; rates for nonrelief families living on incomes of $1,000 and less a year are almost four times as great as the $3,000 and up economic class.

The National Health Survey was a project conducted by the United States Public Health Service with the aid of financial grants from the Works Progress Administration. These reports are based on a house-to-house canvass of some 800,000 families, including 2,800,000 persons in 83 cities and 23 rural areas in 19 states. The survey was made during the winter (largely from November to March) of 1935-36.

The total surveyed population was so distributed as to give a sample which was, in general, representative of cities in the United States according to size and region. In large cities (100,000 and over) the population to be canvassed was determined by a random selection of many small districts based on those used in the United States Decennial Census of 1930. In the smaller cities selected for the study, the population was enumerated completely.—U. S. Public Health Service Bulletin.

TULAREMIA*

With reports for November and December, 1938, the two months of greatest prevalence, not yet available, a total of 613 cases of tularemia were recorded in 1938. This figure does not include cases occurring in Illinois, Ohio, Virginia, and Kentucky, where, for the past twelve years, the highest incidence has been reported.

"While tularemia does not represent a major health problem," says Dr. A. M. Stimson, Medical Director, United States Public Health Service, "nevertheless, the fact that so much distress and mortality could have been avoided by reasonable precautions, renders the subject more interesting than the numbers imply. There had been 8,000 cases with 396 deaths reported up to 1938."

Discovered in 1910, named in 1920, and elucidated from beginning to end by Public Health Service investigators, human cases of tularemia have been recognized everywhere in this country except Connecticut and Vermont. In the decade after 1925, it was variously reported in Japan, Russia, Norway, Sweden, and Austria.

An acute infection disease caused by the *Bacterium tularense* (after Tulare County, California, where first found), it occurs under natural conditions in over twenty kinds of wild life, with cottontail, snowshoes, and jack rabbits the chief reservoirs and direct causes of over 90 per cent of the human cases in this country. Man becomes infected by contact of his bare hands with the raw flesh and blood of these animals, or by bites of blood-sucking ticks and flies which have previously fed on infected animals.

Hunters, market men, cooks, and housewives become infected when skinning or dressing wild rabbits. Their bare hands may become covered with blood when they pull out the livers and spleens. If by chance there is an open sore or cut on the hands, the infection may enter the wound on the hand and cause the disease. When a rabbit is shot, its bones often become shattered into sharp fragments. If, in dressing an infected rabbit, one of these fragments of bone pierces the skin of the hands, the infection may enter at that point.

About three days after exposure to such a wound infection, illness begins with headache, chilliness, vomiting, aching pains, and fever. The patient may think that he has influenza and go to bed. The sore on the hand, or elsewhere, develops into an ulcer. The glands at the elbow or in the armpit become enlarged, tender, and painful, and later may develop into an abscess. There is sweating, loss of weight, and debility. The illness lasts ordinarily about three weeks, and is followed by a slow convalescence which may extend two or three months. Most patients recover without any bad after effects, but about 5 per cent die, especially if the case is complicated by pneumonia.

One who has recovered from an attack of tularemia need not fear a second attack, because he is then immune to the disease. There is no record of a second attack in man. There is only one record of the transfer of the infection from man to man. Doctors, nurses and attendants caring for the sick have not contracted the disease.

Tularemia—R. H. Creel, Volume 29, No. 4, October 1928, page 267.

Tularemia—C. L. Stealy and David Miller, Volume 30, No. 6, June, 1929, page 418.

Tularemia in Nevada—J. C. Geiger and K. F. Meyer, Volume 31, No. 1, July, 1929, page 38.

Tularemia in Cattle and Sheep—J. C. Geiger, Volume 34, No. 3, March, 1931, page 154.

Tularemia—George R. Magee, Volume 39, No. 6, December, 1933, page 421.

Psittacosis and Tularemia—Volume 44, No. 2, February, 1936, page 79.

Tularemia in California—Hiram E. Miller, Volume 42, No. 4, April, 1935, page 236.

Tularemia has no seasonal prevalence except as it is influenced by insects or by contacts with infected animals. Laboratory infections may occur at any time. Human cases are most prevalent in summer time in the western states where ticks and deer flies are the cause of infection. Human cases, due to infection from dissecting jack rabbits, are likewise most prevalent during April to October, because these are the months of greatest destruction of these pests. Each of the Mississippi, cottontail rabbits are responsible for most human cases, and since they are generally protected by law except during a few winter months, the seasonal prevalence is apt to be November to January, when the hunting season is on.

Rabbits raised under domestic conditions and sold for food or for pets, have never been found naturally infected. They are just as susceptible to artificial inoculation in the laboratory, however, as are the wild rabbits.

The prevention of tularemia is almost entirely a matter of personal precaution. No curative or preventive serum has been perfected. Sick or dead wild animals which are found should not be handled; forget about the rabbit which you can stalk on foot and knock over with a stick. Any carcasses in which peculiar whitish spots are found on both liver and spleen should be discarded and buried or burned.

Keep the bare hands out of a wild rabbit. The bacillus of tularemia does not require a wound for its entry, but can go through the healthy skin. Sometimes infection is contracted by rubbing the eyes with soiled fingers.

Rubber gloves afford reasonable protection to those who must dress wild rabbits and other animals, but sharp fragments of rabbit bone can easily pierce a rubber glove and puncture the hand. Employ immune persons when contact with infected material is necessary.

Thorough cooking of all wild game, especially rabbits, is essential. Infected meat is rendered harmless for food by thorough cooking, but if any red juice is allowed to remain about the bones, the germs will remain alive and virulent.

The liberal use of soap and water and disinfection of the hands are recommended to remove rabbit blood from the hands, or even when the hands have come in contact with the rabbit's fur.

NATION ENJOYS BANNER YEAR FOR HEALTH*

A year ago, in a similar statement for Science Service, I said that the health outlook for 1938 was altogether favorable. This prediction was based on the remarkable health record established for 1937 among industrial policyholders of my company.

My optimism was more than justified, for no previous year has even closely approached the record for low mortality established for 1938.

Month after month the death rates among these insured wage-earners and their families have been even lower than during 1937, and at the middle of December we find a year-to-date death rate that is over 7 per cent below the previous minimum, as established only a year since.

What happens among these many millions of people is a pretty sensitive index of health conditions in the country, as a whole. So, even if I had no other source of information I could say that 1938 has been an extraordinary health year in the United States. But, as a matter of fact, information for the first nine months of the year is available from the health officers of thirty-nine states. The story they tell is that, without a single exception, every one of these states has shown improved mortality as compared with 1937—and in many instances very marked improvement.

Principal factors in bringing this about were the much lower mortality rates from respiratory diseases and the gratifying accomplishments of the campaign to reduce the automobile accident toll.

NEW LOW RECORDS

The death rates from tuberculosis, pneumonia, and influenza have reached new United States minima during 1938. It is almost certain that the mortality from tuberculosis will drop below 50 per 100,000 for the first time in history.

If the present rate of decline continues for a few more years, tuberculosis will reach the stage where the number of open cases will no longer be sufficient to maintain it among the leading causes of death in this country.

There has been no more striking instance of the success of the public health movement than the decline in the tuberculosis death rate during the last four decades. The time is now ripe for a final and intensified drive leading to the effective suppression of this disease.

There were no major epidemics of influenza or pneumonia in 1938, a year marked by the wide adoption of the new serum treatment against the more prevalent types of pneumococcus.

Inasmuch as respiratory disease tends to hasten deaths from cardiac, vascular or renal conditions, a natural consequence was the fall in mortality from most of the chronic diseases of old age. The sole exception to this rule, in 1938, was the continuance of the rise in deaths charged to coronary artery disease. But this increase may be only apparent, reflecting improved diagnosis together with the newly awakened interest of physicians in this form of heart disease and an increasing tendency on their part to give coronary disease prominence as the chief cause of death when associated with other conditions.

AUTOMOBILE DEATHS LOWER

Among the most gratifying aspects of the mortality picture for 1938 was the marked decline in automobile fatalities. Present figures indicate that the final tabulation will show fewer deaths by one-fifth from this cause than were recorded in 1937 and this will mean about eight thousand lives saved.

Further gains against both infant and maternal mortality also contributed to the salutary state of public health during the past year. It is safe to report new minimal death rates in both of these important fields of public-health work.

Only disturbing feature is the continued increase of the cancer death rate. Nineteen hundred and thirty-eight is the twentieth consecutive year, with a single exception, to register a rise.

There is some doubt, however, as to whether this upward trend in cancer deaths actually marks an increase of the disease or merely reflects the rapid aging of our population. Since cancer is a disease that is confined largely to the later years of life, it is certain that much of the apparent rise is attributable to the increasing proportion of old people in the general population. Improved means of diagnosis and more accurate reporting also have been important elements in the apparent increase in cancer mortality.

FEWER INFECTIONS

Turning to the sickness side of the subject we find a gratifying situation also. All but two of leading communicable diseases showed below-normal prevalence during 1938. The country was especially blessed in that it was comparatively free of that scourge of childhood, poliomyelitis (infantile paralysis). Less than 1,700 cases were recorded throughout the entire country and no section has suffered what might be called a major outbreak.

Only measles and smallpox were unusually prevalent during the current year. Fortunately, neither of them was responsible for much mortality, although the exceptionally low death rate from measles in 1937 was probably quadrupled in 1938.

The smallpox situation, however, cannot be passed over so lightly. The rate has been steadily climbing during the last four years. Why do some communities persist in taking serious risks when smallpox can be avoided so easily by community-wide vaccination?

---

* By Dr. Louis I. Dublin.

Will the present favorable health conditions continue during the coming year? In general, I think they will.

So much depends upon the occurrence of major epidemics, weather conditions and other "acts of God," that no one, of course, can now predict the final outcome.

On the whole, the augury for the coming year is most propitious. At no time in the history of our country have there been so many signs of popular interest in public health affairs. The widespread and active campaign against venereal disease, the ambitious program advocated by the American Tuberculosis Association, and the successful National Health Conference at Washington in July, all emphasize the keen interest that is being manifested in communal and individual health.

Barring unforeseen and uncontrollable acts of nature, 1939 should prove to be another milestone on the road to better health and longer life for our people.—San Francisco *News*, January 2, 1939.

SYPHILIS IN INDUSTRY

The United States Public Health Service has advocated a six-point program to prevent the spread of syphilis among employees in industry. The recommendations are as follows:

1. Routine blood tests for applicants for employment.
2. Routine blood tests at the time of periodic reëxamination of employees.
3. Industry, with its compact organization, should develop a vigorous educational program.
4. Industry should extend its educational campaign into the field of prophylaxis.
5. There is a responsibility upon the industrial medical officer to see that adequate modern treatment is available to employees at prices ordinary wage earners can afford. If such treatment is not available in private practice or at public clinics, industrial medical service should undertake such treatment.
6. Syphilis must at all times be handled as merely another communicable disease. The privacy of relations between the worker and the medical service should be preserved in the best professional tradition. In ordinary cases it cannot be regarded as ground for discrimination of any kind against employees, when treatment is properly required.

Dr. R. A. Vonderlehr, Assistant Surgeon General in charge of the Venereal Disease Division, stated that when syphilis cases are given proper treatment, industry runs a minimum of risk of having workers disabled or partially disabled from the disease. A recent survey showed that symptoms of syphilis of the nervous system resulted in only 1.6 per cent of the properly treated cases under observation. For untreated cases the rate was 16.9 per cent.

Those studies also revealed no cases of syphilitic heart disease among the group that had received proper treatment, while 3.4 per cent of the cases having no treatment developed heart trouble during the ten- to twenty-year observation period.

"Fortunately," Doctor Vonderlehr says, "some of the larger industries have discovered that the control of venereal diseases in industry can hardly be accomplished by dismissals. They assure the worker that so long as proper precautions are taken during the early stages and proper treatment continued, there will be no dismissals following discovery and treatment of infection.

"Some industries have established clinics to treat both infected employee and his family. Those industries have found out that the employee constantly in fear of being dismissed will neglect treatment and that this neglect simply leads to prolonged and more serious illness. A sick and worried employee is very definitely a liability, at least in terms of inefficiency and possibly in terms of accident and labor turnover.

"Remember, also, that from the public point of view, the patient's continuance of treatment and, therefore, his cure will depend upon the continuance of his income. Nobody would benefit by his discharge. He might easily be thrown upon public relief. That might result from a policy of needlessly discharging syphilitics from their employment.

"The syphilitic person passes through three definite stages: early, latent or symptomless, and late syphilis. If adequate treatment is given to the infected individual, the manifestations of late syphilis are prevented in more than 80 per cent of all cases.

"From the standpoint of incapacitation as a result of syphilis with reference to employment, it should be noted that only those people with very early syphilis—in the first week or two of the disease—and those who have manifestations of late syphilis, might have a lowered earning capacity. The number of syphilitic persons in these categories, however, would not constitute more than 10 per cent of all the syphilitics in the United States."

The greatest proportion of people so infected, Doctor Vonderlehr explained, have the latent or symptomless form of the disease. Thus, unless a special attempt were made to detect the disease through the use of serological blood tests, the average employer would not be able to tell which of his workers were infected.

In its very early stage, before he begins to receive treatment, the patient may have symptoms present which will cause some degree of incapacitation for a few days. These disappear, however, within a week when the patient is given modern treatment, and these treatments should not interfere with his job.

In late syphilis, of many years' duration, serious complications involving the brain, spinal cord, or the heart and great blood vessels may occur, in which event the patient would, of course, likewise be incapacitated. This incapacitation would last for a variable time and might possibly be permanent. A great many of the people with such complications are confined to mental or other hospitals more or less permanently and are not a part of the great employed group in this country.

Statistical biography of ten thousand children born in any one year:

Who Die—

1,323 die before the age of twenty.

Who Live—

34 are crippled.
15 Are deaf or hard of hearing.
5 are blind.
17 are visually handicapped.
260 have defective speech.
86 are so emotionally unstable or delinquent that substituted care is needed.
8 are so mentally defective, dependent, or delinquent that institutionalization is needed.
78 are mentally deficient, and in need of special classes.
347 are mentally handicapped, and in need of opportunity classes (vocational level—manual labor).
1,214 are dull normal, and in need of occupational classes (vocational level—semiskilled trades).
5,206 are normal, and fit into regular grades (vocational level—skilled trades and small businesses).
1,301 are bright, making a college education usually desirable (vocational level—larger business enterprises and professions).
20 are sufficiently gifted to make professional and research education highly desirable.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XII, No. 4, April, 1914

From Some Editorial Notes:

Of Utmost Importance to You.—The coming meeting of the State Society at the Potter Hotel, Santa Barbara, April 14, 15, and 16, will be in many ways the most important session ever held. Problems of the widest range and of the deepest importance of any ever confronting us will come up for discussion and for action. And we must meet them and settle them in some way; the duty cannot be shirked or put over, and a general line of policy must be adopted which can be followed by the Council and the officers in their conduct of the work during the year. Every delegate should attend, even if at some personal sacrifice of time and money on his part, and every county unit should see to it that delegates are elected who will surely attend the meeting and transact the work which will be presented. It is not fair for a county to fail of representation and then kick at what may be done; the time to kick is right there at the meeting of the House of Delegates, and possibly the delegate from the smallest unit may have just the right suggestion to make in regard to some pending matter. Certainly, he should be there and express his views. This is no time in which to think of personal jealousies or little differences of opinion; changes have come and great changes are coming within the next few years, and we must recognize that fact and meet the changes that are here and get ready for those that will be with us before we know it. . . .

There is every reason to believe that we can work these things out so as to do justice to everybody concerned; but we cannot do it if you just sit back and kick at what is.

* * *

Our only Hope.—The only hope for holding up the medical profession and medical conditions in this state today is in holding up and increasing the strength of the State Medical Society. As the Journal said two or three years ago, the time will come (it has almost come now) when membership in the State Society will have to take the place of the official license to practice. . . .

* * *

Medical Defense.—We must recognize the fact and be prepared for it, that the number of suits for alleged malpractice will increase very largely in the near future—in fact is already on the increase. There are a number of reasons why this should be so. More people who are hurt will be treated by physicians; the injured person may not sue the employer and so many unscrupulous lawyers will be deprived of these "contingent fee" cases. There is left only one person who may be sued—the physician; and the same sort of cheap and scaly lawyer who would incite the patient to sue the employer will turn his attention to starting a suit against the doctor. . . .

* * *

The Accident Insurance Situation.—Representatives of the State Society, the San Francisco County Society, the State Commission, and of several insurance companies, have had a number of long conferences during the last month and have come to a better understanding of the case and to a tentative agreement that seems to offer a clearing up, to a great extent, of many of the apparent difficulties. . . .

A word of caution to our county medical societies. Do not pass resolutions of an arbitrary and pugilistic nature;

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By Charles B. Pinkham, M.D.
Secretary-Treasurer

News

"Superior Judge Martin I. Welsh today heard oral arguments on a petition for a writ of mandate, which, if issued, will serve to force the California Board of Education to certify osteopathic physicians and surgeons as school health supervisors. The writ is sought by Dr. Edward William Jordt, thirty-eight, to force his appointment as supervisor of health and development in the Anderson Valley Union High School at Booneville, Mendocino County. The petition for the writ was filed by Attorney John L. Brannely. Deputy Attorney (General) Ralph Cowing presented arguments for the Board of Education. Brannely contends the Board's policy in restricting the appointment of school physicians to medical doctors certified by the California State Board of Medical Examiners is discriminatory. Judge Welsh indicated he will ask both attorneys to file briefs in support of their arguments." (Sacramento *Bee,* March 3, 1939.)

"Legal action, compelling, if sustained by the courts, recognition of osteopaths and chiropractors on the panel of the health plan of the City Health Service was threatened today. David T. Jones, representing the Affiliated Chiropractors of California, said that Attorney Newell Hooey would take what legal action he deemed necessary. . . . The threatened legal action is based, according to Jones, on the contention that the plan when voted in, gave the right to a choice by the employee. . . ." (San Francisco *Call-Bulletin,* February 16, 1939.)

"Complaint that the Health Service Board has refused chiropractors equal consideration with physicians and surgeons in San Francisco's group health insurance program for employees and their dependents was contained in a Superior Court suit on file today by Dr. Lloyd H. Garrison, chiropractor. Doctor Garrison asked a writ of mandate to compel the Board to include chiropractors in the so-called plan No. 1. A supplemental, separate suit was filed by Muriel M. S. Pettit, a city employee, asking for the right to receive chiropractic treatment either under plan No. 1 or under a separate plan without discrimination." (Oakland *Tribune,* March 8, 1939.)

"Felony charges will be issued against anyone caught attempting to influence the Superior Court jury trying Dr. T. Maud Ramer on charges of performing an illegal operation, Judge Edward J. Kelly warned from the bench yesterday. It was the second time during the six days of the trial that Judge Kelly had issued stringent admonitions to spectators and interested persons. On the first occasion a typewritten slip containing propaganda favoring birth control had been turned over to the judge by jurors who found it in a wash basin in a rest room. Judge Kelly said investigators for the district attorney's office were seeking the persons who left the paper and that they would be prosecuted if discovered. Charges that a medical examiner had threatened to 'bankrupt' her prior to the time of her arrest were made by Doctor Ramer during argument over the appointment of the expert witnesses after the jury had

Hearing Acuity.—Only about half the adult population of the nation claims to have normal hearing, according to random samplings made in connection with recent United States Public Health Service surveys.

Findings announced also revealed that only 56 per cent of these people who think they hear perfectly passed audiometer tests for normal hearing. Many failed to hear the very high and the very low tones.

Wide differences were found among men and women. In general, women detect the high tones better, but fail to hear sounds in the lower range. Men do well in detecting low tones, but frequently show loss of hearing for high-pitched sounds.

The investigation was conducted as a phase of the National Health Survey, and in coöperation with prominent ear specialists. Hearing tests and ear, nose and throat examinations were given to about nine thousand persons drawn at random from the population in twelve cities.

The most frequent defect among these persons who erroneously believed their hearing to be normal consists in loss of hearing above the range of sounds most commonly used in human speech, that is, above an audiofrequency level of 3,000 cycles per second.

It was demonstrated through tests with bone conduction vibrators, placed on the mastoid bones, that these losses for high tones are due to primary degeneration of the acoustic nerve. This degeneration results from infectious processes associated with certain systemic diseases—such as scarlet fever, meningitis, diphtheria, influenza, and the like—as well as from local infections of the middle ear (otitis media). The common head cold is a frequent cause of these middle-ear infections.

The study of hearing loss among persons having noticeable impairments of hearing for speech reveals many new facts. Loss of hearing due to congestion and lesions of tissue in the middle ear, without accompanying injury to the acoustic nerve, is found to be characteristic of deafness among children of public-school age. Practically all deafness among persons over twenty-five years of age involves some degree of nerve degeneration. This degeneration is more localized among males and rather widely distributed throughout the ear among females.

In terms of hearing loss as measured with the audiometer, females show typically a rather uniform loss of hearing for all tones from about 100 cycles up to 8,000 cycles. Males, on the other hand, show characteristically greater losses than females for tones higher in pitch than 2,000 cycles. Males also show relatively less loss of hearing than females for tones that are lower in pitch than 1,000 cycles.

Knowledge of this consistent difference between males and females with impaired hearing is of considerable importance to the manufacturer of hearing aids. A much different type of instrument is required in most cases for males and females. In the case of males, hearing aids should typically amplify sounds above 1,000 cycles relatively more than those below this frequency level. For females, hearing aids should amplify sounds in a fairly uniform ratio through the frequency range from 200 to 4,000 cycles. Instruments now available on the market do not take these facts into account, directors of the hearing study said.

There were but ten deaths from malaria registered in California in 1937, and six deaths from this disease in 1936. Only half of these deaths occurred in the interior regions of the state, the rest of them occurring in coastal regions, whence the patients presumably had migrated for treatment.

Without health life is not life; it is only a state of languor and suffering—an image of death.—Rabelais.

OLEUM PERCOMORPHUM (Liquid)

10 and 50 cc. brown bottles in light-proof cartons. Not less than 60,000 vitamin A units, 8,500 vitamin D units (U.S.P.) per gram. 100 times cod liver oil* in vitamins A and D.

OLEUM PERCOMORPHUM (Capsules)

Especially convenient when prescribing vitamins A and D for older children and adults. As pregnancy and lactation increase the need for vitamin D but may be accompanied by aversion to large amounts of fats, Mead's Capsules of Oleum Percomorphum offer maximum vitamin content without overtaxing the digestive system. 25 and 100 10-drop soluble gelatin capsules in cardboard box. Not less than 13,300 vitamin A units, 1,850 vitamin D units (U.S.P.) per capsule.

Capsules have a vitamin content greater than minimum requirements for prophylactic use, in order to allow a margin of safety for exceptional cases.

FOR GREATER ECONOMY, the 50 cc. size of Oleum Percomorphum is now supplied with Mead's patented Vacap-Dropper. It keeps out dust and light, is spill-proof, unbreakable, and delivers a uniform drop. The 10 cc. size of Oleum Percomorphum is still offered with the regulation type dropper.

Uses: For the prevention and treatment of rickets, tetany, and selected cases of osteomalacia; to prevent poor dentition due to vitamin D deficiency; for pregnant and lactating women; to aid in the control of calcium-phosphorus metabolism; to promote growth in infants and children; to aid in building general resistance lowered by vitamin A deficiency; for invalids, convalescents, and persons on restricted diets; for the prevention and treatment of vitamin A deficiency states including xerophthalmia; and wherever cod liver oil is indicated.

MEAD JOHNSON & COMPANY

"Two Generations of Appliance Makers"

More Important Now Than Ever Before.—When Dextri-Maltose was marketed in 1911 "without dosage directions on the package," Mead Johnson and Company of Evansville, Indiana, pioneered the principle that infant feeding was a therapeutic problem. Up to that time far more babies were fed by grandmothers, neighbors, grocers, and commercial houses than by physicians. This Mead policy was not readily accepted in the beginning, and it took many years of unceasing effort before the weight of the majority medical opinion finally led to mandatory action on the part of the Committee on Foods in 1932, whereby all makers of baby foods are now obliged to omit dosage directions. The Mead policy, however, does not stop here. It embraces other principles with which all physicians interested in the private practice of medicine are in agreement, such as: (2) No descriptive circulars in packages, or in shipping cartons (for druggists to hand to patients). (3) We supply no display of Mead products for druggists' windows and counters. (4) We do not advertise Mead products to patients. (5) We give no handbills and send no letters concerning Mead products to patients. (6) We do not broadcast to the public. (7) We refer patients to physicians at every opportunity. (8) We devote a great deal of effort and resources to research and to activities that assist the private practice of medicine. Is the Mead policy worth while?

Mental Hospital Survey.—Headquarters of the Mental Hospital Survey Committee will be transferred from New York to the United States Public Health Service in Washington next July in order to coördinate its activities with those of the Government's Mental Hygiene Division.

This committee was formed in 1936 to survey as many as possible of the 356 public mental hospitals in this country and Canada, to promote research and encourage wider distribution of teaching facilities in psychiatry and neurology. Offices of the committee were first established in connection with the National Committee for Mental Hygiene in New York, and the work has been carried on through funds provided jointly by the Rockefeller Foundation, the American Psychiatric Association, and the Public Health Service.

The original organizations represented on this committee were the American Psychiatric Association, American Neurological Association, American Medical Association, American Board of Psychiatry and Neurology, National Committee for Mental Hygiene, the United States Public Health Service, the Canadian National Committee for Mental Hygiene, and the Canadian Medical Association. Dr. Samuel W. Hamilton, Director of the Division of Hospital Surveys of the National Committee for Mental Hygiene, is medical director of the committee, and Dr. Grover A. Kempf of the Public Health Service is associate medical director.

The aim of the Mental Hospital Committee survey is to discover defects as well as good points in the various hospital systems. By the practical application of information gathered, it is the purpose to effect improvement in the care and treatment of mental patients as well as in the study of mental diseases in the various States and thus to raise the standards to a level commensurate with the importance of the whole problem.

The committee has already surveyed 169 institutions in forty states, and discovered a wide diversity in technical facilities and scientific treatment. In some of the states, for example, hospitals were found to lack proper equipment and operating with inadequate personnel and administrative organizations.

By directing attention to such matters, some betterment in methods of treatment for the mentally ill has resulted. Much work remains to be done, however, in collecting survey data and applying it to the correction of defects in existing hospital systems.

●

CANNED FOODS FOR INFANT AND EARLY CHILD FEEDING

● Milk is the basic article in the diet of the infant and young child. Breast milk is preferred for infant feeding. However, circumstances commonly require that other types of milk, properly formulated and supplemented, must be used.

Because of the wide range of digestive tolerance possessed by most infants the various types of formulas used routinely are usually tolerated by the majority of infants. But, in any group of infants started on a specific formula, there is always a certain number of "non-conformists." A recent study(1) has rationalized the problem of infant feeding by formula in the following statement:

> "More stress has been placed upon the various milks and their properties than on infants and their tolerance. Nutritional research has advanced sufficiently to adapt effectively the required type of milk to the individual infant rather than the infant to the milk."

Thus has been aptly expressed the trend in modern pediatrics towards the use of "individualized" rather than standardized formulas.

Because of many desirable properties such as its uniformity in composition and its physical properties after homogenization and heating—as well as its ready availability and economy—canned evaporated milk has been successfully used for many years in infant feeding. The value of such milk in some instances where individualized feeding is required has also been clearly indicated(1).

There appears to be no uniform agreement among pediatricians as to the exact time of life when other foods should be added to the milk diet. Nevertheless, it is agreed that early but judicious addition of properly prepared soups, cereals, fruits and vegetables is extremely desirable to increase mineral and vitamin intake and to improve gastro-intestinal motility. The psychological value of the early addition of a variety of foods in the formation of proper dietary habits in later childhood is also recognized.

When other foods are to be added to the exclusive milk diet attention might well be directed to the long list of specially prepared canned infant foods. Such foods manufactured by closely controlled procedures from selected raw materials include a full line of soups, cereals, fruits, vegetables, and many food combinations.

The nutritive values of these canned infant foods have been established not only by studies in the laboratory(2), but also by clinical researches(3, 4). Such foods—together with canned evaporated milk—provide reliable, economical and convenient means for formulation of diets for early child or infant feeding.

Wisconsin Experiment in Coöperative Medicine.—The Douglas County (Wis.) Medical Society, in coöperation with the State Medical Societly of Wisconsin and the Coöperative Health Association at Superior, has concluded an agreement to provide members of the association with complete medical and surgical care on a prepayment basis for a period of trial and study, *The Journal of the American Medical Association* for January 14 reports.

In the preface to the agreement that was signed, the following statements were made:

In September, 1938, the State Medical Society of Wisconsin adopted the report of its Special Committee to study the distribution of health service and sickness care in Wisconsin. That report recommended that there be instituted under the direction of a special committee and the local county medical society, and with the assistance of lay groups actively interested in proposals dealing with new methods of the delivery of sickness, care, experimental voluntary plans providing sickness care on a prepayment and voluntary basis. To assure that any such plan create no health hazard to those seeking services under it, and to make certain that any subscriber should obtain those services contracted to be given, even though the fee basis should prove inadequate and the compensation not that which the Cooperative expects, the State Medical Society adopted as a requirement that the local medical society stand guarantor that the services be given and their quality be high. In other words, the actual reserve would be the physicians of the community. The State Medical Society of Wisconsin and the Douglas County Medical Society have agreed that the Coöperative Health Association of Superior offers a proper situation for such experiment, and thus the two medical societies and the Coöperative state these principles, in the form of articles of agreement, to be followed in developing such a voluntary plan in Superior, Wisconsin.

The agreement provides that those who become members of the Coöperative Health Association shall have free choice of physician among the members of the Douglas County Medical Society; that a joint conference committee be established to meet regularly to discuss problems that may arise; that not more than 20 per cent of the membership dues shall be subject to administration charges; that 80 per cent of the gross income should be earmarked for physicians' services, and that no more than 300 units would be encompassed in the trial. Units may represent individual membership or family memberships. The total number of people participating in the trial, it is estimated, will reach a total of 1,200 individuals. The amount of monthly dues has not as yet been established by the Coöperative Health Association. However, $3.00 a month for complete medical and surgical care for an entire family has been tentatively considered. For a couple or for a single person the dues would be less. The plan does not include hospitalization costs, as the members of the association plan to avail themselves of the state-wide group hospitalization plan now being effected by the society in coöperation with the hospital associations. The society emphasizes that the premiums established were accepted by it "without expression of judgment" as to sufficiency. The plan does not limit the participants to any stipulated income group.

Prevalence of Syphilis.—One person out of every hundred in the United States is infected with syphilis and nine more out of every hundred will acquire syphilis at some time in life if present rates prevail, Miss Lida J. Usilton, Senior Statistician of the United States Public Health Service recently declared at a meeting of the New York Chapter of the American Statistical Association at the Hotel Woodstock, in New York City.

In discussing the subject, "Do Ten in One Hundred Have Syphilis?" Miss Usilton stated: "The estimate on the number who have acquired syphilis is 1 in 100. The estimate on the number who under existing detection and treatment facilities will acquire syphilis at some time in life is 10 in 100. This has been aptly expressed as 'syphilis strikes one out of every ten adults.'"

Approved by American College of Surgeons

The Public Health Service arrived at its figures through studies of authorized treatment sources in 1936-1937. The surveys included records from 8,700 physicians and 300 clinics, hospitals, and institutions. These treatment centers served approximately six million people.

Highest rates for acquiring syphilis are found in the group 20 to 24 years of age. The figures for this age level show an annual attack rate of 5.97 per 1,000 population.

The next highest group is that from 25 to 29 years of age, with an annual attack rate of 5.24 per 1,000. Rate for 15 to 19 years of age is 2.66 and for 30 to 34 is 3.80 per 1,000. Computations in this summary, as outlined by Miss Usilton in her presentation to the statisticians of New York do not include inherited syphilis.

The Federal Health Service surveys found no syphilis acquired under ten years of age, and rates for people above fifty were found to be extremely low, varying from 0.49 at 55 to 64 years down to 0.17 for the 70 to 79 age group.

The total number of people at all age levels who have acquired syphilis was computed at 1,407,180. This means an average of 11.46 per 1,000 for all age groups based on the 1930 census figures.

"Growing Pains" in Children.—The so-called growing pains in children have been variously interpreted as a normal phenomenon or as a manifestation of rheumatic fever, *The Journal of the American Medical Association* for January 14 says in an editorial.

Recently Hawksley reported an analysis of 115 cases of growing pains based on an examination of 1,000 children seen in London and Birmingham. Sixty-four of these 115 were subjected to follow-up examinations four years after the initial examination. Although no definitely associated diseases were discovered, there was commonly a history of frequent colds and coughs with coincident exacerbation in pains, signs of general but vague ill health, rather frequent minor orthopedic deformities, some fibrositis in certain cases and psychologic maladjustment. In conjunction with the 189 cases followed up by Sheldon and the sixty-four here reported, cardiac rheumatism was revealed to have developed in less than 0.8 per cent.

Hawksley concluded that the syndrome of growing pains is not related to rheumatic fever or subacute rheumatism and does not provoke rheumatic carditis. The pains may be associated with a number of conditions which can usually be discovered and treated by ordinary clinical methods.

This work finds substantial agreement with a similar study reported by Shapiro at the June meeting of the American Rheumatism Association. Shapiro made a follow-up study at the Lymanhurst heart clinic of 200 children who complained only of leg pains. The pain characteristically comes on at the end of the day and often awakens the patients during the night. Laboratory studies give normal results. None of Shapiro's patients developed rheumatic heart disease. He concluded therefore that this syndrome, which is so common during healthy school childhood and adolescence, is due to normal growth and clearly not to rheumatic fever.

The discussion following this paper indicated general accord on the nonrheumatic nature of most so-called growing pains. In the light of these more recent observations, great skepticism should be attached to a diagnosis of rheumatic fever in those children whose only symptoms consist in vague muscular pains and aches in the lower extremities.

For Acidity and Allied Conditions, we suggest
ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

A Natural Mineral Water

The First Annual Congress on Industrial Health.—"Early in the deliberations of the Council on Industrial Health its members determined to hold a series of conferences to aid in clarifying the objectives of the industrial health movement," *The Journal of the American Medical Association* for January 21 says in an editorial. The first Annual Congress on Industrial Health was conducted January 9 and 10 in Chicago.

"Part of the Council's plan for the advancement of industrial health is a stimulation of clinical discussions on industrial medical problems through the state and county medical organizations. There has been no forum particularly designed for the consideration of nonclinical problems of administration and integration. These may, on occasion, be fully as troublesome as diagnosis and treatment. The first conference of the Council dealt with these problems. As discussions are continued and regular opportunity is supplied for expression of opinions on industrial health by all interested members in the profession, the usefulness of these conferences will become apparent.

"The keynote of the first congress was contained in the report of the chairman of the Council on Industrial Health, Dr. Stanley J. Seeger, who pointed out that the practicing physician must attempt to orient himself in this expanding field. The aims and accomplishments of other organized agencies must be made plain. The progress of industrial medicine must be appraised periodically. Its scope and interrelationships must be constantly reëmphasized and redefined. The program of this first conference undertook to express the points of view of organized medicine and of the principal professional, governmental and lay agencies responsible for the health of the working population.

"Approximately 250 leaders in industrial health attended. Industrial medicine has progressed greatly in twenty-five years. Within the profession a career in preventive industrial practice is recognized increasingly as a worthy aim in itself. There was every indication that lay organizations welcomed the opportunity to learn at first hand the attitude which organized medicine takes toward industrial practice. There can be no essential incompatibility between their purposes and those of the medical profession which the conference table cannot solve. This method is much to be preferred to any legislative approach. Likewise it was frequently and emphatically expressed that organized medicine, both through tradition and structure, has a preëminent opportunity and responsibility to exert a salutary effect on standards and training in the sphere of industrial medical practice."

Flying Hospitals Are Uncle Sam's Speediest and Newest Medical Aids.—Flying hospitals—speediest and newest of Uncle Sam's medical aids—are maintained at eight air bases along both coastlines and the Gulf of Mexico, according to an article by S. R. Winters of Washington, D. C., in the February issue of *Hygeia, The Health Magazine*.

Twenty-one seaplanes are poised ready to answer medical calls from ships at sea. Aid to injured sailors and passengers and removal of persons from disabled vessels are the usual services they render. "NCU," meaning "any Coast Guard unit," is the radio call that summons one of these planes. This request for medical assistance is given right-of-way.

The idea was first put into practice a few years ago when five seaplanes, known as flying lifeboats, began their task of rescuing human lives out at sea. The planes carry a crew of four, and twenty passengers may be accommodated in an emergency. They are constructed to make landings on rough seas if necessary. Each one is equipped with a collapsible lifeboat and has stretchers for removing the injured from ships. The planes are met at their landing field by ambulances to rush the patients to the nearest hospital.

In addition to these services the planes endeavor to warn people of impending danger and assist extensively during floods and other disasters by transporting serums and biologic supplies and scouting the afflicted areas for purposes of operation planning.

From the third to about the eighteenth month the infant uses only three senses: sight, hearing and feeling.

Doctor, are you giving the full benefit of the modern treatment to patients afflicted with

HAY FEVER?

ABOUT 50% OF THE CASES obtain worthwhile relief if treatment is begun *at the onset* of the hay fever season.

80 to 90% are helped if the treatment starts three months or more previous to the season, and

85 to 95% are relieved at least partially under the perennial year-round monthly injection plan.

This latter method is also more convenient and less expensive (12 instead of 15 to 20 injections). There is less chance of the patient putting off or forgetting the treatment, and the expense is more easily budgeted.

High Standards Require Free Choice of Physician.—In a summarization of more than fifty years' experience in providing medical care of the poor and unemployed by the City of Newark, New Jersey, published in *The Journal of the American Medical Association* for February 4, Charles V. Craster, M.D., D.P.H., Health Officer of Newark, draws the following conclusions:

"Under the free dispensary and district physician plan the cost of service is kept at a low figure, the average for a physician's call is between 90 cents and a dollar and clinic treatments average 25 cents. This service does not allow any choice of physician, and the quality of service rendered has a tendency to deterioration. With very few exceptions the reaction to a paid salary is to minimize as far as possible the extent of the service rendered. This can be understood when one considers the excessive calls for mdical treatment that are made on salaried physicians at certain seasons of the year. The 'off' period, when service calls are infrequent, are too soon forgotten by the salaried man.

"Another serious objection to the salaried physician is the attitude of the public. The term 'poor doctor' has not been forgotten, and frequently discourtesy, unfriendliness and actual hostility of the patient's family await the visit of the district physician. This attitude is not so prevalent when the physician demands and receives a fee for each attendance, which is much more in conformity with medical practice.

"The free choice of physician is in my opinion essential for a proper relationship between the doctor and the patient. Whatever framework is set up for the medical care of the employed and the unemployed, it should meet the following conditions:

"1. A service of reasonable cost to the community in which the physician should be willing to receive a fair standard fee for his services.

"2. Free choice of physician.

"3. Creation of a division of medical care in all health departments with an advisory committee appointed by the local county medical society.

"4. All dispensary services to be standardized, with physicians paid for actual services instead of annual salaries.

"5. A medical advisory board appointed by the county medical society to advise and correlate dispensary services.

"6. A pharmaceutical board appointed by the state pharmaceutical society to standardize and correlate the cost of medical prescriptions given to private pharmacies.

"7. The creation of a position of director of medical care who could be a physician or layman of exceptional ability to supervise and coördinate all the various branches and specialties of medical care and to advise on problems affecting hospital care."

Social Normalcy Required for Rehabilitated Cripple. A normal place in society, rather than an extension of his status as a dependent, should be the goal for the rehabilitated cripple, Mather Cleveland, M.D., New York, says in the February issue of *Hygeia, The Health Magazine.*

Overdone kindness, in the form of entertainment, excursions, food and clothing, may give the crippled child the feeling that he is entitled to more than his share of attention, the author warns.

"Prolonged association with other cripples and constant comparison of achievement on a scale which is below standard have a tendency to make him unfit to assume his place in the community," Doctor Cleveland points out. The author believes, therefore, that the home environment is preferable whenever possible, although the financial burden necessary for proper surgical care, education, and psychologic and vocational training should be shifted to the community.

Today, a normal life for the cripple is possible because of the increased concern of society with his problem. Whereas primitive tribes do not allow sickly or deformed children to survive, modern society strives for rehabilitation of the cripple and for the prevention of crippling diseases. Infantile paralysis, estimated to cause from 29 to 35 per cent of crippling among children, is being fought in many laboratories and clinics. Tuberculosis, which ranks second, is definitely declining after a prolonged campaign.

"Our yearly toll of accidents which produce child and adult cripples is so appalling that it merits our most serious study," says the author.

The plight of the adult, crippled after maturity by accident or disease, is often worse than that of the child cripple, who receives more attention. "To be turned in an instant from a self-supporting, self-reliant individual into a helpless dependent is a shocking experience which requires great courage to face," Doctor Cleveland declares.

Out of 5060 infant deaths recorded in 1937, 1437 occurred during the first day of life. By causes, these early deaths are as follows: diseases peculiar to early infancy, 1301; congenital malformations, 110; venereal diseases, 12; other general diseases, 8; external causes, 4; pneumonia, 2.

A BARRY TRADITION

that continues to save time and money for customers

» » In this age of "production line" printing speed, we have never forgotten that the best basis for a business transaction is *personal interest* in your order. Sixty years ago the founders of our company understood how to serve well and they passed along their knowledge from generation to generation.

Though today you visit our large and streamlined plant—and see the last word in type specimen catalogs, type composition machines, modern presses, stock seasoners, folding and binding machines, and distribution facilities—though all is a brilliant reflection of modernity, you still cannot escape the warmth of personal interest that surrounds our efforts to give you satisfaction in printing.

Every job is the most important job to us. We earnestly solicit your printing business on that one best basis. We ask you to counsel with us on your future printing requirements and we pledge you that the Barry tradition of personal interest will protect your printing investment.

Postmortem Examinations' Importance Is Stressed. "For many years, leading physicians and scientists throughout the United States have emphasized the importance of the postmortem examination, not only as a means for advancing medical science but also for the benefits this will confer in prolonging the lives of other human beings," an editorial says in the February issue of *Hygeia, The Health Magazine.*

"*The Readers Digest* for February provides strong support for postmortem examinations in a discussion, by Messrs. Pro and Con, of this highly important subject. Apparently Mr. Pro has all the best points on his side of the argument. He points out, for example, that postmortem examination is a stimulus to more scientific and complete diagnoses. The postmortem examination serves as a check on the competence and on the work of the physician. A postmortem examination, through detecting the source of an infection, may contribute to the public health by giving opportunity to a health officer to eliminate that source of infection. This has been proved repeatedly in relationship to epidemics and outbreaks of infectious diseases. Mr. Pro, for example, reports the case of a girl who died of severe infection with trichinosis. The postmortem examination disclosed this fact. A search was made to find the roadside stand from which the infested pork was purchased. Thus the danger was eliminated.

"The postmortem examination, Mr. Pro empasizes, is of vital significance in training young physicians. In the necropsy room they learn to see the end results of disease, as well as disease processes in various stages. This makes possible a vision in the mind of what goes on beneath the skin while the patient is still living. Moreover, it is significant, Mr. Pro points out, that our leading medical institutions are those with the highest percentage of examinations on the patients who die.

"Now postmortem examination is not compulsory in this country. The decision is left to the family. Doctors do not favor too much compulsion. They prefer to depend on the enlightenment of the people who follow medical opinion because they understand and believe. When the public understands the importance of the autopsy, not only for the future health of the family concerned but also for the advantage to medical science, the people can be depended on to cooperate.

"*Readers Digest* has done a notable service in reaching its vast clientele with this message. In brief the message is, 'Scientific investigation of the bodies of the dead brings dividends to the living.' "

High Consumption of Tomato Juice.—Each person in the United States consumed approximately 54 ounces of tomato juice in 1937, according to production figures released in an article, "Vitamin C via Tomato Juice," in the January issue of *Hygeia, The Health Magazine.* These show that 13,444,162 cases of canned tomato juice were packed that year.

It is best to buy the size can that is adequate for one meal, the article says, since after the can is opened and the juice is exposed to the air, its high vitamin C potency decreases.

There is about two and one-half times as much vitamin C in an ounce of fresh orange juice as in an ounce of canned tomato juice; but as canned tomato juice costs less than fresh orange juice, the cost per vitamin C equivalent is less, at most seasons, if canned tomato juice is used.

In addition to vitamin C, canned tomato juice is rated by the Council on Foods of the American Medical Association as an excellent source of vitamin A and a good source of vitamin B, and contains vitamin G. A four-ounce serving of tomato juice provides approximately one-fourth of the daily allowance for vitamin A, one-eleventh of the daily allowance of vitamin B. and about one-twenty-fifth of the daily allowance of vitamin G.

Home canned tomato juice may have as much vitamin value as commercially canned tomato juice, provided it is canned by proper methods.

In a sense, life is like a stream: If its outlet is dammed in one direction, it will seek another outlet or will overflow.—*Hygeia.*

"Spectatoritis" Is Great American Disease Today.—"Sititis" or "spectatoritis" is the great American disease today, says James Edward Rogers, director of the National Physical Education Service of the National Recreation Association, who writes of "The New Day and the New Education" in the February issue of *Hygeia, The Health Magazine.*

We spend too much time looking and not enough time doing. All of us are sitting at our work and sitting at our play, the author says, which, of course, does not help our physical growth and development. Today, many physical breakdowns are due largely to the sedentary life that young and old are living as a result of modern labor-saving devices.

Modern civilization, therefore, forces the need for health and physical education in our public schools. The open spaces are rapidly disappearing; hence we must have playgrounds and athletic fields. Boys and girls, when they become adults, will be attendants to automatic machines and consequently will not get exercise in their work as their fathers did.

One is always more vexed at losing a game of any sort by a single hole or ace than if one never had a chance of winning it. This is, no doubt, in part or chiefly because the prospect of success irritates the subsequent disappointment.—Hazlett.

As knowledge with regard to the effects of food upon man increases it is more conceivable that the races that first avail themselves of the new handicaps of disease lengthen their lives, and so become leaders of the future.—Victor G. Heiser.

Michigan Society Acts on Medical Care Plans.—The House of Delegates of the Michigan State Medical Society, at a special session held in Detroit on January 9, approved the principles of group hospitalization and group medical service and empowered the Society's Council, in coöperation with hospitals and civic groups, to proceed with the establishment of plans for the formation of nonprofit organizations to provide these two types of service.

The group protection would take the form of insurance with rates and benefits fixed according to actuarial studies. Rates for the hospitalization plan would probably range, for care in a ward, from 60 cents a month for a single subscriber to $1.25 a family. Benefits would include twenty-one days' hospital care for the first year.

For the suggested medical service plan, an employed subscriber would be entitled to a maximum block of units of service, with an alternative plan based on a time consideration.

Nineteen Hundred and Thirty-Eight Brings Lowest Infant Death Rate for California.—Infant mortality, during the first nine months of 1938, achieved a new record in California. There were 3,248 infant deaths during that period, as compared with 3,741 infant deaths recorded during the first nine months of 1937. The rate, based upon the number of infant deaths per 1,000 live births, was 42.8 for the nine months under consideration.

The infant mortality for white infants during this period was 36.5. For Mexican infants it was 78.7, as compared with 120.5 for the first nine months of 1937. Mexican infant deaths dropped from 1,116 in 1937 to 771 in 1938.

Among the counties in which conspicuous reductions in the numbers of infant deaths occurred are: Fresno, Imperial, Kern, Kings, Los Angeles, Monterey, Riverside, San Bernardino, San Joaquin, San Mateo, Santa Clara, Santa Cruz, Stanislaus, and Tulare.

It must be remembered that the trend of the infant mortality rate depends upon the number of live births, and with large numbers of births registered the infant mortality is, naturally, lower. Births, during this period, increased about 10 per cent in number.

To be sure, widespread and intensive activities in the prevention of infant deaths are carried on assiduously throughout the state. It is interesting to note that the decreases in infant mortality rates are in many of those counties where activities in infant care have been most intensive.

The following tables give the infant mortality rates by counties for the first nine months in 1937 and 1938, as well as by race and rates:

Colfax School
for the
Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

VEGEX
BREWERS YEAST EXTRACT
B VITAMIN COMPLEX
EXTRINSIC FACTOR

FOR THE VITAMIN B COMPLEX ON THE HOSPITAL TRAY

Dependable, Palatable, Easily Borne

Vegex is ideal for the hospital tray, for the liquid diet, the drink between meals. It supplies the full vitamin B complex, is palatable, easily borne and economical.

● TASTY FLAVOR

Its meatlike flavor—meat free—with the delicate flavor from the extracted and condensed brewers' yeast proteins, gives zest to the chicken broth, the soup or, alone, it is tasty in hot water or hot milk. Quickly does it make the water from fresh or canned vegetables into a tasty soup. High in all of the B vitamins, it is a marked aid to appetite.

In clinical use, Vegex has been an aid in neurological conditions including alcoholic polyneuritis, in gastro-intestinal disorders needing the B vitamins, for the extrinsic factor in the anemias. There is mass human clinical use in all of these.

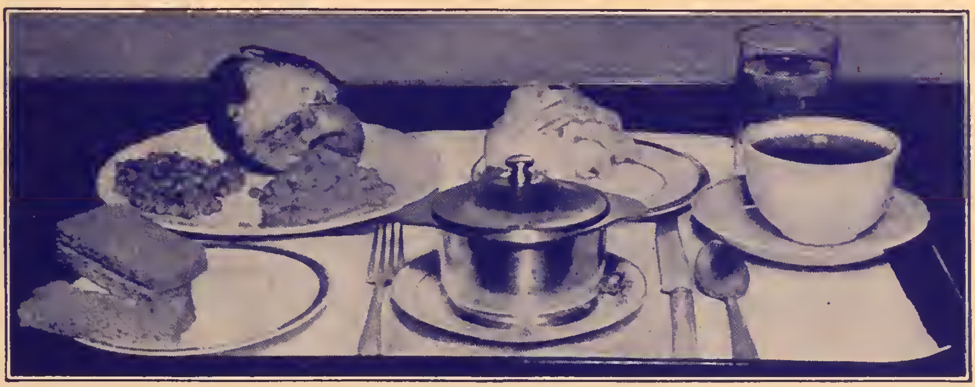
Vegex was the pioneer in finding the relation to and the need of enough of the Vitamin B Complex for child growth; for normal lactation.

● EASILY BORNE

So easily is it borne that it is used as a liquid diet in post-operative cases. Physicians report its use in pneumonia. Its B vitamins are more and more readily available than in the dried brewers' yeast. In the job of bringing back the patient's strength, Vegex is a distinct aid.

● WITH MILK

Vegex and whole milk make up one of the most ideal food combinations known in the science of nutrition, needing only vitamin C. Its iron and B vitamins—five per cent to the milk solids, a teaspoonful to a quart of milk—make up for normal and food growth, as shown in biological tests and child feeding, the iron and B vitamins deficiencies in milk.

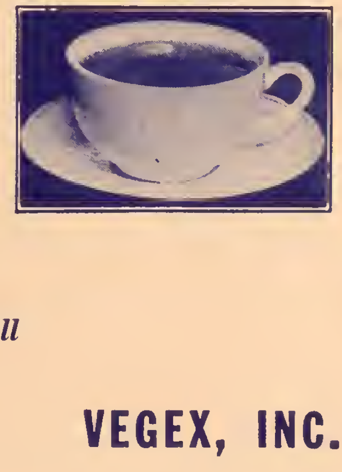


Babies: Mix from a half to two-thirds of a teaspoonful in a cup of hot (not boiling) water. Add two teaspoonfuls or equal proportions to the nursing bottle of milk. It is immaterial if all is given in two or three feedings.

"Babies take it greedily" (Plimmer)

For older children: Mix into soup, noodles, gravies, butter. Vegex amply, dependably adds the independent growth factor which the B Complex and only the B Complex supplies.

For the nursing mother: When two to four teaspoons are indicated; in neurological conditions and for the extrinsic factor where from a half to an ounce a day is indicated, serve Vegex in the soup and a scant teaspoonful in a cup of hot water or milk before breakfast, as the liquid between meals and before retiring.



Vegex is refreshing chilled or jellied in summer.

●

Samples for clinical or professional use will be sent on request

HAY FEVER SUFFERERS

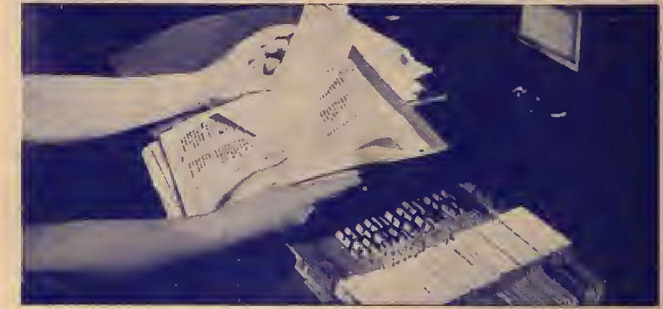
can be your most satisfactory type of patients

Contrary to many physicians' belief, *proper* pollen therapy is not intricate and seldom fails to produce results. Treatment with Cutter Pollen Extracts, as indicated below, neither takes questionable short-cuts nor gets the physician involved in non-essentials.

1 **TESTING** with Cutter's regional pollen test sets requires but a single sitting lasting little longer than your average office visit.

2 **REACTIONS ARE READ** within 10 to 20 minutes and the exact pollen offenders are known, as the tests are for individual pollens, not "pollen groups."

3 **RECORD OF REACTIONS** is made on the test slip itself by sketching a "picture" of your patient's reactions alongside each of the offending pollens listed.



4 **THE TEST SLIP** is usually mailed to the Cutter Allergy Staff, who compare it against their compiled case histories from your locality.

5 **EACH TREATMENT SET** is individually made up from the offending pollens, in varying proportions, according to local case histories (in our files) and your patient's reactions.

6 **EACH TREATMENT CONTAINS** more than 150,000 pollen units, adequate for your patient requiring co-seasonal treatment, as well as pre-seasonal. The combination of proper testing, proper selection of pollens and adequate treatment makes the "batting average" of physicians using Cutter Pollen Extracts exceptionally high.

Regional pollen test sets, $1.50. Treatment sets (single pollen), $9.00. Each additional pollen in specially prepared treatment sets, 50¢.

Officers of the California Medical Association

General Officers

President—William W. Roblee, 202 Mission Inn Rotunda, Riverside.

President-Elect—Charles A. Dukes, 601 Wakefield Building, 426 Seventeenth Street, Oakland.

Speaker of House of Delegates—Lowell S. Goin, 414 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.

Vice-Speaker of House of Delegates—John H. Graves, 977 Valencia Street, San Francisco.

Chairman of Council—Karl L. Schaupp, 490 Post Street, San Francisco.

Vice-Chairman—Junius B. Harris, Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Chairman of Executive Committee—T. Henshaw Kelly, 830 Medico-Dental Building, 490 Post Street, San Francisco.

Chairman of the Committee on Public Relations—George G. Reinle, 532 Fifteenth Street, Oakland.

Past President—Howard Morrow, 384 Post Street, San Francisco.

Secretary-Treasurer—George H. Kress, 450 Sutter Street, Room 2004, San Francisco. Telephone DOuglas 0062.

Editor—George H. Kress, 450 Sutter Street, Room 2004, San Francisco.

General Counsel—Hartley F. Peart, Room 1800, 111 Sutter Street, San Francisco.

Associate General Counsel—Hubert T. Morrow, Van Nuys Building, 210 West Seventh Street, Los Angeles.

Councilors

(In addition to the elected district and at-large Councilors, the Council has as ex officio members, the general officers and the Chairman of the Committee on Public Relations. Chairman of Council, Karl L. Schaupp; Secretary, George H. Kress.)

District Councilors

First District—Imperial, Orange, Riverside, San Bernardino and San Diego Counties, Calvert L. Emmons (1941), 206 Emmons Building, Ontario.

Second District—Los Angeles County, Carl R. Howson (1939), 1114 Wilshire Medical Bldg., 1930 Wilshire Boulevard, Los Angeles.

Third District—Kern, San Luis Obispo, Santa Barbara and Ventura Counties, Louis A. Packard (1940), 563 Haberfelde Building, Bakersfield.

Fourth District—Calaveras, Fresno, Inyo, Kings, Madera, Mariposa, Merced, Mono, San Joaquin, Stanislaus, Tulare and Tuolumne Counties, Axcel E. Anderson (1941), Medical Group Building, 1759 Fulton Street, Fresno.

Fifth District—Monterey, San Benito, San Mateo, Santa Clara and Santa Cruz Counties, Alfred L. Phillips (1939), 84 Walnut Avenue, Santa Cruz.

Sixth District—San Francisco County, Karl L. Schaupp (1940), 530 Medico-Dental Building, 490 Post Street, San Francisco.

Seventh District—Alameda and Contra Costa Counties, Oliver D. Hamlin (1941), 389 Thirtieth Street, Oakland.

Eighth District—Alpine, Amador, Butte, Colusa, El Dorado, Glenn, Lassen, Modoc, Nevada, Placer, Plumas, Sacramento, Shasta, Sierra, Sutter, Tehama, Yolo, and Yuba Counties, Frederick N. Scatena (1939), Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Ninth District—Del Norte, Humboldt, Lake, Marin, Mendocino, Napa, Siskiyou, Solano, Sonoma and Trinity Counties, Henry S. Rogers (1940), Petaluma.

Councilors-at-Large

Harry H. Wilson (1941), 1919 Wilshire Boulevard, Los Angeles.

C. O. Tanner (1939), 3255 Fourth Street, San Diego.

William H. Kiger (1940), 911 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.

Philip K. Gilman (1941), 2000 Van Ness Avenue, San Francisco.

T. Henshaw Kelly (1939), 830 Medico-Dental Building, 490 Post Street, San Francisco.

Junius B. Harris (1940), Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Standing Committees

Executive Committee

The President, the President-elect, the Speaker of the House of Delegates, the Chairman of the Council, the Chairman of the Auditing Committee, the Chairman of the Committee on Public Relations, the Past President, the Secretary-Treasurer, and the Editor. (T. Henshaw Kelly, chairman; George H. Kress, secretary.)

Auditing Committee

O. D. Hamlin	Oakland	1939
T. Henshaw Kelly (Chairman)	San Francisco	1939
Philip K. Gilman	San Francisco	1939

Members of the Auditing Committee are appointed each year by the Chairman of the Council.

Committee on Associated Societies and Technical Groups

William H. Geistweit	San Diego	1939

Junius B. Harris (Chairman)	Sacramento	1941

President ex officio

President-elect ex officio

Committee on Scientific Work

F. M. Pottenger	Monrovia	1939
Lemuel P. Adams	Oakland	1940
J. Homer Woolsey	Woodland	1941

William H. Barrow, Secretary of Section on General Medicine, ex officio

Ray B. McCarty, Secretary of Section on General Surgery, ex officio

George H. Kress (Chairman), ex officio.

Committee on Public Relations

The Committee on Public Relations consists of the chairmen of the following standing committees and of certain general officers of the Association, all serving ex officio. The chairman of the committee is George G. Reinle, the secretary is George H. Kress. The director of the Department of Public Relations is George H. Kress. The chairman of the Committee on Public Relations is ex officio a member of the Council.

Fred B. Clarke	Chair., Com. on Health and Public Instruction
W. Earl Mitchell	Chair., Com. on Hospitals, Dispensaries, Clinics
Philip Stephens	Chair., Com. on Industrial Practice
George G. Reinle	Chair., Com. on Medical Defense
George D. Maner	Chair., Com. on Membership and Organization
John H. Graves	Chair., Com. on Medical Economics
Junius B. Harris	Chair., Com. on Public Policy and Legislation
Alson R. Kilgore	Chair., Cancer Commission
John C. Ruddock	Chair., Com. on Postgraduate Activities
William W. Roblee	President of California Medical Association
Charles A. Dukes	President-elect
George H. Kress	Secretary-Treasurer

Communications for the Public Relations Department should be addressed to the Director, George H. Kress, M. D., Room 2004, 450 Sutter Street, San Francisco.

Cancer Commission

Alson R. Kilgore (Chairman)	San Francisco	1939
Henry J. Ullmann	Santa Barbara	1939
Clarence G. Toland	Los Angeles	1939
Charles A. Dukes	Oakland	1940
Lyell C. Kinney (Vice-Chairman)	San Diego	1940
Otto H. Pflueger (Secretary)	San Francisco	1940
Orville Meland (Sec'y for Southern Section)	Los Angeles	1941
A. Herman Zeiler	Los Angeles	1941
Gertrude Moore	Oakland	1941

Communications for the Cancer Commission should be addressed to the Secretary, Otto H. Pflueger, M. D., Room 2004, 450 Sutter Street, San Francisco.

(Roster lists of officers of scientific section, component county societies. Woman's Auxiliary, A. M. A. delegates, special committees, etc., are continued on advertising pages 4 and 6.)

TESTED!

Physicians must have preparations the ingredients and efficacy of which are of unquestioned value. The steady growth of The Smith-Dorsey Company from 1908 is the best indication that our products measure up to these requirements.

PHARMACEUTICALS
YOU CAN PRESCRIBE WITH CONFIDENCE

Every Smith-Dorsey product is safeguarded in three ways:

1. We operate a control laboratory for the purpose of testing raw materials for purity.
2. Finished products are thoroughly tested for conformity to label statements.
3. No new products are released without subjecting them to physiological tests.

Our laboratory is modern and complete and is manned by competent university trained chemists. No expense is spared to make research complete. No preparations are ever offered the laity.

Such is the background of Smith-Dorsey products.

THE SMITH-DORSEY COMPANY, LINCOLN, NEBRASKA

Epinephrine in Oil Announced by Squibb.—Epinephrine in Oil, as developed by Dr. Edmund L. Keeney of Johns Hopkins Medical School and Hospital, was placed on the market April 1 by E. R. Squibb & Sons. This preparation is a suspension of powdered epinephrine crystals in peanut oil, in the proportion of 2 mg. in each 1 cc., resulting in a dosage form of epineprine that has a more prolonged effect than the usual aqueous solution of epinephrine hydrochloride.

Epinephrine, the active principle of the suprarenal glands, has been used in surgery and medicine for many years. While in aqueous solution it is specific and prompt in its action, the effect is relatively transient. With the dramatic introduction of protamine insulin, investigators began to study the therapeutic possibilities of other hormones administered in such forms that their absorption was retarded. This is the purpose of using oil as a vehicle in his new preparation of Epinephrine in Oil—*slow absorption.* In fact, the preparation has been frequently discussed and described as "Slow Epinephrine."

Epinephrine in Oil is indicated in alleviating the acute paroxysms of asthma; chronic bronchial asthma; urticaria; and angioneurotic edema. It is given preferably by intramuscular injection; it may be given subcutaneously; it should *never* be given intravenously. In the experience of Doctor Keeney the effect of a *single* dose of Epinephrine in Oil is to keep patients free from uncomfortable asthmatic symptoms for periods of from 8 to 16 hours.

Epinephrine in Oil Squibb is available in boxes of 12x1 cc. ampuls and in boxes of 25x1 cc. ampuls.

How to Care for a Book.—The covers of a new binding are likely to warp while seasoning. This warping may be prevented by placing the book under weight while it is not in use, or wedging tightly between other books on the shelf.

ISOPHRIN
TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is ¼% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel's.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

Meeting, *Second Tuesday, El Cortez Hotel.*

San Francisco County Medical Society
2180 Washington Street, San Francisco

President, Edwin L. Bruck, 384 Post Street, San Francisco.

Secretary, Stanley H. Mentzer, 2180 Washington Street, San Francisco.

Meetings, *Every Tuesday, 8:15 p. m., 2180 Washington Street, San Francisco.*

San Joaquin County Medical Society

President, N. P. Johnson, Medico-Dental Building, Stockton.

Secretary, George H. Rohrbacher, Medico-Dental Building, Stockton.

Meeting, *First Thursday, 8:15 p. m., Medico-Dental Club Rooms, Stockton.*

San Luis Obispo County Medical Society

President, J. B. V. Butler, 722 Marsh Street, San Luis Obispo.

Secretary, E. M. Bingham, County Health Department, San Luis Obispo.

Meeting, *Third Saturday, 6:30 p. m., Gold Dragon Cafe, San Luis Obispo.*

(Roster lists continued on advertising page 6)

San Mateo County Medical Society

President, N. D. Morrison, 205 Third Avenue, San Mateo.

Secretary, J. Garwood Bridgman, 205 Third Avenue, San Mateo.

Meeting, *Fourth Wednesday, Benjamin Franklin Hotel, San Mateo.*

Santa Barbara County Medical Society

President, W. H. Johnston, 1515 State Street, Santa Barbara.

Secretary, D. H. McNamara, 317 W. Pueblo Street, Santa Barbara.

Meeting, *Second Monday, Cottage Hospital.*

Santa Clara County Medical Society

President, Cletus S. Sullivan, Bank of America Building, San Jose.

Secretary, Leslie B. Magoon, 652 East Santa Clara Street, San Jose.

Meeting, *Third Wednesday, 8 p. m., Medico-Dental Building, San Jose.*

Santa Cruz County Medical Society

President, John T. Harrington, 10 Cooper Street, Santa Cruz.

Secretary, Samuel B. Randall, 84 Walnut Avenue, Santa Cruz.

Meeting, *First Monday, 7:30 p. m., Club Rio del Mar, Aptos.*

Shasta County Medical Society

President, B. F. Saylor, Redding.

Secretary, Morton J. Murphy, 1542 Market Street, Redding.

Meeting, *Second Monday.*

Siskiyou County Medical Society

President, J. B. McGuire, Mt. Shasta.

Secretary, Victor W. Hart, 113 No. Oregon Street, Yreka.

Meeting, *Sunday on call.*

Solano County Medical Society

President, Ream S. Leachman, 727 Sonoma Street, Vallejo.

Secretary, John W. Green, Box 539, Vallejo.

Meeting, *Second Tuesday, 8 p. m., Casa de Vallejo Hotel, Vallejo.*

Sonoma County Medical Society

President, D. C. Oakleaf, 301A West Street, Healdsburg.

Secretary, T. E. Albers, 600 B Street, Santa Rosa.

Meeting, *Second Thursday.*

Stanislaus County Medical Society

President, John A. Cooper, 1024 J Street, Modesto.

Secretary, Hoyt R. Gant, 403 Beaty Building, Modesto.

Meeting, *Second Friday, 7:30 p. m., Hotel Hughson.*

Tehama County Medical Society

President, O. T. Wood, Red Bluff.

Secretary, R. G. Frey, Red Bluff.

Meeting, *At Call of President.*

Tulare County Medical Society

President, Newton Miller, 231 No. Main Street, Porterville.

Secretary, Ray Cronemiller, Exeter.

Meeting, *Sunday Evening once a month.*

Ventura County Medical Society

President, W. F. Mosher, 34 No. Ash Street, Ventura.

Secretary, A. A. Morrison, 625 Main Street, Santa Paula.

Meeting, *Second Tuesday, Ventura County Country Club.*

Yolo-Colusa-Glenn County Medical Society

President, H. G. Potter, Winters.

Secretary, W. J. Blevins, Jr., Woodland.

Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society

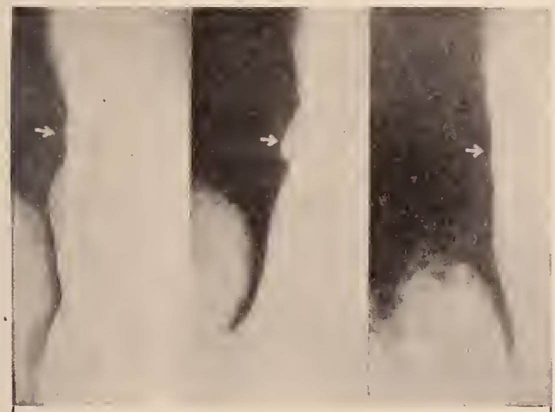
President, P. E. Thunen, I. O. O. F. Building, Marysville.

Secretary, Leon M. Swift, I. O. O. F. Building, Marysville.

Meeting, *First Tuesday.*

Prompt Symptomatic Relief in PEPTIC ULCER

. . . with PLAIN KNOX GELATINE (U. S. P.)



CASE I—FEMALE, 74

Uncomplicated gastric ulcer first demonstrated by Roentgen rays in 1934. Diet and alkalies afforded little relief. Accompanied by loss of weight. Repeated X-ray studies in 1936 and 1937 showed no improvement. She was placed on a diet-gelatine regime in November, 1937. Relief immediate. Gained weight. Roentgen studies in April, 1938 showed no demonstrable ulcer.

CLINICAL research has recently demonstrated the effectiveness of utilizing plain Knox Gelatine (U.S.P.) in treatment of peptic ulcer. In a group of 40 patients studied, 36 (or 90%) were symptomatically improved; 28 of these (or 70%) experienced *immediate relief of all symptoms.* Other than dietary regulation which included frequent feedings of plain Knox Gelatine no medication was given except an occasional cathartic.

NO DANGER OF ALKALOSIS

This regime thus eliminates the "alkalosis hazard" attendant upon continued alkali therapy. In discussing the mode of action by which gelatine brings peptic ulcer relief, Windwer and Matzner* speak of the acid-binding properties by which proteins can neutralize acids, and they state that the frequent gelatine feedings "apparently caused more prolonged neutralization of the gastric juice."

PEPTIC ULCER FORMULA

Empty one envelope Knox Gelatine in a glass three-quarters filled with cold water or milk. Let gelatine settle to the bottom of the glass, then stir briskly and drink immediately. Take hourly between feedings for seven doses a day.

*Windwer and Matzner, *Am. Jl. Dig. Dis.* 5:743, 1939.

NOTE: The gelatine used in this study was plain Knox Gelatine (U.S.P) which assays 85% protein and which should not be confused either with inferior grades of gelatine or with sugar-laden dessert powders, for these latter products will not achieve the desired effects. When you desire pure U.S.P. Gelatine, be sure to specify KNOX. Your hospital can get it on order.

Place of Sulfanilamide in Pneumonia Treatment Not Yet Established.—The future specific treatment of pneumonia probably will be with a combination of sulfanilamide and pneumococcus serum, especially in those cases caused by types II and III pneumococci, Alvin E. Price, M. D., and Gordon B. Myers, M. D., Detroit, state in *The Journal of the American Medical Association* for March 18.

Although the results obtained from using the drug in the treatment of pneumonia are encouraging, the two men point out, the place of sulfanilamide in the treatment of the disease is not yet definitely established.

Their paper in *The Journal* is a preliminary report, based on 115 cases of pneumococcic pneumonia treated with uniform doses of sulfanilamide, forty cases with Felton serum and ninety-four controls with no specific treatment.

The death rate was 15.7 per cent for the group of patients treated with sulfanilamide and 30.8 per cent for the controls. The death rate for fifty-seven patients with types I, II, V, VII and VIII pneumonia treated with sulfanilamide was 10.5 per cent, whereas it was 27.5 per cent for the forty patients with the same types of pneumonia treated with serum.

Of twenty-one patients with pneumococci in the blood stream treated with sulfanilamide seven died, of twelve treated with serum six died and of fifteen controls thirteen died.

Some adverse reactions due to sulfanilamide treatment occurred. In 5.2 per cent of the patients treated with sulfanilamide a severe anemia developed and in an additional 18.2 per cent moderate secondary anemia, influenced by the infection, developed.

Death Rate of Pneumonia with Pregnancy Is Higher. Pneumonia complicated by pregnancy has a much higher death rate than it does in nonpregnant women, Maxwell Finland, M. D., and Thomas D. Dublin, M. D., Boston, point out in *The Journal of the American Medical Association* for March 18. It accounts for about one death in every 5,000 deliveries and is the cause of about one-half of the maternal deaths not directly due to pregnancy.

Doctors Finland and Dublin studied the incidence of pneumonia in pregnancy at the Boston City Hospital. About one of every eight women of child-bearing age who had pneumonia was pregnant, 0.63 per cent of all women admitted during pregnancy or for delivery had pneumonia and in 1.2 per cent of all the cases of pneumonia the condition was complicated by pregnancy.

A study of 212 cases of pneumonia complicating pregnancy in which the type of organism causing the infection was determined, revealed that the incidence of pneumococcic types was similar to that found in all cases of pneumonia in adults. The authors state that "the types for which specific antipneumococcus serum has proved effective were the most frequent.

"Blood borne infection was more frequent in pregnancy than in all cases for the same age groups. Likewise the death rates were higher than in corresponding cases for the same age group.

"The death rates were highest for late pregnancy and for women whose pregnancy was terminated during the disease.

"The death rate for all the serum treated patients was almost one-half of that for the corresponding nonserum treated patients. The lower death rates were for pneumonia complicating both early and late pregnancy, for pneumonia after delivery, and for those women whose pregnancy was unaffected.

"The frequency with which pregnancy was terminated did not seem to be influenced by serum treatment.

"The pneumonias of pregnancy are sufficiently serious to warrant the use of every available means of treatment, and the proved efficacy of specific serum treatment warrants primary consideration in those cases in which it is applicable."

COÖPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY — FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

Widespread Use of Tuberculin Test Urged to Discover Infection.—Emphasizing the importance of early diagnosis in a tuberculosis control program, E. A. Thacker, M.D., Urbana, Illinois, in *Hygeia,* the health magazine, for April, urges the widespread use of the tuberculin test to discover infection.

"Early tuberculosis ordinarily manifests itself in an insidious, gradual onset, sapping the vitality and strength of the individual, yet producing only vague, indefinite symptoms," the author says. "A hacking cough often attributed to smoking or fatigue attributed to overwork may be all that is noticed."

Many persons, therefore, fail to go to a physician when such symptoms occur. A routine program using the tuberculin test, such as many communities and schools have inaugurated, discovers such early cases.

While a positive reaction to the tuberculin test does not mean that the person examined has active tuberculosis, it indicates that at some time or other he has been infected with it. "Positive reactors are far more likely to develop the disease in later life than are the negative reactors," Doctor Thacker points out. Therefore, an x-ray examination should be performed on all positive reactors to determine whether the disease is in the active stage.

Discussing the course of the disease, the author says, "The initial or childhood type of infection produces an inflammatory or pneumonia-like lesion in the lungs and after weeks or months usually completely heals, leaving a small scar or a calcified nodular tubercle. Although children may die from this first infection, the vast majority overcome it, and many pass through this initial infection without knowing it.

"The adult type of tuberculosis occurs in one of two ways. The small healed lesions from the initial infection may break down, allowing some of the organisms that have remained alive within the tubercle to spread through the allergic tissues. Or else the person comes in contact with an active case of tuberculosis; the bacilli are taken into the lungs and the destructive type of tuberculosis begins.

"The classic symptoms of the reinfective or adult type of pulmonary tuberculosis include loss of appetite, loss of weight, fatigue, unexplained pains in the chest, afternoon fever, pleurisy, cough and sometimes blood in the sputum.

At birth an individual has certain definite possibilities for physical and mental progression depending on the health of his parents and the hereditary potentialities coming from his ancestors.—*Hygeia.*

Christmas is a blending of two ancient traditions—an austere ecclesiastical tradition and a pagan tradition of feasting which was anything but austere.—*Hygeia.*

Estimate 48,000,000 Cases of Trichinosis in the United States.—The recent evidence from autopsies that 36 per cent of the inhabitants of Cleveland have trichinosis must not be interpreted as proof that that city is the most highly infested area in the United States, *The Journal of the American Medical Association* for March 18 says.

Such evidence suggests rather that the routine diagnostic methods employed by earlier investigators are fallacious, *The Journal* points out. Routine examinations of the diaphragms of adult cadavers by the Baermann digestion method has led previous investigators to the conclusion that approximately 13.67 per cent of all persons in or around Washington, D. C., are infested with trichinae, 17.5 per cent in Minneapolis and Rochester, N. Y., 24 per cent in San Francisco and 27.6 per cent in Boston.

The editorial states that C. H. Evans, M. D., of the Institute of Pathology, Cleveland, supplemented this routine diagnostic method by application of a newer technic. Combining all positive data, Evans found thirty-six positive cases of trichinosis in the first hundred Cleveland autopsies studied by his double technic.

"Applying the implied correction coefficient to the percentages previously reported from other cities," the editorial says, "one would conclude that there are presumably the following percentages of trichina infestation in other American cities: Washington, D. C., 24.6 per cent, Minneapolis and Rochester, N. Y., 31.5 per cent, San Francisco 43 per cent and Boston 49.7 per cent, an average of 37 per cent infestation of the urban population of the United States.

"There is no way, of course, of estimating the resulting social or economic loss; but the estimated 48,000,000 cases of trichinosis in the United States are far from being a national asset."

Take care of your health; you have no right to neglect it, and thus become a burden to yourself, and perhaps to others. Let your food be simple; never eat too much; take exercise enough; be systematic in all things.—W. Hall.

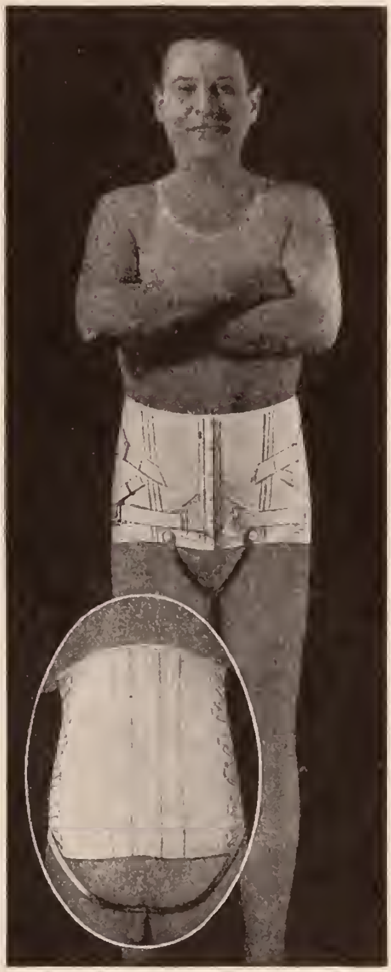
SUPPORTS FOR THE LOWER BACK

In writing of low back pain from a surgical standpoint, a leading orthopedist* in a recent article comments thus:—"Practically all patients who come to the clinic with this symptom receive a course of therapy consisting of massage, heat, exercises for the correction of posture and for the reconditioning of stiff, painful muscles, and support in the form of belts, corsets, or braces. The large majority are relieved by these measures. Only those who are not cured or improved, who have persistent or recurring pain, and in whom there is some definite defect or disorder in the structure of the lumbosacral region of the spine are advised to have an operation."

• • •

The Camp lumbosacral belt for men illustrated herewith is made of firm canvas. The closed back is well boned. There are two adjustment straps at the sides; the lower one providing adequate sacro-iliac support, while the upper strap, coming diagonally down the front, hugs the belt close to the lumbar vertebrae, thus affording them efficient support; the belt comes equipped with perineal straps. Models in this series provide for all types of build.



For the intermediate type of build

Address, Box 500, California and Western Medicine, 450 Sutter Street, San Francisco, California.

ESTABLISHED CLINICAL LABORATORY BUSINESS and equipment for sale. For personal reasons am retiring after nine years in this location. Willing to stay with buyer until he has become established. Brilliant future for right person. Strictly first class ethical business. For particulars, address Box 520, California and Western Medicine, 450 Sutter Street, San Francisco, California.

Excess Weight Increases Mortality.—Because excess weight leads to crippled functioning of several essential organs of the body, fat people neither feel as well nor live as long as slender people or those of average weight, Lemuel C. McGee, M.D., Elkins, West Virginia, says in *Hygeia,* the health magazine, for May.

"The actuality of a shorter life is well established from careful studies," Doctor McGee points out. "The Actuarial Society of America has found that at age 55, 20 per cent overweight means 20 per cent higher mortality and 40 per cent overweight brings 65 per cent higher mortality.

"In long standing obesity there is an infiltration of fat into most of the body organs, particularly into the heart and blood vessels. In both of these places, the fat seriously hinders a vital function. For this reason the death rate from circulatory disease is two and a half times as great in people overweight as in people with normal weight.

"Many of these needless deaths are associated with high blood pressure, for this degeneration becomes more dangerous under the strain created by the fat."

Excess fat is considered by one authority to be the most important single cause of diabetes. Fat people are unduly susceptible to diseases of the liver and gallbladder, they suffer excessively from heat and they are less resistant to bacterial infections than others. The risk of a major operation to the life of a fat man is alarming.

The bony skeleton of the human body suffers from overload it must bear in the corpulent man or woman. The arches of the feet give way to chronic flatfoot. The joints of the spine develop worn areas with a secondary growth of spurs of bone, and arthritis results.

Although in rare instances overweight may be attributed to glandular dysfunction, the cause in the vast majority of cases is simply overeating, the author says. For most of us, eating is a habit and appetite is not an expression of the actual need of the body for food but rather a cultivated response of the highly complicated nervous system of man.

"The problem of weight reduction is actually a scientific and mathematical one," Doctor McGee declares. "The caloric values of foods can be determined from many sources. The kind and amount of food to be taken can be calculated by simple addition."

Live with those from whom you can learn; let friendly intercourse be a school for knowledge, and social contact, a school for culture; to make teachers of your friends is to join the need of learning to the joy of converse. Happiness among the understanding is mutual, rewarded for what they say by the approval they receive; and for what they hear, by what they learn; ordinarily it is personal interest that draws men together but here it is glorified. A man of understanding seeks out the houses of those true noblemen which are more the stages of an heroic than the palaces of vanity. There exist men in this world, known to the discerning, who in their bearing are veritable exemplars of every greatness and whose train, even constitutes a courtly academy of art and of learning.—Baltazar Gracian, 1653.

Cutaneous Cancer and Precancer. A Practical Monograph. By George M. Mackee, M. D., Professor of Clinical Dermatology and Syphilology and Director of Skin and Cancer Unit, New York Postgraduate Medical School and Hospital, Columbia University, and Anthony C. Cipollaro, M. D., Associate in Dermatology, Skin and Cancer Unit, New York Postgraduate Medical School and Hospital, Columbia University. Cloth. Pp. 222, with a foreword by Francis Carter Wood, M. D., and 245 illustrations. Price, $3.75. New York: The American Journal of Cancer, 1937.

Gross Anatomy. A Brief Systematic Presentation of the Macroscopic Structure of the Human Body. By A. Brazier Howell, Associate Professor of Anatomy, Johns Hopkins University School of Medicine. Colth. Pp. 403, illustrated. Price, $6.00. New York: D. Appleton-Century Company, Incorporated, 1939.

Practical Dermatology and Syphilis. By Harry M. Robinson, M. D., Professor of Dermatology, and Director of the Syphilis Clinic, University of Maryland School of Medicine; Instructor in Medicine, Syphilis Division, Johns Hopkins Medical School. Cloth. Pp. 397, with illustrations. Price, $4.50. Philadelphia: P. Blakiston's Son & Co., 1939.

English, German, French, Italian, Spanish Medical Vocabulary and Phrases. By Joseph S. F. Marie. Foreword by Chevalier Jackson, M. D., Sc. D., LL. D., F. A. C. S., Honorary Professor of Broncho-Esophagology and Consultant in Broncho-Esophagologic Research, Temple University School of Medicine, Philadelphia. Cloth. Pp. 358. Price, $3.00. Philadelphia: P. Blakiston's Son & Co., Inc., 1939.

The Mechanism of Thought, Imagery, and Hallucination. By Joshua Rosett, Professor of Neurology in Columbia University, Scientific Director, Brain Research Foundation, Inc., New York. Cloth. Pp. 289. Price, $3.00. New York: Columbia University Press, 1939.

Clinical Gastroenterology. By Horace Wendell Soper, M. D., F. A. C. P., St. Louis, Missouri. Cloth. Pp. 314, with 212 illustrations. Price, $6.00. St. Louis: The C. V. Mosby Company, 1939.

The Vaginal Diaphragm. Its Fitting and Use in Contraceptive Technique. By LeMon Clark, M. S., M. D., Chicago. Author of "Sex Education" and "Emotional Adjustment in Marriage." Cloth. Pp. 107, illustrated. Price, $2.00. St. Louis: The C. V. Mosby Company, 1939.

Annual Report of the President of Stanford University. For the Forty-seventh Academic Year, ending August 31, 1938. This being the thirty-fifth report submitted, to which are appended annual reports of the comptroller, departments, committees, and publications of the faculty. Paper. Pp. 575. Stanford University: Stanford University Press, 1938.

Medical Leaves, 1939. Editor in Chief, Dr. Abraham Levinson; Managing Editor, Dr. Hershel Meyer; Associate Editors, Dr. Irwin Rubell, Dr. Jeanette Hork, Dr. Maurice I. Kaplan, and Samuel H. Holland. Cloth. Pp. 196. Price, $3.00. Chicago: Medical Leaves, Inc., 1939.

How to Open a New Book.—Stand the book, back downward, on a table or smooth surface. Press the front cover down until it touches the table, then the back cover, holding the leaves in one hand while you open a few of the leaves at the back, then at the front, alternately pressing them down gently until you reach the center of the volume. This should be done two or three times. Never open a book violently nor bend back the covers. It is likely not only to break the back but also to loosen the leaves.

GENERAL OPERATIVE SURGERY

Courses now in session » Students may enter at any time » Thursdays, 11 a. m. to 2 p. m.

The principal operations of general surgery will be included. The work will consist of the surgery of the stomach and gall-bladder, intestines and colon, urogenital organs, hernias, goiter, amputation of the breast, bone and tendon surgery, amputations, etc.

Every part of the course will be preceded by a thorough foundation of the anatomy. Opportunity will be given to have demonstrations of operations on the living.

The privilege will be given to perform certain minor operations and have demonstrations in the various clinics. The dissections and the technic of the operations will be done by the students themselves.

Fee—$15 per month

Applicants must be graduates of schools approved by the State Board of Medical Examiners

For descriptive circular and further information inquire of

TWENTY-FIVE YEARS AGO

(Continued from Text Page 392)

The Annual Meeting at Santa Barbara—It is not possible to publish the full proceedings of the annual meeting held last month at Santa Barbara in this issue of the Journal without causing too long a delay in getting it out; they will appear in the June number, however, and as matters of the greatest importance were considered and acted upon, the reports should be read by every member. During January, February, and March, a number of conferences were held between representative members of the Society, the Insurance Commission, and the Board of Adjusters of the insurance companies; and the result of these conferences, in the form of a general agreement and fee schedule, was presented to the House of Delegates in the report of the Council. The agreement is practically a condensation and crystallization of the suggestions which have been made editorially in the Journal during the past four months. . . .

From an Original Article on "George Chismore," by Douglass W. Montgomery, M. D., San Francisco.—I first met George Chismore in the spring of 1886, shortly after I began to practice in San Francisco. Like every beginner in a strange city, I felt the need of friends, and Chismore had a face attractive to everyone seeking human sympathy. This chance acquaintance would, however, never have amounted to anything if it had not been for favoring circumstances. Harry M. Sherman was then living with Chismore, and Sherman and I became fast friends. We two determined to agitate the forming of a society composed of men of our own age, and so began the Friday Evening Club, that met on Friday evenings and that had neither constitution, by-laws nor a permanent place of meeting, as we met in the residence or office of the members. The club was comprised of:

George Chismore, Alexander P. Whitell, William S. Whitwell, John F. Morse, Henry Ferrer, Martin Regensburger, Harry M. Sherman, Robert I. Bowie, J. D. Arnold, W. W. Kerr, C. A. Von Hoffmann, and myself. It was out of this association that the San Francisco Polyclinic later evolved. . . .

He was often not at all enchanted by an accurate diagnosis, and this led to the following amusing incident:

While Chismore was off on a hunting trip, Sherman called me in to see a patient who had arrived from the country to consult Chismore. I made a diagnosis of leukocythemia, of which I was very proud, seeing that shortly before one of these cases had slipped through my hands. We gave the family and the patient the usual gloomy prognosis. Shortly afterward Chismore returned and gave us an entirely new view of the case. According to him we had disturbed the family, and had caused a great deal of unnecessary trouble, and had not done anything to relieve the discomfort of the patient. In fact we had added to the patient's discomfort. It is needless to say that I then learned a few things, both about patients and physicians, and their mutual relations.

He suffered from many disadvantages from his lack of training, although in some ways it may have been an advantage. An educated man, unless he keeps a strict guard on his manner of observing natural phenomena, may become hedged in by his training to think along unbending lines. Books must necessarily be schematic as they have to be built within rigid limits, otherwise they would be compilations of disorder, an inextricable tangle of actions and facts. To comprehend disease phenomena according to books would be to regard them as solid cubes and parallelo-

CALSO Water with SULFANILAMIDE

It has been observed that low concentrations of sulfanilamide appear to be bactericidal in infections of the genitourinary tract if the urine is maintained at a pH of approximately 7.4.

May we suggest the use of CALSO before sulfanilamide administration to establish the desired urinary pH.

During sulfanilamide administration to maintain urinary pH and to offset possibility of supervening acidosis.

After sulfanilamide therapy to promote diuresis and assist in elimination of any residual drug.

CALSO is not a laxative and contains no sulphate

grams, sharply limited and wholly enclosed. To unswervingly follow their guidance is, therefore, to become a ritualist rather than a thinker. Chismore was far from being so constituted. He would see as many penumbrae, shadings, and rotundities in nature as Leonardo da Vinci himself. . . .

Not long before he took to his deathbed I met Chismore on Sutter Street, and a kindlier, more benevolent face you would rarely see. He was thinner than he had been, and his white hair and beard, with his delicately traced features, gave him an ethereal, spiritual look. Some time after this I went to visit him with Sherman. On entering the room Sherman kissed the old man on the forehead. The answering look of full, tender, lingering affection was one of the finest sights I have ever seen.

Hardship may embitter a man, and prosperity is even a severer test for human character, and Chismore had passed through all grades of both the one and the other, and at the end still retained his capacity for loving and being loved. This was worth while.

From an Original Article on "A Review of the Early Vaccination Controversy with an Original Letter by Jenner Referring to It, and to the Spread of Vaccination to the Spanish Possessions of America, the Philippines, and Other European Settlements in the Orient," by Philip King Brown, M.D., San Francisco.—No sooner had Edward Jenner proposed the practice of vaccination as a preventive for smallpox than there arose in England a controversy as to its safety and efficiency which has been endemic ever since, interrupted by more or less violent epidemic outbreaks. Nor has the controversy been confined to the home of its birth, for we find it more than a century later in full flower even in the classic hamlets of our own state.

The humor of the situation reveals itself in the analysis of the present state of the controversy, in which it is clear that the antivaccinationists have contributed no new argument in those more than hundred intervening years, whereas science has shown that whatever little claim they had to a hearing was based on misrepresentations now well understood and revealing no truth in favor of their contention. The tenth edition of the Encyclopedia Brittanica, in an article on vaccination, presents only an unintelligent arraignment of the method unworthy of a place even in the earliest edition. In a short biography of Jenner, closing with an apologetic paragraph, is the only meager account of Jenner's great discovery. The eleventh edition gives a fairly satisfactory historical review of the established facts of vaccination. . . .

From an Original Article on "Reminiscences: The Transition of Surgery to Antiseptic Surgery," by Martin Regensburger, M.D., San Francisco.—In the early months of 1875 I had the extreme pleasure of being a witness to one of the most marvelous reactions in surgery.

At the Allgemeine Krankenhaus in Munich, Von Nussbaum, professor of surgery at the University of Munich, one day, in utter disgust, threw down his knife with the expression that he would never operate another case in that hospital. Every case he operated was infected with nosocomial (hospital) gangrene. Every wound that came into the hospital, even the slightest lesion, such as a panaritium, would become infected. The mode of procedure in the operating room at this time was as follows:

The nurse would bring into the operating room a tinker's soldering pot, and we students would take the soldering

Oxygen Therapy in Cardiac Trouble

It may surprise you, as it did us, to know that about half of the oxygen tents we are furnishing are used in cardiac trouble.

This wider field for oxygen therapy makes our service of even greater value to you. As the largest independent manufacturer of oxygen in California, we have developed an unsurpassed service for hospitals and for private use.

From four cities where there are Stuart establishments—San Francisco, Oakland, Fresno, and Los Angeles—we furnish oxygen and the most approved type of tents.

This service never sleeps—not even on holidays. Trained men answer your call immediately. They install the equipment, check it to assure performance, and give your nurses the simple instructions that are necessary.

Recognizing our responsibility in offering this service, we have given it specialized supervision and training so as to maintain it on the highest professional standard.

iron and sear the infected wounds, reminding us of the days of Ambrose Paré. For the benefit of those who have not seen hospital gangrene (I, myself, not having seen it for the last thirty-five years), I would state that it was one of the most common complications of wounds, and its history was marked by a fearful mortality; and so inseparable was the disease once assumed to be from hospitals that Poteau (1783), the first historian of the disease, himself a sufferer from it, proposed the inquiry whether, in view of the facts, "hospitals were not more pernicious than useful to humanity." . . .

Lister's achievements were just in embryo at that time and but little was known about antiseptic surgery; there were many pros and cons. Such men as Billroth bitterly opposed the whole technique of Lister's, saying that it was not the technique, but that simple cleanliness and hot water would accomplish the same results.

Pasteur's theories at that time were also in their infancy. The general theory was that there was only one source of contamination and that was the air. Upon this theory Lister based his ideas and thought by keeping the air, and especially unclean air, from wounds he would prevent infection, etc.

Von Nussbaum determined to send his first assistant, Von Lindpaintner, to Edinburgh for the purpose of studying Listerism. In about two months he returned to Munich with all of the paraphernalia of Listerism: carbolated gauze, mackintosh (a waterproof rubber sheet), protective (a greenish oilsilk or linen), drainage tubes and catgut ligatures, and last, but not least, a steam spray.

Before the operation the steam spray was set to work and the air was thoroughly saturated with carbolic acid (mind you, no gowns, no thorough cleaning nor disinfecting of the hands, etc.), then the patient was brought in and the spray was played over the field to be operated upon, and kept up to the end of the operation. Many times the operator would have to stop for the reason that his hands became absolutely anesthetic from the carbolic spray. The sutures were either catgut or silver wire; then the spray was taken away and the protective was placed directly over the wound, then eight layers of gauze, then the mackintosh, and then the gauze bandage. The results were simply marvelous. If the technique was properly carried out, all wounds, excepting those near or in connection with the mucous membrane, healed by first intention. It was marvelous to see the change in that hospital.

I remember Von Nussbaum operated upon a patient in a bathtub for loose cartilages in the knee joint, under water, for fear the air might infect the wound; it did not seem to matter what condition the water was in. Under Listerism I saw the same operation with splendid results.

About six months after Listerism was introduced into Munich, Von Nussbaum invited Lister to Munich and introduced him to the students at the clinic, and this is where I first met Lister, the most modest man that I have

WHY

THE EMULSION... Petrolagar FOR CONSTIPATION

#2

Miscible in aqueous solutions. Mixes with gastro-intestinal contents to form a homogeneous mass.

1. Petrolagar is more palatable. Easier to take by patients with aversion to plain oil—may be thinned by dilution.
3. Does not coat intestinal mucosa. Petrolagar is an aqueous suspension of mineral oil — oil in water emulsion.
4. No accumulation of oil in folds of mucosa.
5. Will not coat the feces with oily film.
6. Does not interfere with secretion or absorption.
7. Augments intestinal contents by supplying an unabsorbable fluid.
8. More even distribution and dissemination of oil with gastro-intestinal contents.
9. Assures a more normal fecal consistency.
10. Less likely to leak.
11. Provides comfortable bowel action.
12. Makes possible five types of Petrolagar to select from to meet the special needs of Bowel Management.

Petrolagar — Liquid petrolatum 65 cc. emulsified with 0.4 Gm. agar in a menstruum to make 100 cc.

Petrolagar

Petrolagar Laboratories, Inc. • 8134 McCormick Boulevard • Chicago, Illinois

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

TWENTY-FIVE YEARS AGO

(Continued from Page 18)

ever met—a man about six feet tall and extremely bashful; while he was being eulogized before the students his lips would twitch from embarrassment. After Nussbaum had praised him up to the skies, calling him a second Saviour, Nussbaum fell upon his neck and kissed him, and his embarrassment and modesty were really painful to observe—the great man almost collapsed. . . .

When I came back to San Francisco I brought all of the material necessary to carry out Listerism, and introduced it into the City and County Hospital under Douglass, Professor of Surgery in the Medical College of the Pacific, and later the Cooper College.

Douglass was an excellent surgeon, but very slow to introduce innovations, and in using the spray he would exclaim, "Take that damn thing away"; then I would say it was part of the technique and he would be satisfied for a few minutes and again would say, "Take it away." His hands would become numb during the operation and he would have to stop for a few minutes, but his results were fine.

From an Original Article on "The Green Operating Room at St. Luke's Hospital," by Harry M. Sherman, M. D., San Francisco.—The difficulty I have had in seeing into the mouth of a small child, to properly trim and suture the soft palate and uvula, in cases of cleft palate, led me, some ten years ago, to use black cloths around the mouth instead of the ordinary white toweling. With the white environment, the hollow of the mouth is in the deepest shadow and cannot be comfortably seen, unless it be specially and overilluminated, as by the wearing of a headlight by the operator. With the black environment, however, the mouth is in the high light, not in the shadow, the pupils of the operator are not dominated by the light reflected from the white towels, and ordinarily bright daylight is ample illumination for the work in the back of the mouth.

The discomfort I have had in the present-day white operating rooms led me to suggest that we have dark floors and wainscots in these rooms, so that the operator who looks up from a wound shall not encounter a glare of light and find his eyes useless for a moment, as he looks back into the less well-illuminated wound. The color scheme, it seemed to me, should start from the red of the blood and of the tissues; therefore, I advised that green, the complementary color to red, should be chosen for the color of the floor and wainscot. The particular shade of green to be selected was that which was complementary to hemoglobin, and it was found to be the green of the spinach leaf. Incidentally, it may be said that the iron in the chlorophyl of spinach is said to be in the same chemical combination as is the iron in hemoglobin, but I know nothing of the value of this, in making spinach-green complementary to hemoglobin red.

A room painted in this way—the floor and the walls for six feet from the floor—a bright spinach green, and all above a glazed white, was matched for use against a room painted a glazed white—floor, walls, and ceilings—in the little operating pavilion built at St. Luke's Hospital just after the fire. No one who could get into the green room to do an operation ever went into the white room; and after some months of this experience the point was accepted as settled sufficiently to warrant the innovation of a room similarly colored in the operating suite in the new hospital. . . .

From an Original Article on "Blindness Following Injuries to the Back of the Head," by L. Newmark, M. D., San Francisco.—Given a patient who has sustained an in-

THE MOST IMPORTANT YEAR!

The vital year for the healthy development of bone and tissue structure!

S.M.A. is nutritionally correct. Not only is it essentially similar to human milk in percentages of protein, fat, carbohydrate and ash, but *equally important from a nutritional standpoint,* it is also similar in biological factors, especially in chemical constants of the fat and in physical properties.*

The vitamin content of S.M.A. remains constant throughout the year. With the exception of orange juice no additional vitamin supplement need be given.

A trial will show convincing proof.

**S. M. A. is a food for infants — derived from tuberculin tested cows' milk, the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil; with the addition of milk sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, it is essentially similar to human milk in percentages of protein, fat, carbohydrate and ash, in chemical constants of the fat and in physical properties.*

(Continued from Page 20)

jury to the back of his head, and is found to be deprived of his power of vision without showing any ocular changes, the physician will find in the following observations what he may expect in regard to the restoration of sight. . . .

From an Original Article on "Removal of the Cervical Glands in Malignant Disease of the Head and Face," by H. A. L. Ryfkogel, M. D., San Francisco.—No operation for removal of cancers of the head and face can offer any hope of permanent cure, in the majority of cases, unless the lymph glands that drain the affected area (and, as far as possible, the intervening lymphatics) are thoroughly removed. The gland-bearing tissues and, if feasible, the original growth, should be removed in one mass so as to avoid cutting or crushing the cancerous material and implanting or forcing cancer cells into the healthy tissues. . . .

From an Original Article on "Recollections of the Listerian Epoch," by Charles G. Levison, M. D., San Francisco.—The subject that I have chosen for my paper this evening is of perennial interest, for it has exercised an incalculable influence upon the evolution of modern medicine. The name of Lister is so well known to the fraternity that it needs no introduction, but, unfortunately, this is not the case with the layman, who is quite uninformed regarding the remarkable achievements that have been accomplished in medicine, and it would seem an almost hopeless task to properly educate him. In this connection I have often, in conversation, inquired of people whether the name of Lister was known to them, and the response has almost invariably been returned: "Oh, yes; he is the man that makes the Listerine." I repeated this to Sir Charles Ball when he was here delivering the Lane lectures a number of years ago, and he was very much amused. He laughed heartily and said that he was going to tell Sir Joe about it. At that time Lord Lister had not yet been elevated to the peerage, which event took place in 1897, and it was the first time that any medical man had been so honored.

I have been particularly interested in Lister as a man, as I had the privilege of knowing him personally. It was in the summer of 1892 while he was still teaching surgery in Kings College, London. One year later he retired from active work.

I visited him as a student and was received most graciously, and during several times that I saw him he addressed his remarks particularly to me instead of to the students. He took me through the wards and he removed the dressings from the patients to demonstrate the action

In Appreciation

As an expression of appreciation to the medical profession of the Western States, the Schering Corporation is pleased to sponsor the exhibit on "SEX HORMONES" in the Hall of Science of the Golden Gate International Exposition, in San Francisco.

The role of hormones in controlling the physical and mental development, and the sexual function of men and women is concisely told. That you, the doctor are prepared to treat endocrine disorders is pointed out. The exhibit is purely educational, non-commercial. We hope you will visit it.

Notice

CANYON SANATORIUM

REDWOOD CITY, CALIFORNIA

announces a complete reorganization

Edward A. Schaper, M. D., formerly medical director and superintendent of Stony Brook Retreat, the Kern County Tuberculosis Sanatorium, has been made medical director. The business policies and medical care will be under his supervision.

Leo Eloesser, M. D., will be surgical consultant. Edward S. Schulze, M. D., becomes resident physician.

Mr. Arnold W. Scheier continues as business manager.

The San Francisco office has been transferred from 516 to 450 Sutter Street, San Francisco.

Rates and information concerning the sanatorium may be obtained by either writing to the San Francisco office or the sanatorium.

of the cyanide of mercury gauze that he had introduced into surgery a short time before. His modesty and simplicity were extreme, and one would never have recognized him as one of the most important influences of all time. An example of his great modesty was shown at an International Medical Congress at which both he and Pasteur were present. In an address that he delivered, he stated that Pasteur was the only one that deserved any credit for the discoveries that he (Lister) had made. . . .

From an Original Article on "Basic Principles in Eczema," by Ernest Dwight Chipman, M. D., San Francisco.—Eczema was defined by Bateman one hundred years ago as "a noncontagious eruption, generally the effect of an irritant, whether externally or internally applied, but occasionally produced by a great variety of irritants in persons whose skin is constitutionally very irritable." It has been said that this definition cannot be improved upon today.

Since Bateman three important doctrines have claimed supremacy. First, Hebra and the Vienna school contended strongly that eczema is of external origin. Following upon this came the French school with the claim that it is of internal or diathesic origin. Later Unna promulgated the theory that all eczemas can be traced to a microbic origin. Both the Vienna and French schools attracted many followers, but Unna's claims never gained wide acceptation. In recent years the most commonly held views have been that eczema is exactly what Bateman called it a century ago, viz., "the effect of an irritant whether externally or internally applied." There has now appeared a tendency toward the idea of exclusively external causation. To what extent this view is tenable a consideration of some of the basic principles of the affection will possibly help us to decide.

No discussion of eczema can be intelligently pursued until there is a common understanding as to the distinction between eczema and dermatitis. . . .

From an Original Article on "A Case of Extraperitoneal, Intraligamentous Dermoid Cyst and Pregnancy," by Henry J. Kreutzmann, M. D., San Francisco.—In the course of time I have operated a few dermoid cysts of the ovary, also some extraperitoneal, intraligamentous cysts not of ovarian origin. Likewise, I have done ovariotomy in a number of cases during pregnancy; but I have never seen an extraperitoneal intraligamentous dermoid, not during nor outside the gravid state, until quite recently. . . .

From an Original Article on "Artificial Cultivation of the Gonococcus," by Ernst Albrecht Victors, M. D., San Francisco.—Experience in attempting the cultivation and isolation of the gonococcus for bacterial vaccines, and for complement-fixation antigen, has long convinced me that this is attended with considerably more difficulty and disappointment than is usually conceded. Less difficulty is encountered with subcultures when primary inoculations have been successful, provided that suitable environment and pabulum have been maintained. . . .

From an Original Article on "Upon the Early Diagnosis of Renal Tuberculosis by the General Practitioner," by Martin Krotoszyner, M. D., San Francisco.—We are accustomed, of late, to point with justifiable pride to the marvelous progress of the science and art of medicine, by which the diagnosis as well as the treatment of all ailments which human flesh is heir to have been revolutionized. At the bedside, as well as in the laboratory, new methods of

To help you IN RECOMMENDING ALLERGY DIETS

To help your patients AVOID SERIOUS DIETARY MISTAKES

With these Allergy Diet Sheets your patients can more accurately follow the wheat, egg or milk-free diet you prescribe. Planned with the aid of leading allergists, it provides complete lists of allowed and forbidden foods. Also practical advice to help patients guard against such common food anomalies as the wheat flour in rye bread, the egg in many baking powders, the milk in which many margarines are churned.

These diets are for professional use and distribution only. None are ever distributed to the laity. In examining the diets, you will find that Ry-Krisp is frequently used in the approved recipes. That's because these wafers—made of flaked whole rye, salt and water—are perfectly safe. Besides, because of their brittle crispness and unique flavor, patients gladly eat Ry-Krisp at every meal. For free samples and Allergy Diet Sheets, use the coupon below.

(Continued from Page 24)

examination by means of complicated and delicate instruments and apparatus are in daily use at the hands of specialists, experienced in the interpretation of the results of their investigations. Thus, at the great medical centers, and particularly at the large modern hospitals, a correct diagnosis of the more serious pathological conditions is now only considered feasible through so-called teamwork done in several special departments and aided by various laboratory tests. Gratifying as the results are under this system—as regards the welfare of our patients, as proved by the marked and steadily growing decrease of the mortality rate—matters are, nevertheless, not quite as favorable for the general practitioner who has been brought up under this system at the teaching hospital of his college and who, when left to his own resources, has to make his diagnosis and to devise the proper and effective treatment by a less circuitous, complicated and costly route. For the most important aid toward accomplishing this end, in view, viz., the art of observation, or the faculty to correctly interpret symptoms and to group them to a diagnosis, has not been sufficiently developed by the above-described system. Thus, it occurs that patients daily enter our hospitals with long-standing lesions, the earlier recognition of which would have spared them long suffering and a serious operation, often resulting in the loss of an important organ.

No special field of medicine has of late made more rapid strides as regards exactness of diagnosis and efficacy of treatment than urology. It is generally conceded that these excellent results are obtained through the skillful application of instruments of precision; and the opinion prevails among the rank and file of the profession that a urological lesion cannot be diagnosed without instrumentation. . . .

From "Important Information!" Action of the State Society on Industrial Accident Work.—In these four pages—so numbered that they may be torn out of the JOURNAL, if so desired, without mutilating the remaining reading pages—will be found presented the plan recommended by the Council of the State Society and adopted by the House of Delegates at the Santa Barbara meeting last month, together with the fee schedule which was also presented as a part of the report and adopted.

The full proceedings, minutes, reports. etc., will appear in the June issue.

* * *

Report of the Reference Committee on New Business: . . . Item 22. We recommend for adoption and ratification by the House of Delegates, the recommendations made by the Council relative to accident insurance, and the relation of our members and Society and county units thereto, as given on pages 6 to 7 inclusive, of attached report (beginning on page 6 with the line, "In the following statement," etc., and ending on page 7 with the twenty-first line reading, "subject to discipline," etc.) :

"A. Note. In the following statement the Industrial Commission is considered as one of the companies, for it is doing the same sort of work and on the same basis, and is agreeable to the general conditions as outlined.

"B. *Contracts:* No contracts at flat, fixed fees for all work are to be made, and those now existing are to terminate at the earliest possible date.

"C. *Fee Schedule:* The fee schedule, which has been prepared as heretofore indicated and is herewith presented to you, is recommended for the approval of the Medical Society of the State of California and of its various county units, as a schedule of the minimum fees to be charged for the services indicated in the schedule in the treatment of persons who may be injured as specified in the law. Ad-

Cosmetics and Your Patient's Morale

THE DOCTOR IS OF NECESSITY A STUDENT OF LIFE. Each new patient presents a new study, a new problem. Psychology plays an important role in the course of treatment he prescribes. With some patients he must be frank to a point of harshness, with others he must be gentle and coaxing. The nature of the illness and, more particularly, the nature of the patient determine his attitude. He knows from experience the value of bolstering his patient's morale. As a student of psychology he knows that few things are more depressing to a woman than the fear that she is losing her charm, that when she no longer cares how she looks the chances are she has lost touch with a vital interest in life. And because he appreciates the importance of a sensible interest in personal appearance he quite rightly encourages his patients to look their best at all times. FINE COSMETICS appeal to that interest. That is why they deserve to be recommended by doctors who are, after all, greatly concerned with their patient's morale.

LUZIER'S, INC., MAKERS OF FINE COSMETICS & PERFUMES

KANSAS CITY, MO.

ditional compensation will be allowed in unusual cases for unusual services on proper representation.

"D. *Choice of Physician:* The employer (or the company, if the employer is insured) is to have the right to a free choice of physician and such selections are to be made from lists of names furnished by the insurance companies, these lists of names to be the lists of members of the several county medical societies which collectively compose the Medical Society of the State of California; but no member may be compelled to do the work if he does not wish to. Provided, that in counties where there is no county medical society, or in special cases where the employer may desire to secure the services of some physician who is not a member of his county medical society, he reserves the right to do so; also, provided that in the larger centers the societies are to prepare lists of names of members who are willing to do the work and to arrange so that the services of some of them may be secured at any time by means of a telephone exchange or some other plan by which their whereabouts may at any time be ascertained; and also, provided that the companies are to be permitted to advise their policyholders that certain physicians have in the past done work for them satisfactorily. It is understood that an insurance company may have a regularly appointed medical referee in any given locality.

"E. *Adjustment of Fees:* In case a bill rendered by a member is regarded as excessive by the employer (or company), it shall be submitted to the county medical society for scrutiny and adjustment, and if there be still failure to agree, it may be submitted to the Council of the State Society or to the Industrial Commission.

"F. *County Units and Professional Conduct:* In order to carry out the provisions of this plan, it will be necessary for each county unit to approve the schedule—in so far as it applies to the work indicated, and to persons whose income does not exceed the maximum indicated in the law. Charging in excess of the proper ones, or unduly padding bills by fictitious or unnecessary visits, shall be deemed unprofessional conduct and subject to discipline by suspension or expulsion."

(Adopted)

Respectfully submitted,
G. A. Hare, Fresno
Rene Bine, San Francisco
George H. Kress, Chairman, Los Angeles.
(Adopted as a whole)

From California Industrial Accident Commission "Fee Schedule."—"These fees represent a minimum. Fees higher than schedule will be approved when warranted by extraordinary difficulties encountered by the surgeon.

"Unusual cases and procedures not specified are entitled to same fee as specified procedures of approximately equal magnitude." . . .

From "Are You Interested?"

If you are interested in this insurance matter and have suggestions to make, write to the secretary, Doctor Jones.

If you are interested in your Journal, look through the advertising pages and deal with your advertisers.

From an Original Article on "Concerning Ununited Fractures," by James T. Watkins, M. D., San Francisco.—In this paper I take for my text the following sentence from Joseph Bloodgood's review of surgery in *Progressive Medicine:*

"In my mind the most important contribution of Mr. Arbuthnot Lane is the remark that people should demand better results in recent fractures," and this comment by John B. Murphy: "Twenty-five or thirty years ago we practically never had a case of nonunion of a fracture.

TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

Today cases of nonunion are so common that I do not know what we are going to do."

Rightly to understand the significance of a pathological condition presupposes a knowledge of the normal histology and normal physiology of the affected tissues. For, after all, pathology is only physiology which has broken the law. . . .

From an Original Article on "Artificial Pneumothorax in Advanced Lung Tuberculosis," by Lewis Sayre Mace, M. D., San Francisco.—During the last few years the operation of artificial pneumothorax as a therapeutic procedure in a certain type of cases of lung tuberculosis has come into general use and its value determined.

Following favorable reports from all operators who have obtained 45 or 50 per cent of recoveries in an otherwise hopeless condition, it is natural that the attention of clinicians should turn to the possible value of lung compression in other stages of the disease than that in which the production of an artificial pneumothorax may be said to be the operation of choice.

Tuberculosis mainly confined to one lung, not too far advanced but advancing under proper treatment, while the opposite lung is fairly free from disease, represent the ideal conditions under which a favorable outcome may be expected from this method of treatment; but only a small percentage of cases correspond to this description. The consideration of other indications for compression (such as very early cases, hemorrhage, and advanced bilateral disease in which delay of its progress or amelioration of its symptoms may be hoped for) is at the present time extremely important. The following series of cases is reported for the reason that they all present the same conditions, viz., advanced bilateral disease with cavities in one lung so situated that constant and wearing cough was the result. . . .

From an Original Article on "Iodin a Specific Germicide in Respiratory Affections" (Preliminary Report), by Sanford Blum, M. D., San Francisco.—Few drugs have so successfully stood the test of time as iodin. Not only does its past record bear evidence to its worth, but the esteem in which it is held at present is evidenced by its unanimous employment in the practice of medicine. It is used not only as an antisyphilitic, but in gynecology, dermatology, internal medicine, pediatrics, surgery, and in every branch of medicine. . . .

From "Society Reports. Sonoma County."—Resolutions passed by the Sonoma County Medical Society, March 12, 1914:

WHEREAS, The State of California has passed an act known as the Boynton Act, whereby it is the intention of the State to provide for the care and treatment of all persons who are engaged in the various industrial pursuits, and who may be injured while so engaged; and

WHEREAS, The State has caused to be formed a commission for the enforcement of said act; and

WHEREAS, Said commission has formulated certain rules and regulations for the application of said act, and has fixed a schedule of fees to be paid for medical and surgical services rendered under said act, which they believe to be as liberal as their present financial condition will justify; and

WHEREAS, Said act was passed for the humane purpose of caring for the unfortunates who are engaged in the

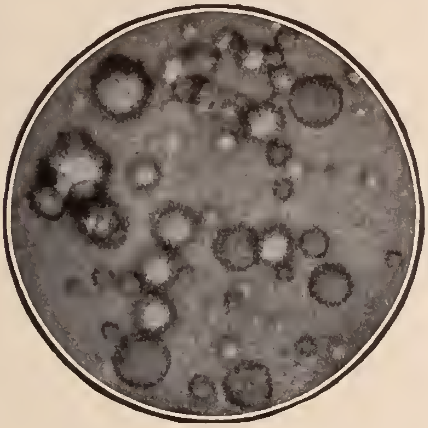
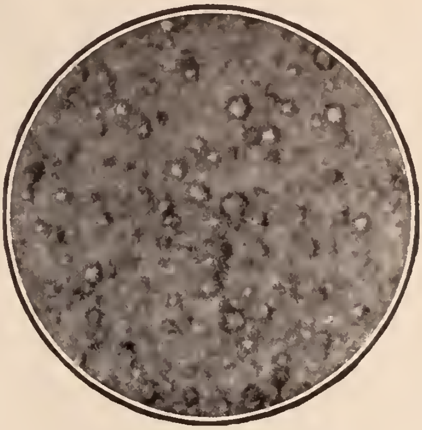
More Easily Tolerated



Cod Liver Oil Concentrate Globules and Butter Fat Globules . . . before Homogenization



Cod Liver Oil Concentrate Globules and Butter Fat Globules . . . after Homogenization

Special Morning Milk is homogenized under great pressure **after** the cod liver oil concentrate is added. Through this process the cod liver oil concentrate globules and butter fat globules are reduced to about 1/10 their normal size, offering a greater area for the gastric juices to work upon. Thus Special Morning Milk is more easily tolerated than evaporated milk and cod liver oil fed separately.

The homogenization process also brings about complete and permanent emulsification of the cod liver oil concentrate throughout the body of Special Morning Milk, making vitamin D available to the infant in a more dispersed form.[1]

Not Advertised to the Laity -:- No Formula Instructions on the Label

BECAUSE THERE IS NO COD LIVER OIL TASTE IN SPECIAL MORNING MILK, THE ADMINISTRATION OF VITAMIN D IS GREATLY SIMPLIFIED.

President, California Medical Association
1939

CALIFORNIA
AND
WESTERN MEDICINE

OFFICIAL JOURNAL OF THE CALIFORNIA MEDICAL ASSOCIATION

VOL. 50 MAY, 1939 NO. 5

SALUTATION FROM WILLIAM W. ROBLEE

OF RIVERSIDE

PRESIDENT OF THE CALIFORNIA MEDICAL ASSOCIATION

To Members of the California Medical Association—

Greetings:

It is my happy privilege to extend to you a cordial invitation to attend another annual meeting of your California Medical Association, which will be held May 1 to 4.

This year we return to Del Monte, which choice, we know from past experience, will be a happy one. The hospitality extended by the hotel heretofore has been most cordial; the opportunities for out-of-door sports during the recreation periods are ample, and the provision made for the section meetings is satisfactory. Old friendships will be renewed, new ones acquired, and the social functions are always happy occasions.

Medicine is not static, both its science and art being constantly improved. The doctor of medicine and surgery who fails to take cognizance of new developments soon fails to render the type of service to which his patients are entitled. The papers and discussions arranged by the committee in charge are designed to bring to us, in an authentic and thorough manner, the latest developments of medical science. I urge your attendance at as many sessions as possible.

Consideration will also be given, at the first general session and at the meetings of the House of Delegates, to the present status of our medical economic problems.

There never has been a time in the history of the Association when loyalty to our national, state and county organizations was more necessary. I ask your continued interest and support, in order that those to whom you have intrusted leadership may feel that they are backed by a united profession. A good attendance at the Del Monte meeting will give them that assurance.

Cordially,

W. W. Roblee.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the Journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this Journal. New copy must be sent to the editorial office not later than the fifteenth day of the month preceding the date of publication.

Contributions—Length of Articles: Extra Costs.—Original articles should not exceed three and one-half pages in length. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—CALIFORNIA AND WESTERN MEDICINE has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested that contributors to this Journal write to its office requesting a copy of this leaflet.

EDITORIALS†

DEL MONTE ANNUAL SESSION: NEWLY-ELECTED OFFICERS

Official Journal in Press During the Annual Session.—CALIFORNIA AND WESTERN MEDICINE's May issue will be in press during the time of the California Medical Association's sixty-eighth annual session at Del Monte, May 1–4. Therefore, in the present number, it will not be possible to give detailed information concerning the proceedings, and a recital of happenings must lie over until June.

Space for the names of newly-elected general officers, however, having been reserved on the last form to go to press, the list received by telegraph from Del Monte may be given.

* * *

Newly-Elected Officers.*—The newly-elected officers include the following:

President-Elect, Harry H. Wilson, Los Angeles.
Speaker, Lowell S. Goin, Los Angeles.
Vice-Speaker, Dewey R. Powell, Stockton.
Councilors: Second District, George D. Maner, Los Angeles; Fifth District, C. Kelly Canelo, San Jose; Eighth District, Frank MacDonald, Sacramento.
Councilors-at-Large: C. O. Tanner, San Diego; J. Elbridge Best, San Francisco; Frederick N. Scatena, Sacramento.
Delegates to the American Medical Association: J. Elbridge Best, San Francisco; Lyell C. Kinney, San Diego; Lowell S. Goin, Los Angeles.
Alternates to the American Medical Association: Robert S. Stone, San Francisco; Bon O. Adams, Riverside; Roy E. Thomas, Los Angeles.

The Hotel Del Coronado at Coronado was announced as the meeting place for the 1940 annual session.

* * *

Service Rendered by Retiring President William W. Roblee and the Incoming President, Charles A. Dukes.—A few words, therefore, about William W. Roblee of Riverside, now past president, and Charles A. Dukes of Oakland, now president, may not be amiss.

As has been stated in the past, positions of responsibility in so large a constituent state medical association as that of California (the fourth largest state unit in the American Medical Association, and perhaps, next year, the third largest) are no longer to be rated as sinecures. Be it said to the credit of the retiring president, William W. Roblee, and to his successor, President Charles A. Dukes

---

† Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

* At the annual organization meeting of the Council, held at Del Monte on Thursday, May 4, 1939, the following officers were elected: Chairman, Dr. Karl Schaupp, San Francisco; Vice-Chairman, Dr. Charles A. Dukes, Oakland. Dr. Earl Moody, Los Angeles, was elected Councilor to fill the unexpired term of Dr. Harry H. Wilson, Los Angeles, incoming President-Elect. Dr. George H. Kress, San Francisco, was elected Secretary-Treasurer-Editor.

(both, by the way, members of the Stanford-Cooper Medical College class of 1895), that neither of these colleagues has failed to meet each and every call made upon him. More than that, to Doctor Roblee, through a tour to component county medical societies in the northern sections of California, and to Doctor Dukes, for a series of visits to county units in the southern section of the State, much credit must be given in laying the foundation for a more unanimous reaction to the medical service plans on periodic payment basis, as promulgated by the California Medical Association, that have found concrete expression in the separate organization, now known from one end of the State to the other as "California Physicians' Service."

So, also, in many other activities concerning which they have been consulted, Doctors Roblee and Dukes have at all times been ready to give willing and efficient service.

In bidding adieu, then, to Doctor Roblee, as he lays aside the extra responsibilities of the presidential office, the Association at the same time extends its welcome to incoming President Charles A. Dukes as he assumes the obligations of his new field of work. His past record, in many lines of altruistic service in medical practice and organization, is of so creditable a nature that all members of the California Medical Association may feel sure that the interests of the profession will be most punctiliously safeguarded.

* * *

California Medical Association Welcomes All Newly-Elected Officers.—And now, some words of welcome to the new president-elect, whose name, at the time of this writing, we of course do not know. Whosoever may be selected by the House of Delegates at Del Monte on May 3, 1939, likewise has the good will of all members of the Association. The problems immediately before us, while the Legislature is in session, will probably continue as problems, to be met at the next legislative session. The president-elect, therefore, will need to be actively alert, not only in 1941, but prior thereto, in order that no major political situations of a surprise nature be thrust upon the already overtaxed profession.

That the newly-chosen president-elect and councilors will join with other colleagues in official positions to meet courageously and in an alert manner all issues having to do with medical practice and public health standards we cannot doubt.

To each and all such administrators the Official Journal, on behalf of the members of the California Medical Association, pledges loyal and generous service, and tenders its best wishes for most successful terms of office.

GOVERNMENTAL HEALTH INSURANCE PROPAGANDA

Emotionalism Not Conducive to Clear Thinking.—Strange as it may seem, it is nevertheless a fact that, under the influence of emotional partisanship, persons otherwise looked upon as honest are not infrequently guilty of making misstatements in support of causes they espouse that are far removed from the real truth. An example of this weakness in human nature has been repeatedly manifested in the speeches of certain proponents of compulsory health legislation, as they have recently appeared before the public in California, in promotion of the Assembly and Senate bills (A. B. 2172 and its companion measure, S. B. 1128) now pending for consideration before the State Legislature. These proposed laws, so vociferously urged for adoption by certain specific political and associated interests, if enacted, would inaugurate for one of the largest and wealthiest states of the Union a system of medical care radically different from that which has brought to the United States the lowest morbidity and mortality rates of any comparable land in the civilized world!

The fact that the proposed system has not been tried out in any country where environmental and other conditions are actually similar to those which obtain in California seems unworthy of serious thought or acceptance by most of these sponsors of compulsory health laws, who apparently have concluded that, if certain European nations (classified as in the groups of civilized lands) have compulsory health systems, then the systems in vogue there must necessarily be equally adaptable to America. Such factors as the geographic, economic and social welfare elements, and the homo- or heterogeneity of the population types, as well as the quantity and quality of medical service that has been and is rendered to three-fourths or more of the respective populations, are passed over as of little or no moment!

And yet, if the supposed amount of inadequate medical care does not exist in America—and physicians, who should know, do not believe it to exist as so darkly painted—then there is no reason for revolutionary changes in the method of medical practice, through institution of a governmental health system, in which political supervisors would rule over scientifically trained physicians.

* * *

Theorists Are Not Always Logical Thinkers. As one observes the continued activities of the advocates of compulsory health legislation in our State, this defect in logical thinking on the part of many of the theoretical expounders of compulsory health laws—be they in the groups of political, social welfare, or philosophy teachers matters not—becomes increasingly apparent. And nowhere more so than when, in forums or assemblies, or in other public places of announcement or discussion of their cause (under what might be called a spell of auto-hypnosis), they sally forth in gratulatory enunciation of their points of view. If the issues at stake were not of such vital relationship to the health of the people, and to the system of American government as handed down by the country's founders, as well as to the economic background, and therefore to the social welfare of the citizenry of California, the entire matter could be passed over as just "one of those things."

Vicious Features of A. B. 2172 and S. B. 1128. It may be stated that A. B. 2172 and S. B. 1128 are proposed statutes which, if they became laws,

1. Would *not* bring better medical care to the people of California;

2. Would inflict upon the economic interests of the State, in all their expressions, an overload of taxation, creating bankruptcy for many now self-sustaining firms, with loss of employment, and the sad supplements of lowered welfare standards and poverty, with resulting illness, for thousands upon thousands of wage earners; and

3. Would destroy, yes, one might say, debauch, the system of medical practice that has been and is now in existence, in which, both from within and from without, necessary changes in methods are constantly made, in harmony with changing times and needs.

* * *

Physicians Are Practically a Unit Against Compulsory Health Systems.—With such possible end-results, it is not to be wondered at that, by and large, the great majority of physicians are unalterably opposed to compulsory health legislation, as expressed in A. B. 2172 and S. B. 1128, either as originally presented to the California Legislature on January 25, 1939, or in the almost entirely rewritten A. B. 2172, as amended on April 14, 1939. (The long-awaited amendments were finally submitted three days before the public hearing held on April 19 by the Assembly and Senate committees in the crowded Assembly chambers at Sacramento.)

* * *

Public Hearing on A. B. 2172 at Sacramento: A Practically New Bill.—In the Sacramento public hearing it was stated that the persons backing the proposed legislation had given long and serious thought to the drafting of A. B. 2172 and S. B. 1128, so that, when submitted to the legislators, a minimum of amendments only would be needed. It became evident, however, soon after the initial presentation of the bills on January 25, that the proposed laws (seen practically up to the date of their submittal only by those who had previously committed themselves to a compulsory health system) contained many defects in the drafts.

This fact was emphasized at the Sacramento hearing when, in exchange of statement and opinion by Mr. Chester Rowell, Chairman of the Governor's Committee of Twenty-one,* and Assemblyman Ben Rosenthal (who stated he was the author of the bill), with a representative of the Labor Council of San Francisco, it was brought out by the last speaker that the Labor Council had adopted a resolution favoring only health insurance in principle (not A. B. 2172 as submitted on January 25, and certainly not A. B. 2172 as amended from some nine to about thirty pages on April 14). The amended measure, no one, presumably, other than the proponents who were seeking the endorsement of the Assembly committee had had an opportunity to study prior to the evening of the April 19 hearing.† And yet, the proponents hoped to have the Assembly committee bring out a recommendation that it "do pass." Strange inconsistency.

* * *

Professors Dodd and May.—Yet it was just such a measure, with an estimated annual income from taxation sources of almost seventy million dollars (the figures are those read by Paul A. Dodd of California Medical Economic Survey fame, and given by him in the April 19 hearing), that the sponsors of the legislation insisted should be adopted!

With this insistence goes an implied threat to the members of the medical profession that if they do not accept the legislation as proposed the matter will be taken to the people for vote! Witness in this connection some excerpts from the talk by Professor Samuel C. May, Director of the Bureau of Public Administration, University of California, as given on page 383 of the official publication of the Commonwealth Club, issue of March 28, 1939, at which time he stated:

> . . . A voluntary plan covers the worst risks rather than the best risks. *But the most important factor is that from 30 to 40 per cent of the American public are not receiving adequate medical service,** and they are in the income groups which will not join the voluntary plan. . . .
>
> *The bill which is now before the California Legislature has been carefully thought out by people who have been studying this for many years. If it is not adopted by the Legislature, it will go on the ballot and be voted on by the people of California.* I have no doubt whatsoever that if it goes on the ballot it will pass by an overwhelming vote. . . .
>
> So, gentlemen, as a practical problem, you cannot stop compulsory health insurance. The medical profession, instead of continually fighting it—and I am not certain they have stopped that fight—should come into the compulsory plan and see that it is properly formulated and administered, because they are going to get compulsory health insurance, whether they want it or not. . . .

Columnist Rowell, in his dissertation in the San Francisco *Chronicle* of April 25, gives expression to a point of view similar to that of his co-worker, Professor May, when he states:

> There is going to be a health insurance law submitted to the people—by referendum, if the Legislature passes the bill; by initiative if it does not. The doctors would do well to coöperate in passing the bill by the Legislature, so that the vote may be by referendum and on it, as it may emerge from the crucible of legislative discussion, rather than risk that the initiative might be submitted by groups less considerate of the doctors, employers and taxpayers than the framers of this bill have been. To use the sort of Latin in which doctors often write prescriptions: "verb. sap. sat."

The above quotations should be of special interest to physicians, not only because Professor

* For names, and complexion as to interests, see CALIFORNIA AND WESTERN MEDICINE, March, 1939, on page 229.

† The item below, which appeared in the San Francisco *Chronicle*, April 26, gives later news on the course of A. B. 2172 in the Assembly. The vote of the committee is the same as the forecast thereon, prior to the April 19 Assembly hearing. Item follows:

Assembly Unit Backs Health Insurance

Sacramento, April 25 (AP).—The Assembly committee on unemployment tonight sent to the floor with a favorable recommendation the Rosenthal bill proposing a State compulsory health insurance program. The decision was reached at an executive session and the vote was 5 to 2.

Under terms of the bill the program would be financed through joint contributions from employers and employees, with the State also bearing a portion of the expense.

Fred Reaves, San Pedro Democrat, who is chairman of the committee, predicted the bill would be passed by the Assembly.

* Editor's Note.—Italics our own.

May and Editor Rowell have sat with the inner council of the sponsors of the compulsory legislation, but also owing to the patently erroneous statement by these laymen, both on the rostrum and in print, concerning the large proportion of American citizens whom they and others claim are receiving inadequate medical care.

* * *

By Contrast, Read a Sane Statement by an International Authority on Public Health.—By way of contrast to statements made by several of the laymen who were associated with the California Medical Economic Survey, and by others in the proponent group for compulsory health legislation who have recently been making speeches on the subject, and to close these comments, we shall quote from an address, "Signs of the Times in Public Health," by Haven Emerson, M. D., Professor of Public Health Practice of the De Lamar Institute of Public Health of Columbia University, an international and much-beloved authority on public health problems, who has made important surveys at home and abroad,[‡] and who said, in a recent New Jersey address:

> . . . That a high quality of care has been given to the sick poor in the past is generally admitted, and is attested by adequate statistical proof of the reduction in morbidity and mortality to their present low levels among such persons.
>
> That some people who need medical attention do not receive it will always be true, as it is today, but the reasons for this are not largely, if at all, due to the inability of these sick to pay for the cost of necessary treatment, but chiefly result from ignorance, superstition, and misinformation growing out of religious beliefs and faith in the promotion of advertised medicaments. *That anything like one-third of the sick now lack medical care*[†] or even that a larger proportion of the population are hindered from gainful employment by preventable and remediable but uncared for disease, as the peroration of the technical committee [lay committee of "technical experts, appointed by President Roosevelt's 'Interdepartmental Committee' "] would try to persuade us with statistics and emotional publicity, is just so far from the truth that it will be forgotten by the public and by the physicians of this country who know it is not so. . . .
>
> . . . We must expect on the experience of other countries that if government actually operates on any compulsory insurance scheme a considerable amount of the services for the sick for people at low-income levels, the cost of medical care of these people will be largely increased, perhaps doubled by the cost of administration!
>
> We have good reason also to suspect that the quality of care will deteriorate, and that the amount and duration of complaints of illness, and the amount of medicaments used will all markedly increase.
>
> The present cause of lack of well-qualified medical care for those really needing it, and wanting it but not receiving it, is chiefly ignorance of available resources, and it would appear that *such sick persons are included in not more than five per cent and in various samplings less than one-half of one per cent of the total population.*[†]
>
> It is as much the duty of the medical profession to warn the public against extravagant and utopian schemes of all inclusive commercial or governmental provision of medical care with their inevitable inferiorities as it is to assure a constantly improved standard of personal service to the sick on the basis of private economic and professional relationship! . . .

Who Are the Proponents and Opponents of Compulsory Health Legislation?—Is it not permissible to state, as regards compulsory health insurance, that there are two camps?

1. *The Proponents* for such legislation, who are largely lay persons, with little inside or expert knowledge of medical practice and service, who expound theoretical plans supposedly based on the experience of peoples in other lands, but which, if logical and clear thinking be observed, are not applicable to California; and

2. *The Opponents,* the leaders of whom are the practitioners of medicine, to whom America is so greatly indebted for having the lowest morbidity and mortality rates of any civilized country[†] (the compulsory health system countries not excluded), and who, probably up to 90 per cent or more, are opposed to a compulsory health system of medical practice, their opposition being reinforced by public health experts of wide experience and international reputation, such as Haven Emerson of New York. Fortunately, also, allied with this group are the large and small business interests of the United States, through whom much of the prosperity that has made for higher standards of living has been developed.

In conclusion, it may be affirmed that if a health system were to come into existence in California such as is contemplated in the proposed law known as A. B. 2172, the people of California, in every walk of life, would rue and doubly rue the day on which they took the advice of false prophets to sell their birthright for a mess of pottage!

AUSTRALIA'S RECENT EXPERIENCE WITH A COMPULSORY HEALTH SYSTEM

Misstatement Regarding Universal Success of Compulsory Health Insurance.—Proponents of a governmental compulsory health system for California have emphasized during the last several months, and almost overstressed their statements, that compulsory health systems have been great successes wherever tried. Some brief excerpts, however, from the speech of Mr. Chester Rowell of San Francisco (Chairman of Governor Olson's Committee of Twenty-one on Health Insurance, of which committee Barbara Nachtrieb Armstrong is secretary, he and she also having held similar positions when the abortive attempt was made some two decades ago to use California as the guinea pig for a compulsory health system), may indicate why the statement above is here given. We quote from page 375 of *The Commonwealth* (Vol. XV, No. 13, for March 28, 1939), where Mr. Rowell states:

> . . . Now, all the way from the Chinese coolie up to the highest and most developed civilized nations in the world, health insurance is in operation. . . .
>
> . . . The rest of the world has abundant experience in applying health insurance to non-occupational diseases—more than fifty years in Germany, a quarter of a century in Britain and other countries. It now covers the civilized world—except for this country. . . .

[‡] See "Who's Who in America," 1938-1939, on page 838, for the record of past services of Professor Haven Emerson.

[†] Editor's Note.—Italics our own.

[†] See in this issue, for example, the record of California for the year 1938, on page 387.

Australia's Repudiation of Its Recent System. Because of declarations such as the above, it may not be out of place to call attention to the recent experience of Australia, where propagandists for a compulsory health system were successful in securing the enactment of laws not greatly dissimilar from those now being so assiduously advocated in California by certain well-recognized interests.

Read, by variation, not the supposed laudatory commendation of the peasant class of Germany or the very low income wage-earning group in England, on the beneficent nature of compulsory health systems (as so frequently portrayed by American proponents of such legislation), but what has actually come to light in a recent real experience with compulsory health insurance among the highly progressive, up-to-date and forward-moving Australians!

The tale* of the events there, as cited below, may be of interest to Editor Rowell and his colaborers, and not without deep significance to Californians, should their citizenry ever be so unfortunate as to embark upon a similar compulsory enterprise:

> National Health Insurance Abandoned †
>
> The commonwealth government of Australia has now decided to abandon completely its scheme for national health and pensions insurance. In a determined effort to preserve the plan even if only in skeleton form, several alternative schemes less comprehensive in nature were considered, but the agreement to abandon the whole insurance act was reached today with only two members dissenting. The treasurer (Mr. R. G. Casey), who evolved the scheme and fathered it through Parliament, has now emerged as one of the strongest advocates against it. Reasons advanced for this decision are fear that the financial burden involved may be so great as to stifle the normal developmental expenditure if it is allowed to fall simultaneously with the heavy defense program to which the ministry is already committed, fear of the repercussions from the cost of insurance while the greater part of the commonwealth is suffering from the effects of severe drought and widespread bush fires, and a recognition of the fact that throughout Australia the act is highly unpopular and that its introduction against the wishes of the people may lead, ultimately, to grave political consequences.
>
> The opposition to the scheme in the ministry itself, although strong when Parliament adjourned in December, has increased immensely since. In the past two months, members of the cabinet have moved freely in their electorates and have in many cases been astonished at the intensity of public feeling against national insurance.
>
> The abandonment of the scheme will cost the commonwealth government at least 750,000 pounds and perhaps 1,000,000 pounds, according to estimates made by the National Insurance Commission. Large sums of money have been spent on the initial steps for its establishment, and numerous "approved societies" have incurred heavy expenditures to cope with the new responsibilities which they were prepared to undertake. Already 156 such societies have been formed in Australia, sixty by trade-unions, fifty-nine by friendly societies, and thirty-seven by miscellaneous organizations; wages contracts have been entered into with staffs, and many men have left lucrative posts to take administrative positions with the government or with approved societies. The government has not yet considered whether the whole organization which it created will be disbanded immediately or whether it will be kept to form a nucleus for the proposed national register (for defense purposes). The British Medical Association in Australia has been opposed from the start to national insurance as proposed by the government. It is to be hoped that this abandonment of the present scheme will furnish an opportunity for drawing up at some future date a scheme more universally acceptable, to be put into practice at a time when the nation is better prepared to handle developmental measures.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 367.

EDITORIAL COMMENT†

THE PELVIC FLOOR

There is no doubt that the mooted question of what constitutes the most important natural supports has had more different answers, by more different men, than perhaps any other gynecological question. Abundant reason exists for the wide discrepancies in opinion, depending upon the investigator, whether anatomist or gynecologist. For the anatomist there exists the plain evidence of the different normal tissues which make up the pelvic walls, with little or no speculation upon the pathological state. The gynecologist, on the other hand, views first the pathological changes which may occur, whereby the basic support of the pelvic contents are either wanting or greatly insufficient. Having determined the results of these changes, he sets about to effect a restitution of the normal. This is accomplished by operation about the vagina, or entering the abdomen from above.

When we review the anatomy of the pelvic floor, with its related structures, we see why either method of attack may be necessary. We see, also, that what appears at times an incomplete operation, is met with a splendid functional and symptomatic result.

The pelvic floor may be divided into two parts—a superior and an inferior—on account of their anatomical relations. The inferior pelvic floor consists of voluntary muscles, their sheaths or fascia, some areolar tissue, blood vessels, sheaths and nerves. As this is not an anatomical paper, but rather gynecological, the anatomy is but grossly referred to.

The chief muscles of the female perineum are, of course, the levator ani and the cocygeus which, according to anatomies, support and raise the floor of the pelvis. They are chiefly swung between three important points—rami of the pubes, central raphe coccyx, and sacrum behind. These muscles lie between an important fascia which forms their sheath, and which is derived from the obturator and recto-fascia. The obturator fascia covers the inner surface of the obturator internus muscle; it is attached to the iliac portion of the iliopectineal line, to the body of the pubis, and to the great sacrosciatic ligament and notch. Below it joins the falciform process of the great sacrosciatic ligament, and binds the ischiorectal fossa externally. Near its upper margin it gives off the anal fascia, which covers the levator ani and binds the ischiorectal fossa internally. The fascia of the pyriformis is continued back from the obturator muscle. The rectovesical fascia is attached in front to the back of the pubis, and is laterally separated from the obturator fascia. This fascia, covering the upper surface of the levator ani muscle, passes to the upper surface of the vagina to form the front of the sheath of the rectum. In front it is continued to the upper layer of the triangular ligament. Thus, this fascia forms the staunch support of the ligaments of the bladder and rectum.

---

* From the *Journal A. M. A.*, April 8, 1939, on page 1402.

† From our regular correspondent: February 14, 1939.

† This department of California and Western Medicine presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

When one compares these relatively poorly developed muscles with those of the rest of the body, which must bear constant stress of tension and work, it becomes evident from the ever present pressure from above that the muscles, themselves, were scarcely intended, even in a slight way, to represent support. They have always appeared to serve some local function of the vagina and rectum, though in no sense as an important muscular support. The interposition of the vagina nullifies any intention of these muscles as supports. This slit offers abundant room for the uterus, as a wedge, whenever that organ, with bladder and rectum, begins to prolapse.

In spite of the above, almost every authority stresses upon uniting the torn edges of the levator muscles in repairing the perineal floor. Yet, when this is done, only a few torn strands of muscle are found, surrounded by well-developed fascia.

It is evident that the inadequate strands of muscle fibers cannot act as supports, while the strong fascia in this region can; hence, the importance should be placed where it belongs, namely, upon the fascia. The muscle itself affords movement, resiliency, and adaptability. For example, could we assume that the well-developed recti, back muscles, neck and thigh muscles, act as efficient supports without their strong sheaths. Notwithstanding these facts, almost every authority and textbook abound with the importance and significance of this poor, frazzled and torn levator muscle, and no emphasis is laid upon the torn fascia. The important thing is, as we have come to learn from our own cases, that the perineal fascia is the structure of paramount importance, and the approximation of its torn edges is the operation of necessity.

Now, in view of the above facts, we know that uteri prolapsus is due to weakness in the pelvic floor, and insufficiency of intrapelvic and uterine supports. A tight, well-closed vaginal outlet is the most important factor in retaining the uterus within the pelvis.

San Francisco.

SKIN TEST FOR ALCOHOL TOLERANCE

That individual susceptibility to ingested alcohol can be titrated by the endermic injection of ethyl alcohol was recently claimed by Dr. John M. Nagle[1] of the Psychiatric Clinic, Agnews State Hospital, California, in a paper, presented by invitation, before the San Francisco meeting of the Association for the Study of Allergy. If the reliability of the Nagle skin test is confirmed by other investigators, the test would be a valuable addition to the practical clinical technique, and might lead to new and more effective methods of therapy and control of alcoholism.

That there are wide differences in the susceptibility of different individuals to ethyl alcohol is now generally recognized. Recent studies by the Psychotechnic Institute,[2] Dresden, Germany, for example, show that 20 per cent of all normal individuals are rendered psychologically incapable of safe automobile driving as soon as the alcohol content of the blood stream is increased to 0.02 per cent. This is an amount equivalent to the alcohol content of one small bottle of beer, assuming that the beverage is completely absorbed from the gastro-intestinal tract. At the other end of their susceptibility scale, the Dresden investigators claim that 10 per cent of all individuals remain perfectly sober, even after the alcohol content of the blood stream is increased to six times this amount.

If the complex psychological tests used by the Dresden investigators can be replaced by a simple skin test, as Doctor Nagle affirms, a feasible scientific diagnosis of alcoholic intoxication will be made possible. Methods now official in certain European countries are unscientific. In Sweden, for example, a man is legally intoxicated as soon as the alcohol content of the blood stream reaches 0.05 per cent, irrespective of the individual coefficient of tolerance. Accepting the percentages reported by the Dresden psychologists, less than half of the individuals are demonstrably intoxicated at this concentration.

In Doctor Nagle's endermic titration, 0.03 cubic centimeters, 60 per cent ethyl alcohol is injected intracutaneously in the deltoid region of the left arm, with a control injection of the same volume of physiological salt solution in the right arm. Almost immediately wheal formation is noted. Since this wheal is fairly constant in size and intensity in all individuals, it is of no diagnostic significance. Surrounding this wheal, however, an inflammatory reaction of varying size and intensity soon develops, reaching its maximum in about thirty minutes. In alcohol allergics this peripheral erythema may be three or more inches in diameter, in extreme cases even extending over the entire surface of the upper arm. About 20 per cent of the two hundred cases tested by Doctor Nagle gave reaction of this severity, agreeing quite closely with the 20 per cent alcohol allergics reported by the Dresden investigators. At the other end of Doctor Nagle's scale, approximately 10 per cent of his tested individuals gave no peripheral inflammatory reaction whatsoever, agreeing quite closely with the 10 per cent alcohol-tolerant group of the Dresden psychologists.

---

[1] Nagle, John M., paper read before the Association for the Study of Allergy, San Francisco, June 11, 1938 (to be published).

[2] Foreign Letters (Berlin), J. A. M. A., 110: 1617 (May 7), 1938.

Doctor Nagle supported his conclusion that the proposed skin test is a reliable measure of individual tolerance or susceptibility to ingested alcohol by the histories of one hundred committed alcoholics tested during the past eighteen months in Agnews State Hospital. Habitual alcohol consumption by these individuals before court commitment was, in all cases, inversely proportional to skin tolerance. In many alcohol allergics habitual consumption was less than that of the average nonalcoholic social drinker. In one extreme case, for example, alcohol was not suspected as an etiological factor in the commitment "psychosis," till his skin test revealed a four plus hypersusceptibility. In this case the commitment diagnosis was changed to "alcoholic allergy without psychosis." A very interesting confirmation of Doctor Nagle's conclusion was obtained by susceptibility tests on eleven nonalcoholic volunteers. The minimum number of highballs taken on an empty stomach necessary to cause detectable intoxication (speech defects) was determined for each of these individuals. From data thus obtained, Doctor Nagle predicted the severity of the subsequent skin reaction correctly in ten cases.

In the discussion of Doctor Nagle's paper before the Allergic Association, it was pointed out that ten years ago his conclusion would have been accepted without question. At that time the skin reaction was quite generally considered to be both qualitatively and quantitatively diagnostic of the allergic sensitivity of all other tissues and organs of the human body. During the last decade, however, it has been definitely shown that marked cutaneous sensitivity may be, and often is, associated with a nonreacting bronchial musculature, and that high pulmonary sensitivity is occasionally associated with nonallergic skin. At the present time, therefore, most allergists will be skeptical of Doctor Nagle's claims till the reliability of his test is confirmed by more adequate and detailed experimental or clinical evidence. If confirmed, however, Doctor Nagle has made an epoch-making contribution to medico-legal and clinical technique.

CONTRAINDICATIONS OF MANIPULATION IN ORTHOPEDICS

Manipulation should be used judiciously, for its use in many cases may be definitely harmful. Particularly is this so when there has been a failure of diagnosis of the condition to be treated, or where the diagnosis has been incorrect. The condition called lumbago, for example (which implies simply the existence of back pain), consists, in fact, of a failure of diagnosis. Probably 90 per cent of the cases of so-called sciatica constitute incorrect diagnoses, the reason being that any pain radiating down the back of the leg is frequently labeled sciatica.

The reasons for this should be clear, but to elucidate: A patient with a diagnosis of lumbago is sent in for treatment. All this means is that the patient has a pain in his back, and that, too frequently, is all the doctor knows about it. Obviously, a pain in the back, or lumbago, may be due to any number of pathologic conditions, such as acute and chronic infectious spondylitis, syphilis, osteochondritis, tuberculosis, spondylolisthesis, or forward slipping of one vertebra on another, the only symptom of which may be back pain. It is probably superfluous to mention fractures of the spine as a contraindication to manipulation, yet certain fractures of transverse processes are frequently missed and, therefore, may be called lumbago.

Many other conditions may be mentioned, but attention will be called only to acute and chronic osteomyelitis, bone tumors, whether primary or metastatic, and finally low-back strain, by which is meant lumbosacral or sacro-iliac strain. This last-mentioned condition is probably that most frequently called lumbago. The reason why manipulation is contraindicated in this condition should be clear when one visualizes what, in fact, is meant by strain. In sacro-iliac strain, for example, the underlying pathology is a rupture or tearing of the sacro-iliac ligaments, or those ligaments which bridge the joint between the ileum and the sacrum, and which constitute its principal support. Coincidental with such rupture or tearing, there is bleeding or hemorrhage from the ends of the torn ligaments and, eventually, organization of the blood-clot and repair by means of infiltration of new connective tissue.

Now, if at any phase of this process a back so affected is manipulated, the reparative process is interrupted, thereby prolonging recovery and adding to the patient's pain. The contraindication to manipulation in the other conditions mentioned is more easily apparent; as, for instance, the dissemination of malignant cells in bone-tumor cases, facilitating metastases, or the production of pathologic fractures, by weakening a spine already structurally weak from disease. In spondylolisthesis, manipulation may increase the deformity, may cause, as in fractures of the spine, pressure on nerve roots or on the cord, as the case may be, resulting in paralyses of varying extents.

As mentioned before, sciatica is frequently an incorrect diagnosis. Sciatica is a synonym for sciatic neuritis, or inflammation of the sciatic nerve. When present, there is, in fact, pain down the back of the leg, but, in addition, there are sensory disturbances and loss of reflexes. The signs are scattered, or they may be referable to involvement of the entire nerve. Incidentally, the condition is relatively rare. On the other hand, pain down the back of the leg is relatively common, and is frequently due to pressure on the nerve roots of one of the nerves which forms the sciatic, by changes in the vertebral articulations at the point of emergence of the nerve. In either instance, manipulation is contraindicated, but particularly so in true sciatic neuritis, where rest, heat, and removal of focal infection should be carried out. It is, of course, almost as absurd to manipulate a leg because of pain down the back of it, when the pain is due to pressure on one of the nerve roots above. It is not only futile as a therapeutic procedure, but it also helps to mask the true cause of the pain and delays investigation leading to proper diagnosis and appropriate treatment. For these reasons, the procedure known as "stretching the sciatic," in the author's opinion, should be completely dropped as a therapeutic modality. In addition to an almost universal contraindication, it is extremely doubtful if the sciatic nerve is stretched by the procedure, and if it is stretched, whether it makes any difference.

Manipulation is also contraindicated in many definitely diagnosed conditions, such as fractures which are not completely healed, acute subacromial bursitis, cases of which undoubtedly have been labeled neuritis of the shoulder, acute and chronic arthritis, and others. In instances of fibrous ankylosis of joints, whether the result of a cured arthritis, or of prolonged immobilization during the healing of a fracture, this modality may be used, but only with extreme caution, lest a fracture result. Hence, it seems wise to use the modality of manipulation only occasionally, rather than almost constantly, as is done by the chiropractors and osteopaths.

In conclusion, the most outstanding contraindication for manipulation is failure of diagnosis, or incorrect diagnosis. When the condition under treatment is known to be a fibrous ankylosis, and almost only then, manipulation may be used with safety and with benefit.

Oakland.

Explains Means of Preventing the Reactions From Vein Feedings.—Means of preventing the fever and chills which may follow intravenous or vein feedings are explained by Charles M. Nelson, M.D., Richmond, Virginia, in *The Journal of the American Medical Association* for April 8.

Although these reactions have been commonly attributed to various causes, Doctor Nelson says that experiments show the real factor is bacterial contamination of the distilled water used in the solutions for these feedings.

Boiling the water to be used for six hours will destroy the fever-producing agent. Autoclaving (sterilization under steam pressure) for three or four hours will also destroy it. The usual sterilization period tends to enhance its growth.

Even when sterilized by the usual method, the tubing and flasks used in giving intravenous feedings may sometimes cause fevers, as the fever-producing factor may have lodged in them previously while a solution (not autoclaved) was passing through the apparatus.

Doctor Nelson points out that "any organism that is capable of elaborating a fever-producing substance, which thrives at room temperature and which is a common contaminant, may be the offender. No organism will ever be the offender if the distilled water is taken directly from the still—most storage tanks are contaminated by backflow of air when the still cools—and autoclaved immediately."

People who are always taking care of their health are like misers, who are hoarding up a treasure which they have never spirit enough to enjoy.—Sterne.

MEDICAL TRENDS*

ADDRESS OF THE PRESIDENT

By William W. Roblee, M.D.
Riverside

Another year in the history of the California Medical Association has come and gone. The by-laws provide that, at the annual meeting, the President shall deliver an address which shall summarize for its members the events of the past year and the problems unsolved or in prospect. Your President presents his report in fulfillment of that mandate.

This has been a very busy and eventful year in organized medicine. Administrative, political, economic, and scientific problems have engaged the attention of your officers, committeemen, the House of Delegates and membership to a larger degree than heretofore.

INCREASING COMPLEXITY OF MEDICAL PROBLEMS

Each year the problems become more complex. The reasons therefor extend far out into the fabric of civilization. Medicine is but one part of this social picture; and much as some of us may wish for a continuation of the *status quo,* such a policy is impossible. The science and art of medicine are not static, its social and economic features are also subject to evolutionary change. Our thought and action must conform to them or we shall go the way of the dinosaur, and the saber-tooth tiger. They were physically powerful, but lack of adaptability to changed conditions eliminated them.

HISTORICAL BACKGROUND

A brief historical résumé of some of the elements of American life that have brought about present-day conditions and problems may profit us.

The American continent was settled by a sturdy, independent group of citizens. They were adventurous spirits who desired freedom from oppression and an opportunity to develop along independent lines. There was room for all on a continent rich in natural resources. Pioneer conditions were not easy and the fit who survived became, because of inheritance and the struggle for existence, a hardy race of independent thinkers, in which the family was the social unit and the family cared for its own. In comparison with our cities theirs were very small towns, life was largely rural, social contacts were confined to small villages and neighborhood gatherings. Life was simple, needs were few and largely provided by the products of the farm.

AUTHOR'S RECOLLECTIONS

My memory goes back to grandfather's pioneer farm in northern Wisconsin and of seeing him cut wheat with a scythe, thresh it with a flail and take it to a grist mill where the miller ground it for a share of the flour. I have seen grandmother at the spinning wheel, spinning yarn from wool raised on their own sheep, then knitting it into various protective garments. The doctor made his calls in a well-weathered phaeton or on horseback, and he not infrequently had to face a blizzard on foot. His financial receipts were small and often in kind; but he was rich in the confidence and affection of the people he served.

---

* Address of the President. Given at the first general meeting of the sixty-eighth annual session of the California Medical Association, May 1-4, 1939, Del Monte.

TWO SCHOOLS OF ECONOMIC THOUGHT

Immediately preceding and following the Revolutionary War two great schools of economic thought developed in this country. One, headed by Alexander Hamilton, advocated as rapid a development of industry as possible and a restricted electorate veering toward a monarchy. The other, with Thomas Jefferson as its spokesman, advocated a nation of small rural land holders, a more liberal electoral franchise, and a trust in the common people. There were many other lines of cleavage between the economic thought of these men which lack of time does not permit us to consider in detail.

Out of the very strenuous debates of that period, which were serious enough to result in the death of Hamilton at the hands of Aaron Burr, there developed the American concept of government which, while providing for unity of national life, conserves the highest degree of freedom for the individual.

SUBSEQUENT DEVELOPMENTS

In the meantime the country was being settled by immigrants from northern Europe who rapidly became splendid American citizens. Take the Irish, for example; what would the country have done for policemen, railroad section bosses or politicians if the Irish had remained in Ireland? Its Friendly Sons of St. Patrick, organized before the Revolutionary War and of which George Washington was happy to become an honorary member, has until this day supplied patriotic leadership in every time of crisis affecting our nation. The English, Dutch, French, and Scandinavians were equally splendid additions to our citizenship. Every man and woman worked, dependency was negligible, and when it did occur the family cared for its own. These conditions obtained until after the Civil War. In the 80's and 90's the picture underwent a decided change. By the beginning of the present century good Government land was about exhausted and the population became less mobile. Yankee inventiveness resulted in the development of a "machine age," whereby hand labor became less in demand and population was concentrated in industrial areas. The capitalist owner of the machines found that he could increase his profits greatly by securing a supply of cheap labor which was imported in great quantities, largely from southern European countries.

Big business was ruthless in competition, and its brutal exploitation of the workers became of great economic and social concern. The great organizations of capital were gradually counterbalanced by the slow, but steady organization of the workers into trade-unions with resultant improvement in labor conditions, often arrived at after serious strife and occasional bloodshed.

The center of political and economic life shifted to the great cities and factory centers and the farmer ceased being the controlling force in the nation. During these same years great discoveries were made in the realm of theoretical and applied science, and their application to our lives wrought profound changes in them. I have but to mention the changes in transportation and communication within the life of most of those here today to illustrate the point. Material standards of living were elevated and American citizens became the best fed, housed and clothed, educated and amused, that the world has ever known. The trite remark, that the "luxuries of our forefathers have become our necessities," certainly holds good.

RÔLES OF PREVENTIVE AND CURATIVE MEDICINE

Medicine, both preventive and curative, partook of this great renaissance. The great plagues of the past no longer mow down our citizens; infant and maternal mortality have been greatly lowered; specific remedies, such as quinin, salvarsan, sulfanilamide, insulin, and the curative and prophylactic sera, have been discovered. The advances in surgery have been unparalleled, and the psychiatrists take our minds apart, polish up the wheels and return many victims of mental disease to useful citizenship.

Of the three great agencies that limited population—famine, pestilence, and war—two are largely under control, and only war is functioning in the same old efficient manner.

Hospital care for sick people has been established with resultant saving of many lives. Few of the younger men in the profession realize that many of their older colleagues, who are their competitors, went through the horse-and-buggy, kitchen-table stage of medicine and surgery.

The factors enumerated have doubled the life expectancy in the past fifty years and the population of the world in the last one hundred years—a greater increase than in the preceding two thousand years.

We were geared in territory, in population, in business and in ideas to a continuously expanding world. There were wars which consolidated the existing system, but none of which disrupted it. The normal state was peace. Democracy had arrived in the advanced countries and appeared on the way elsewhere. Everything had grown so fast during our lives and that of our fathers that we forgot how small the earth was and imagined our particular sort of progress would go on forever. No one doubted that the able and energetic man could get ahead, nor questioned the desirability of his free opportunity to do so. We thought that we had arrived at the goal of human progress and that nothing remained but to improve, on the same lines, the job already done. It was a generation satisfied with itself and the world.

HOW AND WHEN THE CENTURY CLOSED

The century closed, not on its chronological date, December 31, 1900, but fourteen years later when the world with which we had been so satisfied cracked to pieces, never to be restored. Since then, to be sure, there has been progress even of the old sort, and it is not over. But we have discovered that the earth is a limited planet on which there will never be room to do again the spectacular expansions which the nineteenth century saw. However, out of this time of confusion must come something constructive. It will not be the restoration of the nineteenth century, much as some of us would like it. But neither will there be discarded the truths, a repudiation of the standards, the rejection of the experience which it and its predecessors bequeathed. Medicine has, and must continue to share in the adjustments which social evolution has forced upon the modern world.

Many factors enter into the picture of present-day civilization as it exists in this country, but those enumerated will suffice to illustrate the points that I desire to discuss with you today.

PRESENT-DAY PROBLEMS

First: Famine and pestilence having been abolished, mothers and babies conserved, generally better housing and food made available, preventive and curative medicine and surgery advanced, what has been the result? It is perfectly obvious that there has been a greatly increased number of people who live to old age.

Second: Industry has no place for the elderly citizen. A man beyond forty or forty-five has a hard time securing a job or holding it after he gets it.

Third: Because of war, dictatorial restriction, tariff walls and competition developing in other countries and dire want therein, commerce has been greatly dislocated. The prunes of Santa Clara, the peaches of San Joaquin, the oranges of the South, no longer find a ready market in other countries. Economic conditions confronting our great agricultural population have been very trying for the past several years. Many of our usually solvent independent farmers have had great difficulty in securing sufficient return from their crops to remain solvent. The dread of the unusual expense entailed by catastrophic illness hangs heavily over them. Your Council and special committees have had several conferences with the State Farm Bureau leaders. They are a splendid group of citizens, and we were able to acquire a knowledge of our mutual problems that will be invaluable.

They desire an insurance program and a moderate liberalization of admissions to the county hospitals. They frankly say that unless we present a helpful program they will consider a connection with a private insurance group and join with those who advocate county hospital admission on as free a basis as are the public schools for the education of their children.

These factors and many others, some of the most serious of which are domestic and political, combine to cause serious unemployment. About 10 per cent of our citizens are without jobs and their dependents suffer with them.

The machine age is upon us, hand labor will be continuously less in demand. It is perfectly obvious that social and economic life must be readjusted to these changed conditions. The basic needs of mankind, viz., food, shelter, clothing, and care for the sick and disabled—must be supplied. A study of any of these factors must take them all into consideration. Many such studies have been financed and made by philanthropic foundations, the Federal Government, and special interests.

APPLICATION TO CALIFORNIA

But we must narrow our consideration to our own State and the problems of sickness herein. We note the studies made by the "Committee on the Costs of Medical Care," under the chairmanship of Dr. Ray Lyman Wilbur, in 1929 and 1930; the study made by Margaret Klem in 1935 for the State Relief Administration; our own economic survey in 1935-1936; the survey now being completed by the SRA, and various special studies made by the Farm Bureau, organized labor, etc.

It is to be noted that none of these studies were made by doctors of medicine, but all were made by lay social workers. Our own survey was supervised by a university economist, the field work being done by untrained State relief workers, a mistake that we have had cause to regret. None but experienced doctors of medicine can accurately evaluate a sickness or disability problem. This has been abundantly proved by our own experience. The basic conclusion reached by the lay surveys is that at least one-third of our population is without adequate medical care. You and I know that such a condition does not exist in this State. I have visited every county society in California and I have put the question to our members individually and collectively, and the reply has been invariably that any person applying to a doctor of medicine for medical care either will receive it at once or be directed to where it can be secured.

The State Medical Society of New Jersey has made a survey by its own members, and they have reached the conclusion that not over 5 per cent of their people are not receiving adequate care and that the lack is largely of their own choosing, the facilities being available if called for. Organized medicine is fully conscious of the medical needs of the public, and is willing and able to meet these needs, and has been doing so at the rate of one million dollars of free service per day during these years of special stress!

CONCLUSIONS OF THE LAY ECONOMISTS

The major conclusions reached by the lay economists and socialists are three in number:

First: That one-third of the people are without adequate medical care.

Second: That some form of sickness insurance under governmental regulation is the answer.

Third: That this must be compulsory.

These conclusions have been publicized from the platform, the press, the "halls of learning," and legislatures, until a large portion of the population believes them to be true. Any statement can be iterated and reiterated often and vociferously enough to cause its acceptance by many people, and in fact very many of our people are thinking and saying that they know better than the doctors how medicine should be practiced. They do not question the doctors' ability to treat the sick, but they do question the *modus operandi* by which his skill shall be available.

ANALYSIS OF THE CONTENTIONS

Of the three basic contentions just enumerated the medical profession is in hearty accord with the initial clause of the second, namely, that an application of the insurance principle to the hazard of catastrophic illness is a proper measure, and organized medicine has laid down a set of principles to guide any such endeavor. These principles safeguard both the patient and his physician. They provide for the free choice of physician, no interference with medical practice by a political agency or organization for profit, and no compulsion. The aim is to provide adequate medical care for all the people by the physician of their choice at a price that is fair to all the people, including those who render the service.

PROVISION FOR MEDICAL CARE ON A PERIODIC PAYMENT BASIS

The principle that a person in time of physical and financial competence may provide on a budget basis, by fractional payment, for catastrophic need, is sound, and to be encouraged. This common-sense application of basic principles, however, does not satisfy the agitators for radical socialistic treatment of the problem. A goodly number of persons high in the councils of the State, both nationally and in our own State, and even a small minority of our professional colleagues, will not be satisfied with anything that is short of compelling regimentation of both the doctor and his patient. They would provide for another European experiment in social economics which would be dictatorial, un-American, political, regimental, and entirely beyond any guidance or control by the doctors of medicine who are best fitted by experience to handle the problem. This is a far cry from the principles enumerated and fought for by our forefathers, to which I called attention early in this address. They fought compulsion, regimentation and unjust taxation in every way possible. Are we, then, their sons, to flaunt their example and sit supinely by while these things are forced upon us?

The inherent right of both the patient and doctor for protection is largely ignored by the economists, social workers, and politicians in the plans they evolve. Medicine cannot be practiced on a mass-production basis. No compulsory panel system can assure the individual that careful attention to which the American people have been accustomed.

RÔLE OF THE PHYSICIAN

The physician has also been vested by custom and the State with certain rights that cannot lightly be cast aside. He has, in perfect good faith under the law of the land, spent years of time and at least $15,000 in cash in acquiring the necessary training for his professional work. Medicine is big business. The ten thousand doctors of medicine registered in this State spent not less than $150,000,000 in their preparation for service. They have families depending on them. The State has licensed them to conduct their professional work in competition with their fellows, each man making a success or failure in accordance with his capacity and worth. This is the American way, and we insist upon its continuance.

STUDIES BY ORGANIZED MEDICINE

The officers and committeemen to whom you have given authority to care for your interests have not been derelict in their duty. The American Medical Association and our own State Association both felt impelled to call special sessions of their Houses of Delegates for the consideration of pressing economic questions involving our profession. At these sessions the recommendations of your officers and committees were received, policies were debated and conclusions arrived at with which you are familiar.

In this connection I quote as follows from the annual report of the Director of the Bureau of Economics of the American Medical Association:

"Interest in Medical Care Plans.—Since the special session of the House of Delegates in September, 1938, some forty or more medical societies have sought assistance in the study and development of forms of medical service suited to their respective localities.

"The growing interest of medical societies and of the public in special arrangements for organizing payments for medical services can be almost directly measured by the increasing number of experiments conducted by state and county medical societies. In 1934 about 150 plans for distribution of medical services were being conducted by medical societies in various communities in the United States. By 1935 this number had grown to 200, by 1936 to 250, by 1937 to 350, and at present the number is in excess of 450.

"The existence of these organizational plans for the delivery of medical services is a direct refutation of the assertions that have been made concerning the unwillingness of the medical profession to tolerate change in the arrangement for payment for medical services. As a matter of fact, medical societies throughout the United States have in operation more experiments with new plans for the distribution of medical services than all the proponents of group payment plans have ever proposed."

CALIFORNIA PHYSICIANS' SERVICE

We, in California, have responded to the call and are rapidly perfecting a plan whereby prepayment of medical care on a coöperative basis can be secured.

The organization of our Physicians' Service corporation has entailed a tremendous amount of work on the part of the Council, the legal department, the Board of Trustees, of the corporation, and the special committees. We owe them our heartfelt appreciation. Such a state-wide effort has not heretofore been undertaken, and its progress is being observed with keen interest throughout the nation. It is an honest effort to supply, under proper auspices, a service of which the people at large feel the need. This effort will settle the question as to whether the public generally will patronize such a service. We believe it to be in line with modern economic thought.

The question has been asked repeatedly why was such a plan not offered ere this? The answer is that, in the opinion of your committees which have had this study in hand, neither the public nor the profession were ready for it. This year the various interested lines have converged both within and without the profession, and the time seems ripe for such a social experiment. The details, up to this date, will be supplied by the speakers who follow me on this program.

OTHER POLITICAL PROBLEMS

Our political interests have been this year very important, as there has been both a general state election and a session of the Legislature to keep under observation. Under the guidance of our legislative and special committee, the antivivisection initiative was decisively defeated. There is the usual collection of proposed laws in the Legislature which interest us. Some of them are very vicious, and they are demanding the close attention of our Legislative Committee. Any calls for assistance from the membership at large that may be issued must, as in the past, be loyally responded to.

The next regular or special state election will see other initiative measures qualified for the ballot. We hope to have a Basic Science measure for approval of the electorate at that time. These measures, both good and bad, will require our energetic attention.

SCIENTIFIC ACTIVITIES

Our scientific work is being well handled. The County Society programs are uniformally excellent, the state-wide postgraduate sessions are justifying the work of the committee, the program arranged for this annual session is unusually attractive, and we trust that those in attendance will take part freely in the discussions.

MEMBERSHIP

Membership: Our membership for the year 1938 reached an all-time high. We certified 6,219 members in good standing to the American Medical Association for that year. I would urge continued vigilance on the part of the secretaries of county units in order that all eligible, desirable doctors of medicine may be enrolled.

WOMAN'S AUXILIARY

I desire to draw attention to the excellent work done by our Woman's Auxiliary. Their acquaintance, one with another and with their husband's problems, has developed a solid substantial group of helpers that is wielding a very powerful influence for scientific medicine. In behalf of the Council, I extend to them warmest appreciation for their helpful influence.

COUNTY SOCIETY VISITATION

Your President has enjoyed visiting the county societies. California is an unwieldy State to administer, and a systematic visitation of our county units is a time-consuming effort; but it is well worth while. A first-hand discussion of our problems profits both the society members and especially the visiting officials. I recommend a continuance of that work.

THE FUTURE

As for the future of organized medicine I have no fear. We shall have our differences of opinion as to policies and leadership, but they will be solved in the American way. In the future, as has been in the past, after free and frank discussion we shall acquiesce in the will of the majority. Any other course is unthinkable.

Finally, your President desires to express his heartfelt appreciation for the support and friendly consideration that have been extended to him, and he requests that the same loyal support be given to President Charles A. Dukes during his coming year of service.

X-RAY TREATMENT OF CARCINOMA OF THE BREAST*

By Lyell C. Kinney, M.D.
San Diego

Discussion *by William E. Costolow, M.D., Los Angeles; Alson R. Kilgore, M.D., San Francisco; Robert S. Stone, M.D., San Francisco.*

BETWEEN the enthusiastic claims of some radiologists and the iconoclastic statements of some surgeons there are certain proven facts concerning the value of x-ray in carcinoma of the breast that can now be accepted. Any critical estimate must be based on a careful analysis of what constitutes early curable cancer and what must be considered late cancer, where only palliation can be expected. It is certain that x-ray cannot replace surgery in early operable carcinoma of the breast, and it is equally certain that radical surgery cannot replace x-ray or improve the palliation in late advanced cancer. The important problem is how far, if at all, surgery and radiation should overlap in the treatment of carcinoma of the breast. Early carcinoma of the breast where the growth is limited to the gland, or Group 1, is solely a surgical problem. The radical surgical procedure is well standardized, and the five-year cures have reached a constant level of approximately 75 per cent in well-organized clinics. There is no evidence that radiation, either before or after surgery, will improve this result. There are certain cases that are inoperable because of age or physical condition, where it is necessary to resort to radiation instead of surgery, but the best that can be expected is a 45 per cent survival rate, in contrast with a 75 per cent obtained by radical surgery.

PRACTICAL PROBLEMS

The practical problem arises as to which case is early and localized without extension to the axillary glands. There is approximately a 30 per cent error in the clinical estimate of axillary metastasis by palpation; that is, the palpable glands may not be metastatic, and there may be small metastatic glands that are not palpable. Another practical consideration is whether a localized tumor of the breast is, or is not malignant. In the absence of aspiration biopsy, which is not available or accurate in most clinics at this time, the final diagnosis must be made by surgical excision and frozen section.

---

* Read before the Radiology Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

It seems logical at this time to consider any localized, freely moveable lump in the breast as a possible carcinoma that should be immediately excised, with preparations made for microscopic diagnosis and for radical surgery at the time of the excision if proved malignant. If the pathological survey of the axillary contents shows no evidence of metastasis, there will be no indication for radiation. If, on the other hand, metastatic glands are discovered the case is no longer of Group 1, and the question of postoperative radiation must be considered.

There is no evidence at this time to justify extensive preoperative radiation or ovarian sterilization before a microscopic diagnosis is made in an early tumor of the breast without palpable axillary metastasis. The only indication is immediate microscopic diagnosis coincident with radical surgery if the growth is malignant.

LATE CARCINOMA OF THE BREAST: GROUP 3

Late carcinoma of the breast, or Group 3, where the growth is extended beyond the line of defense in the axillary glands, is strictly a radiation problem. According to Bloodgood, where the glands at the apex of the axilla are involved there is less than 5 per cent chance of five-year cure from surgery. If the axillary glands are fixed or massive, if there is involvement of the supraclavicular glands, if the growth is fixed to the chest wall, if there is extensive involvement of the skin or multiple skin metastases, or if roentgenographic survey shows distant metastases, the case is inoperable. There is no method today that will offer any appreciable percentage of five-year cures, and the problem is that of securing the greatest palliation. The attempt at radical surgery in these cases will shorten the patient's life, increase the suffering, and cannot be justified even from a palliation standpoint. Furthermore, the recession of such a growth under radiation does not render the case operable or increase the chance of radical surgery being curative or palliative. On the other hand, fractional radiation carried to skin tolerance will usually arrest the growth and the glands in a large percentage of cases, and will give maximum palliation without prolonged discomfort. There is a small group of cases where growth in the breast does not prove radio-sensitive and where simple mastectomy, following thorough radiation, is indicated to prevent or remove local ulceration. The radiation will not materially increase the length of life in Group 3 cases, but the palliative control from fractional radiation offers so much more than radical surgery that the lines of operability should be strictly drawn to those cases where the growth is localized to the breast or where there is no evidence that it is past the first defense barrier.

OPERABLE CARCINOMA OF THE BREAST: GROUP 2

In about 70 per cent of the cases of carcinoma of the breast that may be considered early and operable, the axillary glands are involved, Group 2. The average case is of at least six months' duration. The well-established results from efficient radical surgery in this group are a 25 per cent five-year cure. Variations from this percentage largely depend on the strictness with which the rule of operability is applied. This 25 per cent recovery rate is the maximum that can be expected from radical surgery, and if this surgical rate is to be increased it must come from the proper combination of radiation and surgery.

There is no proof that x-ray should replace radical surgery where the axillary glands are involved. Adair has shown that with a tissue dose of 3500 r, 22 per cent of these cases will show microscopic disappearance of axillary metastases, but this is not better than can be obtained by surgical removal. In another series of cases treated by radiation alone, Adair has shown that there are no five-year cures when axillary glands are involved. Thus, the surgery must be as radical and complete as possible and as thorough as though no additional help were expected from radiation. There is no reason to believe that where the surgery is incomplete, or where axillary glands are discovered which cannot be removed, postoperative radiation will increase the chance of cure.

POSTOPERATIVE RADIATION

The value of postoperative radiation in increasing the five-year curability of cases with axillary metastases is still seriously questioned. White from the Roosevelt in New York, Graham from the Crile Clinic, Simmons from the Massachusetts General Hospital, and Harrington from the Mayo Clinic, deny that there is any increase in the recovery rate following postoperative radiation. On the other hand, there are large and significant series showing 40 to 50 per cent five-year cures in Group 2, with a combination of surgery and radiation. It is quite significant that the critical analysis from the University of Pennsylvania shows only twelve deaths in known Group 2 cases which had radical surgery and postoperative radiation, and only one death in Group 2 cases which had pre- and postoperative radiation. While statistics differ with various clinics and depend on the accuracy of their analysis as well as upon the efficiency of the surgery and the radiation, and careful attention to operability, there is a wide consensus of opinion that radiation adds 10 to 15 per cent to the life expectancy in Group 2 cases when combined with radical surgery.

MODERN FRACTIONAL RADIATION

The pre- and postoperative treatment of carcinoma of the breast has changed materially with modern fractional radiation. There are two methods at present that can be considered adequate. The first, and most logical, has the approval of Pfahler. The breast is radiated tangentially, including the anterior mediastinum and lateral chest wall. The axilla is cross-fired through at least three areas, including the supraclavicular glands. These five to six portals are treated with fractions of 300 r at 200 K. V. with copper or Thoraeus filter, spacing the dosage on each port at forty-eight to seventy-two hours and reaching a total of approximately 900 r. The cumulative skin dose amounts to about 480 r effective, and the total tissue dose in the axilla averages about 1700 r. This preoperative series is followed within two weeks by radical surgery, and the postoperative radiation is resumed in two to three weeks' time, using the same portals and dosage. Each port is given an additional 900 to 1500 r, making a total of 1800 r for the pre- and postoperative series. The fields after the surgery on the chest wall may be given at 140 K. V., but the cross-fire of the axilla and the supraclavicular glands should remain at or above 200 K. V. This method does not cause undue delay in the surgery, and does not render the surgery more difficult or the healing less prompt or satisfactory.

The second method of radiation that may be considered adequate, attempts the maximum destruction of the carcinoma and the maximum reduction in the axillary glands before the surgery. Using at least two tangential ports to cross-fire the breast, and at least three ports to cross-fire the axilla and supraclavicular glands, fractions of from 200 to 300 r are given on alternate days to each port, building up a total of at least 2000 r per port. Using 200 r every second day or 300 r every third day, this gives a cumulative dose of approximately 800 r on each port and a tissue dose of about 4000 r in the axilla. The skin reaction is marked and the surgery must be delayed from six to eight weeks. The advantages of this method are that 33 per cent of the breasts become microscopically free from carcinoma and that in 22 per cent there will be complete destruction of the axillary glands. However, the two months' delay is a mental hazard to the patient; the operation is more difficult, the bleeding increased and the healing delayed.

RADIATION IN GROUP 2 PATIENTS

When radiation is initiated after radical surgery in Group 2 cases, the problem is considerably different. With the breast and pectoral muscles removed, the chest wall is, on the average, three centimeters thick, and the axillary fold has disappeared. There is little chance to cross-fire the operated area or the supraclavicular glands, and the opportunity to cross-fire the axilla is considerably diminished. Granting that the lethal dose of mammary carcinoma cells lies between 2500 and 3500 r, postoperative radiation must depend upon growth restraint rather than on cell destruction. If the surgery has been complete, and there is residual carcinoma, it must be looked for beneath the operative field in the intercostal lymphatics or the mediastinal chain, or beyond the operative area at the apex of the axilla and the supraclavicular glands, or hidden around the axillary vessels and brachial plexus. In order to cover these areas, the anterior chest wall should be radiated from the sternum to the posterior axillary line and from the costal margin to the clavicle. This may be either by direct portals at 140 kv. or tangential areas at 200 kv. The apex of the axilla and the supraclavicular region may be cross-fired through an anterior and a posterior port; and if the arm can be abducted, by a direct axillary port. The radiation in this region should be at 200 kv. Using fractional doses at 200 to 300 r. and alternating the ports so that the radiation to each is spaced at two to three days, the dosage to each area may be built up to 900 to 1200 r without undue skin reaction. Such a series should be repeated in six to eight weeks, and again at three months after the second series. There is no indication to damage the skin beyond the point of a moderate erythema, which can be repeated at suitable intervals.

The above considerations are applicable only to strictly Groups 1 and 2 cases, where the growth has not passed the first line of defense in the axillary glands. The indications as noted are complete radical surgery, combined with pre- and postoperative radiation, or postoperative radiation when axillary glands are first discovered at surgery, or where the coöperation of the patient or surgeon cannot be obtained for preoperative treatment.

A sharp delineation should be attempted between early operable cases, limited to the breast and low, moveable axillary glands, and between the carcinoma that has extended beyond these points, which must be considered late and inoperable. It is only in the former group that radical surgery is indicated or curative, and where additional radiation may increase the percentage of cure. Failure to appreciate this distinction submits the patient to unnecessary surgery and discredits the value of pre- or postoperative radiation as a curative factor.

The treatment of Group 3 carcinoma is, at best, palliative, and is strictly a radiation problem. At the expense of repetition, carcinoma of the breast should be considered inoperable and suitable only for palliative radiation where there are high, fixed axillary glands, supraclavicular glands, fixation of the breast or multiple skin metastases. Also inflammatory carcinoma should be considered inoperable and belonging to this group.

TREATMENT OF INOPERABLE CARCINOMA

The treatment of inoperable carcinoma should include cross-fire of the breast through as many portals as its size will permit, and cross-fire of the axilla and supraclavicular glands. Fractional doses of 200 to 300 r, spaced at a two-to-three-day interval to each port, are built up to a total dosage of 1500 to 2500 r per port. The actual dosage will depend on the size of the port and the skin reaction required by the clinical judgment of the operator. The underlying principle is that of repeated fractional radiation over a period of three to four weeks, reaching a total of skin tolerance. We, personally, prefer large portals, except in the direct axilla. The breast portals and supraclavicular port are tangential and overlapping, and are carried to at least 1500 r. If the growth does not prove radiosensitive at this dosage or threatens local ulceration, a simple mastectomy is considered after the subsidence of the skin reaction. If the growth is apparently radio-sensitive at this point, the case is handled entirely by radiation.

The treatment of Group 3 cases must be well individualized. In each case the program should depend on a careful survey of the general condition of the patient, the character and extent of the growth, and the extent of possible metastases. A thorough roentgenographic survey of the chest and skeleton for metastases is just as essential here as before surgery in early operable cases. It is at least discouraging to have arrested an extensive growth in the breast and axilla and to find immediately thereafter undiscovered metastases in the chest or cervical spine, or a threatening pathologic fracture in the hip or pelvis. It is this sort of case that tempts the patient's family or the referring physician to feel that x-ray has "scattered the cancer" and to question the value of radiation. If there are distant metastases, these should be recognized and treated, either before or with the attack upon the primary lesion. The presence of metastases will also determine the indication for treatment of the breast, keeping in mind that the ultimate object is maximum palliation.

SUMMARY

1. The prognosis of carcinoma of the breast depends primarily on early recognition and complete radical surgery.

2. Early carcinoma clinically localized to the breast should have immediate biopsy by excision and radical surgery. If metastatic glands are found in the axilla or if the growth is undifferentiated of pathological Groups 3 or 4, the surgery should be followed by postoperative radiation.

3. Early carcinoma, with clinically enlarged axillary glands, should have preoperative radiation before radical surgery, followed by postoperative radiation. If this is not possible, the surgery should be followed by postoperative radiation, as there is evidence that radiation will add 10 to 15 per cent to the expectancy of cure from surgery.

4. The value of x-ray in combination with radical surgery in Group 2 cases does not justify operating cases that are not strictly localized, or expecting the radiation to add to the curability following questionable surgery.

5. Pre- and postoperative radiation are never an excuse for incomplete surgery in operable cases. Postoperative x-ray following incomplete surgery will not increase the probable cure.

6. Carcinoma of the breast, which is not clinically localized to the gland and moveable axillary lymphatics, must be considered late and inoperable. Only palliation is possible, and that is best obtained by radiation.

1831 Fourth Street.

DISCUSSION

William E. Costolow, M.D. (1407 South Hope Street, Los Angeles).—Doctor Kinney has thoroughly covered most of the phases of x-ray treatment of breast cancer. Surgery alone is probably not curing any more cases of cancer of the breast today than it did a quarter of a century ago. Halsted and the men who followed him undoubtedly performed the radical breast amputation as thoroughly as any of our present-day surgeons, and obtained similar results. Operation cannot be made any more radical, nor can one expect a higher percentage of cures from surgery alone. Furthermore, there is no evidence to prove that the cautery or the electroscalpel will produce any better results than the cold steel knife.

It is no wonder then that surgeons now wish to coöperate with the radiologist in trying to better the surgical results in cases with axillary extension, which heretofore have been admittedly poor.

As Doctor Kinney has pointed out, postoperative irradiation has definitely added a small percentage of improvement to the five-year curative results. In addition, there is the enormous palliative value of x-ray in clearing up local recurrences in that group of cases dying of visceral metastasis, before the end of the five-year period.

We agree with Doctor Kinney that the advanced cases with large axillary glands, supraclavicular glands, extensive skin involvement (inflammatory type) or fixation to chest wall, generally should be taken care of by irradiation alone. Some massive involvements will show marked local regression or complete disappearance with thorough x-ray treatment. It may be thought that when these advanced cases are made clinically operable, surgery should be used. Experience, however, shows this to be unwise. These cases are usually of high-grade malignancy, and probably have visceral or bony extension, or some smouldering local areas which may be relighted, with rapid local recurrence taking place. The prognosis in women under forty is extremely poor, regardless of the stage of the disease.

There is a group of cases which offers a field in which five-year curability may be increased. This is stage II, with axillary involvement. This group is now being submitted to preoperative irradiation. This procedure has not been employed long enough for a large group of five-year statistics to be collected. Adair, in 148 operable cases treated by postoperative x-ray following radical operation, had a 40 per cent five-year cure (50 per cent with axillary glands). In 193 operable cases with preoperative x-ray, 64 per cent are living after four years. Adair states that formerly 60 per cent of his operable cases showed axillary involvement, whereas since using preoperative x-ray he had found only 40 per cent with axillary involvement.

Preoperative x-ray should be thorough and operation withheld until the full effect of the treatment is secured and the reaction allowed to disappear. We usually divide the breast and axilla into multiple areas, as described by Doctor Kinney, but apply only 100 r daily to each area, usually to a total of 2000 to 2500 r. The smaller breasts may be covered by two 10 by 15, or 15 by 20 tangential areas, but larger breasts may require multiple areas in order to obtain the desired tumor dosage. Operation is usually delayed until after two months. In our cases there has been very little added operative difficulty, and healing has taken place in all cases.

⁂

Alson R. Kilgore, M.D. (490 Post Street, San Francisco).—It is refreshing to hear this clear and well-balanced exposition of a still controversial subject. I can contribute only complete agreement with Doctor Kinney that the great contributions of radiation to the treatment of mammary cancer have been (1) to encourage restriction of surgery to those cases offering at least reasonable hope of cure; (2) to increase apparently definitely the survival rate following surgery in the more advanced cases operated; and (3) to offer invaluable palliation to inoperable patients.

⁂

Robert S. Stone, M.D. (University of California Hospital, San Francisco).—Doctor Kinney has presented a masterful survey of the subject, with which I am in general agreement. I shall not reiterate those points on which we agree, but shall stress those on which we differ.

Group 1 is a broad grouping which I believe should be subdivided. If the lump in the breast is such that a diagnosis of cancer cannot be made clinically with a fair degree of accuracy, then, of course, surgical excision is in order, with preparation for an immediate radical mastectomy if the frozen section shows it to be cancer. If a presumptive diagnosis of cancer can be made on clinical grounds, then I believe that at least a short course of preoperative radiation should be given. It has frequently been shown that cancer transplanted into an area previously irradiated has a much less chance of growing. Advantage of this should be taken by giving an immediately preoperative short course as a minimum. It delays operation only a few days and does not increase the operative difficulties.

The author showed that there is a 30 per cent error in diagnosis of the axillary glands in supposedly Group 1 cases. It is probably in this 30 per cent of cases that preoperative radiation has its chance to be of benefit. Let us remember that if we can increase the five-year survival by even five in one hundred, it is just as important to save these five women in Group 1 as in Group 2.

In Group 2 patients, I believe that preoperative irradiation should be used for the same reasons as preoperative irradiation in Group 1. In Group 2, because the surgical results are so poor, a thorough course of radiation should be used rather than a short course. It must be remembered that there are practically no statistics on the value of preoperative protracted fractionated courses. To base our opinions of the value of preoperative radiation on older statistics is like basing an opinion of the value of surgery on late nineteenth century surgery.

Another point on which we disagree is on the value of repeated courses of radiation after surgery. If the cancer was found to be limited to the breast and axilla, we should give one really thorough course of irradiation, such that we would not care to repeat, and rest with that. Most authorities are agreed that the chance of irradiation curing lies in the first attack on the disease and not on repeated attacks.

The number of fields to be used and their size will always be a matter of individual opinion. In general, I use a smaller number of fields and larger total doses per port than the author indicates. From sad experience, I should like to emphasize what the author insinuated, namely, that the ports must be arranged so as not to get large doses of radiation in the lungs, either by crossfire or direct radiation.

DERMATOMYOSITIS*

REPORT OF CASE ASSOCIATED WITH RHEUMATIC HEART DISEASE

By Frederick Kellogg, M.D.
Long Beach
and
Felix Cunha, M.D.
San Francisco

Discussion *by Robert W. Langley, M.D., Los Angeles; Hiram E. Miller, M.D., San Francisco.*

DERMATOMYOSITIS is a rare disease best described as an acute, subacute, or chronic disease of unknown origin, characterized by a gradual onset with vague and indefinite prodromata, and followed by edema, dermatitis, and multiple nonsuppurative inflammation of muscle. The first clear-cut cases were described independently by Unverricht,[1] Hepp,[2] and Wagner[3] in 1887.

PATHOLOGY

Early the skin and subcutaneous tissues show edema, infiltration with neutrophils and some areas of hemorrhage. Later there may be desquamation of the surface layers with degeneration of the corium and disappearance of the papillae. The changes in muscle are characteristic. First, there is transudation of fluid and interstitial and perivascular infiltration of leukocytes. The muscle bundles show a patchy involvement, and normal ones may be seen among others showing all stages of degeneration. Later, evidence of regeneration of muscle appears in scattered areas, and there is much increase in connective tissue.

ETIOLOGY

The cause of the disease is obscure. Certain features suggest an infective origin, namely, the first symptoms frequently following some febrile disturbance such as tonsillitis, influenza, measles, rheumatic fever, etc.; the demonstration often of foci of infection; the febrile course; the presence of splenomegaly in many cases; and the relapsing nature of some cases.

Various organisms have been thought specific by different observers, but in many cases no organisms are found. Probably the disease is a syndrome which may result from a variety of causes. All ages are affected, and the incidence in both sexes is approximately equal. The white races have been almost exclusively affected. Winter seems the commonest time of onset.

SYMPTOMS

Following the vague prodromata, symptoms appear insidiously. These consist of increasing muscular weakness with pain, swelling and rigidity, which is usually widespread and symmetrical, and accompanied by a peculiar exanthem and a brawny edema. The muscles alternately feel firm and tough, or soft and boggy. The limbs are most commonly affected and, in contrast to trichinosis, the muscles of the eyes are not often involved. The rash usually has a peculiar heliotrope color and is distributed over the affected muscles. Later in the disease the rash may resemble various types of skin disease, and as an end-result brownish pigmentation is common. Eventually the skin becomes thickened and may even resemble scleroderma.

A high intermittent or remittent fever may be present during the acute stages, but frequently is of mild character. The spleen is often enlarged. Leukocytosis is common but, typically, no eosinophilia is present. Creatinuria has been reported. This is not primary, but is undoubtedly secondary to the anatomical changes in the muscles.

Death is common during the acute stage, usually from intercurrent infection. If the patient lives long enough, the pain and edema begin to subside and fibrosis of the skin and muscles develops, resulting in marked deformity. The skin then becomes hard and inelastic and bound down to the underlying muscles, which may be felt as boardlike wasted bands.

Recovery is often accompanied by residual weakness and contractures, and certain areas of skin may always remain sclerotic. However, it is possible for the patient to recover completely after a most severe attack. Unfortunately, relapses are common. About 50 per cent of the reported cases die, some in the acute stages, but more after months of illness.

DIFFERENTIAL DIAGNOSIS

Dermatomyositis, during its acute stage, may so simulate trichinosis that early reports used the title "Pseudo-trichiniasis." However, in trichinosis, changes are usually most prominent in the

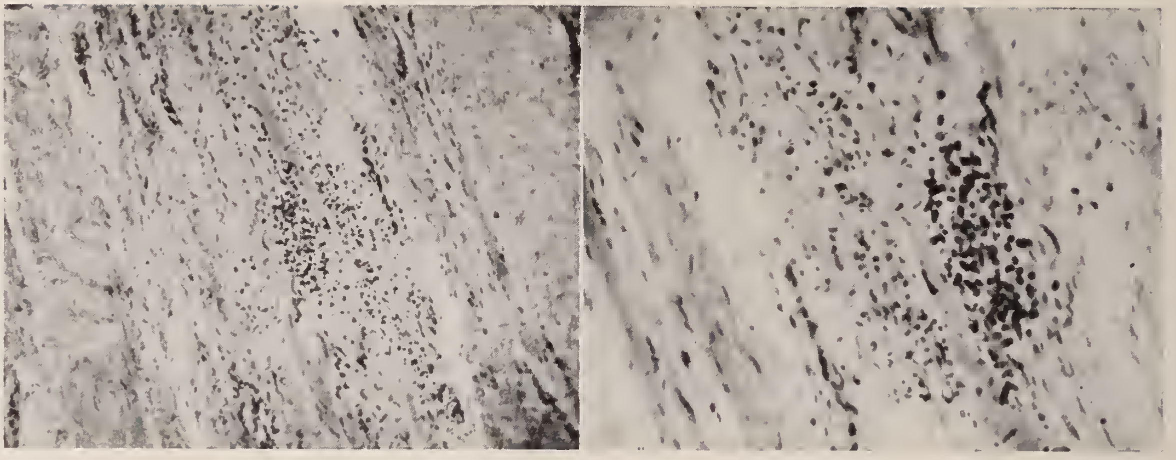

Fig. 1 Fig. 2

Fig. 1.—Photomicrograph of muscle from calf. Note infiltration of leucocytes about muscle bundles and increase in connective issue. (X105)

Fig. 2.—Photomicrograph of muscle from calf. Varying degrees of degeneration of muscle are shown. Note wavy contour of fibers and fibrosis. (X210)

ocular muscles. Eosinophilia, which is uncommon in dermatomyositis, is always present in trichinosis, and larvae may be found in the blood or muscle.

Polyneuritis may cause confusion, especially as in some cases of dermatomyositis the nerves are involved as well. However, in uncomplicated polyneuritis, edema and muscular swelling are absent.

Scleroderma can be excluded in the chronic cases only by the presence of myositis. Many believe that the two diseases are different manifestations of the same morbid process, for sclerodermatous changes often accompany dermatomyositis.

TREATMENT

All forms of therapy have been advocated, none of which have been specific. Stress should be laid upon the prevention of deformity and upon various orthopedic and physical therapeutic measures which should be employed if the patient recovers. The patient presented was treated with autogenous vaccine, as was one other patient reported by McGarrahan.[4] Ordinarily no bacteria are found in biopsy specimens. McGarrahan isolated a culture of Staphylococcus albus from a nasal smear. As this gave a positive intradermal reaction, a vaccine was made and administered with apparent benefit.

REPORT OF CASE

M. B., a 22-year-old female milliner, of Italian descent, was first seen on the Medical Service of the University of California Hospital in September, 1935, complaining of pigmentation and muscular weakness of two years' duration. Eight years previously, at the age of fourteen, she was vaccinated for smallpox. A small brown area of pigmentation appeared at the site of vaccination which extended over the entire upper left arm during the next few years, and similar areas of pigmentation appeared on the right arm. This was accompanied by a decrease in size of the left arm. Two years before entry, at the age of twenty, she noted nodules in the calf of the left leg and weakness of both legs. This was followed by edema and she was treated for congestive cardiac failure, with improvement. However, contractures of her calf muscles developed, so that she was unable to walk flat-footed. For eighteen months before entry she was confined to bed with generalized muscular weakness and stiffness. With the onset of stiffness the pigmentation previously noted spread over the entire body. During the last month of her acute illness she had had fever and profuse perspiration, and had lost thirty-five pounds in weight. No muscular pain had been noted. Infected ingrown nails of both great toes had been present about three years. Her past history was not remarkable, except for "growing pains" at thirteen and fourteen years of age.

Examination in 1935 revealed an emaciated girl with fixation of elbows, knees, and hips in 90 degrees flexion. The ankles were fixed in plantar flexion. Generalized pigmentation was present, with the exception of the nose, palms, and soles of the feet. The pigmentation was mottled and of a dirty-brown color. The pigmented area about the left upper arm had sharply demarcated borders. All extremities were wasted, and all muscles felt indurated and cord-like to palpation. Slight generalized pitting edema was present. The mouth could be only partially opened. The heart was slightly enlarged to the left and right. The rhythm was regular. A presystolic murmur, ending in a booming first sound and followed by a blowing systolic murmur, was heard at the mitral area. The pulmonic second sound was accentuated and reduplicated. The blood pressure was 116 systolic, and 70 diastolic. The abdomen showed an enlarged spleen at the left costal margin. Clubbing of the fingers was present. The left great toe showed an infected ingrown nail. The patellar and abdominal reflexes were barely elicited.

Extensive laboratory procedures, including routine urine and stool examinations, Wassermann test on the blood, phosphorus and calcium determinations of the blood, culture of the blood, gastric analysis and spinal fluid examination, were normal. The blood showed a mild secondary anemia and leukopenia. No eosinophilia was present. Creatinuria was present, the twenty-four-hour output of creatin being 98 milligrams and of creatinin being 218 milligrams. Culture of the toe showed Staphylococcus albus and Bacillus subtilis. A biopsy from the right calf showed characteristic lesions of dermatomyositis (Figures 1 and 2). Culture of tissue obtained at biopsy showed nonhemolytic streptococci.

X-ray films of the chest showed the heart to be enlarged and of a mitral configuration. Films of the lumbosacral spine showed extreme lumbar lordosis. Films of the elbows showed no lesions of bone or joint.

While under observation the patient was febrile, the fever being remittent at times and intermittent at others, reaching maximum of 40 degrees Centigrade. A vaccine was prepared from a mixture of streptococci isolated from a stool culture, and the muscle biopsy and staphylococci from the infected toe. This vaccine was administered intravenously at weekly intervals. With large doses temporary exacerbations occurred, but with small doses improvement appeared. Following the subsidence of the acute involvement, exercises and physical therapy were instituted. At this time the patient was unable to feed herself or to turn in bed. During the past two years improvement has gradually occurred, until now she is able to walk alone with difficulty and can care for herself in bed.

COMMENT

The history and findings of the patient reported are typical of dermatomyositis and show the diagnostic triad of eruption, edema and myositis. Unusual features of this case were the absence of pain, the presence of mitral stenosis, and the isolation of organisms in the biopsy specimen. The onset in this patient was very gradual, and an organism of low virulence, undoubtedly introduced at the time of the vaccination, slowly spread throughout the body over the next few years.

Dermatomyositis may at times involve the myocardium, but never causes valvular lesions as seen in rheumatic heart disease. The mitral stenosis was probably due to rheumatic infection, as manifested by the "growing pains." These preceded the vaccination and were probably independent of the dermatomyositis.

Apparently, an autogenous vaccine was of value in this patient as in that of McGarrahan. Unfortunately, it is seldom that organisms can be isolated from muscle, and it is this fact that has cast doubt on the infectious etiology of the disease. It is of utmost importance, however, that contractures be prevented as much as possible, and that fixation of limbs occur in positions favorable to physiologic function. Following the subsidence of the acute disease, proper massage and graded exercises and manipulation are of inestimable value in rehabilitation.

IN CONCLUSION

1. A case of dermatomyositis is reported which followed vaccination for smallpox and which was associated with rheumatic heart disease.

2. Because of its apparent benefit in this case, further trial of autogenous vaccine in the treatment of dermatomyositis is indicated.

DISCUSSION

Robert W. Langley, M.D. (1930 Wilshire Boulevard, Los Angeles).—The condition of dermatomyositis occurs infrequently. Its recognition justifies attention and recording. The outlook is usually quite poor. There is little a cardiologist may contribute to this subject. Doctor Kellogg states that dermatomyositis may at times involve the myocardium, but I have been unable to substantiate this statement from any proved cases in the literature. Two fatal cases were recently reported by members of the staff of the Hospital of the Good Samaritan in Los Angeles. Autopsies on both cases failed to show myocardial damage, either gross or microscopic.

There is no question about the diagnosis of rheumatic heart disease of moderately severe degree in this case. The congestive heart failure responded satisfactorily to medical treatment.

Doctor Kellogg suggests, quite rightly I think, that rheumatic infection was associated with, but independent of the dermatomyositis. There may be some relationship between scleroderma and dermatomyositis. Cases have been reported where a transition appears to have taken place. This writer has observed a case of scleroderma associated with rheumatic heart disease. No relationship between the two seemed apparent.

⁂

Hiram E. Miller, M.D. (384 Post Street, San Francisco).—Dermatomyositis is a comparatively rare disease, and it is always of value to report the findings in such unusual cases as this one. The prodromal symptoms in this woman were of very slow onset, extending over a period of eight years or more. She had marked contractures of her leg muscles; pigmentation gradually covered her entire body, but there was no history of an actual dermatitis. She had an associated valvular heart disease, with clubbing of the fingers. Streptococci were obtained by culture from a biopsy taken from the leg muscles. There are probably a number of diverse and only remotely related conditions classified under the symptom-complex of dermatomyositis.

I have observed several patients with this disease. They all have had a dermatitis on the upper face, eyelids and, in most instances, on the extremities. Many of them died due to paralysis of the visceral muscles generally of the respiratory tract. The dermatitis in most instances closely resembled disseminated lupus erythematosis. An associated leukopenia is also observed in this disease. In my experience, a leukopenia is generally found as is recorded in this case, and not a leukocytosis as is stated in the paragraph on symptoms.

I have seen various types of treatment used in this disease, but have not been convinced that any of them have materially changed the course of the disease. Some of the patients recovered and some of them died.

I do not believe that vaccination has played any part in causing the disease in this patient. I think it is unfortunate that this phase of the condition has been given such a prominent place in the conclusions.

INSULIN SHOCK THERAPY IN DEMENTIA PRAECOX: A REPORT OF A SERIES OF CASES*

By Clifford W. Mack, M.D.
and
B. O. Burch, M.D.
Livermore

Discussion *by J. M. Nielsen, M.D., Los Angeles; E.W. Mullen, M.D., Agnew; Samuel D. Ingham, M.D., Los Angeles.*

Introduction.—The treatment of dementia praecox by hypoglycemic shock, according to the method of Sakel, is largely empirical in character. The determination of its value can only be made by clinical application to a large number of cases over a period long enough to see the proportion of successes and failures. As the last four years have furnished much data, it is well for us to review the results and try to ascertain if this dramatic form of therapy merits a place in psychiatric practice.

EUROPEAN REPORTS

The reports from European clinics are much larger than from those in this country. Recent literature indicates that about two thousand patients have been treated all over the world. The greater magnitude of the work abroad may be due to its earlier use there; but this also leads one to believe that it has been given wider application than in America. Sakel[1] first reported 104 cases completed in 1937, in which series there were 70.7 per cent recoveries. If to this figure is added those not having a full remission, but who were classed as fit to work, the total is 86.2 per cent. These were in the group of new cases under six months. The total percentage of recoveries in the series of 104 was 48 per cent, including both old and new cases. This is a startling recovery rate for a disease that has baffled psychiatrists for generations. A more recent article by Strecker,[2] including a report from the Müller Clinic in Switzerland, gives an analysis of 495 cases. The percentage of recoveries of those patients under one year was 57.2; under two years, 27.3; over two years, 11.3. The percentage of improved cases under one year was 22.2; under two years, 34.1; over two years, 32.2. These statistics, showing a recovery rate of 40.4 per cent for the entire series, are decidedly more modest than those just quoted.

---

* Read before the Neuropsychiatry Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

AMERICAN STATISTICS

The American reports are not so extensive, but compare favorably with the European. The largest series comes from the Harlem Valley State Hospital,[3] in July, 1937, and comprises eighty-one cases. There were fifteen cases of a duration under two years, showing recovered and much improved, 66.66 per cent, improved 26.66 per cent; ten cases of two to four years, recovered and much improved, 40 per cent, improved 40 per cent; eight cases of four to six years, recovered and much improved, 37.5 per cent, improved 37.5 per cent; and thirteen cases of six years and over, recovered and much improved, 15.38 per cent, improved 61.51 per cent. It will be noted that there is a recovery rate of 44.4 per cent in the group as a whole if the much improved cases are included with the recoveries. The commonly accepted spontaneous remission rate is from 5 to 20 per cent.

REPORT OF CASES

The following nineteen completed cases are reported, out of a total of twenty-three treated.

Case 1.—B. Age, 16. Some original mental defect. Duration, eleven months. Mental symptoms consisted of violent conduct, hysterical spells simulating fits. Later, in the course of the illness, the patient became apathetic, indifferent, and unproductive. Progressive mental deterioration. *Diagnosis:* Dementia praecox, hebephrenic form. *Treatment:* Total number, 93, with a maximum dose of 140 units. Four convulsions. *Result:* Slight improvement in conduct. Discharged unimproved.

* * *

Case 2.—Bo. Age, 20. Normal youth, except somewhat retiring. Duration, one year. Mental symptoms consisted of delusions of poisoning, periods of extreme mental excitement, great pressure of activity, delusions of mistaken identity and auditory hallucinations. During the course of the illness these periods of excitement alternated with periods of quietude, unproductiveness, and a sad mood. *Diagnosis:* Dementia praecox, hebephrenic, with some features of manic-depressive psychosis. *Treatment:* Total number, 81, with maximum dose of 120 units. One convulsion. There was slight improvement, with diminution of cycles and hallucinations. *Result:* Unimproved.

* * *

Case 3.—Ba. Age, 60. Normal social personality. Duration, four years. Delusions of persecution, despondency, fear of dirt infection and of contaminating other people. Suicidal ideas. Agitated and restless. Pronounced negativism. Physical examination negative. *Diagnosis:* Dementia praecox, paranoid. *Treatment:* Total of 6, with maximum dose of 60 units. The patient died, after receiving 40 units. Cause of death, on clinical data without autopsy, coronary sclerosis.

* * *

Case 4.—T. Age, 40. Always timid, sensitive and overly conscientious. Duration, eighteen years. Symptoms of pronounced mental deterioration, following years of mental disease. Negativistic, unproductive. Mutters to himself and laughs sillily. Listless and apathetic; very untidy. *Diagnosis:* Dementia praecox, hebephrenic. *Treatment:* Total of 96, with maximum dose of 140 units. *Result:* Slight change in conduct, so that patient could engage more in occupations. Unimproved.

* * *

Case 5.—McE. Age, 25. Shut-in type of personality. Duration, one month. Chief symptoms: Violent, impulsive conduct; delusions of persecution that he is to be electrocuted; that he is possessed of the devil. Homicidal threats. No hallucinations. *Diagnosis:* Dementia praecox, paranoid. *Treatment:* Total of 90, with maximum dose of 160 units; two convulsions. *Result:* Recovered. (A report after six months states that this patient is still well and working at his occupation.)

* * *

Case 6.—To. Age, 20. Shut-in type of personality. Duration, nine months. Chief symptoms: Abnormal fear of death; depressed, anxious mood. Excitable and restless. Stereotyped conversation and conduct; mannerisms. *Diagnosis:* Dementia praecox, hebephrenic. *Treatment:* Total of 9. *Result:* Unimproved.

* * *

Case 7.—MacL. Age, 34. College graduate. Normal personality. Duration, four years. Chief symptom: Delusions of persecution. Psychosis progressed slowly. Unable to work for three years because of delusional control and some neurasthenic complaints, with a mild degree of anemia. Outbreak of violent conduct and threats against the authorities caused his arrest and commitment. *Diagnosis:* Dementia praecox, paranoid. *Treatment:* Total of 189, consisting of two courses: the first one of ninety-three treatments, which brought about a remission lasting only two weeks; the second course, ninety-six, with the result that symptoms entirely disappeared. The patient is following normal conduct, but is still in the hospital. *Result:* Improved.

* * *

Case 8.—W. Age, 23. College graduate. Unusually high intelligence—one of Terman's one thousand cases. Duration, two years. Chief symptoms: Inability to continue studies; delusions and suspicions about people; auditory hallucinations. Voices that came from former friends, one of whom kept her constantly hypnotized. Psychosis progressed, with evidence of deterioration. The patient became uncouth in manner and untidy. After some months, delusions changed to feelings of grandeur and ideas of royalty. *Diagnosis:* Dementia praecox, paranoid. *Treatment:* 114 doses, with maximum dose of 110 units. *Result:* Temporary improvement, but final result unimproved.

* * *

Case 9.—F. Age, 25. Normal personality. Duration, one year. Chief symptom: Outbreak of violence because he could not conform to social usages. Arrested and taken to jail. After release he was unable to adjust himself. Psychosis progressed, with delusions of poisoning, and he eventually developed a state of stupor with complete negativism, in which condition he was brought to the hospital. *Diagnosis:* Dementia praecox, catatonic. *Treatment:* Total of 68, with maximum dose of 100 units. *Result:* Recovery. (A report five months later certifies that he is still well and following his former occupation.)

* * *

Case 10.—J. Age, 33. Normal personality. Duration, five years. Chief symptoms: Delusions of poisoning. Violent spells. Homicidal, threatening to kill the family. Unregulated conduct, noisy, screaming, laughing sillily. The psychosis progressed. Auditory hallucinations, interfering with daily conduct. Hallucinations became sexual in content. *Diagnosis:* Dementia praecox, paranoid. *Treatment:* Total number, 68, with maximum dose of 70 units. Three convulsions. The patient improved very much in conduct, hallucinations diminished but did not disappear. No violent spells. The patient was very sociable and able to engage in occupations and exert good self-control among other people. *Result:* Improved, although still in the hospital.

* * *

Case 11.—S. Age, 22. College graduate. Normal personality. Duration, three months. Chief symptoms: Mental confusion. Religious delusions that the world was coming to an end; that certain people were possessed of the devil; that he had power to do miracles. State of great mental and physical excitement continued. Auditory, and possibly visual hallucinations. As the psychosis progressed he became very noisy and disturbing, requiring packs and seclusion. *Diagnosis:* Dementia praecox, hebephrenic. *Treatment:* Total of 38, with maximum dose of 65 units. Two convulsions. Improvement began during second week of treatment. *Result:* Recovered. (Six months after discharge, report indicates that he is very well, and socially adjusted.)

* * *

Case 12.—Wh. Age, 40. Rather retiring personality. Duration, eleven years. Chief symptoms: Delusions of a sexual nature, that she was being assaulted, and persecuted by neighbors and officers. Belief that husband's business was being hampered by her enemies. Delusions about dirt and infection in the house, always washing her hands and cleaning. *Diagnosis:* Dementia praecox, paranoid. *Treatment:* Total of 85, with maximum dose of 60 units. *Result:* The patient improved steadily in conduct and emotional reactions. She became more interested and concerned about her daily life. Delusional content diminished gradually. No new delusions were formed, and she was willing to refrain from any reaction to delusional ideas. Discharged improved. (Follow-up report is satisfactory.)

* * *

Case 13.—L. Age, 15. Rather above the average in intelligence. Duration, three years. Chief symptoms: Loss of application in school. Disturbing dreams. Mental confusion. Auditory hallucinations. Religious delusions. Psychosis progressed, and while in the hospital she expressed many fantastic ideas, such as that she was pregnant, that voices accused her of wrongdoing. Negativistic. Tube-fed. *Diagnosis:* Dementia praecox, hebephrenic. *Treatment:* Total of 96, with a maximum dose of 80 units. Nine convulsions. *Result:* Unimproved.

* * *

Case 14.—Tr. Age, 34. Rather quiet, retiring personality. Overly conscientious. Duration, five months. Chief symptoms: Painful depression. Fear that he had made an error and would lose his job. One month before admission he became very delusional and was placed under complete rest treatment at home. Thought that the company had spies about the house who were going to put him in jail. The psychosis progressed. He would not talk, sleep or eat. There was a severe excited spell, during which he ran about the house in terror, wanted to call the police, and jump out of the window. *Diagnosis:* Manic-depressive psychosis, depressed. *Treatment:* Total of 68 injections, with maximum dose of 140 units. Improvement began one month after treatment started. Symptoms gradually disappeared and the patient became more cheerful and coöperative. *Result:* Recovered. (Three months later the patient was reported well and has since been working at his former occupation.)

* * *

Case 15.—K. Age, 25. College graduate. Very sensitive and seclusive type of personality. Duration, two months. Chief symptoms: Despondency, fear. Delusions that he had caused trouble in the plant and would be discharged. Afraid he would be shot, and attempted to disguise himself. Talked of suicide. Delusion that his reputation had been ruined by certain stories circulated about him in regard to sexual affairs. Believed his presence would injure everyone in his surroundings. *Diagnosis:* Manic-depressive, depressed. *Treatment:* 86 injections, with maximum dose of 200 units. Three convulsions. Improvement began after three weeks. He became more responsive in conversation, and applied himself to tasks and recreation. Psychomotor retardation, depression and delusions remained in evidence, but these gradually diminished and were the last to disappear after return of normal mood. *Result:* Recovered.

* * *

Case 16.—R. Age, 27. Normal personality. Mild depression seven years previously. Duration, one and one-half months. Chief symptoms: Depression. Lack of interest in surroundings. Psychomotor retardation. Hypochondriacal delusions. Psychosis progressed. He became greatly disturbed emotionally and could not coöperate. *Diagnosis:* Manic-depressive, depressed. *Treatment:* Total of 45 injections, with maximum dose of 160 units. He improved gradually each week. At the end of the seventh week he was very much better, and appeared to his wife and others to be entirely well, except for a feeling of inadequacy and worry. *Result:* Recovered. (Three months later patient was normal and able to carry on his business affairs.)

* * *

Case 17.—Ri. Age, 31. College graduate. Inclined to neurasthenic complaints. Duration, nine months. There had been a mental condition two years before, during which he was depressed. Chief symptoms: Confused, restless, and negativistic. Letters showed verbigeration. After a few weeks he became mute. A few spells of extreme excitement and violence. No change during a period of five months before treatment was instituted, except increasing stupor. *Diagnosis:* Dementia praecox, catatonic. *Treatment:* Total of 94, with maximum dose of 120 units. One week after treatment began the patient became less negativistic. In the second week voluntary activity predominated, and after six weeks he engaged normally in occupational and recreational pastimes. Improvement was gradual, with blocking in conversation the last symptom to disappear, but at the end of twelve weeks he was definitely convalescent. *Result:* Recovered.

* * *

Case 18.—Wi. Age, 17. Slow in school. Industrious, but not sociable. Duration, seven months. Chief symptoms: Ill-tempered in school and could not study. He developed delusions that people were making fun of him. Later he was indolent and impulsive, and laughed sillily. Active hallucinations appeared, also delusions of poisoning. Committed to a state hospital. *Diagnosis:* Dementia praecox. *Treatment:* Total of 84, with maximum dose of 130 units. During a period of six weeks there was little change in the patient's behavior, but then he became more interested in activities. The acute symptoms left him, and he showed steady improvement. *Result:* Recovered.

* * *

Case 19. Le. Age, 19. Normal personality. Duration, twenty months. Chief symptoms: State of depression and fear; later, pronounced mental confusion and violent conduct. Untidy habits, destructiveness, inability to feed herself or care for her person. Mental condition grew worse up to time of treatment. *Diagnosis:* Dementia praecox, catatonic type, allied to manic-depressive psychosis. *Treatment:* Total of 72, with maximum dose of 150 units. Two convulsions. Improvement was first noted at the end of the second week, with change in the patient's conduct. She became quieter and more easily controlled, and at the end of the seventh week mental condition began to clear and symptoms entirely disappeared. *Result:* Improved.

RESULTS

The results* of treatment of these cases can be summarized as follows: Recovered, 8 (42.1 per cent); improved, 4 (21.0 per cent); unimproved, 7 (36.9 per cent).

---

* Thanks are due Dr. B. O. Burch, who personally managed the insulin treatments, and the other members of the medical staff of the Livermore Sanitarium for their assistance in the examinations and reports.

ANALYSIS OF CASES

Our series includes some very old cases—one as long as eighteen years, and another ten years; but they were included in the group because the families were very anxious to have them treated. If we classify the cases in accordance with the duration of the psychosis, those under two years give a recovery percentage of 61.5. The designation "recovered" in our classification means the disappearance of symptoms, return of insight, and ability to resume the former mode of life. "Improved" means those patients whose symptoms have not entirely ceased, who lack true insight but are able to make a fair social adjustment.

RELAPSES

The recurrences in our series are only two, and these were during the course of treatment. In Case 7, after the first twelve weeks of treatment the patient was symptom-free, but after two weeks there was a relapse, so his treatment was immediately resumed and has been satisfactorily concluded. In Case 19, the patient had a distinct remission at the end of six weeks, and for a few days was entirely well; but then she relapsed over a week-end. This we thought might have been due to the fact that she did not receive the usual dose of insulin. Treatment in this case was continued, and there is improvement, although the case is not yet completed. Among the patients who have been discharged from the Sanitarium, there have been no relapses; and one case in particular has been doing well for a period of ten months. The reports from the European clinics, as summarized by Strecker,[4] give 23, 15, and 14 per cent, while the large group of cases of Müller gives only 6.5 per cent. In our series it is to be noted that two of the cases had a very long course of treatment—189 injections in Case 7, which improved; 114 in Case 8, with possible improvement; and no harmful results in either case.

EFFECT ON CENTRAL NERVOUS SYSTEM

The possibility of damage to the central nervous system by a treatment that causes, during coma, definite signs of cortical irritation, such as unconsciousness, convulsions, positive Babinski, etc., should be considered. In our cases, follow-up neurological examinations are negative, even in those cases having the largest number of treatments, such as Case 7 with 189 treatments. Another patient, Case 2, had an atypical Babinski, but no other signs of neural injury. Also, none of the patients in the unimproved group developed a more serious psychotic state, but were to some extent better.

DANGERS OF TREATMENT

The hazards of such a radical form of treatment must be recognized because of the possibility of death or permanent physical or mental injury. The one fatality in our series was probably due to insulin sensitiveness, causing coronary thrombosis. Sakel, in his early series of 104 cases, reports the treatment of three cases over sixty, one of whom showed cardiac complications, but treatment was resumed. Dr. I. C. Brill of Portland, in a personal communication, furnished the following extract, quoting from a recent book by Arthur M. Fishburg on heart failure: "It has been seen that insulin hypoglycemia increases the work of the heart and that the injection of insulin may be followed in individuals with coronary arteriosclerosis by anginal pain and perhaps coronary thrombosis."

The extensive application of hypoglycemia cannot be accomplished without the coöperation of the public, relatives, and medical profession. It behooves us, then, to select our patients with the utmost care, excluding those who are poor physical risks or who are so far deteriorated as to mitigate against recovery, in order not to discredit this form of therapy. Therefore, it may be well to limit the cases to those under the age of forty.

FURTHER DANGERS

The dangers during shock from aspiration of mucus, convulsions, or lack of time to terminate coma, are not very grave. There is, undoubtedly, a wide margin between deep coma and death, as illustrated by the case mentioned in an article by Cameron and Hoskins, where a delayed reaction was unrecognized and the patient lived forty-eight hours. Also, the margin of safety between reversible and irreversible cellular changes in the brain is sufficient to give considerable latitude. Moersch and Kernohan,[5] reporting on the autopsy of three patients dying of hypoglycemia, give the following: "There were acute degenerative changes in the brain cells, but it appeared that early acute degeneration could have been restored to normalcy and have assumed their normal function under favorable circumstances." The death rate in Europe of a large series of cases has only been one-half of one per cent.

DIFFERENTIAL DIAGNOSIS

The cases in our series are not all dementia praecox, as some were diagnosed by the staff as manic-depressive psychoses. This brings up the question of selection of patients. As we lack exact differential diagnostic methods, such as the laboratory tests in paresis, the limitation of hypoglycemic shock to dementia praecox is impracticable. In view of the uncertainties of diagnosis, it would seem that all functional psychoses would be suitable for hypoglycemic shock treatment, possibly with the exception of the manic-phase of the manic-depressive psychoses. Patients with the depressed phase might well be included, as they are so often confused with dementia praecox patients. The treatment is not a specific for dementia praecox, so a wider selection is justified, and probably definitely indicated. There is a possibility that the manic-depressive psychoses would have less predilection to relapse if they, too, were treated by hypoglycemia.

ACCESSORY TREATMENTS

The many other therapeutic aids ordinarily in use should not be denied our insulin patients. They require a well-balanced daily program, including recreation, exercise, and occupational therapy. These need to be prescribed in proper dosage and regulated in accordance with the rate of return of normal psychic functioning and emotional balance. It is our experience that psychotherapy—such as persuasion, suggestion, and therapeutic talks—is beneficial, but energetic probing of the mind must be avoided. This should be reserved until the patient is well advanced in a stage of convalescence, and not applied in the early days of treatment when the mental processes are only partially under conscious control.

THEORETICAL CONSIDERATIONS

As to the theoretical explanation of the therapeutic benefits, we have very little to offer. It may be that we are entering upon a new era in the treatment of mental patients, using the physiological approach, as pointed out in a paper by C. W. Mack[6] before this Society in 1935. Stimulation of brain cellular activity by the hypoglycemic state might well be the explanation of the improvement obtained. The only practical point in this connection to be seen in our series is that all recovered cases showed a gain in weight. This may mean an improvement in brain nutrition, due to an increase in the power of neuronic tissue to utilize sugar.

CONCLUSIONS

The final place in psychiatry of hypoglycemic-shock therapy will be determined in the years to come after the extent of recurrence has been studied. It may be that the ultimate result will show a more severe deteriorative process in patients with a malignant psychosis. A survey of the method to date, however, leads to the conclusion that it is a most fruitful form of treatment, and far surpasses anything at our command for the functional psychoses. The thought arises that hypoglycemic shock might well be applied to all new cases of this type received for treatment, either in private or public practice. The increased recovery rate in comparison with conservative programs of the past outweighs the risks, difficulties and expense. The state hospitals have such a large influx of patients that a great burden would fall upon the medical organizations of these institutions if all new patients were treated. The economic saving, however, by decreasing the total number of hospital days, would soon recompense the state for any additional expense in the acute services. The need for early treatment is apparent to all who have been engaged in this work, as the best results are obtained in the first few months of the illness.

SUMMARY

1. A review of the literature reveals a recovery rate of 40 to 50 per cent of patients treated with hypoglycemic shock.
2. The largest American report available compares favorably with the European statistics.
3. A series of nineteen cases is reported by the author, with 42.1 per cent recoveries.
4. The relapses in Europe are 6.5 to 23 per cent.
5. The treatment should not be limited to dementia praecox, but deserves wide application in all early functional psychoses.

DISCUSSION

J. M. Nielsen, M.D. (727 West Seventh Street, Los Angeles).—Doctor Mack's paper is timely and well chosen. It is evident, from the number of treatments given to each patient, that he treats thoroughly. I am not in position to discuss the efficacy of the treatment in conditions other than schizophrenia, as we have confined our work to that group. Our group of three doctors has given thirty-six courses of insulin shock treatment to thirty patients (fifty shocks per treatment) and this means fewer shocks to each than Doctor Mack has given. On the other hand, we have given considerably larger single doses, as many have received 200 units daily, and some a great deal more, one 450 units per dose for a time.

As to complications, I note that Doctor Mack has had one death. This, however, was in a patient sixty years of age, so that is not strange. Our series of thirty cases includes only four over 36 years of age—39, 43, 48, and 49, respectively. We were more careful with these four than usual, and all survived; but there was no therapeutic benefit, except improvement in one of them. On the other hand, we have had considerable trouble with pulmonary complications. Three of our patients have had severe pulmonary edema and one, pulmonary embolus. The complication was very nearly fatal in each case. Those complications are our greatest fear; and a report of them will appear in the *Journal of the American Medical Association.* Prolonged coma, from which it was impossible to restore our patients for many hours (as long as thirty-three hours), has also occurred quite a number of times, but this is not dangerous unless simultaneous pulmonary edema ensues. So far we have had no fatality, but we may have one at any time.

I have arranged our therapeutic statistics to be comparable with those of Doctor Mack. Of our cases of schizophrenia (thirty cases) there were eighteen recent ones with recovery in twelve, improvement in four, and no results in two. We have treated twelve patients with disease of long standing (old cases), in which we did not obtain recovery in a single one, but improvement in six.

We think the method has come to stay as a permanent part of a psychiatrist's armamentarium, and we recommend it in the acute cases, especially those in young persons. In cases of long standing (more than a year), we tell the relatives that the percentage of recovery is very low, and hardly worth while unless the situation is desperate. We promise no results to anyone and we stress the dangers. We demand that the family take its part of the responsibility in any unfavorable outcome. The family must similarly be a unit in meeting the hazards emotionally. We assume the attitude that each treatment is very much like a surgical operation, and one must be prepared for all emergencies.

⁂

E. W. Mullen, M.D. (Agnew State Hospital, Agnew). I have enjoyed Doctor Mack's paper on insulin shock therapy in dementia praecox very much. This is a subject which is receiving attention in the medical profession, and especially in that part of the profession which practices psychiatry.

Doctor Mack's approach is scientific and thorough. His conclusions are well founded. His findings indicate that, while a certain percentage of mental cases recover under the insulin shock treatment, some only improve and some do not improve. I think he might have added that in some cases their condition becomes more aggravated. Therefore, the treatment is not a specific. However, any treatment that gives relief in some cases should be given our honest and earnest attention.

Perhaps the name "insulin shock" is not the best name that we could have used in this treatment. It is not a true condition of shock as we see in surgery, etc.; it is more of a toxic condition. Perhaps it is really more of a mental shock than a physical. This, however, is not important if you get good results.

⁂

Samuel D. Ingham, M.D. (727 West Seventh Street, Los Angeles).—The authors have given us a practical review of the status of insulin shock therapy, as reported from various clinics, as well as their own results. Their experience has been in close accord with most of the work reported, and indicates that the insulin treatment of dementia praecox is the most efficient means of treating this condition.

It is to be emphasized that success of this treatment depends largely upon the technique of its administration and, therefore, upon the experience and judgment of those who are using it. The best results are obtained when insulin shock is carried to the ultimate degree consistent with a reasonable margin of safety. It is, therefore, important to be on the alert for danger symptoms and to be ready with emergency treatment. No satisfactory theory has been offered to explain benefits derived from the insulin treatment of schizophrenia, although several have been proposed.

It is of interest to note the marked improvement in the physical condition of patients which occurs simultaneously with the improvement of the mental condition. This includes a gain in weight, improved digestion, better circulation and vasomotor stability, as well as general improvement in vegetative functions.

I think that all who have had a comprehensive experience with this form of treatment can subscribe to the conclusions of the authors expressed in their summary.

CONGENITAL RENAL ANOMALIES*

WITH SPECIAL REFERENCE TO HORSESHOE KIDNEY

By Carl F. Rusche, M.D.
and
Samuel K. Bacon, M.D.
Hollywood

Discussion *by Robert V. Day, M.D., Los Angeles; Benjamin H. Hager, M.D., Los Angeles; William E. Stevens, M.D., San Francisco.*

DOUBLE kidneys, reduplication of pelves and ureters are the most frequent anomalies of the upper urinary tract. Next in frequency is horseshoe kidney. In general, this interesting renal mass may be defined as a symmetrical, semicircular fusion of the two kidneys across the vertebral column by a bridge or isthmus which, even without concomitant disease or gross pathology, produces a clinical syndrome called horseshoe kidney disease; an entity due to pressure, which is characterized by indefinite epigastric or umbilical pain, intestinal and urinary stagnation.

CLASSIFICATION

In order to institute better clinical and surgical management of horseshoe kidney, Gerard, and later Gutierrez, have classified the subject into symmetric and asymmetric groups. The symmetric division refers to fusion by a bridge of renal or fibrous tissue of the two organs at the lower poles with concavity upward, or fusion of the upper poles with concavity downward. This organ rests astride the vertebral column. The asymmetric type refers to irregularities in shape, location, and position. This entity is less common and the individual types accordingly are termed unilateral fused kidney, L-shaped renal fusion, fusion en glatte or disc form, sigmoid fusion, fusion en masse, and fusion without form.

INCIDENCE

With the advent of urography, the incidence of this anomaly has markedly increased. Various averages from the statistics of several necropsy surgeons before the introduction of pyelography, fix the rate to about 1:1000; however, with this method of urologic diagnosis the frequency has been increased to about 1:400, and even more recently the ratio is reported to be 1:200 pyelograms. In 68,989 necropsies reported by Carlier and Gerard, there were eighty horseshoe kidneys, or 1:862; Kuster, 1:1100; Davidsohn, 1:1000; Judd, Braasch and Scholl, 17:2424 operations on the kidney; Bettez, 1:715; Guizzetti and Pariset, 1:1142; Marynski, 1:683; Naumann, 1:600; Jeck, 1:643; Thompson, 19:12,888 (1:671); Motzfield, 92:73,489 (1:710); Lipshutz and Hoffman, 105:70,502 (1:671); Legueu and Papin, 1:600.

EARLY LITERATURE

In the annals of medical history, from the ancient down to modern times, one can find a fascinating story of this subject. First, the ancient anatomist and post-mortem surgeon reported this "monstrosity"; then, with the commencement of kidney surgery late in the nineteenth century, the anomaly was discovered during abdominal exploration for tumor; and, finally, this history continues on to an era of clinical diagnosis by physical examination, and more recently, to conclusive diagnosis by retrograde or intravenous urography.

Early in embryonic life it is an established fact the pronephros, mesonephros, and metanephros arise from both entoderm and mesoderm. The pronephros degenerates early and is considered rudimentary in character; the mesonephros is important during embryonic life, and its remnants enter into formation of the genital tract; and, lastly, the metanephros establishes itself as the permanent kidney. The renal buds appear behind and at the lower end of the mesonephros or Wolffian duct during the fourth week and progressively change their shape and position; hence, the opportunity for anomalous development between the fifth and seventh week. These anlagen arise on a level with the second sacral vertebra below the umbilical arteries and aortic bifurcation, and migrate upward. This vascular mechanical obstruction, according to several writers, may impede the ascent and rotation and permit fusion to take place.

SYMMETRICAL FORM

The most common or symmetrical form of horseshoe kidney is a semicircular mass of renal substance whose concavity is upward, and united at the lower poles (90 to 95 per cent) by a bridge or isthmus of renal or fibrous tissue which crosses the spinal column. The renal parenchyma usually retains some marks of fetal lobulation, and the right and left halves are seldom exact in position or shape. The asymmetrical organ presents a remarkable tendency to dystopia.

---

* Read before the Urology Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

The isthmus connecting the lower poles is in close apposition to the surrounding structures, namely, (*a*) posteriorly, the inferior vena cava, abdominal aorta, solar plexus and vasovisceral branches, the great lymphatic reservoir, and the spine; (*b*) anteriorly, the parietal peritoneum and intra-abdominal viscera. Usually the bridge is low at the umbilical level, the aortic bifurcation, or level of the fourth to fifth lumbar vertebrae.

The pelves, usually two in number, are generally anterior to the blood supply, incompletely rotated, and extend on to multiform calices in the reverse position. The latter frequently cross a portion of the spine. The ureters cross the isthmus and connect each pelvis to the bladder. If fusion of the upper poles (5 to 10 per cent) is present, the ureters usually arise from the upper portion of the kidney mass and do not cross the isthmus.

In collected studies from the literature, from four to six renal arteries supply and support the median and two lateral sections; however, anomalies predominate. The solar plexus, splanchnic nerve, sympathetic and parasympathetic nerves, phrenic nerves, and other regional interanastomoses enervate the kidney. The lymphatics are multiple and run parallel to the retroperitoneal vessels. In close proximity is the cisternal chyli.

DIAGNOSIS

In clinical practice the diagnosis of horseshoe kidney is made usually after the urine has become infected. Pressure of the isthmus on the adjacent structures produces extensive nervous and circulatory phenomena. Then stasis in the renal pelves, due to ureteropelvic juncture obstruction, high ureteral implantation, and structural dependency, initiates the sequelae of infection.

Horseshoe kidneys undergo the same pathologic lesions as normal kidneys; however, because of the predominating factor of stasis, hydronephrosis, pyelonephritis, pyonephrosis, and calculous disease are common sequelae. Cases of tuberculosis, neoplasm (parenchymal or pelvic), polycystic disease, and chronic diffuse nephritis, have been reported.

The clinical history and physical examination are seldom sufficiently significant to suggest the possibility of a tentative diagnosis of horseshoe kidney. Gutierrez's horseshoe kidney syndrome, consisting of umbilical or epigastric pain, chronic constipation, and urinary findings, is worthy of emphasis by repetition. In the thin patient an abdominal mass and isthmus may be palpated. Israel and others have stated that "the surgeon must bear in mind the possibility of such a congenital kidney malformation." Symptoms, signs, and findings such as, or of, renal colic, nephritis, pyelonephritis, uremia, and chronic cystitis, are to be considered.

The conclusive diagnosis of horseshoe kidney has been reduced to simple mechanical technique since the era of cystoscopy and urography. Routine urologic study, consisting of medical history, physical examination, urinalysis, blood chemistry, phenolsulphonephthalein test, roentgenography, cystoscopy, ureteral catheterization, differential renal function tests with phenolsulphonephthalein, and retrograde bilateral pyelography or intravenous urography without cystoscopy, adequately provides a complete diagnostic armamentarium. The horseshoe kidney pyelographic triangle of Gutierrez is fascinating and seems to be pathognomonic; at least practical in its application.

Certain roentgenological and pyelographic findings, such as delineation of renal poles of both kidneys, close proximity to vertebral column, obliteration of psoas outline, renal calculi in transverse position near midline, "flower vase" figure of ureteral catheters, inversion and rotation of pelves, inversion of lower calices and directed medialward, bizarre pelves near spine, "bottle neck" ureteropelvic appearance, "minimum lower angle of horseshoe kidney triangle," if critically employed should establish conclusively the diagnosis of this anomaly.

TREATMENT

The treatment of horseshoe kidney varies with each individual case, and is particularly dependent upon the existing pathologic lesions. Indwelling ureteral catheter drainage is necessary in the presence of acute manifestations. Intermittent drainage may be sufficient as a temporary procedure in chronic urinary stasis. In infected hydronephrosis, pyonephrosis, tuberculosis, or neoplasm, involving half of the renal mass and in the presence of a normal half, resection (heminephrectomy) is a rational procedure. The surgical technique is comparable to that carried out in similar pathologic processes in a normally formed kidney. Transperitoneal anterior as well as retroperitoneal lateral and anterolateral approaches have been recommended and practiced. The transperitoneal anterior incision simplifies the operation. During surgery in infected cases, care should be exercised to avoid peritoneal contamination, and with tight peritoneal closure a retroperitoneal stab wound and drain are recommended. Conservation of renal substance is even more axiomatic in dealing with this congenital anatomopathologic entity. Pelviolithotomy should be stressed more seriously than resection, because of the potential danger of subsequent disease of the opposite parenchyma or pelvis. The literature attests to the rational of symphysiotomy and nephropexy in "chronic cases of horseshoe kidney disease with clinical symptoms."

To demonstrate several of the above ideas, which are in no way original with us, we give below the clinical history of one recent case of horseshoe kidney which we personally observed, and our surgical technique will be shown in motion pictures in color.

REPORT OF CASE

History.—A white female, aged 56 years, was admitted to the hospital on May 10, 1937. She complained of blood in the urine, dull pain and a sensation of heaviness in the upper and right side of the abdomen, extending through to the back, especially for the past four months. The patient stated that passage of the uniformly bloody specimen of urine was without bladder discomfort. The familial and early personal history were not relevant.

Examination.—The examination revealed a very well-nourished female, who was alert, coöperative, and in no acute distress. Temperature was 98.6 degrees; pulse 78. The abdomen was characterized by a hard, slightly moveable mass about the size of a large grapefruit, located in the epigastrium, but more prominent just to the right of the

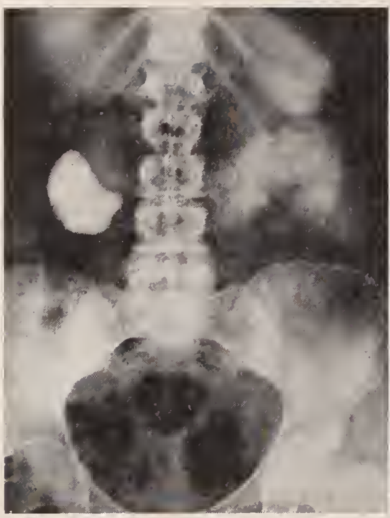

Fig. 1

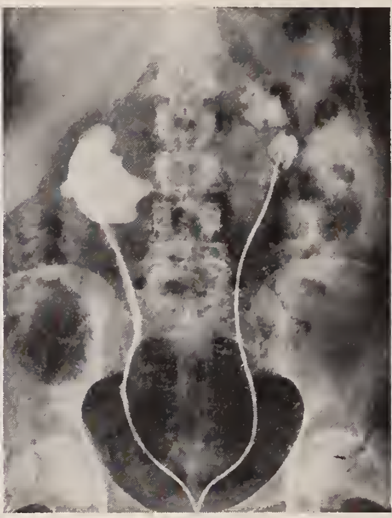

Fig. 2

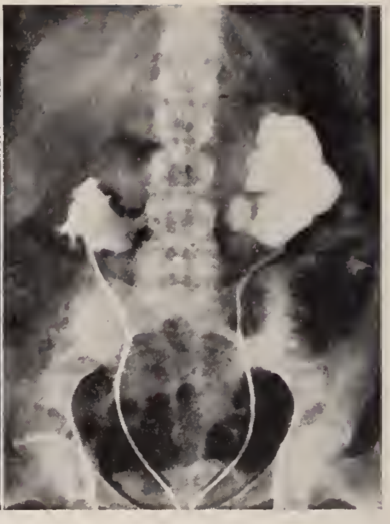

Fig. 3

Fig. 1.—Antero-posterior roentgenogram of the kidney, ureter, and bladder area, showing a large calculus near the spine and indistinct delineation of the kidney poles.

Fig. 2.—Bilateral pyelograms showing calculus in right kidney pelvis; left pelvic dilatation although incompletely filled; pelves near spine, and improperly rotated; "flower vase" figure of ureteral catheters; 22 degree "minimum lower angle of horseshoe kidney triangle."

Fig. 3.—Postoperative (11 months) bilateral pyelograms showing satisfactory anomalous kidney pelvis and enormously dilated left kidney pelvis.

midline. A very hard, protruding irregularity (calculi), particularly noticeable upon inspection and palpation, was localized to the right of and somewhat above the umbilicus.

The urine was suggestively bloody grossly and contained many red blood cells, pus cells, and Gram-positive cocci in clumps. Blood non-protein nitrogen, 25 milligrams per 100 cubic centimeters. One cubic centimeter of phenolsulphonephthalein given intravenously appeared in three and three-quarter minutes; 45 per cent and 10 per cent recovered in the first and second thirty-minute periods, respectively. Blood Wassermann and Kahn tests were reported negative. Hemoglobin, 85 per cent; red blood cells, 5,250,000; white blood cells, 9,600; 69 per cent polymorphonuclear leukocytes.

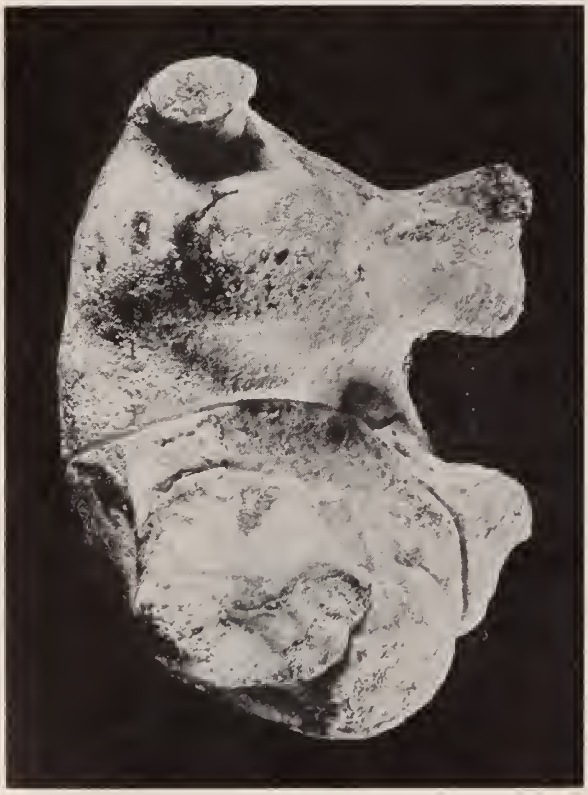

Fig. 4.—Surgical specimen, staghorn faceted calculus reassembled.

Kidney, ureter, and bladder roentgenogram (Figure 1) presented a large staghorn calculus near the spine, on the right side at the level of the third and fourth lumbar vertebrae. Several small opacities were reported in the corresponding area on the opposite side. The renal silhouettes were indistinct; however, the lateral borders of a mass of tissue seemed to be closer than normal to the midline.

Cystoscopic examination presented evidence of a mild cystitis. The ureters were readily catheterized and specimens of urine obtained from the renal pelves showed the following: Right—many pus cells and Gram-positive cocci in clumps; left—few pus cells and Gram-positive cocci. Differential renal function test, using one cubic centimeter of phenolsulphonephthalein intravenously showed: Right—appearance time eight minutes, 5 per cent excreted in twenty minutes; left—appearance time five minutes, 15 per cent excreted in twenty minutes.

Other roentgenograms, including bilateral pyelograms (Figure 2), disclosed the following findings: (*a*) Large right staghorn renal calculus near the vertebral column; (*b*) small densities (?) in the corresponding area of the opposite side; (*c*) "flower vase" figure of the ureteral catheters; (*d*) inversion and rotation of bizarre renal pelves; (*e*) inversion of lower calices directed medialward; (*f*) bilateral pelvic dilatation, especially the left; (*g*) "bottle neck" ureteral position; and (*h*) 22 degree lower angle of horseshoe kidney triangle. The diagnosis of horseshoe kidney with calculous disease was definitely established. Surgical removal of the calculi in the right renal pelvis was recommended and accepted.

Operation.—(May 25, 1937, recorded in motion pictures in color.) Under inhalation anesthesia, an incision was made parallel to and one and one-half inches to the right of the abdominal midline, commencing high in the right epigastric area and extending a few inches below the umbilicus. After opening the peritoneum the intra-abdominal contents were readily displaced to expose the horseshoe kidney. Incidentally, a 2.5 centimeter calculus was discovered in, but not removed from, the gall-bladder. The posterior peritoneum was incised longitudinally and the anomalous kidney, particularly its right half and isthmus, was exposed. Fusion of the upper poles was readily discernible. A moderately dilated, highly implanted right ureter and thickened, distended anterior pelvis were found. After opening the renal pelvis several large faceted calculi, forming a complete silhouette of the pelvis, were removed

(Figure 4). Due to the thickness of the pelvic wall, it was possible to make a substantial repair. A Penrose drain was directed retroperitoneally to the costo-iliac space and retrieved externally through a small stab wound. Each peritoneal incision was closed tightly without drainage, and the remainder of the abdominal wall was repaired with chromic catgut and skin dermal sutures.

Postoperative Course.—At no time did the temperature exceed 100.4 degrees, or the pulse 100 per minute. These were normal on the fifth day. The abdominal wound healed by primary union and only a slight amount of serous drainage came from the stab wound. The abdomen remained undistended and peristalsis was active. The patient was discharged from the hospital on the twenty-second, postoperative day, ambulatory and apparently in good health.

Unfortunately, this patient did not keep her clinic appointment and was not examined until January 1, 1938 (seven months later). At that time she complained of severe aching in the left abdomen and costo-iliac space. Examination disclosed the following: Well-healed surgical scars; tenderness in left abdomen and costo-iliac space. Temperature 98.6; pulse 80; respiration 20. Bladder urine: many pus cells and Gram-negative bacilli. Phenosulphonephthalein test: Appearance time four minutes, 50 per cent first half-hour, 15 per cent second half-hour. Blood nonprotein nitrogen, 23 milligrams; kidney, ureter, and bladder roentgenograms negative for calculi. Cystoscopic study, ureteral catheterization, and bilateral pyelography presented mild cystitis, large irregular, left hydronephrosis, and sharply defined minor calices of the right pelvis. Urine from the right pelvis was negative for pus and bacteria; however, the left one contained many pus cells and myriads of Gram-negative bacilli. Phenolsulphonephthalein, one cubic centimeter intravenously, appeared in 5 minutes and 11 minutes from the right and left pelves, respectively, and the right excreted 22 per cent in 20 minutes; the left 2½ per cent. This study substantiated a diagnosis of left infected hydronephrosis. The patient responded with left ureteral dilatation and lavage of the kidney pelvis.

Again the patient was discharged from the hospital; however, one of us (S. K. B.) recently (April 14, 1938), subjected her to another complete kidney study. The essential points of interest are: No demonstrable urinary calculi; only a trace of function from the left pelvis; right pelvic urine without pus or bacteria; left, "loaded" with pus and Gram-negative bacilli and, according to the pyelogram, consistent with a far-advanced hydronephrosis (Figure 3). At this writing no further treatment has been instituted, since the patient has established residence in a distant rural community.

CONCLUSIONS

1. A case of horseshoe kidney (fusion of the upper poles) with calculous disease is reported; its clinical history given and the surgical treatment (transperitoneal pelviolithotomy) recorded through motion picture in color.

2. Urinary stasis, due to anomalous pelves and ureteropelvic juncture obstruction, is the main causative factor of associated pathology.

3. Roentgenographic procedures, especially bilateral pyelography, offer a conclusive diagnosis.

4. Surgical technique is comparable to that carried out in similar pathologic processes in a normally formed kidney. We, in this instance, chose the transperitoneal approach.

5. Conservation of kidney substance is even more axiomatic in dealing surgically with this congenital entity because of the potential danger of subsequent disease of the corresponding parenchyma and pelvis.

1680 North Vine Street.

DISCUSSION

Robert V. Day, M. D. (1911 Wilshire Boulevard, Los Angeles).—With the advent of excretion urography, fewer cases of horseshoe kidney are overlooked—as stated by the authors. But even greater emphasis should be placed on the careful study and correct interpretation of urograms obtained both by the intravenous and retrograde methods. The clinical syndrome in itself is highly suggestive, and calls for adequate urologic investigation. In their modesty, and apparent attempt not to appear dogmatic, I fear the authors have not sufficiently stressed these points, although the case history shows how painstakingly all these were carried out. Excretion urography is of more diagnostic import in horseshoe than in other forms of upper urinary-tract anomalies, for the reason that in so many of the other anomalies of the kidney and ureter one segment is apt to be entirely functionless and no radio-opaque agent is excreted in this segment.

At this point it might not be amiss to state that when one is too eager to discover rare anomalies he is apt never to find them. But if we strive with wide-open minds to make correct and total urologic diagnosis in each and every case as they are presented—simply assaying the patient for whatever pathologic condition, lesion or disease that he may have—the rare anomalies will seldom be overlooked. This does not mean, however, that we should carry out routine major urologic diagnostic procedures which the clinical history, subjective symptoms and simple subjective findings do not warrant. Individualizing of cases, and their careful study, supply the clues which indicate the kind and extent of urologic investigation that should be carried out.

The authors' case is an interesting one from several standpoints. First of all, the fusion was at the upper pole—quite rare.

From the clinical standpoint, one is bound to note the wise conservativeness of the authors in the management of this case. Moreover, the practical results attest this. Each case is apt to present a specific problem, and perhaps their next case of horseshoe kidney would call for a quite different surgical procedure, such as, for example, division of the isthmus and unilateral nephropexy.

I wish to commend the authors on their clear, succinct presentation of a rare and interesting case history, and their sound judgment in its management.

⁂

Benjamin H. Hager, M.D. (1136 West Sixth Street, Los Angeles).—Doctors Rusche and Bacon have presented a most unusual case of congenital anomaly in which a huge stone could be readily palpated through the abdominal wall. This unquestionably was the factor which decided the transperitoneal approach, a very courageous one in the presence of kidney infection. It has been established that horseshoe kidneys, in the absence of pathology, often give rise to a characteristic syndrome. This anomaly likewise is prone to develop symptoms arising from interference with urinary drainage—hydronephrosis, stone and infection being rather common complications. More lasting benefits are apt to follow surgery if attention to stasis is instituted. I have been very much impressed with the teachings and results of Doctor Foley of St. Paul, who makes it a practice, when feasible, to sever the communicating isthmus and perform a nephropexy at one sitting. This is followed, at a later date, by nephropexy of the remaining half. His records show an enviable result from the standpoint of complete relief of symptoms.

⁂

William E. Stevens, M.D. (490 Post Street, San Francisco).—In reviewing the literature some years ago I found that, in the combined reports of 148,329 autopsies, horseshoe kidneys were present in 198 or once in 749 cases. As Doctors Rusche and Bacon have stated, they are found more often clinically since the advent of pyelography.

In the horseshoe kidneys that have come under my observation the most frequent symptom has been pain or discomfort in the abdomen, usually increased by exercise and relieved by rest in bed. A smooth, apparently oval mass was occasionally detected on palpation. The isthmus, unless composed of fibrous tissue, will often be more clearly outlined following excretory rather than by retrograde pyelography. Concomitant abnormalities of the genital organs are common, and horseshoe kidneys are not infrequently confused with lesions of the pelvic organs in the female. Pyelography is always indicated in the presence of an abdominal or pelvic mass of uncertain origin.

I wish to present brief histories and lantern slides of three cases:

Case 1. A young married woman complained of pain in the right groin (worse during menstruation), frequent urination and a sensation as if "something was pressing on the bladder." The characteristic pain was reproduced during vaginal palpation. The urine was negative. Pyeloureterography revealed a horseshoe kidney, and it was thought her symptoms were partly due to this anomaly. These disappeared, however, following the removal of infected tubes and a cystic right ovary. Many horseshoe kidneys exist without symptoms. The urine was negative in two of these cases I am reporting.

Case 2. A married woman, sixty-eight years of age, complained of a burning pain in the entire abdomen and frequent urination. Her urine contained numerous pus cells. Both pelvic and urinary-tract pathology were suspected. Pyelography revealed a horseshoe kidney. The isthmus is unusually well outlined in this case. The patient refused further investigation.

Case 3. Although previously reported, I am again presenting the following unique case, as it is interesting in connection with Doctors Rusche and Bacon's paper. The patient, a young woman, twenty-three years of age, complained of lower lumbar backache, worse during menstruation, and relieved by rest in bed. She also suffered from obstinate chronic constipation and malaise. The urine was negative. Pelvic and gastro-intestinal examinations were likewise negative. A firm oval smooth abdominal mass, the size of a large hen's egg, could be palpated a little to the right of the midline above the umbilicus in this case. Forceful aortic pulsation could be detected over the inner half of this mass. Cystoscope was negative and the ureters were easily catheterized. Kidney function was slightly increased on the right side. A pyelogram of the right kidney showed marked overlapping of the calices. Unfortunately, the patient, a very nervous individual, refused further cystoscopic or pyelographic investigation. Exploratory laparotomy revealed a somewhat kidney-shaped mass with a pelvis lying transversely across the fifth lumbar vertebra. A third ureter ascended about 1.5 centimeters from the center of this mass, turning to the right and descending about one centimeter, where it joined the right ureter. The mass was fused at both extremities with the right and left kidneys, respectively. Another unusual feature in this case is the normal position of the left kidney. Both kidneys are almost always lower in fusion of the horseshoe type. The patient's symptoms improved and eventually disappeared, following the removal of an appendix which showed evidence of previous inflammation and a cystic right ovary. Should this be classified as a fused third kidney or a horseshoe kidney with three ureters?

Doctors Rusche and Bacon's paper has been most interesting. They are to be congratulated on both their surgical conservatism and their excellent motion picture. According to statistics, operative mortality is increased following operation on horseshoe kidneys.

SOBISMINOL: ITS ORAL ADMINISTRATION*

CLINICAL RESPONSES AND ADVANTAGES IN FIVE LUETIC PATIENTS IN PRIVATE PRACTICE

By WILLARD E. KAY, M.D.
AND
JOHN W. FRICKE, M.D.
San Francisco

SOBISMINOL is a soft mass in capsules, each capsule containing equivalents of 0.2 gram sodium bismuthate, 0.4 gram tri-isopropanolamin, and 0.1 gram propylene glycol. The bismuth content is about 70 per cent, equivalent to about 0.14 gram of bismuth metal in each capsule. The reaction product has not yet been identified chemically, but appears to be a complex organic bismuth compound with unique properties. The description of the product and its actions, absorption, excretion, toxicity, etc., have been reported in several papers from Doctor Hanzlik's department,[1] and the following brief summary of the product will suffice here: High stability in body fluids, tissues, weak acids and alkalies; readily and adequately absorbed from the alimentary canal; bismuth distributed to all tissues; excreted in urine; low toxicity, but has a fatal dose in animals; tolerance good; potent antisyphilitic actions in experimental and clinical syphilis in all stages. A solution can also be used intramuscularly. The gastro-intestinal absorption, urinary excretion, tolerance, and high antisyphilitic potency of oral sobisminol in patients have been confirmed by Cole, Sollmann, and Henderson of Cleveland,[2] who feel that sobisminol is the most potent bismuth compound of all bismuth compounds by any method of administration. Sobisminol is the only compound of several proposed for oral administration that is really adequately absorbed and effective in antisyphilitic treatment. The favorable reports on sobisminol justified the clinical trial we have given it. Brief protocols of our cases follow.

REPORT OF CASES

CASE 1.—Mr. A. W., age 83, a capitalist, first seen at his home on July 2, 1935, complained of agonizing pains in the lumbar and lower dorsal regions (which had come on three months prior, following a prostatic resection), an incontinence and nocturia as often as twelve times per night. The pains were especially prone to occur at night while the patient was in bed and particularly when changing position, and were described as lightning and knife-like, radiating from the lower dorsal spine region to the mid-abdominal region.

Physical findings were: an old chronic antrum infection, a chronic bronchitis with bronchiectasis and emphysema, an enlarged heart (chiefly left ventricular hypertrophy), a widened and thickened aorta with especially supravalvular widening, an accentuated aortic second with a loud systolic blow, moderately thickened peripheral blood vessels, pulse rate 68, blood pressure 200/80 in both arms, a palpable liver but not tender, marked tenderness over the descending colon (x-ray later revealed chronic diverticulosis), moderately atrophic gonads, slightly hypertrophied and firm prostate, and some lordosis, and scoliosis and tenderness of the lumbar and lower dorsal spine. Tendon reflexes of lower extremities could not be obtained. No Babinski or Oppenheim. Romberg was negative, no past pointing. Motor force was good. No sensory disturbances. The pupils were regular in outline, myotic, but reacted sluggishly to light. The blood Wassermann, Kline, and Kahn were three plus. No spinal puncture was done because of the patient's age. Inquiry from his genito-urinary specialists disclosed the fact that he had, in years past, been extensively treated with neoarsphenamin, which always gave him a severe reaction, with temperature reaching as high as 102 and 104 degrees, and mercury, intramuscularly, topically, and orally.

Iodobismitol with saligenins was exhibited intramuscularly every five to seven days, which brought about prompt but not complete relief from the pain. After twenty-four injections the Wassermann, Kahn, and Kline, however, did not improve. At this time, April, 1936, the patient decided to take a trip through the Panama Canal to New York, and it was then that sobisminol was administered by mouth. Two capsules of sobisminol were taken each day for approximately fourteen days, at the end of which time he would usually manifest symptoms of intolerance, characterized by weakness, depression, sleeplessness, slight diarrhea, and frequent urination. Upon the earliest signs of saturation the patient would discontinue the capsules for two or three days, and then again feel quite well. After taking the capsules for one month—approximately fifty-six capsules (7.8 grams of bismuth)—the pains in his back disappeared entirely, and the nocturia decreased to an average of three times a night. On his return, two months later, blood Wassermann was taken and sent to Doctor Wyckoff, Stanford Clinical Laboratory, which was negative in all three antigens. The Hinton and Kline tests, however, were positive, three plus.

---

* Through the courtesy and kindness of Dr. P. J. Hanzlik, of the Stanford University School of Medicine, San Francisco, and the Cutter Laboratories, Berkeley, we have had the privilege of treating five cases of syphilis orally with sobisminol in our private practice. The clinical responses in all five cases has been so satisfactory that it seems warranted to publish them.

Mr. A. W. passed away at the age of eighty-eight on March 21, 1938, of pneumonia, working hard up to the onset of his illness of five days' duration. He had been symptomless as far as his lues was concerned, and, additionally, rather frequent attacks of angina pectoris had disappeared altogether, and a brownish-colored skin had cleared and appeared normal to him. Mr. A. W. used approximately 1,200 capsules of sobisminol over a period of about twenty-one months, or an equivalent to 168 grams of bismuth ion. His serology had changed from a three plus Kline, Kahn, and Wassermann to a two plus Kline, one plus Kahn, and a negative Wassermann.

His serological findings are tabulated as follows:

July 10, 1935	Kahn 3 plus Kline 3 plus Wassermann 3 plus
January 17, 1936	Kahn 4 plus Kline 4 plus Wassermann 4 plus

Sobisminol—three capsules daily:

April 17, 1936	Kahn 4 plus Kline 4 plus Wassermann 4 plus

Return from two months' trip:

June 26, 1936	Kline 3 plus Kahn 3 plus Wassermann negative
July 21, 1936	Kline 3 plus Wassermann negative
October 26, 1936	Kline 3 plus
December 11, 1936	Kline 3 plus
March 4, 1937	Kahn 3 plus Wassermann negative
October 13, 1937	Kahn 4 plus Kline 3 plus Wassermann negative
January 19, 1938	Kahn 2 plus Kline 1 plus Wassermann negative

* * *

Case 2.—Mrs. E. R., age 66, was first seen on September 17, 1937, with a "sore" in her mouth, which failed to heal in five weeks, as well as a "sore" on the base of the left index finger which had healed very slowly. A history of lues, contracted eleven years ago (1926), was obtained which had been intensively treated for two years at that time.

Physical examination only revealed an accentuated aortic second sound and a moderately widened aorta, the latter borne out on fluoroscopic examination. The neurologic examination was essentially negative.

Laboratory findings were as follows:

Urine: Clear; acid; specific gravity of 1.028; sugar 3 plus; albumin, negative; white blood cells, 3.4 per high dry field.

Blood: Hemoglobin, 80 per cent, 13.25 grams; red blood cells, 4.38 million; white blood cells, 8,600; differential—neutrophils 55, lymphocytes 38, endotheliocytes 5, eosinophils 2.

Serology: Kahn, 3 plus; Kline, 3 plus; Wassermann negative.

Chemistry: Blood sugar, 250 milligrams per 100 cubic centimeters of blood.

The patient was placed on a diabetic regimen, and sobisminol, one capsule three times daily, was administered. Twelve days following the exhibition of the capsules (thirty-six capsules equivalent to 50 grams bismuth ion) the oral mucosa had healed completely. Approximately 1,000 capsules of sobisminol, 140 grams of bismuth ion, have been taken by her, and at no time have they caused any deleterious effects. The blood picture chronologically is as follows:

November 3, 1937	Blood sugar, fasting specimen, 200 milligrams per 100 cubic centimeters Wassermann negative Kline negative Kahn negative
January 12, 1938	Blood sugar, fasting specimen, 136 milligrams Serology negative
April 12, 1938	Blood sugar, fasting specimen, 134 milligrams Serology negative
July 14, 1938	Serology negative

* * *

Case 3.—Mr. M. O., age 34, on November 9, 1937, complained of a sudden ptosis of the left upper eyelid and continuous headache. Physical examination revealed, in addition to the ptosis, an external strabismus, the eye being directed a little downward, a slight protrusion of the eyeball, a mydriasis, and a loss of accommodation. No diplopia was determined. The general physical examination was essentially negative. The blood serum, Kline and Wassermann, were four plus and the spinal fluid revealed a cell count of five, a trace of globulin and sugar, a four plus Wassermann, and a colloidal gold: 234321000.

The patient was placed on one capsule of sobisminol three times a day, and has taken them continuously to the present time. In July, 1938, he wrote that the eye had practically returned to normalcy, that the headaches had disappeared six weeks after the exhibition of the drug, and that he at no time showed any evidence of intolerance, having ingested a little over 700 capsules. This clinical response was confirmed by the patient's local doctor in Nevada. He has promised to return for reëxamination before the end of the year.

* * *

Case 4.—Mr. W. F., age 50, a miner in an isolated town in Nevada, came to us in July, 1934, suffering from severe coughing spells, shortness of breath, weakness, and loss of weight. Examination disclosed much density throughout the chest, particularly in the left upper lobe, and in the lower posterior part of the right upper lobe and the upper posterior part of the right lower lobe, a large area of compact density measuring almost five centimeters in diameter. Our impression was that he had a combination of pneumonoconiosis and tuberculosis with encapsulated fluid or pneumonitis. No fever was present, and repeated sputum investigations failed to uncover acid-fast organisms. Wassermann and Kahn were both four plus. Antiluetic treatment was instituted. He received two injections of neoarsphenamin, .15 grams and 3 grams, respectively. Following the second injection he developed a scarlatiniform rash with fever. He then received eighteen injections of iodobismitol with saligenins. A radiograph of the lung, taken on November 21, 1934, revealed a marked amount of absorption of the dense area already described, which was so striking after the antiluetic therapy that we thought we were dealing with syphilis of the lung plus pneumonoconiosis.

Because of urgent business reasons the patient left for home feeling much improved. A simple cough syrup was prescribed, to be taken when necessary, and lipiodid tablets at periodical intervals. Since then he has come to us for treatment on eight different occasions. His last visit was on February 25, 1938. He still coughed a good deal, especially in the morning; was somewhat short of breath, tired easily, and was underweight. Blood serum revealed Kahn 3 plus, Kline 3 plus, and Wassermann 2 plus. Antiluetic treatment was again exhibited, commencing with neoarsphenamin, .15 gram intravenously, which was followed almost immediately by a severe and almost fatal nitriod reaction with edema, circulatory and respiratory collapse. He then was placed on the sobisminol capsules, one three times a day, and an ample supply was given him to take home, which he gratefully received as a substitute for the injections.

He writes that he has been so busy and has felt so well, *e. g.*, without cough, sputum, and with a general feeling of well-being and gain in weight, that he has delayed his return visit, but will do so in January, 1939. This marked improvement leads us to believe all the more that syphilis of the lung complicates the pneumonoconiosis. We might feel that the iodin component of the sobisminol, exerting salutary effect on a pneumonoconiotic lung, was responsible had it not been for its (iodin) exhibition previously over a long period of time. He has taken approximately 800 capsules (112 grams of bismuth ion), and has never had any ill effects. We look forward with interest to our findings on his next visit.

* * *

Case 5.—Mr. J. G., age 25, a printer, complained of severe headaches, confined to the top of his head, which usually forced him to bed. No apparent reason for them could be given by the patient. In the course of a routine examination a three plus Kline was obtained, but no evidence of lead poisoning. The patient denied ever having an acute infection, nor could he give any information so far as his family was concerned, since both his parents died when he was but nine years of age. A careful physical and neurologic examination was made, revealing no evidence of lues, nor could any evidence of hereditary stigmata of syphilis be obtained by careful investigation of teeth, etc. Blood sent to the state laboratory was reported as a three plus Kline and a four plus Kahn, the Wassermann being negative. Stanford Medical School clinical laboratories reported a positive Hinton test and a negative Wassermann, which was slow to clear.

The patient underwent a submucous resection and was relieved of his headaches entirely. Following twelve weekly intramuscular injections of Fraisse's Quinine Iodo-Bismuthate, 0.2 grams, all tests—Kline, Kahn, and Wassermann—were negative, both in our own laboratory and the State of California laboratory. A spinal puncture, too, was negative. Six months later blood again was checked, showing Kline three plus and Wassermann negative in our own laboratory, and Kahn four plus and Wassermann negative in another laboratory.

The apparently conflicting serum reactions were highly interesting, though disconcerting. Several clinical pathologists, as well as Dr. B. S. Kline, were consulted. On two different occasions whole clotted blood, collected under sterile precautions, was sent to Doctor Kline, and the blood on both occasions gave the following results in the slide tests: Diagnostic, plus, minus—doubtful; exclusion, four plus—strongly positive. Doctor Kline was of the opinion that lues could not be excluded because of the persistence of at least weakly positive reactions with the flocculation tests, and did not believe that the four negative Wassermann reactions were as significant as the five weakly positive flocculation reactions, because the latter tests were more sensitive.

The patient was placed on sobisminol capsules, two capsules three times a day, but after twenty-five days' administration the patient became nauseated, so a week's rest was ordered. Since then Mr. J. G. has adjusted the dosage to two capsules before breakfast, and finds he has no symptoms of intolerance whatsoever. His last serologic report on December 8, 1938, both in our laboratory and another laboratory, was negative throughout. A total of 500 capsules had been taken.

Serologic findings were as follows:

July 23, 1936	Kline 3 plus Wassermann negative (slow in clearing)
July 28, 1936	Hinton moderately positive Wassermann negative (slow in clearing)
July 31, 1936	Kline 2 plus Wassermann negative
October 20, 1936	Kline 1 plus
December 18, 1936	Kline negative Kahn negative Wassermann negative
August 5, 1937	Kahn 4 plus Wassermann negative (000000) Kolmer
September 11, 1937	Slide test for syphilis by B. S. Kline, M. D. Diagnostic doubtful Exclusion strongly positive
September 24, 1937	Diagnostic doubtful Exclusion strongly positive
January 19, 1938	Kline 2 plus Kahn 3 plus Wassermann negative
July 14, 1938	Kline 1 plus Kahn 2 plus Wassermann negative (000000) Kolmer
December 8, 1938	Kline negative Kahn negative Wassermann negative

COMMENTS

Our clinical results indicate that sobisminol given orally is definitely effective in cases of late syphilis. Sypmtomatic and serologic improvements occurred in all five patients. This is in general agreement with the observations of others.

The daily dosage used by us was much less in four of the patients; that is, one-half to one-third the daily dosage now being used in the Stanford clinics and by others. We used generally three capsules, or 0.6 gram, sobisminol daily as against six to nine capsules, or 1.2 to 1.8 grams daily, used by others. The total number of capsules in these four patients ranged from 300 to 1,200, given in from about eight months to two years. The total amount of sobisminol given ranged from 100 to 219 grams, equal to about 70 to 166 grams of bismuth ion. One patient (J. G.) was given six capsules daily, or 1.2 grams, of sobisminol for twenty-five days, total 30 grams of sobisminol, and then three capsules daily, or 0.6 gram, for sixty days, total 36 grams or a grand total of 60 grams in about three months. These are large doses of bismuth, but the absorption is comparatively small, though adequate for antisyphilitic action.

Considering the large dosage, the tolerance was remarkably good. Two of the patients, Mr. A. W. and Mr. J. G., showed some evidence of intolerance, but were able to adjust their dosages easily, in the one case (A. W.) by "resting" a few days, in the other (J. G.) by taking the capsules before breakfast. All five patients gratefully received the capsules as a substitute for the injections, particularly Mr. A. W. and Mr. W. F., both of whom usually had severe reactions following the injection of neoarsphenamin; the former stating he felt that the capsules were the only medication that helped him, and he always stressed the ease of administration, availability at all times, freedom from serious reaction. Mr. W. F. frequently expressed his gratitude for "such a wonderful medicine that can be taken by mouth."

Unfortunately, we could not make excretion tests under our conditions, and when our treatments were begun, the short clinical method for bismuth in urine, developed by Doctor Hanzlik and assistants,[3] had not been introduced. This test, however, would be desirable control on the oral treatment.

CONCLUSIONS

The oral treatment of syphilis in all its manifestations by sobisminol marks a great advance in the treatment of patients with this disease, and is a worthy addition to our armamentarium. It enhances the success of treatment by the ease of administration over long periods of time, its freedom from serious reactions, its saving of time, and its low cost, making treatment possible in many cases in contrast to comparatively expensive forms in vogue.

Symptoms of intolerance are few and, when occurring, are easily controlled by discontinuing the drug for a few days. As a corollary, sobisminol can be ingested over long periods of time without intolerance, and patients can receive the proper and maximum antiluetic therapy even in secluded places or while away from home.

URINARY TRACT INFECTIONS

FROM A GENERAL PRACTICE STANDPOINT

By H. C. Bumpus, Jr., M.D.
Pasadena

PART II*

Discussion *by Charles Pierre Mathé, M.D., San Francisco; Harry W. Martin, M.D., Los Angeles; Frank Hinman, M.D., San Francisco.*

By far the commonest of urinary infections are those of the ascending type, one of the more frequent being associated with the passage of catheters into the bladder. The passage of a urethral catheter on a postoperative patient, followed in twelve or twenty-four hours by a chill and pyuria, is frequently interpreted as indicative of faulty technique in its sterilization, or undue trauma by the nurse or house officer officiating. It is now generally accepted by urologists, however, that the primary cause of such ascending infection has occurred prior to the catheterization. The trauma that has resulted from allowing the bladder to become overdistended being the true etiologic factor, whoever is responsible for the delay in ordering catheterization should accept the blame for the subsequent ascending infection—with its elevated temperature, chills, and fever—rather than the one who actually performed the catheterization. There seems little question that the custom of waiting for surgical patients to void after their bladders have filled is responsible for a far greater number of acute renal infections than the poor technique of nurse or house officer who did the catheterization. Nothing so sets the stage for immediate urinary infection as the overdistention of any part of the urinary tract. The stretching of the mucosa causes a serious hemorrhagic exudate which, in the presence of urine, seems to be the finest of culture media.

ASCENDING RENAL INFECTION

All urologists can attest to the distressing febrile reactions following the first drainage of an uninfected and frequently unsuspected hydronephrosis. Ascending renal infection stands, today, as the most common cause of death associated with the drainage of the overdistended bladder in prostatic obstruction. In this group should undoubtedly be included those disturbances following cystoscopic examination described by the comforting title, postcystoscopic reactions or, in the jargon of the specialist, cystoreactions.

Such an attack of acute ascending infection is usually characterized by frequency, dysuria, fever and, if particularly severe, chills, and was treated, until the decade previously referred to, more or less successfully by the administration of methenamin. Its effect was known to depend upon the liberation of formaldehyd, which could only occur in an acid media, and so acid sodium phosphate was also prescribed to insure acidity of the urine. This method of treatment met with failure in all cases in which the urine remained alkaline, either because of the simultaneous ingestion of alkalizing drugs, or more frequently, due to the presence of a mixed infection in which were included urea-splitting organisms constantly liberating ammonia. In other cases the liberation of the formaldehyd resulted in so much irritation to the urinary mucosa that the symptoms were aggravated rather than improved. When such unfortunate results developed, it was customary to reverse the process by the administration of alkalizing drugs. If the urine was already alkaline, this, of course, brought no relief.

The effect of acid and alkaline values on the power of growth of organisms in the urine is not a new discovery. Kitasabo in 1888 showed media of different acid values will kill, inhibit or allow typhoid or cholera organisms to grow. In 1917 Quinby suggested the investigation of the effect of acids in inhibiting the growth of bacteria in the human being, and Shohl and Janeway later proved that B. coli are inhibited in urine at p^H of 4.6 to 5.0 on the acid side, and 9.2 to 9.6 on the alkaline side. The p^H values for the acid side can easily be obtained by the administration of drugs; but it is not possible in the human being to obtain alkaline values sufficiently high to inhibit the growth of organisms, and not until the degree of acidity or alkalinity in urine could be accurately and easily determinable by calorimeter methods, was rational therapy possible.

ACIDITY AND ALKALINITY: p^H SCALE

Acidity and alkalinity have long been recognized as important factors in practically all branches of research and industrial work. Although it has proved its value and been widely adopted in so many different lines of work, many still hesitate to use p^H methods because they feel that its application requires the services of trained experts. Such misapprehension should not exist, since it it almost as easy to make p^H determinations as it is to make measurements of the rise and fall of the temperature. All are familiar with the Fahrenheit thermometer. On its scale, 32 degrees represents the freezing point. For the sake of illustration, let us assume that values above or below 32 degrees represent degrees of heat and coldness, respectively. Thus, any value higher than 32 degrees denotes an increase in heat, the degree of heat increasing as the numbers increase. On the other hand, any value below 32 degrees denotes an increase in coldness, the decrease in coldness increasing as the numbers decrease.

---

* For Part I, see California and Western Medicine, April, 1939, on page 254.

In a similar manner the degree of acidity or alkalinity of a solution is expressed by the p^H scale. Instead of being called degrees, as in the case of the thermometer, the units on this scale are called p^H values. It is apparent that it is not necessary for a person to know the derivation of the term "degree Fahrenheit" in order to determine the temperature of a solution with a thermometer, nor is it essential that one should know the derivation of the term "p^H" in order to measure the acidity or alkalinity of a solution.

On the p^H scale the value of p^H 7.0 represents neutrality. The solution is neither acid nor alkaline. Values higher than 7 denote alkalinity, the degree of alkalinity increasing as the numbers increase. Any value lower than p^H 7 denotes acidity, the degree of acidity increasing as the numbers decrease. This increase or decrease is measured in multiples of 10. Thus, a solution with a p^H of 5 is ten times as acid as one with p^H of 6.0, or a p^H of 4.0 indicates an acidity a hundred times as great as a p^H of 6.0.

The principle of making p^H measurements is based on the fact that various indicators change color when they are acted upon by solutions of different acidities or alkalinities. Until recently it was impossible, except in careful laboratory experiments, to tell the degree of acidity or alkalinity one was dealing with, as the determination of the reaction of urine was ascertained usually by litmus. Now, however, the exact percentage of acidity or alkalinity can be determined by simply dropping a piece of Squibb's nitrazine paper in the urine and comparing it with a color chart. Such accuracy was not possible with litmus paper, for its color range runs from p^H 4.6 to 8.4, which amounts to 3.8 p^H units, and experiment has shown that p^H values of 6.6, 6.7, 7.4, and 7.9 will appear neutral to litmus, while values of 6.8, 6.9, and 7 are recorded as alkaline.

Other indicators, such as chlorphenol red and bromthymol blue, change within a range of 1.6 p^H units and so are more accurate. For the practitioner no indicator is as satisfactory as Squibb's nitrazine papers, which are accurate to one-half unit readings.

ALKALINITY

Although it was shown experimentally that bacterial growth could not be inhibited by any degree of alkalinity obtainable in the human urine, the belief in its clinical virtues persists, based on the following: That the acidity of the urine rather than the products of bacterial growth are responsible for the irritated mucosa with its associated burning, frequency, and tenesmus. In fact, the idea that increased acidity will produce untoward symptoms is so firmly fixed in the human mind that we find the unscrupulous, by a campaign of fear, proclaiming this accepted fact in their national advertising in order to dispose of still greater and greater quantities of alkalinizing drugs. Indeed, today soda fountains are taking on the character of virtual prophylactic stations, where the purchase by the hypochondriac of that universal panacea, Alka-Seltzer, is supposed to prevent the worst. If to this group of distracted citizens one adds the large number of food faddists who, by similar urges, are pursuaded to ingest ever-increasing amounts of pineapple, orange and tomato juice, in order that they, too, may dwell in safety on the alkaline side, it sometimes seems surprising that a normally acid urine is now ever encountered!

The sad part of this erroneously held belief is that there is no evidence to show that an acid urine is irritating, or that an alkaline urine is soothing. The pertinent point is that irritation, frequency and other symptoms associated with urinary infection are the result of the infecting organisms and their by-products, not the result of the reaction of the urine.

METHENAMIN

In our attempt to rid our patient of these various organisms, let us first consider the efficiency of our oldest urinary germicide—methenamin. It is cheap, it has been used for years, and is known to be free of dangers; I have never heard of a death resulting from its administration. To be effective, the urine must be acid in order to liberate formaldehyd, and it is evident that this must be present in the urine in sufficient strength and of long enough duration to be germicidal. If the concentration of methenamin in the urine is .5 per cent and its p^H is 6, bacteria will survive for twenty-four hours; but if the p^H is lowered to 5, it will become sterile in six hours. So it is obvious that it is as important to increase the acidity of the urine as to increase the dosage of the drug to obtain the maximum of germicidal effect. In fact, so many patients are sensitive to formaldehyd that the administration of too large doses of methenamin may lead to a bladder irritability quite as annoying as that caused by the infection itself, and hematuria has not infrequently been produced by the drug alone.

Except for this drawback, methenamin is an ideal urinary antiseptic, inexpensive and efficient. In cases where there tends to be any retention of urine from atony of the bladder musculature, the administration of methenamin may cause sufficient vesical irritation to result in better emptying.

KETOGENIC DIET AND URINE

In 1931 Helmholz noticed that the urine of his epileptic patients who were on a ketogenic diet did not become foul after standing. He reasoned that this urine must contain some bacteriostatic or bactericidal property not present in normal urine. He, naturally, investigated the possibility that its diacetic content was responsible, but as many colonies grow in urine with .5 per cent diacetic as that without, while in ketonurine growth it was much diminished.

At almost the same time that Helmholz was investigating the cause of the bactericidal effects of ketonurine, Anson Clark was searching for some drug or diet that would inhibit the growth of colon organisms. Being informed by Barborka of the extreme degree of acidity produced by the ketogenic diet in children with epilepsy, he at once applied the diet to a large series of adults having urinary infections with surprising clinical results.

Helmholz, having demonstrated that the germicidal properties of this urine were due neither to its acidity nor its diacetic acid content, it was not long before A. T. Fuller of England discovered that the germicidal factor was Levor rotary betaoxybutyric acid. He published his findings in 1933, and it was soon conclusively shown that this acid in concentrations of 0.5 per cent or below was not only bacteriostatic, but definitely bactericidal. But the efficiency of its germicidal effect remained in direct proportion to the p^H of the urine.

Since betaoxybutyric acid is difficult to manufacture, and is also unstable when taken by mouth except for individuals already in ketosis, M. L. Rosenheim searched through the organic acids for one that would be excreted unchanged in the urine. With such an acid he hoped to duplicate the effect of betaoxybutyric. Schotten in 1883, and Knoop in 1905, had showed mandelic acid to be excreted unaltered in the urine. Being used extensively in photography, it was readily available, and Helmholz injected 700 centimeters of a one per cent solution into a dog over a seven-hour period, during which time the concentration of mandelic acid in the urine varied from 1.5 to .5 per cent. The blood urea and urea clearance tests both showed a temporary insult to the kidney as a result of this injection, with complete recovery some three days later.

When given to a patient in doses of three grams of a 10 per cent solution four times a day, the concentration of the drug in the urine rises rapidly to over one per cent; and at a p^H of five a concentration of .25 per cent proves bactericidal for most organisms. As in the case of betaoxybutyric acid, the lower the p^H of the urine the lower is the concentration of mandelic acid necessary to secure bactericidal action. In a series of experiments the bactericidal action of normal urine, to which one per cent of mandelic acid had been added, was found to correspond closely to that of urine to which the same concentration of acid was present on excretion.

Experience has demonstrated that mandelic acid is most satisfactorily administered in the form of its sodium salt neutralized by sodium bicarbonate, and dispensed as a liquid flavored with lemon syrup. A gram of ammonium chlorid should be dispensed with each dose to insure the most effective germicidal p^H level.

In the presence of urea-splitting organisms, such as the proteus ammonia and pseudomonas, the lowering of the p^H may prove difficult or sometimes even impossible to accomplish. In such cases ammonium nitrate, dilute hydrochloric or even nitrohydrochloric, should be tried in association with an acid-ash diet. Such patients should be impressed with the contraindication to the ingestion of citrus fruits, milk of magnesia, or the consumption of large quantities of spinach, celery and other foods of high alkaline-ash content.

If renal function is poor, there is the possibility of producing an acidosis, and it may be impossible with such impairment to obtain sufficient concentration of mandelic acid in the urine to be effective. Under such circumstances the most recent of our urinary antiseptics should be employed.

SULFANILAMIDE

The history of sulfanilamide demonstrates how tedious are our advances in therapy, and illustrates how indebted is the medical profession to the labors of those in other fields of science. Physicians are inclined to forget that neither Pasteur, Roentgen nor Currie held M. D. degrees, and few urologists feel any debt of gratitude or, in fact, remember that Arthur Binz, a German chemist, made intravenous urology possible by his synthetizing uroselectan. So with sulfanilamid the profession is again in deep debt to the chemists of the dye industry that developed this drug.

As soon as the bactericidal properties of sulfanilamid were demonstrated, the determination of dosage and discovery of its toxic effects rapidly followed, and quite as rapidly confusion in its nomenclature developed as different chemical houses applied proprietary names, such as prontylin, prontosil, allum, streptocide, et cetera; so that the Council on Pharmacy and Chemistry of the American Medical Association has adopted the term "sulfanilamid" as a nonproprietary name, and has declared that it is unfortunate that the term "prontosil" is used in this country for a compound not identical with the product that has been used in Europe.

Employed first as a specific agent against streptococcal infections, it has proved equally effective in the urinary tract against the Escherichian coli, while paradoxically it has no effect against streptococcus fecalis. It was soon discovered that larger doses of the drug are better tolerated by the patient in bed, and that much smaller doses must be used in the ambulatory cases. Apparently, a concentration of ten milligram per cent in the blood serum is sufficiently large to insure a germicidal effect in the urine, and this can be obtained by administering 40 to 60 grains a day in ambulatory cases. Reactions vary and must be warned against; happily, if the drug is discontinued at once they subside rather rapidly. The most annoying, although not most serious, are the skin reactions most likely to occur in warm weather, and characterized by extensive erythema and moderate vasiculation. When large doses are given, the blood counts require careful checking, as the destruction of red blood cells has been known to be as high as a million in twenty-four hours.

If the urine is not rendered sterile in a two weeks' period, one may be certain that some abnormal anatomical condition is preventing proper drainage, or that one of the organisms—such as streptococcus fecalis or areabacteric areagenis—is present, and that the battle is going to be hard and long-fought.

It apparently has little effect on streptococcus fecalis, which is the specific organism of impetigo and frequently seems as difficult to eradicate from the urinary tract as from the skin. This organism probably never occurs as a natural invader of the urinary tract, but is carried in on instruments or catheters improperly sterilized. In stained smears it is characterized by the organisms occurring as oval cocci joined together by a refractive streak down the center. When a urinary infection has not responded to this type of therapy, the presence of this organism should be suspected. The administration of the drug by mouth appears to give better results than its administration by needle, and the new form of the drug dispensed under the name of "Neoprontosil," while unquestionably less toxic, seems also less efficacious.

Another advantage of this drug over other urinary germicides is its effectiveness in an alkaline media. So many urinary infections are mixed in character, and not infrequently one of the organisms will be capable of splitting urea into ammonia, so that the possibility of receiving any therapeutic effect from either mandelic acid or methenamin is nil. The pseudomonas and proteus group of organisms are the chief offenders in this respect, although there are some of the cocci that seem but slightly less efficient in the production of ammoniacal urine.

One of the most frequent causes of failure in the treatment of urinary-tract infections in the male is the reinfection of the urine from chronic foci in the prostate. Sulfanilamid is found in the prostatic secretion and would appear, therefore, to be particularly indicated in these cases. Were it not for its distressing side reactions, this drug would indeed seem the ideal urinary antiseptic, but its untoward reactions seem the thorn of this particular rose.

Coccus infections of hematogenous origin, as described earlier in this paper, seem to be little affected by either mandelic or prontylin therapy, while those of the ascending type usually respond to one or the other. Fortunately, the hematogenous type of infection is, in the majority of cases a self-limited affair, from which the patient recovers; but when it assumes a chronic form, treatment by neoarsphenamin has proved the most successful drug for its eradication. Its mode of action is still in dispute, but Pace believes sufficient arsenic is eliminated in the urine to produce a bactericidal effect. This seems somewhat doubtful, however, as such infections, when limited to the bladder, do not respond as well as do those in which the kidneys are also involved. The most efficient and best tolerated dosage scheme is to give two-tenths grams, followed in five or six days by three-tenths grams. If no improvement is noted after these two injections, it is rare for a third dose to produce good results. The elimination of foci in the cervix, prostate, teeth, and tonsils in this type of infection is most important, and until taken care of recurrences seem certain.

IN CONCLUSION

In conclusion, it seems well to emphasize that in the treatment of urinary-tract infections we now have available four efficient drugs, namely, methenamin, mandelic acid, sulfanilamid, and neoarsphenamin. If cases of such infection do not respond to their proper therapeutic administration, the probabilities are great that there are associated pathological conditions in the form of stone, obstruction, stasis or neoplastic disease, which demand thorough investigation by your urological colleague.

112 North Madison Avenue.

DISCUSSION

Charles Pierre Mathé, M.D. (450 Sutter Street, San Francisco).—Doctor Bumpus' timely paper, dealing with the rapidly changing treatment of infection of the genito-urinary tract, will aid in clarifying this obscure subject in the minds of general practitioners. Unfortunately, in our enthusiasm to employ new medicaments, represented as the last word in urinary antisepsis, one is liable to overlook certain fundamental principles of treatment that have stood the test of time and that are so necessary for eradication of infection of the genito-urinary tract. The essayist does well to emphasize the fact that the infecting organism should be identified before it is attacked by a bacteriocide. Good, well-stained smears of urinary sediments are not so difficult to make if one will only take the necessary time and trouble, and then one can always intelligently supplement his studies by culture and animal inoculation. In patients in whom infection persists in spite of the administration of antiseptics that the physician has chosen to administer, further urologic investigation should be carried out. In these patients, stasis is the most common cause of persistent infection. We have seen a number of cases presenting resistent chronic infection in the kidney which cleared up permanently after relieving obstruction, viz., dilatation of a ureteral stricture, corrective plastic repair of hydronephrosis, and suspension of an obstructed, ptosed kidney. Other causes for persistent urinary infection are stone, vesical neck obstructions, foreign bodies, neoplasms, etc. It is obvious that, although infection can be ameliorated in these patients by the use of urinary antiseptics, definite relief cannot be obtained without eradication of the predisposing cause.

Out of the large number of available antiseptics, Doctor Bumpus has chosen four that he feels are most efficacious in combating the different types of urinary infection. These are: methenamin, mandelic acid, sulfanilamid, and neoarsphenamin. To this list I would add methylene blue, whose germicidal effect against cocci, particularly the staphylococcus, has been definitely proved. It is less powerful than sulfanilamid, but is indicated when this drug is poorly tolerated. Methylene blue may also be used to supplement sulfanilamid, in which case it aids in the elimination of that drug, counteracts toxicity, decreases the severity of methemoglobinemia occurring in sensitive patients as well as prolonging bactericidal action. I do not feel that pyridium, caprokol, salol and other antiseptics should be condemned. They have their place, affording relief to certain patients who fail to respond to the four drugs enumerated above; and they are also efficacious in others in whom they are not tolerated.

I am heartily in accord with the opinion that methenamin is an efficient urinary antiseptic, provided that the urine has been properly acidified. We have found its intravenous use, injecting two grams of this drug daily, most efficacious for the treatment of urinary fever, the well-known syndrome of chills and fever that sometimes follows instrumentation. We feel that in many of these cases fever is due to invasion of the blood stream by infecting organisms. Strange as it may seem, we have been able to prevent the development of this type of bacteremia by the previous empirical administration of quinin.

⁂

Harry W. Martin, M.D. (6253 Hollywood Boulevard, Los Angeles).—Doctor Bumpus has given us a very timely paper and one that should be studied by every general practitioner, because urinary antiseptics at this time are a matter of great discussion between physicians and surgeons, and also the laity as well.

It must be borne in mind that, with any infection in the urinary tract, drainage is the most important factor in its treatment, and no urinary antiseptic can be efficient if obstruction to drainage is present.

Another notable point that Doctor Bumpus has brought out is the significance of the Gram stain, which is sufficient for the diagnosis of urinary sediment and more accurate than cultures. Many physicians are of the opinion that in in order to diagnose the majority of urinary-tract infections it is necessary, as Doctor Bumpus points out, to have cultures made. The Gram stain is the most efficient aid we have and everyone can avail themselves of it, and only in certain cases is it necessary for extra laboratory work.

Another point of Doctor Bumpus' worth noting is the necessity of catheterization following operative procedure. Years ago it was taught that catheterization should be resorted to only after every other procedure to empty the bladder had failed, with the result that more damage was done by the distended bladder and its back-pressure changes on the kidneys than could ever be done by catheterizing.

Methenamin is a valuable drug if administered properly when the urine is carefully watched. Fairly large doses should be given if good results are to be obtained, but care must be taken not to cause hematuria.

Sulfanilamide is very likely the most widely discussed drug on the market today, and practically every layman has some slight knowledge regarding it. Like every new discovery, however, care must be taken to see that it is used properly. I recently saw an ambulatory patient who had been taking 80 grains a day for two months, with no change in the urine but a marked change in the blood.

I am firmly of the opinion that if the urine does not show any changes the drugs should be discontinued after two weeks. I also believe that better results are obtained when large doses are given, but that the patient should remain in bed while taking the larger dose.

❊

Frank Hinman, M. D. (384 Post Street, San Francisco).—Between the lines of this report by a specialist, upon the use of urinary antiseptics in general practice, it seems to me that I can read doubt and uncertainty. In his opinion, only four of the myriads of drugs advertised and advocated are at all reliable, and he shows that the potency of each one of these is largely contingent. My own incredulity as to the efficacy of casual medication in the treatment of infections of the urinary tract, as well as my firm conviction that therapy should never replace diagnosis in these conditions, and that when so used it only hinders diagnosis, lets me imagine the more easily, perhaps, this meaning in Doctor Bumpus' paper. His pessimism is fully shared. Most urologists seldom use other drugs than hexamethylenamin, one form or another of mandelic acid—of which a calcium salt has seemed to some less disturbing to most digestive tracts than the sodium—sulfanilamide and arsphenamin. It is important, of course, to know the limitations of use and the prerequisites for greatest efficiency, so ably outlined by Bumpus, of each of these internal urinary antiseptics. Each drug has its own particular field of usefulness, and each, as a rule, acts best only under certain particular circumstances; how useless, for example, are the first two, without proper urinary acidity! Ahead of knowing these contingencies, however, I should place knowledge of the urinary infections themselves. In my opinion, greater attainments are to know well all of the clinical possibilities in both the upper (renal) and lower (urogenital) tracts when pus and organisms occur in the urine; to know when to suspect urinary sepsis as the cause of fever and prostration even in the presence of a negative urine; and, above all, with the clinical induction of the full significance of his history as a guide, to know how to examine the patient for the purpose of diagnosis. The services of a specialist are not required for preliminary studies of this kind, and the routine use of internal urinary antiseptics without such studies is malpractice. The mind of an experienced clinician follows a very simple but logical deduction as facts and findings are brought to it step by step with the history, physical examination and course of clinical events.

The history gives the first lead (the sex, the age, the complaint, and the clinical coincidences). The physical examination gives the next cue (pulse, temperature, palpation of the kidney area, external genitalia, etc.), and then, in the order indicated, laboratory and special investigations (blood counts, urine examinations, particularly the "three glass test," or two if preferred, rectal [and vaginal] examinations with a study of the prostatic secretion, exploration by x-rays, functional tests, occasionally intravenous urograms) will enable the trained clinician to make a very close, if not correct, deduction of the condition, enough at least to tell him whether or not to put his trust wholly in internal urinary antiseptics. *The dangers of procrastination grow greater and greater as urinary antiseptics grow better and better.* Why all this excitement when the ingestion of a few pills clears the urine? The wise doctor, knowing that most urinary infections are secondary, will suspect other trouble even when successful with his pills. He will not be satisfied until all the findings, gradually collected step by step by means of the preceding studies, either demonstrate the suspected pathologic changes or prove that his suspicions were false. In the course of such investigations he may conclude that the services of a specialist are in order (residual urine, cystoscopy? ureteral catheterizations?). Nevertheless, by his knowledge of infections of the urinary tract and his ability to carry out, not as a routine but as indicated, these simple preliminary steps of investigation for which the services of a specialist are not needed, is established the degree of his clinical wisdom. Few conditions exact a graver price for rough handling and mismanagement. None of the preceding studies, however, is instrumental, and all, when rightly used, are perfectly safe. Answers to queries raised by each step of examination are necessary if the clinician expects to meet, in the best scientific manner, the many contingencies of efficiency in the use of internal urinary antiseptics. By the nature of these answers, their fullness and accuracy, is measured his prescience as a clinician. Clinical sagacity in choosing the right road to a correct diagnosis of infections of the urinary tract is the incidental essence of success in their treatment with internal urinary antiseptics.

THE LURE OF MEDICAL HISTORY[†]

MEDICINE IN COLONIAL AMERICA[*]

By David Harris, Ph.D.
Stanford University

I

In a time when medical knowledge has progressed far beyond the scope and imagination of its primitive days, it is natural that we should have forgotten the story of Colonial America's medicine. The worthy preacher has won admiration for his labors, and the legal man's services have rightly received the praise of later generations, but the doctor, crude though he may have been, has been allowed to sink into an unwarranted oblivion. Church and court have not been radically altered; we feel in them strong ties to the past. Medicine, on the other hand, has gone far from the men and practices of the sixteenth and seventeenth centuries. The pioneer ministry of healing, consequently, seems but the most bizarre of unrelated fancies.

[†] A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

[*] From the Department of History, Stanford University. The author prepared this essay a number of years ago when he was an undergraduate. The friendly interest of an esteemed colleague in the Stanford Medical School has induced him to overcome his hesitations and offer the study to a wider circle of readers.

Yet to the struggling colonists the physicians seemed as indispensable as today, and their ministrations brought blessing and comfort to many. They served as best they could, and for that service they deserve the charitable memory of a generation which has profited by their pioneering.

BARBER-SURGEONS OF EARLY COLONIAL DAYS

In the records of the immigrations to America and of the early settlements there are to be found but few references to officially appointed physicians or surgeons. However, with the ships' crews of the day there sailed, almost without exception, someone who had the official title of surgeon, even though his qualifications were scant. It is not surprising, then, that among the pioneers there should be found men—barber-surgeons at first—who were serving bodily needs. The honor of being the first physician in the colonies is ascribed to Thomas Wooten, surgeon-general of the London Company, who arrived in Virginia in 1606. The next year "Doctor" Walter Russel was in the country, and accompanied Captain John Smith on some of his explorations. These men, along with Anthony Bagnall, must have been, in modern language, transients; for in 1609 the picturesque Captain went to England for treatment for an injury received by the explosion of gunpowder, "for there was neither chirurgeon nor chirurgery at the fort." A year or two later Dr. Lawrence Bohun, former student in Holland, came to Virginia as surgeon-general. Next in time was Dr. John Potts, M.A., who came in 1624; was temporary governor in 1628; and in 1630 was reputed to be the only physician in the colony. This gentleman seems to have been a reckless liver, embroiled in all of the factional intrigues of his time. On one occasion his medical skill alone saved him from being hanged for theft. Seemingly the governor did not have the courage to put to death the colony's only medical man in time of epidemic.

EARLIEST PRACTITIONER IN NEW ENGLAND

The earliest practitioner in New England, and perhaps the first permanent "physician," was Samuel Fuller, who came in the *Mayflower*. He had no medical degree and probably did his ministry of healing and blood-letting in connection with his duties as deacon at Plymouth. In 1629 the Massachusetts Bay Company entered into an agreement with Lambert Wilson, chirurgeon, that he should serve the settlers and neighboring Indians for three years, and give medical instruction to one or two of the young men of the colony. Most conspicuous, however, of the early New Englanders was John Winthrop, Jr., who came to the colony as a doctor in 1630 after graduating from Trinity College, Dublin, and traveling in Holland, France and even Turkey. For years, he was the governor of Connecticut and a writer on a variety of scientific subjects.

In 1626 New York, then Dutch New Amsterdam, received from Holland two *zieckentroosters* who were educated primarily for spiritual ministration, but also had a training in simple healing. Another Dutchman, of perhaps more questionable attainments, came in 1631 as a medical practitioner. Still another immigrant, a Huguenot, came from Leyden in 1637, and he was perhaps New Amsterdam's first regular physician.

One of the founders of Rhode Island was Dr. John Clark, a London physician, who had been banished from Boston along with Roger Williams. In 1633 the General Court gave what is thought to be the first license to practice: Captain John Cranston was licensed "to administer physicke and practise chirurgerie, and is by this Court styled doctor of physick and chirurgery by the Authority of this the General Assembly of this Colony."

Jan Peterson was "barber" to one of the colonies of the Swedes and Dutch on the Delaware at a salary of ten guilders per month in 1638. John Goodson, "Chirurgeon to the Society of Free Traders," is mentioned as the first practicing physician in Pennsylvania. He arrived shortly after William Penn.

Another interesting case where medical skill saved a man's life is that of Jacob Lumbroze, "the Jew Doctor" from Lisbon. In 1656 the Maryland courts condemned him to death under the "Toleration Act of 1649" because of his refusal to accept Christian orthodoxy; but he was pardoned "because of professional knowledge."

ONE HUNDRED AND THIRTY-FOUR PHYSICIANS IN NEW ENGLAND PRIOR TO 1692

But the list must not be continued. The physicians increased as the years went by and kept up their inconspicuous service, thereby being condemned to personal oblivion while collectively perpetuating themselves to the thoughtful reader. In the three generations prior to 1692, one hundred thirty-four men in New England are listed as physicians in name at least. At the close of the Revolution there were from three thousand to thirty-five hundred doctors practicing, of whom not more than four hundred had received medical degrees. Almost twelve hundred men served in the Surgical Service of the Revolutionary Army, and many doctors distinguished themselves in nonmedical contributions. It is interesting to note, in passing, that it was a physician, Dr. Joseph Warren (1741-1775), who found that the British were to attempt to capture the stores at Concord and dispatched Paul Revere. Dr. Ephraim Brevard, a Princeton graduate, drafted the Mecklenburg Resolution in 1755. Among the signers of the Declaration of Independence were several men sometimes styled physicians, but Benjamin Rush (1745-1813) of Pennsylvania was the only genuine doctor of medicine.

Since there were no legal limitations on medical practice, the increase in the number of doctors may be accounted for in several ways. Under the circumstances it was inevitable that many charlatans should set themselves up as healers. Others, like the early Virginia "practitioners," drifted in from the outside world with their varying degrees of knowledge and skill. For example, Gustavus Brown, nineteen years of age, arrived in Maryland in 1708 as surgeon or surgeon's mate to his ship. During the course of a visit to the shore a storm arose, making it necessary for the ship to weigh anchor and quit the port, and Brown was left to build up a medical practice and accumulate a fortune.

PERIOD OF APPRENTICESHIP

In the earlier Colonial period it was the general custom for young men desiring a medical training to take their degrees at Edinburgh, London, or on the Continent. However, there were many aspirants in America too poor to go to Europe, and they indentured themselves for their instruction to practitioners in this country. Many of the successful men gathered around them small groups of students who assisted in the regular practice and listened to occasional talks and lectures, for which they sometimes paid a set fee. This situation was apparently not universally satisfactory. Eliot, the Indian missionary, wrote in 1647: "Our young Students in Physick may be trained up better than yet they bee, who have onely theoreticall knowledge, and are forced to fall to practise before ever they saw an Anatomy [dissection] made, or duley trained up in making experiments, for we never had but one Anatomy in the Countrey, which Mr. Giles Firmin (now in England) did make and read upon very well, but no more of that now."

In the same year the Massachusetts General Court Records printed this suggestive statement: "We conceive it very necessary yt such as studies physick, or chirurgery may have liberty to reade anotomy & to anotomize once in foure yeares some malefactor in case there be such as the Courte shall alow of."

FIRST DISSECTION IN THE COLONIES

Not for over one hundred years do we have records to show progress in this line. In the year 1750 Dr. Thomas Cadwalader, who had been a student in London, gave a series of practical demonstrations of anatomy to his colleagues in Philadelphia. In the same year a criminal in New York City was executed for murder and his body was dissected by Dr. John Bard and Dr. Peter Middleton for the instruction of a group of students in medicine. This is considered the first attempt in the colonies to acquire medical knowledge by dissection.

PENNSYLVANIA HOSPITAL: BENJAMIN FRANKLIN, FOUNDER

Two years later, in 1752, came other adventures in formal medical instruction. The Pennsylvania Hospital, founded in 1750-1751 by Benjamin Franklin and Dr. Thomas Bond, allowed students who were not apprenticed to some doctor the privilege of making the rounds after payment of a "gratuity." In 1773, apprentices were taken for five years, and at the end of his service each man was to receive a certificate and a suit of "cloathes."

ADVERTISEMENT CONCERNING A COURSE IN ANATOMICAL DISSECTION

The following advertisement appeared in the *New York Weekly Postboy,* January 27, 1752: "Whereas Anatomy is allowed on all Hands, to be the Foundation both of Physick and Surgery, and consequently without some knowledge of it, no Person can be duly qualified to practice either: This is therefore to inform the Publick: That a course of Osteology and Myology is intended to be begun, some time in February next, in the City of New Brunswick. (of which Notice will be given in this Paper, as soon as a Proper Number has subscribed towards it.) In which Course, all the human bones will be separately examined, and their Connections and Dependencies on each other demonstrated; and all the Muscles of a Human Body dissected; the Origin, Insertion, and Use of Each, plainly shewn, &c. This course is proposed to be finished in the space of a Month. By

Thomas Wood, Surgeon

N. B. If proper encouragement is given in this Course, he proposes soon after, to go thro' a course of Angiology and Neurology; and conclude with performing all the Operations in Surgery on a Dead Body: the use of which will appear to every person, who considers the Necessity of having (at least) Seen them performed; before he presumes to perform them himself on any living Fellow Creature."

In the same year Dr. William Hunter of New Port, Rhode Island, a relative of two of the greatest medical teachers of England, was delivering lectures on anatomy and comparative anatomy.

LECTURES ON MIDWIFERY PRACTICE

But the man most responsible, perhaps, for the advancement of the study of medicine was Dr. William Shippen, Jr., of Philadelphia, graduate of Princeton and Edinburgh. He returned to his home in 1762 and advertised a course of twenty lectures on midwifery. Up to this time very few men had been engaged in obstetrical work. During the year Doctor Fothergill of London presented the Pennsylvania Hospital library its first volume and seven cases of anatomical charts and casts. To promote further study, Doctor Shippen agreed to display these to interested persons who were willing to give one dollar to the hospital.

ANATOMICAL LECTURES: EXCITING EXPERIENCES

Continuing his work, Doctor Shippen announced a course of anatomical lectures in the *Pennsylvania Gazette.* A portion of the announcement is as follaws: "Philadelphia, November 11th, 1762.

"Mr. Hall

"Please to inform the public that a course of Anatomical Lectures will be opened this winter in Philadelphia, for the advantage of the young gentlemen now engaged in the study of Physic, in this and the neighboring provinces, whose circumstances and connections will not admit of their going abroad for improvement to the anatomical schools in Europe; and also for the entertainment of any gentlemen who may have the curiosity to understand the anatomy of the Human Frame. In these lectures the situation, figure and structure of all the parts of the Human body will be demonstrated, their respective uses explained, and as far as a course of anatomy will permit, their diseases, with the indications and methods of cure briefly treated of."

In February, 1763, the following notice was published: "Dr. Shippen having finished on Osteology—the most dry, though the most necessary part of anatomy—will admit gentlemen who want to gratify their curiosity, to any particular lecture—Tickets five shillings."

His first course was attended by ten students, but in later years attendance at some classes ran as high as two hundred and fifty. There was, on the part of the general public, an aversion to the establishment of a place for human dissection, and on several occasions Doctor Shippen's laboratory was attacked and once his home was mobbed. Doctor Norris says: "In one of these attacks the Doctor, himself, made a narrow escape by passing out through an alley, while his carriage, which stood before the door with its blinds raised, and which was supposed to contain him, received, along with a shower of other missiles, a musket ball through the center of it. More than once he was compelled to desert his own dwelling and conceal himself, in order to avoid the tyrannical exactions of the people. Several times he addressed the citizens through the public papers, assuring them that the reports of his disturbing private burying-grounds were absolutely false, and stating that the subjects he dissected were either of persons who had committed suicide, or such as had been publicly executed; except, he naïvely adds, 'now and then one from the Potter's Field.' "

FIRST MEDICAL DIPLOMA WAS GRANTED BY YALE UNIVERSITY

The first medical diploma given in this country was presented to Daniel Turner by Yale University in 1720. This was an honorary degree conferred on the gentleman after he had made a substantial donation to the school. Latin scholars of the time declared that the M.D. stood for *Multum Donavit*—"He gave much."

EARLIEST MEDICAL SCHOOL OF THE COLONIAL ERA: IN PHILADELPHIA

The earliest formally constituted medical school was the department established in the College of Philadelphia in 1765 under the leadership and instruction of Dr. John Morgan, former student in Europe, and Dr. William Shippen, Jr. Courses were offered in Anatomy and Surgery, "Theory and Practice of Physic," Materia Medica, Pharmacy, Chemistry, Botany, and Natural Philosophy. The fees for single courses under the different professors were not to exceed six pistoles, or twenty dollars, a course. Rigid requirements were laid down for both Bachelor's and Doctor's degrees, and the former degree was conferred on ten candidates on June 21, 1768. The custom of giving a Bachelor of Medicine degree was maintained until 1789. At the Commencement of 1771 four of the first graduates were given the degree of M.D. The College of Philadelphia Medical Department became a part of the University of Pennsylvania in 1791.

KING'S COLLEGE OF NEW YORK FOLLOWS

The Medical School of King's College in the year 1768 became the second and last institution organized before the Revolution. At the end of the year in 1769 two M.D. degrees were conferred, and one of the graduates returned for an M.D. in 1770. This school collapsed during the Revolution and was not revived until 1792 as a part of Columbia University.

Department of History, Stanford University.

CLINICAL NOTES AND CASE REPORTS

GONORRHEAL VAGINITIS IN CHILDREN*

REPORT OF 548 CASES—1917–1937

By J. C. Geiger, M.D.,
R. W. Burlingame, M.D.
and
Ethel Righetti, M.D.
San Francisco

GONORRHEAL vaginitis in children is not an uncommon disease. Its prompt detection in hospitals and institutions is necessary because of the apparent ease of spread by contact, both direct and indirect. The discharge on the diaper may be the only sign noted. Experience at the San Francisco Hospital of the Department of Public Health indicates the necessity for routine vaginal smears on all patients under fifteen years entering the institution. This procedure is repeated for three successive days and has proved successful in discovering cases heretofore unsuspected and uncontrolled. The usual sources of referred cases are clinics, boarding homes, and private physicians.

CLINICAL MATERIAL FOR THIS STUDY

A series of 548 cases has been observed during the period 1917–1937. The age periods range from two days to fifteen years. The lowest number of cases (7) occurred, respectively, in 1919 and 1920, and the highest number (64) in 1927. It may be of interest that in none of the cases were there such complications as arthritis and pelvic inflammation, so generally noted in gonorrheal infections of the older age groups. Furthermore, when gonorrheal ophthalmia was present, it appeared to have occurred almost concurrently, since both conditions were apparent on entrance in the acute stage. In those cases without gonorrheal ophthalmia, it may be of further interest to note that, despite the fact that no special precautions were taken to prevent this complication, none occurred. Of the total 548 cases, 66 were discharged, usually on the insistence of parents, to private physicians and clinics. Four hundred and ninety-five cases (or approximately 90 per cent), occurred between the ages of two and twelve years; and 220 cases (or approximately 42 per cent), between the ages of six and nine years. Inasmuch as this can be considered a disease without mortality or complications, the efficacy of the treatment used can only be determined by days of hospital stay before the patient is released as cured. The criteria of cure are three consecutive, microscopically negative vaginal smears, the absence of pus cells, and, clinically, no discharge. The smears and examination are to be made at five-day intervals. If previous smears from the urethra showed positive microscopical findings, the same criteria established for the "cures" must be met. It is of decided interest to note that thirty-one patients returned with positive microscopic smears, but with negative clinical findings. These cases were classified as relapses, though the question of reinfection could not be eliminated in many. Eleven additional cases returned twice after being discharged as cured, and one case returned three times. Therefore, in the total number of 482 cases, 42 are to be classified as relapses, or possible reinfections.

---

* From the Department of Public Health, City and County of San Francisco.

TREATMENT METHODS DURING DIFFERENT PERIODS

Because of the length of the period under discussion (1917–1937), the methods of treatment have varied with the years. From 1917 to 1921, inclusive, the routine procedure consisted of warm vaginal douches of 1-4000 potassium permanganate, administered night and morning to the patient in a reclining position. This was followed by instillation of 10 per cent argyrol solution with further substitutions of solutions of acriflavin, neo-acriflavin, dichoramin-T in oil, metaphen, and other antiseptics. Such treatment was continued for two weeks, then smears were taken and examined microscopically at the five-day intervals mentioned heretofore. If smears were found positive, the treatment was continued. The average hospital stay for the patients so treated was 97.7 days.

In 1921 the routine treatment was varied to a nightly twenty-minute hot sitz bath at 108 degrees Fahrenheit, and this was followed by a douche with tap water and a vaginal cotton tampon saturated with 4 per cent mercurochrome solution. This tampon was left in place during the night. The following morning, the tampon was removed, and a douche of one gallon of potassium permanganate administered to the patient in a reclining position. This course of treatment was followed for two weeks, and then smears were taken. With few exceptions, this type of treatment was continued through 1934, and the average hospital stay shown to be 91.6 patient days.

In 1932, five cases were selected for treatment by subcutaneous injection with gonorrheal vaccines. In addition, a gonorrheal antigen in jelly was used to replace the usual mercurochrome tampon. Two of these patients were given thirteen injections at four-day intervals. The dose began with 50,000,000 organisms and was gradually increased to 170,000,000. Both patients were released as cured in fifty-four and sixty-four days, respectively. In another patient, six injections of vaccine were administered, while one had ten injections, and another, eighteen. The average hospital stay for this group was 105.7 days. This type of treatment was discontinued.

Table 1.—*Summary Showing Results Under Different Treatment Procedures*

Average time in hospital with douches and local application of antiseptics	97.7 days
Average time in hospital with douches, mercurochrome and sitz baths	91.6 days
Average time in hospital with gonorrheal vaccine (1 m.) and intravaginally	105.7 days
Average time in hospital with 50 to 150 unit doses theelin started late	52 days
Average time in hospital with 50 to 100 doses theelin alone	57.3 days
Average time in hospital with 2,000 unit doses theelin alone	57.2 days
Average time in hospital with 10,000 unit suppositories amniotin alone	44.8 days
Average time in hospital with 10,000 unit suppositories and 2,000 theelin (1 m.)—1 case	89 days
Average time in hospital with 2,000 unit doses of theelin and sulphanilamid—2 cases	49 days
Average time in hospital with 2,000 units theelin (1 m.), 10,000 unit suppositories—2 cases	60 days

In 1933 and 1934, six patients were selected for treatment with theelin. All of these patients had been inmates of the hospital and under routine treatment with chemical douches for 60, 148, 204, 229, 232, and 608 days, respectively, and were classified as a highly resistant type of infection. The results of treatment were interesting. One patient received thirteen intramuscular injections of 1 cubic centimeter (50 rat units per cubic centimeter), of theelin daily; the other patients received twelve, nineteen, twenty-three, thirty-one, and thirty-two injections, respectively. The average hospital stay, after theelin was administered, was fifty-two days.

THEELIN TREATMENT

Beginning in 1935, treatment with theelin was made a routine procedure, and all irrigation and local douche treatments were discontinued. In 1935 and 1936, twenty-nine patients were treated with theelin in doses varying from 50 to 150 units. The average hospital stay of this group was 57.3 days. In addition to these cases, twenty-nine patients were treated during 1936, with an estrogenic substance containing 2,000 rat units per cubic centimeter suspended in corn oil. The average hospital stay was 57.2 days. In 1937, an additional six patients were treated daily with vaginal amniotin suppositories of 10,000 rat unit doses. The average hospital stay for this group was 44.8 days. In 1937, there were three cases treated with amniotin suppositories, theelin, and sulphanilamid. Table 1 summarizes the results of various types of treatment.

IN CONCLUSION

The cases in each of these groups are too few in number to draw definite conclusions. It would appear, however, that estrogenic substances, with or without sulphanilamid, are an improvement over the antiseptic douche.

EXTREME HYPEREXIA AND PROLONGED CONVULSION

ACCOMPANYING HEAT STROKE: COMPLETE RECOVERY

By C. C. Fitzgibbon, M.D.
and
V. S. Briden, M.D.
Merced

Patient, V. S., Mexican, age 43, is a common laborer, and was piling lumber all day on August 2, 1938. The weather was exceptionally warm, temperature rising above 105 degrees in the shade. At 4:30 p. m. he suggested quitting work, sat down to rest, and that is the last he remembered. Coworkers stated that he became delirious and uncontrollable, and it required four men to hold him. He was taken to an emergency station in the lumber camp.

One of us was called by the male nurse at the station, who stated that the patient was having a continual convulsion and his axillary temperature was 110 degrees; breathing was labored and his pulse was feeble and weak. Morphin sulphate, one-fourth grain, was given by hypodermic.

When we arrived the patient was comatose and having a generalized convulsion, which had persisted for one and one-half hours. His skin was dry and hot. Axillary temperature was above the limits of the thermometer, which was 110 degrees. His eyes were opened and fixed, pupils were pinpoint in size, and did not react to light. It was impossible to obtain a radial pulse; breathing was shallow and irregular, and he displayed all the signs of impending death. A tentative diagnosis of heat stroke, with disturbance of the heat-regulating mechanism was made, and symptomatic treatment begun. Ice pack to his head and a cold sponge were given, and 1000 cubic centimeters of normal saline was started intravenously. Then 3¾ grains of sodium amytal were given intravenously, which completely relaxed the convulsion. Two cubic centimeters of coramin, 7½ grains of caffein, and 5 cubic centimeters of metrazol were administered intravenously. Following the normal saline, 1000 cubic centimeters of 5 per cent dextrose in normal saline was given.

One hour after treatment was started, the patient's pulse was of fair quality—96 per minute. The temperature dropped to 103.8, and his blood pressure was 72 systolic; breathing was regular. The patient remained relaxed, but on manipulating his arms a slight generalized convulsion began. Three grains of sodium luminal were given intramuscularly. His condition remained fair, and he was moved by ambulance for twenty-six miles to a hospital. On arrival at the hospital, 1000 cubic centimeters of 10 per cent dextrose in normal saline were given intravenously.

August 3, 1938.

The following morning the patient attempted to get out of bed. He was incontinent, both from bladder and bowels. He would arouse to strong stimuli, but would not respond. He appeared dazed. The temperature was 99.2. A spinal tap was done; spinal fluid was not under increased pressure, and there were no cells found. Red blood cells, 5.14 million; hemoglobin, 80 per cent; white blood cells, 16,800, with 88 per cent polymorphonuclears. Urine showed: specific gravity 1.012, a trace of albumin, an occasional granular cast, and a moderate number of spermatozoa. His deep reflexes were absent. He progressed rapidly, and took nourishment later in the day.

August 4, 1938.

The morning of the second day the patient's temperature was normal. He vomited once, vomitus containing bits of tomato and green peppers, eaten at the noon meal before his illness. The patient was rational, and gave a history of events before that time. Past medical history was entirely negative. No apparent memory loss. Only complaints at this time were: aching in all his muscles, and weakness. Non-protein nitrogen was 26.3 milligrams per 100 cubic centimeters of blood serum. Blood Wassermann and spinal Wassermann were reported negative.

August 5, 1938.

The third day the patient felt nauseated, so nothing was given by mouth, and that day he had three intravenous injections of 1000 cubic centimeters of 5 per cent dextrose in normal saline. His mind was perfectly clear, and a complete neurological examination was normal. His only complaint was a feeling of weakness. Temperature was 99 degrees, pulse 102, and blood pressure 122 systolic and 70 diastolic.

Following this the patient made an uneventful recovery, and was discharged from the hospital on August 10, 1938. At this time there was no evidence of any residual damage to the brain, and complete physical examination was negative. The patient was told to return to his previous job, but to do only light work for a week or so, and at no time become overheated.

October 15, 1938.

The patient was seen at this time for routine check-up. Apparently, he has fully recovered and has no residual damage or ill effects from his illness.

ACTINOMYCOSIS WITH SUBSEQUENT EXTENSION AND ABSCESS FORMATION

By Stanley Dougan, M.D.
and
Robert B. Cragin, M.D.
San Jose

Infection of the human body by actinomyces is relatively common. The original portal of entry is probably the mouth. Naeslum has been able to isolate the aerobic, anaerobic, and combined forms from the normal mouth. Lord and Trevett were able to obtain the organism from dental scum or the contents of carious teeth. The buccal cavity being the portal of entry, vaginal invasion probably comes from the rectum via sanitary pad, toilet tissue, etc. The organism has been found in the uterus, tubes, and ovaries.

REPORT OF CASE

Mrs. D. M., age 49, was first seen by one of us on May 11, 1937. At that time she complained of a painful swelling in her back in the region of the sacrum. This had first appeared in October, 1936, accompanied by practically no pain and little febrile reaction. This original swelling had persisted about two months, and then disappeared almost completely. It reappeared about four months later and gradually extended outward over the right hip. One week before being seen the lesion pointed on the lateral surface of the right ilium. About 500 cubic centimeters of purulent material had drained from the lesion. Past history showed that some swelling and tenderness had occurred in the right inguinal glands a few months prior to the time the swelling appeared in the back.

Physical examination showed a moderately well nourished female. No pathology was found in the head, neck, or chest. All the teeth had been removed. No abdominal tenderness was present nor were any masses palpable. Examination of the area referred to previously showed a sinus opening over the lateral surface of the right iliac crest with a line of induration running backward to the lumbosacral area. Pelvic examination showed the viscera to be normal in size and position. No tenderness was present. Smears from the vagina were positive for actinomyces. This was verified by the clinical laboratory. X-rays of the pelvis revealed an old ankylosed arthritis, involving the third, fourth, and fifth lumbar vertebrae and upper sacrum, apparently nonactive at the present time. Laboratory examination showed the following: white blood cells, 13,000; small lymphocytes, 16 per cent; monocytes, 5 per cent; eosinophils, 2 per cent; neutrophils, 77 per cent, of which 5 per cent were stabs; red blood cells, 4,480,000; hemoglobin, 75 per cent. Blood Wassermann was negative. Urinalysis showed only a trace of albumin.

A working diagnosis was made: "Deep abscess, etiology undetermined."

Treatment.—On June 17, 1937, the patient was taken to surgery and, under a general anesthetic, the abscess was opened and explored. The abscess and accompanying sinus tract extended from a point above the anterior crest of the right ilium back to the lumbar spine. There was no evidence of bone involvement. Many ramifications were present, some of which extended down to, but not through the peritoneum. Cultures were taken and sent to the laboratory. The tract was cleaned and packed with vaselin gauze.

Recovery from the operation was uneventful. The laboratory report on the smears was positive for actinomycotic granules. Postoperative treatment consisted of packing the tract regularly with vaselin gauze and exposing the unhealed areas to ultra-violet rays. Potassium iodid was given during the entire convalescence, the dosage being maintained at maximum tolerance. Because of the depth of the tract and the nature of the causative agent, healing was of necessity slow. On June 20, 1938, the patient was discharged, completely cured.

COMMENT

Apparently, the focus of the infection was the vagina, with extension to the inguinal glands and then the back. The causative organism we believe to be actinomyces.

IN CONCLUSION

We feel that this case is of interest for the following reasons: First, the actinomycotic infection apparently extended from the vagina through the inguinal glands, forming the sinus tract that ultimately resulted in abscess formation. Second, complete healing of these deeply infected areas is unusual—so often we find sinus tracts remaining. Third, we feel that we were definitely able to determine the original location of the causative agent.

CHANCROIDAL BUBO CURED BY SULFANILAMIDE

By J. F. Doughty, M.D.
Tracy

Mr. M. H., age 22, noted a "sore" on the glans penis about one week after intercourse. He came under my observation about four days later, at which time there was an ulcerated lesion completely destroying the frenulum, and extending into the superficial tissues of the glans penis. The inguinal glands were slightly enlarged. Darkfield examination for Spirocheta pallida was negative. Under treatment with mild antiseptic washes and dressings, the lesions healed very slowly. Two months later, with the lesions still not completely healed, the patient developed large inguinal buboes on the left side. The swelling was the size of a lemon, and there was redness of the skin around the area for a distance of about three inches. The swelling was hard and moderately tender. The patient's temperature was normal, but he felt sick.

Sulfanilamide was administered orally, 20 grains every four hours for four doses, and 10 grains four times daily, to a total of 250 grains. Within twenty-four hours the patient felt considerably better, and recession of the swelling was quite noticeable. At the end of five days the ulcer was entirely healed, and the glands were no larger than small walnuts. They continued to recede. There has been no recurrence.

In this case an ulcerated chancroid, which healed very slowly and developed buboes after two months, responded after the administration of sulfanilamide.

TRICHINA SPIRALIS: ITS INCIDENCE IN NECROPSY MATERIAL*

By E. M. Butt, M.D.
and
J. L. Lapeyre, M.D.
Los Angeles

Routine examinations of human postmortem material for the presence of Trichina spiralis have yielded interesting information regarding the incidence of trichinosis. Percentages of infestation, ranging from 3.5 to 27.6, have been reported from widely separated localities. When it is realized that one-third to one-half of these patients probably have had clinical symptoms of the disease, a morbidity figure is obtained that is not only startling, but extremely important to the clinician and public health officials. In the papers of Queen,[1] Hall and Collins,[2] Riley and Scheifley,[3] Hinman,[4] McNaught

and Anderson,[5] and Magath,[6] are found complete discussions of the methods used, presentation of the statistics and summaries of the literature.

Inasmuch as no reports of the incidence of trichinae infestation in cadavers have appeared from Southern California, we thought it of interest to record our findings.

METHODS AND RESULTS

This study is based upon the examination of human diaphragms by the digestion method. The method used in digesting the muscle is essentially that described in the article by McNaught and Anderson.[5] The diaphragms were stripped free of fat, weighed, and ground in a meat grinder. Fifty grams of the ground muscle were mixed with 500 cubic centimeters of 0.7 per cent hydrochloric acid, and 1.5 per cent granular pepsin. The mixture was then agitated by means of a mechanical stirring device arranged within an incubator (37 degrees centigrade), and allowed to remain over night. The incubation period varied from fourteen to eighteen hours. The following morning the material was passed through brass mesh sieves, No. 40 and No. 60, and allowed to settle in a large glass funnel, to which was attached a rubber tube closed by a pinchcock. The filters were rinsed several times with normal saline solution. After allowing the entire mixture to settle for one-half to two hours, small portions of the sediment were drawn off into a petri dish and examined under a microscope equipped with a 35-millimeter objective. Liberated trichinae and cysts were easily identified. In the event no trichinae were found, larger quantities of the sediment and washings from the apparatus were examined.

Diaphragms containing more than one hundred cysts or larvae were considered to be heavily infested. Not more than five to ten trichinae were found in the average case.

The results of the examination of 170 diaphragms are recorded in Tables 1 and 2. It will be noted that 18.2 per cent were found to be infested with either trichinae, cysts, or with both cysts and worms. Four of the thirty-one positive diaphragms were classified as heavily infested, while of the remaining twenty-seven diaphragms only one to ten trichinae were found in each instance.

Fourteen cases in the age groups from ten to thirty years were negative. In the remainder of the cases separated according to age, little variation in infestation was noted.

Further analysis of the data is presented in Table 2. It will be noted that there is a higher percentage of infestation in females than in the males. This is due to the higher incidence of trichinae in colored and Mexican females than in males of the same races. The differences in the percentage of infestation of white males and females are not significant.

Over 95 per cent of the diaphragms used in this study was obtained from the Los Angeles County Hospital. This fact, in addition to the variations in the degree of infestation in the colored and white groups of the series, may have an implication regarding the percentage of infestation in the population at large. The explanation for the higher percentage of positivity in colored and Mexican females, in comparison with the males of the same races, is not apparent. However, it is apparent that less discrimination is practiced by individuals of the latter groups in the selection and preparation of pork products.

It is interesting to point out that none of the past histories of the positive cases contained information upon which to base a diagnosis of trichinosis.

Table 2

	Total Number in Group	Number Infested	Per Cent Infested
Males:			
White	80	10	12.5
Colored	10	3	30.0
Mexican	23	4	17.3
Total	113	17	15.0
Females:			
White	38	4	10.5
Colored	7	4	57.1
Mexican	12	6	50.0
Total	57	14	24.5
Males and Females:			
White	118	14	11.8
Colored and Mexican	52	17	32.6
Total	170	31	18.2

[5] McNaught, J. B., and Anderson, E. V.: The Incidence of Trinchinosis in San Francisco, J. A. M. A., 107:1446–1448 (Oct. 31), 1936.

[6] Magath, Thomas B.: Encysted Trichinae, Their Incidence in a Private Practice and the Bearing of This on the Interpretation of Diagnostic Tests, J. A. M. A., 108, No. 23 (June 5), 1937.

In the histories in which blood studies were recorded, the eosinophile counts were within normal limits.

It is quite apparent from the foregoing data that trichinosis is as prevalent in Los Angeles as it is in other cities in which surveys of trichinae infestation in cadavers have been made. This information becomes even more startling when the percentages of infestation are transferred from the dead to the living. The droll implication is that nearly one-half million residents of Los Angeles County eat undercooked, infected pork, and carry worms in their muscles.

SUMMARY

1. Eighteen and two-tenths per cent of diaphragms examined by the digestion method were found infested by Trichina spiralis.
2. The percentage of infestation is much higher in Mexicans and colored people than in the white population.
3. Four of the thirty-one positive diaphragms were found to be heavily infested.
4. A definite clinical history of trichinosis was not found in any of the positive cases.

University Park.

HUNNER'S ULCER AS AN UNSUSPECTED CAUSE OF GASTRO-INTESTINAL SYMPTOMS

By Fred H. Kruse, M.D.
and
Walter W. Herrmann, M.D.
San Francisco

In 1914 Hunner[1] reported, before the Southern Surgical and Gynecological Association, a series of eight cases having a hitherto undescribed lesion of the urinary bladder. These cases all occurred in women, since his practice was so limited. At the time, however, he predicted that the lesion also occurred in men, and since then this has been reported.

This lesion is characterized by intractable bladder pain, frequency and burning on urination, a low bladder capacity, and paucity of changes in the chemical, microscopic, and bacteriologic study of the urine. The cystoscopic examination, unless carefully done with this lesion in mind, is frequently reported as negative, and half the women in Hunner's group had been subjected to extravesical surgery before the lesion was recognized.

The cystoscopic picture consists of very minute ulcerations through the mucosa, 1 to 5 millimeters in diameter. These are surrounded by radiating, dilated capillaries, and a zone of edema 4 to 5 centimeters in diameter. The ulcerated area bleeds readily if the bladder is overdistended, or is touched by instrument or cotton pledget.

The tissue changes consist of a small zone of epithelial destruction, with regeneration around the margins of the ulcer. The underlying submucosa shows extensive fibroblastic proliferation, an increase in the number of capillaries, and infiltration with inflammatory cells over a zone much wider than the ulceration. The inflammatory cells are chiefly polymorphonuclear, but mononuclear cells are present in abundance.

Urinary examination shows little to account for the cystitis, at most a very few red blood cells; although the patient will have noted, in some instances, some blood in the urine. Cultures of the urine have been consistently negative, and search for tubercle bacilli has been fruitless.

The tissue changes present have given the lesion the aptly descriptive name of submucous fibrosis of the bladder.

While the typical symptomatology leaves no doubt as to the site of the disturbance, there are occasional cases, exemplified by the fourth case of Hunner's series and the one here reported, in which the presenting complaints and symptoms are misleading.

REPORT OF CASE

A 58-year-old white housewife was first seen in September, 1937, complaining of abdominal distention with gas, belching, and flatulence. Accompanying the distention there was severe vaginal pain and urinary frequency. Her symptom-complex started with the abdominal discomfort which came immediately after or during meals, and produced the intolerable pain in the vagina. The symptoms had been present for four years, and she was accustomed to being forced to hurry from the table during this period of time in order to relieve herself of accumulated rectal gas and thus ease her pain. If this was not successful she would resort to enemas or sitz baths. The pain occurred so promptly after the ingestion of any food and most liquids that she was undernourished, very nervous, apprehensive, and afraid to eat.

She gave a story of lifelong constipation, with the habit of regular, frequent use of the enema tube because the use of cathartics and their resultant cramping aggravated the intense vaginal pain. There was no rectal pain and no burning on urination. Her sole urological complaint was frequency, which she stated always came and was made worse with the accumulation of gas in the bowel. Her past history and inventory of systems were not relevant.

The positive findings in the physical examination were: a small, undernourished, pale, apprehensive woman. Weight, 94½ pounds; height, 59 inches. The turbinate bones were large and covered by reddened, thick mucous membrane. The tonsils were large and showed moderate infection. The mouth was edentulous, the last teeth having been removed some three months previously because of infections. The heart was small, rate 92 with a slightly impure, first sound and a faint systolic murmur. The blood pressure was 162/100. The peripheral vessels were slightly sclerotic. There were a few, diffuse, sibilant squeaks throughout the lung fields, which were thought to be atalectatic in origin. The abdominal wall was relaxed, with moderate diastasis of the recti muscles. There was much crepitus and gurgling of gas on manipulation of the abdominal contents. The wall was held semi-rigid, and the ascending and descending portions of the colon could be felt as contracted, firm cords. The rectal sphincter was spastic and the pelvic examination revealed nothing of note. The urine showed a faint trace of albumin, five to seven pus cells and two to five red blood cells per high dryfield. Blood count showed a secondary anemia.

Roentgenological examination of the gastro-intestinal tract showed evidence of colon irritability and a questionable filling defect in the rectosigmoid junction, which has since been shown to fill out.

After three weeks' trial on carefully outlined and faithfully executed colon management, she reported back with no relief of symptoms. At that time she was referred for a study of the urinary tract. The cystoscopic investigation revealed a submucous fibrosis in the vault of the bladder, which was then cauterized. When seen three days later there was still some slight urethral irritation, but practically all of the agony she had suffered for four long years had subsided. In three weeks' time her only symptoms centered about the constipation. In three months' time her weight had increased by ten pounds, and this has been maintained at that level since. There have been several recurrences of the bladder symptoms, necessitating repeated fulguration, which is a typical story of Hunner's ulcer. Between fulgurations, however, she has continued to enjoy reasonable comfort and health.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

HERPES ZOSTER

I. ETIOLOGY

Samuel Ayres, Jr., M.D. (2007 Wilshire Boulevard, Los Angeles).—Herpes zoster belongs in the group of virus diseases and, etiologically, is in the same category with variola, varicella, anterior poliomyelitis, encephalitis, herpes simplex, verruca, molluscum contagiosum, etc. A considerable amount of investigation has been done which points to the probability that the virus causing herpes zoster, and that causing varicella, are either identical or very closely related, and differ from the virus causing herpes simplex. R. T. Brain pointed out that the serum of persons convalescent from zoster and varicella contains specific antibodies which can be demonstrated by complement-fixation, using the vesicle fluid as antigen. According to Brain, fluid from zoster vesicles gives equally good fixation with zoster and varicella serum, and the same is true of the fluid from varicella vesicles. This work confirms similar findings of Netter and Urbain. C. R. Amies called attention to the fact that "elementary bodies" (cell degeneration products), morphologically similar to those found in varicella and vaccinia, are constantly present in the fluid from the vesicles of zoster. He demonstrated that pure suspensions of these bodies, prepared by high speed centrifugation of fluid from the vesicles, are specifically agglutinated by zoster convalescent serum. Attempts to demonstrate a relationship of zoster and varicella by means of cross-agglutination tests have met with a fair measure of success. Both Kundratitz and Bruusgaard were able to cause varicella by inoculating children with the vesicle fluid from cases of herpes zoster.

Bokay, in 1888, first called attention to the possibility of a relationship between herpes zoster and varicella, and since then many clinical observations have tended to confirm this idea. As stated by Andrews, "the usual circumstances are that a case of herpes zoster is followed in fourteen to sixteen days by outbreaks of varicella in associated persons who have not, so far as is known, been otherwise exposed to varicella infections."

Wise and Sulzberger conclude that "it, therefore, seems possible that zoster is an eruption of altered type, a relatively immune or allergic type of chickenpox, which occurs in those whose tissues have been specifically changed in their capacity to react through previous acquaintance with the same virus (allergy). This previous acquaintance may have led to preceding clinical disease (in the form of chickenpox, perhaps many years previously) or may have been subclinical, as is the case in many instances of other diseases (diphtheria, poliomyelitis, etc.).

"This hypothesis, which requires confirmation through adequate study and experimentation, would explain why, as a rule, (1) herpes zoster is rare in children; (2) chickenpox is rare in adults; (3) inoculation of the virus of a case of chickenpox produces chickenpox in children and zoster in adults; and (4) the zoster vesicle virus produces chickenpox in children and zoster in adults."

Practically nothing is known regarding the usual mode of transmission of the virus of zoster. The disease must be very feebly contagious, inasmuch as it is quite uncommon for more than one member of a family to be affected, although a number of such occurrences are on record. The virus certainly must in some manner find its way to the posterior or sensory nerve root, as indicated by the following observations: (1) Inflammatory and degenerative changes have been found in the posterior nerve roots or root ganglia; (2) spinal fluid changes with increased pressure have been demonstrated; (3) pain usually precedes the eruption; (4) the eruption is usually centrifugal in its development.

The disease is thus a posterior poliomyelitis, and yet inoculation experiments with vesicle fluid clearly indicate that the virus must travel along the nerve and finally appear in the skin. The claim has also been made that the virus may appear first in the skin and travel along the nerve toward the spine, but this is probably not the usual course of events.

The fact that many cases of zoster have closely followed trauma, such as back injuries, spinal puncture, spinal manipulation, etc., suggests that the clinical picture of herpes zoster may be produced by mechanical means. Zoster has also been reported as being caused by chemical poisons, such as arsenic, streptococci from foci of infection (Rosenow and Oftedal), malaria, septicemia, spinal-cord tumors, tabes, springomyelia, leukemia, etc. The occurrence of zoster in connection with the above-mentioned conditions does not prove, however, that such eruptions are not of virus etiology. Such extraneous factors may have served merely to lower the resistance, thereby allowing a latent virus infection to manifest itself in the same way that exposure to the sun or a bad cold, by lowering the resistance either locally or generally, allows a latent herpes simplex to flare up. The virus etiology of herpes simplex can be easily demonstrated by animal inoculation with vesicle fluid, even when precipitated by physical agents; whereas the virus in the vesicle fluid of zoster is not readily transmissible to animals, although, as mentioned before, it can produce either zoster or varicella on human inoculation. Inoculation experiments with vesicle fluid from cases of zoster apparently of traumatic origin would be interesting.

The virus of herpes zoster generally stimulates the development of an immune state, so that the disease is self-limited and usually does not recur. This is a strong argument for the differentiation of zoster virus from the virus of herpes simplex where no immunity is established. The difference in behavior of the two viruses on animal inoculation is further evidence of the separate nature of the two viruses.

* * *

II. DIAGNOSIS

Stanley O. Chambers, M.D. (826 Roosevelt Building, Los Angeles).—Herpes zoster presents such characteristic features that it is one of the easiest of all cutaneous diseases to recognize. A unilateral eruption, consisting of groups of rather large vesicles upon an erythematous base, following the course of cutaneous nerves and accompanied or preceded by neuritic pains, is characteristic of herpes zoster. If one has the good fortune to always have ready these cardinal features, little or no difficulty should be encountered in diagnosis. Often, the preceding neuritis represents the only diagnostic evidence—and, although a conclusion cannot be drawn, it is generally good judgment to observe for herpes zoster any unilateral pain following the course of a cutaneous nerve. Erythematous patches may soon appear with their characteristic, superimposed vesicles. Preceding neuralgic pains usually announce the skin lesions to follow. Characteristic skin lesions of herpes zoster can develop, however, with little or no pain preceding their appearance. Pain is variable at the onset, and may vary from a negligible degree to the severity of a passing ureteral stone or acute mastoiditis. Surgical errors have been made during this phase of the disease. The cutaneous lesions are comprised of two elementary ones, erythematous patches and vesicles superimposed. Although these two phases are distinct in development, the time interval between is never great. The degree of definition of both phases is variable. The erythematous patches may be very indefinite or extremely prominent. Likewise, the vesicles may be large and numerous or small and few. Never, however, are either of these two phases insufficient to avoid clinical detection. The erythematous patches, with their superimposed, grouped vesicles, follow accurately the distribution of the nerve or nerves affected. The most frequent regions affected are those supplied by the intercostal, lumbar and trifacial nerves, although any portion of the cutaneous surface may be involved. The enlargement of adjacent lymph glands, although not always found, represents a rather consistent and diagnostic feature. These glands share in the inflammatory phase of the disease and are seen at the onset of the cutaneous lesions, slowly subsiding in relation to the involution of the acute phase of these lesions. The neuralgic pain usually preceding the eruption may persist throughout the course of the disease, with more or less severity, and may too frequently persist for months following the complete healing of the cutaneous lesions (postzoster neuritis). Rarely experienced is the development and healing of herpes zoster without pain.

This is, indeed, in contrast to the usual development of herpes simplex without pain, and represents a differential feature. Severe pain is an expected accompaniment and usually represents the outstanding treatment problem. In the course of the disease the vesicles which do not tend to spontaneous rupture dry upon the skin as yellowish-brown crusts and fall off.

Then here again the ready tendency to early rupture of its superficial vesicles is characteristic of herpes simplex. The entire pathologic process may be so slight as to leave no sequelae at the site of the healed lesions.

This is consistently true of herpes simplex, but in herpes zoster the degree of severity may vary: the simple vesicles may become purulent, hemorrhagic, or gangrenous. The duration of the disease and the cutaneous sequelae may likewise vary. Three to six weeks might elapse from onset to healing, and extensive deep scarring result. It is of diagnostic importance to observe that severity, duration and sequelae appear more extreme in older individuals and less so in young ones. Prognosis, therefore, where the disease involves specialized structures, can from this observation be better interpreted. The disease is self-limited, varying in duration from one to five weeks. It is no more common in men than in women. It affects the elderly more commonly than the young. Histopathologic evidence, although presenting characteristics common to herpes zoster, smallpox, and chickenpox, is rarely used in diagnosis.

Differential diagnosis should not be confusing in unilateral herpes zoster. Where the disease expresses itself bilaterally or as a generalization, however (herpes zoster generalizata), differential problems might arise; but, fortunately, this is extremely uncommon.

The sudden onset of unilateral pain, followed by the development of grouped vesicles on an erythematous base along the distribution of cutaneous nerves, should always serve to identify herpes zoster without difficulty.

* * *

III. TREATMENT

Merlin T.-R. Maynard, M.D. (407 Medico-Dental Building, San Jose).—Since a discussion of treatment of this disease is to be found in textbooks of general medicine as well as dermatologies, it is my intention to give a résumé of my own preferences and routine procedures. The case of herpes zoster, after being questioned in relation to possible sensitivity to iodin and considered from the standpoint of age and physical condition particularly as regards hypertension or arteriosclerosis, is, if regarded as a good risk, treated as follows: One or two grams of sodium iodid are given intravenously. One cubic centimeter of surgical pituitrin is mixed with five cubic centimeters of whole blood, and injected intramuscularly. This treatment is repeated daily for three days, and every second day after that if necessary.

The above treatment is chosen to make use of the exudate absorption effect of sodium iodid with the vasoconstrictor effect of pituitrin. The whole blood is used to delay the absorption of the pituitrin and prevent the annoying peristaltic activity which would otherwise be considerable. All three of the above agents have been advised by different authors, and I have used them individually as well as together.

I have seen abortive effects from sodium iodid in early cases. Pain is often not relieved by sodium iodid. It is often dramatically relieved by pituitrin, and less often by autohemotherapy. I believe the combination of the above three treatments to be the most effective routine for the average case.

Recently, vitamin B has been widely used internally, with various reports of success; however, it has also been apparently a causitive factor in one author's experience.

Local treatment is often not necessary, aside from protection and antisepsis. Spraying with ethyl chlorid has been useful in relieving local pain, as has also painting with collodion. Dry heat is helpful. Powders and drying lotions are also recommended. Ointments are not used in the treatment of zoster *per se,* but only to control secondary infection. If the case is seen late, and gangrene and sloughing are present, the indication is one of control of infection. Gentian violet, compresses, and antiseptic ointments, such as 5 per cent ammoniated mercury, are all used according to usual practice in infected wounds. The sloughing skin is trimmed away as it separates.

"After Pain." An unfortunate and regrettable occurrence, particularly in the aged, is the matter of "after pain." This may be neuralgic or of the intense burning sympathetic type. I believe that sodium iodid therapy helps to prevent this complication. If the pain is of the neuralgic type, section of the nerves involved is helpful. If of the sympathetic burning type, section of the sympathetics is accomplished by tying and severing the larger blood vessels leading to the area. Relief is usually partial and not complete. In one case in my experience of the ophthalmic distribution, cocainization of the sphenopalatine ganglion gave temporary relief. Alcohol injection was not done, due to the poor condition of the subject. "After pain" may persist for only a few days, but often continues for months or years. It is commonly of such severity that morphia or dilaudid is needed, and the patient may seek relief in suicide.

Teaching of Night-Driving Technique Is Urged by Journal.—Teaching of night-driving technique as a part of the initial training of motorists is advocated by *The Journal of the American Medical Association* in an editorial, "Motor Accidents at Night," in its April 8 issue.

"Numerous accidents at night on the highways continue to indicate the need of more adequate supervision of traffic," the editorial says. "Whereas the enforcement of traffic laws has heretofore been mainly a day-time activity, many cities are now placing policemen on streets to handle traffic during the dark hours. Most motorists obtain their experience and training under daylight conditions; the problems that arise at night have not been sufficiently impressed on drivers, and traffic engineering has not kept pace with the situation. The fatal motor accident rate at night, on the basis of traffic, is more than three times the accident rate during daylight.

"Motor-vehicle fatalities during the hours of darkness have increased 43 per cent since 1930. The entire increase in traffic deaths in 1937 over those in 1936 resulted from the increase in night accidents. However, the recent emphasis on safe driving at night is producing results. The Committee on Night Accident Hazards of the National Safety Council reports for the first six months of 1938 a reduction of 26 per cent in the motor fatalities occurring during dusk and darkness.

"In its analysis of the problem the committee finds that eyesight, driving experience, and mental attitude are the important factors in the driver himself. He, too, is responsible for the associated problems of intoxication, speed, fatigue, and age. The committee found that 78 per cent of the accidents in which the driver had been drinking occurred between 6 p. m. and 6 a. m. Further studies on intoxication as related to driving accidents are under way. Night driving involves a different technique from day driving because of the difference in visibility and in the reactions of the driver. Motorists should be taught night-driving technique in their initial training. Much can be done to eliminate the hazards which are the result of low visibility at night. Highway officials should insist on the best design and maintenance of highways with adequate signs and warnings designed for good visibility at night. An improved type of lighting the highways is being installed in many places throughout the United States. The most common method of lighting the road is by means of headlights. Unfortunately, the possibilities in head lamps on cars have not been developed as rapidly as those of other parts of the car. Headlights lose as much as half of their original effectiveness in a short time unless they are kept clean and adjusted. The committee recommends that officials consider the importance of securing adequate visibility for night driving and promote safety through the installation of good illumination for the heavily traveled and dangerous main highways and by the installation of flood lights at such hazardous locations as railroad crossings, intersections, and special entrances.

"Recently the Michigan Highway Department studied the use of reflector buttons on rural highways. Units were spaced 100 feet apart and 8 feet from the edge of the pavement on eighty miles of road between Lansing and Detroit. In the first three months of 1938 there was a reduction of 79 per cent in accidents on this stretch of highway, whereas on a control stretch of highway the reduction was only 19 per cent.

"The night pedestrian is susceptible to accidents. Night pedestrian fatalities in Philadelphia increased from 56 per cent of the total number of night fatalities in 1935 to 73 per cent in 1937. In New Jersey, in 1936, 67 per cent of the urban pedestrian fatalities and 83 per cent of the rural pedestrian fatalities happened at night. The committee urges that the pedestrian give the motorist every possible opportunity to see him. If it is necessary to walk at night in rural districts the pedestrian should carry a light when practicable and wear light-colored clothing. Even carrying a white handkerchief is a considerable aid. Because the pedestrian sees the motor's headlights does not mean that the motorist sees him.

"The night limits the speed for safe driving. The National Conference on Street and Highway Safety recently fixed forty-five miles an hour as the *prima facie* speed limit at night in sections where the corresponding day limit is fifty miles an hour. Lower speeds are necessary in many places. Drivers should lower the speed at night in order to keep their safe stopping distance within the range of clear visibility. Safe driving at night is a challenge to the ingenuity of the driver, who must be alert for every indication of objects ahead or changes in the road."

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

Official Call: Annual Session

To the Officers, Fellows and Members of the American Medical Association:

The ninetieth annual session of the American Medical Association will be held in St. Louis, Missouri, from Monday, May 15, to Friday, May 19, 1939.

The House of Delegates will convene on Monday, May 15.

The scientific assembly of the Association will open with the general meeting, held on Tuesday, May 16, at 8:30 p. m.

The various sections of the scientific assembly will meet on Wednesday, May 17, at 9 a. m. and 2 p. m. and subsequently according to their respective programs.

IRVIN ABELL, *President.*
H. H. SHOULDERS, *Speaker, House of Delegates.*

Attest:

OLIN WEST, *Secretary.*
Chicago, March 25.

CALIFORNIA MEDICAL ASSOCIATION: SIXTY-EIGHTH ANNUAL SESSION

The May issue of CALIFORNIA AND WESTERN MEDICINE will be in press at the time the California Medical Association will be in session (May 1 to 4).

In this issue of the OFFICIAL JOURNAL it is only possible to list the names of newly elected officers and to present the address of the retiring president, William W. Roblee, M.D. Full reports will appear in the June issue.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

ON CALIFORNIA'S PROPOSED COMPULSORY HEALTH INSURANCE LAW (A. B. 2172)

Recently, the secretary of the California Medical Association Department of Public Relations wrote to friends in the East, requesting comments on certain phases of A. B. 2172, now before the California Legislature. Reply follows:

April 5, 1939.

Dear Doctor Kress:

To comply with your request for information concerning the probable outcome of the proposed amendment to the Unemployment Reserves Act would require considerably more time than the few days allowed. Enclosed is an analysis of the Sickness Insurance Bill sponsored a few years ago by the American Association for Social Security, which probably contains the type of information you want. The statistical data in the "Supplementary Information" of this analysis indicate the type of calculations that are necessary.

The following is also offered as some help in answering your specific questions:

1. Enclosed are two lists of studies of physicians' income showing the median and average income during the past several years. Also enclosed is a clip sheet from *The Journal* of the latest report by the Department of Commerce. From these several studies you will be able to approximate the average or median income of physicians. A recent study by the National Bureau of Economic Research concludes that during the period of 1929 to 1934 the incomes of physicians averaged $4,100 annually.

2. You will notice that these lists of the studies of physicians' incomes include the study by the San Diego County Society for 1933 and the California Economic Survey for the period 1929 to 1934. These studies give some hint of the level of physicians' incomes in the State of California.

3. In regard to this question it might be first observed that the proposed amendment undertakes to include all persons in employments as defined in Section 6.5 and Section 7 of the Unemployment Reserves Act with the two exceptions specified in Section 153 of the proposed amendment. The scope of the amendment in designating the persons from whom contributions may be expected, to be paid either by the worker, the employer, or later by the State, is so wide that it would virtually include all persons in the State of California. However, your question "How many citizens in the State of California would come in the group of annual salaries between $840 and $3,000 per year?" can be answered to a certain extent. We take it you mean residents of California, not necessarily citizens.

A study by Margaret Kelm, "Medical Care and Costs in California Families in Relation to Economic Status," published by the State Relief Administration of California in 1935, includes an analysis of the incomes of selected samples of 5,096 low-income and wage-earning white families in California. From this selected sample it appears that 60 per cent of low-income and wage-earning white families in California would be included in the income class of $840 to $3,000 per year, according to present income levels. While the very poor sections and the very rich sections of the area surveyed were excluded, it may be that this

---

† For complete roster of officers, see advertising pages 2, 4, and 6.

† The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. George G. Reinle of Oakland is the chairman, and Dr. George H. Kress is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. George H. Kress, Room 2004, Four Fifty Sutter Street, San Francisco.

Estimated Contributions Under the Proposed California Social Insurance Act, an Amendment to the Unemployment Reserves Act.

Income Class (Annual)	Estimated Income* (Thousands)	EMPLOYEES		EMPLOYERS		STATE	
		Tax (Per Cent)	Contribution (Thousands)	Tax (Per Cent)	Contribution (Thousands)	Tax (Per Cent)	Contribution (Thousands)
0-$ 840	$ 588,000	....	....	2	$11,760	1	$ 5,880
$ 840- 1,200	637,000	½	$ 3,185	1½	9,555	1	6,370
1,200- 2,400	1,666,000	1	16,660	1½	24,990	½	8,330
Over 2,400	2,009,000	1½	30,135	1	20,090	½	10,045
	$4,900,000		$49,980		$66,395		$30,625

* According to data in "America's Capacity to Consume," The Brookings Institution, pages 174 and 207, corrected according to United States Department of Commerce estimates of income in the United States.

Total estimated contributions equal $147,000,000, or 3 per cent of the total income of $4,900,000,000.

percentage distribution of family income would be somewhat representative of the majority of California families.

The California Medical-Economic Survey, with its records for 4,882 white families interviewed during an approximate year, 1934, also gives some indication of the income status of Californians. According to this study, 55 per cent of the families fell within the income group of $840 to $3,000.

From general studies of the distribution incomes, such as the reports of the Brookings Institution, the National Industrial Conference Board, and the Department of Commerce, it would seem that no fewer than 75 per cent of the individual persons and 69 per cent of all families would be included in the income group earning between $840 to $3,000 per year, in California.

4. In regard to your fourth point, it should not be overlooked that the proposed amendment undertakes to provide service benefits for all persons earning under $3,000 and not just the group earning between $840 to $3,000. Likewise, disability unemployment benefits and so-called reimbursement benefits are payable to persons earning more than $3,000 per annum. Disability unemployment benefits are also payable to persons earning less than $3,000 per annum. Consequently, it would appear that at least 90 per cent of the entire population would be eligible for some benefits under the proposed amendment.

5. The nearest possible estimate that could be made of the income in California from salaries and wages is $4,900,000,000. This is based on the geographic distribution of personal income from occupations as reported by the Brookings Institution for 1929, corrected to the level of income for 1937 according to the reports of the Department of Commerce.

It is impossible to know the number of persons who would be taxed under the proposed amendment or their incomes, but assuming that the total income from salaries and wages would be taxable under the amendment, the computation would be about as indicated in the accompanying table. It cannot be emphasized too much that all such computations are simply approximations, but it is believed that results are somewhat indicative of what may be expected. As shown in this table, the total money collected on and after July, 1941, would be approximately $147,000,000, or 3 per cent of the total income from salaries and wages. The contribution that employees, employers, and the State would probably make are shown in the table.

6. It is impossible to hazard a guess as to the average gross income that would accrue to the physicians under the proposed Social Insurance Act. The total fund collected under the Act must be used for so many diverse benefits that it is impossibel to know the amount that would be left for payment to physicians. Notice that out of the estimated $147,000,000 the benefits are payable for six categories of service benefits, one for maternity cash benefits and one for reimbursement benefits.

Particular attention should be called to the provision providing for disability unemployment benefits. The Interdepartmental Committee estimated that the cost of a disability compensation program would be 1 per cent of wages. Hence the disability unemployment benefits alone would require one-third of the total contributions.

Administrative costs would probably be not less than 15 per cent, if not more.

The probable cost of the benefits for hospitalization, drugs, medicines, and laboratory services is most uncertain, but would not be less than 25 per cent.

The cost of the reimbursement and maternity benefits cannot even be estimated.

However, from the foregoing it should be evident that the amount that would be left for payment to physicians would indeed be small. Which of the benefits would take preference cannot be determined from the amendment, but it seems fairly certain that the total contributions amount to but three per cent of the wages and salaries and will not be sufficient to provide for the grandiose system of benefits promised.

In regard to reimbursement benefits, it is rather curious that individuals earning more than $3,000 are considered as capable of spending their own money to obtain medical services but that persons earning less than $3,000 per year must have a paternalistic medical organization arranged for their medical services. It is not believed that the persons falling in this latter category would not want to be considered as unable to make their own purchases.

We trust that the foregoing will be of some help to you in your consideration of the proposed Social Insurance Act. Again it should be emphasized that all of the foregoing has been hastily prepared and should be considered as suggestions rather than as conclusions. . . .

GENERAL HOSPITALS AND THE WAGNER BILL*

Section 1201 of the Wagner Bill, Senate 1620, authorizes the appropriation in successive years of eight, fifty, and one hundred million dollars, respectively, for the construction and improvement of general hospitals. Under Section 1203 (a) (1), financial participation by the states is required. Naturally the extent of this participation will vary from state to state. Assuming, however, that the contributions of the Federal Government will be on a fifty-fifty basis, there will be available for the construction and improvement of government-owned general hospitals $16,000,000 in the fiscal year ending June 30, 1940, $100,000,000 in 1941, and $200,000,000 in 1942. Taking $4,000 as the average cost per bed of general hospitals, this bill would make provision for the addition of 4,000 general hospital beds in 1940, 25,000 general hospital beds in 1941, and 50,000 general hospital beds in 1942. These figures relate only to government-owned hospitals and do not include such enterprises, public or private, as may be undertaken without a Federal subsidy. Over an eleven-year period, 1928–1938 inclusive, the average annual increase in the number of beds in general hospitals was 1.9 per cent. The increases in number that are proposed in the Wagner Bill amount to a total of 79,000 beds, 16.2 per cent, in three years, or an average rate of increase of 5.4 per cent. In 1938 the general hospitals of the country were filled to 68.9 per cent of their capacity; 31.1 per cent of the beds were unused. Wherein lies the justification of the proposal to multiply threefold the normal increase of hospital facilities?

ORANGE COUNTY MEDICAL SOCIETY CIRCULARIZES EMPLOYERS OF LABOR

Text of the circular letter:

TO EMPLOYERS OF LABOR:

Increased Taxes, Increased Bookkeeping, Increased Overhead

There are before our legislators two Administration COMPULSORY Health Insurance bills (Assembly Bill No. 2172 and Senate Bill No. 1128). These bills provide that a tax, the major portion of which is paid by employers (based upon employees' salaries) be levied to provide employees and their dependents with medical, surgical, hospital, dental, drug and nursing services under political dictation.

---

* Concerning Wagner Bill, see page 380.

This will mean another heavy expense to the employer. Taxes are high enough today without this unnecessary increase. These bills provide for another European experiment in social economics. They are dictatorial, un-American, political, regimental, and apparently un-Constitutional.

The Senate hearing occurs on April 4 and 5. If you do not want an increase in your pay-roll, bookkeeping and overhead, write or wire your Assemblyman to VOTE NO on Assembly Bill No. 2172, and your Senator to VOTE NO on Senate Bill No. 1128. Also send a copy of your letter or wire to Governor Olson.

Protect your employee's right to choose his doctor.

THE EXECUTIVE LEGISLATION COMMITTEE,
ORANGE COUNTY MEDICAL SOCIETY.

COMPULSORY HEALTH BILLS

The Public Health League of California on April 6, 1939, issued an interesting circular under the following captions:

DANGER!

KEEP EUROPEAN REGIMENTATION OUT OF CALIFORNIA

Stop Assembly Bill 2172; Senate Bill 1128

Prevent Medical Dictatorship!

"Isms" Won't Work in America!

Text of the circular follows:

Assembly Bill 2172 and Senate Bill 1128 provide a system of socialized *compulsory* medical care which originated in Germany. Despite the failure of this plan there and elsewhere, some California politicians are trying to subjugate the working people of this state to the same galling yoke of public medical care at an estimated cost of $70,000,000 a year, much of which would be *deducted from employees' pay rolls!*

* * *

Under the *"panel service"* plan contained in A. B. 2172 and S. B. 1128 the present confidential relationship of doctor and patient would be destroyed. *Your intimate personal and family medical records would become public property!*

* * *

In Europe, where compulsory medicine is the law, doctors frequently examine thirty patients in an hour—an average of two minutes to each patient. Do you want to be herded like cattle when illness takes you to a doctor's office?

You have paid large sums to the Unemployment Reserve Fund. These funds are held *in trust for you* to provide bare necessities in case of another economic depression—*The proponents of these bills propose to use unemployment funds*—thus *diverting your* reserve funds for more political jobs. *Do not allow tampering with your Unemployment Reserve Funds.* Cash disability benefits could be given now from these funds without saddling the state with a tax-eating system of compulsory medical care.

* * *

Staggering tax burdens and vast bureaus of government employees have been the net results of compulsory medical care in Europe. S. B. 1128 and A. B. 2172 propose to start in California by deducting up to 1½ per cent of the salary of every worker (except those earning $70 a month or less) making up to $3,000 a year. These bills provide taking 2 per cent of the total payroll in this classification from the employers also. In addition, conservative estimates place the remaining cost to the state at $36,000,000 a biennium—*and you would pay this huge amount in taxes, too!*

* * *

Write or telegraph your state senator or your assemblyman, or both, to vote No on A. B. 2172 and S. B. 1128. (Your local newspaper can give you the names of your senator and assemblyman. Address both at State Capitol, Sacramento.)

* * *

Compulsory Medical Care has been *repudiated* in New York, New Jersey, Massachusetts and other states after careful and thorough investigation.

The people of California don't want it!

* * *

The doctors of California don't want it!

Investigation of those supporting A. B. 2172 and S. B. 1128 show that those who do want compulsory medical care are almost without exception politicians—these bills would create thousands of political jobs *at our expense.*

* * *

It would not help indigents—they get free medical care.

It would not help the wealthy (those making over $3,000 a year), as they would not be included in compulsory care and would continue with their own doctors anyway.

It would not help the salaried man who would pay the taxes, lose his present personal relation with his physician and become one of the crowd rushed through the panel doctor's office.

* * *

Write your senator and assemblyman to vote No on A. B. 2172 and S. B. 1128.

Have your friends do likewise.

PUBLIC HEALTH LEAGUE OF CALIFORNIA

Issued April 6, 1939

ASSEMBLY BILL 2172 AND SENATE BILL 1128

Informative Bulletin—A

1. *By Whom Sponsored.*

Assembly Bill 2172 and its companion, Senate Bill 1128, are said to be "Administration" Bills. According to the newspapers, these bills are sponsored by and supported by Labor's Non-Partisan League and "a number of Liberal organizations."

2. *Why the Tie-In with Unemployment Funds?*

They establish a system of health insurance within the system of Unemployment Reserves. There is now $130,000,000 reserve in the Unemployment Fund contributed by employers and workers as a sacred trust against unemployment. This new scheme plans to tap this unemployment reserve fund and use it for health insurance.

3. *"Regimentation" of Workers.*

The bills regiment every worker earning up to $3,000 per year. Employing units which at any time during year have any individual in employment come under plan. See Section 155.

4. *Additional Taxation Levies on Payrolls.*

In addition to the amounts already being deducted from the worker's pay check for Federal and State reserves, there will be deducted from ½ to 1½ per cent from their wages. The employer will have to contribute up to 2 per cent, which is added to his already heavy taxes. Beginning with July, 1941, the State must contribute as high as one per cent. This will add a large sum to our taxes. In 1941 the total payroll contributions for Federal Security plans, State Unemployment reserves, and health insurance will reach 9 per cent.

5. *Physicians Are Also Regimented—Arbitrary Assignment in Cases.*

Not only are all workers earning up to $3,000 per year regimented, but physicians and surgeons, dentists, nurses, and hospitals will be regimented. Every worker must select a physician and surgeon to supervise his health at all times. If he fails to make such selection, one is arbitrarily assigned to him.

6. *Indefinite Number of Patients to Be Assigned.*

There are no provisions for the amount of remuneration the physician is to receive, and Section 304 even gives the State the authority to fix the number of patients he may serve. An influential doctor might be assigned five thousand patients.

7. *The Diagnostic Center Scheme for Services of Specialists.*

X-ray, laboratory services, and specialists and consultants' services will be rendered in public centers or let under contract at rates fixed by the State.

8. *How Drug Stores Might Be Involved.*

Drugs and medicines may be purchased from any pharmacy which has agreed to sell them at prices fixed by the governing authority. It would be possible for a large chain to contract with the State at prices that would force the thousands of independent pharmacies out of business.

9. *Tremendous Power of the "Governing Authority."*

The governing authority has full power to fix remuneration for nursing, hospitalization, dentistry, etc. See Section 306.

The worker is given no guarantee as to what length of service he is to receive and is at the mercy of the governing authority. See Section 235.

10. *Tremendous Power of the "Medical Director."*

The scheme sets up a new State bureau known as the Bureau of Medical Service and places full administration of the health of all workers in the State earning up to $3,000 per year, and all doctors serving them, in the hands of a medical director.

11. *Insufficient Representation of the Medical Profession.*

Although medical men are presumed to be best fitted for advising on health administration and medical societies have been studying this problem for many years, they *are not* represented on the Advisory Council which assists the medical director. This Council is made up of three representatives of labor and two representatives of employers. When this Council acts in an advisory capacity to the Bureau of Medical Service, two physicians are added, but no physicians are on the Council when it assists the director in administering this vast scheme.

12. *Other Objections.*

Careful reading of the bills will bring out many more points which are of serious concern to all citizens of the State.

These bills would set up another new bureaucracy, add additional tax burdens to workers, employers, and all citizens in general and embark California on an untried scheme of social insurance. It is impossible to estimate the hundreds of millions of dollars that such a scheme will collect from workers, employers, and general taxpayers.

These bills are unnecessary because the physicians of the State have already voluntarily established a plan to provide hospital and medical care on a proper actuarial basis at reasonable rates.

SOME OBJECTIONS TO SENATE BILL 1128 AND ASSEMBLY BILL 2172

Informative Bulletin—B

1. *Revenues.*

The revenues possible under the schedule of taxation and pay roll deduction will not cover 50 per cent of the benefits promised.

2. There is no social or economic justification of a schedule which assesses directly such a small sum from the beneficiary, *i. e.*, 40 cents a month for a person making $80 a month—$2 for a person making $200 a month, for the maintenance of the health of his family.

3. *Panel System.*

The *panel system* has inherent defects which are repugnant to American medicine and to the American people, such as: the tendency for casual and hurried care, the disturbance of physician and patient relationship, the forced tying together of a contract basis of patient and doctor for a specified time, the tendency toward injudicious increased medication, etc.

4. *Capitation Systems.*

The *capitation fee system* encourages poor work, unnecessary attentions, sloughing off of all cases possible onto the clinic specialist or hospital, discourages preventive medicine, etc.

5. *Proposed Types of Physicians.*

The division of the profession into general practitioner and clinic specialist will lower medical standards, tend to make two distinct castes. (Now most so-called general practitioners limit themselves voluntarily to certain types of practice, approaching the complete specialist in ability.) Under this system, they will be required to take care of all conditions which the powers to be may decide constitute general practice, thus leveling them down to mediocrity in all fields.

6. *Morbidity and Mortality Rates in Foreign Countries.*

Morbidity and mortality rates are higher in compulsory health insurance countries.

7. *Who Chooses Specialist or Hospital.*

Patient will not be allowed to choose his specialist or hospital.

8. *"Governing Authority" Decides.*

(Section 235) There is no guarantee that the beneficiary will obtain the benefits promised him. The amount of service may be sharply curtailed by the governing authority.

9. *How Large Can Panel Be?*

The size of a physician's practice is under the control of the governing authority. There is nothing in the act to prevent this authority from allowing political favorites to have extensive practices and to sharply limit those whom the authority desires to punish.

10. *Public Competition to Private Laboratories.*

Laboratories (X-ray and pathological) and hospitals will be compelled to meet rates upon which publicly owned and tax-supported hospitals and laboratories can be operated.

11. *Existing "Groups" May Be Favored.*

Provision is made to allow perpetuation of clinics and groups such as Ross-Loos, etc., or others that may be formed, and the rate of remuneration will be decided by the governing authority, giving an open road to political control.

12. *Rights of Pharmacists May Be Endangered.*

The governing authority shall fix the price at which pharmacies may sell drugs. Chain stores will be the answer, or dispensing of drugs at the clinics.

13. *"Advisory" Board to Medical Department Lacking in Sufficient Medical Personnel.*

The representation of the medical profession in the control of this act is completely inadequate. The governing authority is composed of laymen. The medical director will be politically appointed. His advisory council of seven will have only one representative of the physicians, and one of medical schools.

14. *Hospitals Are Forgotten.*

The hospitals have no represenation at all.

15. *A New State Bureaucracy will Come Into Existence.*

The health of the State will be politically controlled, a new bureaucracy.

16. *Defects in Plan not Easily Remedied.*

The code, if unworkable, can only be changed by the Legislature, which meets every two years, and even then organized opposition must be overcome.

17. Increased taxation will further retard recovery.

18. *Voluntary Plan of State Medical Association a More Desirable System.*

The code will seriously handicap the California Physicians' Service which offers definite guarantee of services promised, preserves the high standard of medical care, and the relationship of the physician and patient as far as possible under any insurance set-up.

CALIFORNIA PHYSICIANS' SERVICE*

Informative Bulletins

Bulletin I

Contract agreements with the three great nonprofit hospital associations of California were reported recently by California Physicians' Service, clearing the way for prompt presentation to the public of a voluntary, low-cost, monthly prepayment plan for medical, surgical and hospital care.

The three hospital associations are the Intercoast Hospitalization Insurance Association, with headquarters in Sacramento; the Insurance Association of Approved Hospitals group in and surrounding the San Francisco Bay area and the Associated Hospital Service of Southern California, with headquarters in Los Angeles.

Formal signing of the contracts agreed upon has now been set and the next step in the plan of the licensed doctors of medicine in California to enable employed and other groups to secure medical, surgical and hospital care by the doctors and hospitals of their own choice will be signing of contracts with the groups of patient, or beneficiary, members.

Signing of the hospital contracts will make available to the beneficiary members the services of approximately 80 per cent of the hospitals in California, excluding government-owned institutions and those which do not provide full hospital service. California Physicians' Service officials stated, however, that all other hospitals will be welcomed into the comprehensive medical, surgical and hospitalization plan, provided their standards of operation are approved.

With more than 4,700 licensed doctors of medicine in California now professional members of California Physicians' Service, Dr. Ray Lyman Wilbur, president, said the goal will be 100 per cent membership of licensed doctors of medicine and of approved hospitals in order to give the broadest selection to beneficiary members.

California hospitals, segregated by counties, that are affiliated with the three hospital associations are listed below:

Los Angeles County.—California Hospital, Cedars of Lebanon Hospital, Good Samaritan Hospital, Methodist Hospital, Presbyterian Hollywood Hospital, Santa Fe Hospital, White Memorial Hospital, Long Beach Community Hospital, Seaside Memorial Hospital, Huntington Memorial Hospital, St. Luke's Hospital, Glendale Physicians and Surgeons Hospital, Glendale Sanitarium and Hospital, Alhambra Hospital, Compton Las Campanas Hospital, Inglewood Centinela Hospital, San Pedro Hospital, Huntington Park Mission Hospital, Artesia Hospital, Covina Hospital, Monterey Park Garfield Hospital, Long Beach Harriman Jones Clinic Hospital, Golden State Hospital, Pomona Valley Community Hospital.

San Bernardino County.—Redlands Community Hospital, Loma Linda Sanitarium and Hospital, Upland San Antonio Community Hospital.

Riverside County.—Riverside Community Hospital.

Orange County.—Orange St. Joseph Hospital.

Santa Barbara County.—Santa Barbara Cottage Hospital, St. Francis Hospital.

Ventura County.—Ventura Foster Memorial Hospital, Oxnard St. John's Hospital.

San Diego County.—San Diego Mercy Hospital, Paradise Valley Sanitarium and Hospital, La Jolla Scripps Memorial Hospital, San Diego Elwyn Hospital.

San Francisco County.—Children's Hospital, Dante Hospital, Franklin Hospital, Greens' Eye Hospital, Mary's Help Hospital, Mount Zion Hospital, St. Joseph's Hospital, St. Francis Hospital, St. Luke's Hospital, St. Mary's Hospital, San Francisco Polyclinic Hospital, Stanford University Hospital, University of California Hospital.

Alameda County.—Alameda Sanatorium, Alta Bates Hospital, Berkeley General Hospital, Children's Hospital of the East Bay, East Oakland Hospital, Peralta Hospital, Providence Hospital, Samuel Merritt Hospital.

Marin County.—Ross General Hospital, San Rafael Cottage Hospital.

Contra Costa County.—Antioch Hospital, Concord Hospital, Martinez Community Hospital, Richmond Cottage Hospital.

Sonoma County.—General Hospital of Santa Rosa, Healdsburg General Hospital, Petaluma General Hospital, Sebastopol Hillside Hospital, Sonoma Burndale Hospital, Eliza Tanner Hospital.

Sutter County.—Yuba City General Hospital.

Butte County.—Chico Enloe Hospital, Oroville-Curran Hospital, Chico Hospital.

Yuba County.—Marysville Rideout Memorial Hospital.

Yolo County.—Woodland Clinic.

Placer County.—Auburn Highland Hospital, Auburn Landis Hospital.

Nevada County.—Grass Valley W. C. Jones Memorial Hospital.

Eldorado County.—Placerville Sanitarium.

Calaveras County.—San Andreas Hospital.

Tuolumne County.—Sonora Hospital, Sierra Hospital.

Stanislaus County.—Newman Hospital, Oakdale Hospital, Robertson Hospital, St. Mary's Hospital, Turlock Lillian Collins Hospital, Emmanuel Hospital, Modesto McPheeters Hospital.

Sacramento County.—Mercy Hospital, Sutter Hospital.

San Joaquin County.—Stockton Dameron Hospital, St. Joseph's Home and Hospital, Lodi Mason Hospital, Lodi Buchanan Sanitarium.

Tehama County.—Red Bluff Mercy Hospital.

Lake County.—Upper Lake Hospital.

Mendocino County.—Ukiah General Hospital.

Humboldt County.—Arcata Trinity Hospital, Eureka St. Joseph's Hospital.

Napa County.—Vallejo General Hospital, Napa Victory Hospital, Calistoga General Hospital.

San Mateo County.—Mills Memorial Hospital.

Santa Clara County.—O'Connor Sanitarium, Palo Alto Hospital, San Jose Hospital, Wheeler Hospital.

Santa Cruz County.—Hanly Hospital, Santa Cruz Hospital, Watsonville Hospital.

Monterey County.—Community Hospital, Park Lane Hospital, Peninsula Community Hospital, Salinas Valley Hospital, The Monterey Hospital.

San Benito County.—Hazel Hawkins Memorial Hospital.

Merced County.—Merced Mercy Hospital, Los Banos Hospital, Los Banos Emergency Hospital, Dos Palos Community Hospital.

Madera County.—Madera Dearborn Hospital, Madera Sanitarium.

Fresno County.—Clovis Hospital, Fresno Burnett Sanitarium, Reedly Hospital, St. Agnes Hospital, Coalinga Hospital, Kingsburg Hospital, Coalinga Pleasant Valley Hospital, Sanger Sanitarium, Selma Sanitarium.

Tulare County.—Tulare Bellevue Hospital, Lindsey Hospital, Porterville Hospital, Tulare Hospital, Visalia Municipal Hospital.

Kings County.—Hanford Sacred Heart Hospital, Hanford Sanitarium.

Kern County.—Delano Hospital, Bakersfield Mercy Hospital, Bakersfield San Joaquin Hospital, Taft Community Hospital, Tehachapi Hospital.

* * *

Bulletin II

Voluntary group prepayment plans for low-cost medical service have achieved notable success in the United States within recent years along lines similar to that of California's plan embodied in the California Physicians' Service, Dr. Ray Lyman Wilbur said recently.

"Although California doctors of medicine are the first group to launch a voluntary plan for low-cost monthly prepayment medical, surgical and hospital care on a state-wide basis, they have as precedents the operation of voluntary programs elsewhere which indicate beyond question the voluntary system is practicable," said Doctor Wilbur, who is president of California Physicians' Service.

The King County, State of Washington, plan was referred to by Doctor Wilbur in support of his statement. A voluntary service for medical, surgical and hospital care was started there six years ago and at present numbers more than 30,000 beneficiary, or patient, members.

---

* Address: 220 Montgomery Street, San Francisco. Telephone: EXbrook 3212.

"More than half the members of the King County plan are in the low-income group, in fact, earning between $65 and $75 a month," Doctor Wilbur said. "Yet these members have voluntarily joined the service and made their monthly payments in anticipation of illness or accident. Proof of their satisfaction is given by the steady growth of the service. The doctors, on the other hand, have found that application of the plan has greatly widened their field of service to the people."

Doctors in Missouri are now engaged in organization of a voluntary group medical care plan similar to that of California Physicians' Service and thus will be in all probability the second state-wide group in the United States to inaugurate this modern medical care plan, Doctor Wilbur said.

COUNTY SOCIETIES

HUMBOLDT COUNTY

The Humboldt County Medical Society met on April 14 at the St. Joseph Hospital in Eureka at 8:30 p. m. Dr. Samuel P. Burre, President of the Society, presided.

Dr. Jacob Smith of the University of California Medical School surgical staff gave a very interesting discussion on *Gastric Surgery*. His dissertation was illustrated by x-ray films, photographs, lantern slides, and blackboard sketches. Doctor Smith took up the various methods of diagnosis and explained the advantages of the gastroscope for some cases. The operation of choice was pointed out in each particular type of case.

Saturday morning, at the Humboldt County Hospital, Doctor Smith conducted an operative clinic in which he did a gastric resection. Doctor Smith is an able teacher as well as operator, and we consider ourselves fortunate in having an opportunity to learn from him.

Proposed changes in the constitution and by-laws of our medical society were read for the first time. A committee of three was appointed to formulate plans to combat subversive legislation. Dr. W. J. Quinn gave a report on his recent trip to Sacramento and discussed bills detrimental to the welfare of the medical profession.

J. S. Woolford, *Secretary*.

⁂

KERN COUNTY

The Kern County Medical Society held a dinner meeting at the Taft Hotel, in Taft, on Saturday evening, April 22. Doctor Chester Mead presided at the meeting, which is held annually in Taft to enable the members of the Society to become better acquainted with the physicians practicing in the West Side. Nineteen members and guests were present.

Announcement was made by Dr. C. S. Compton regarding new plans for clinics at the farm workers' camps under consideration by the Agricultural Workers' Health and Medical Association. Dr. L. A. Packard reported on further developments of the California Physicians' Service. Sixty-two physicians in Kern County have applied for professional membership.

Dr. Lloyd Tarr introduced the speaker, Dr. C. M. Hyland, on the staff of the Children's Hospital, Los Angeles, in charge of the Serum Center. He spoke on the *Use of Immune Sera in the Treatment of Infections*. Doctor Hyland emphasized the value of convalescent serum as the best means of modifying and preventing measles and advised its use in children under three years of age and those who have had recent attacks of other diseases, such as pneumonia, whooping cough, childhood type of tuberculosis, etc., to reduce the mortality from the disease. Dosage is 5 cubic centimeters for a child under three, 10 to 15 cubic centimeters for older children and adults. In scarlet fever the use of immune serum has reduced the incidence of complications to 8 per cent in the Los Angeles General Hospital. Doctor Hyland stated that the contact rate is practically nil in children exposed to scarlet fever in the immunized group and 18 per cent in the nonimmunized group. The scarlet fever serum also has been used with good results in streptococcic pneumonia, postpartum septicemia and in various streptococcic septicemias. The speaker also advocated the use of convalescent serum in the treatment of poliomyelitis, in spite of recent reports casting doubts on its efficacy. In the treatment of surgical shock, prolonged vomiting, diarrhea, severe burns, and other conditions which lower the blood serum proteins, Doctor Hyland recommended using dried human blood serum, which may be administered in Ringer's solution or with glucose.

Following a long discussion of the subject, the meeting was adjourned. C. S. Compton, *Secretary*.

⁂

MENDOCINO-LAKE COUNTY

The April 1 meeting of the Mendocino-Lake County Medical Society was called to order by President Robert B. Smalley.

The speaker for the evening, Dr. George M. Uhl, Chief of the Bureau of County Health Work, Department of County Health, spoke on the subject of *The County Health Officer*. The duties of the full-time health department were explained. The advantages of a highly integrated county health program were enumerated. The actual cost of the present health program, with part-time health officers, was presented. Doctor Uhl felt that for little additional cost the full-time health program could be inaugurated.

The subject was discussed by Dr. H. O. Cleland, the present county health officer. He urged that the present facilities be utilized, though changes to a full-time department might be contemplated for the future.

The Secretary reported on letters sent to our State Senator and Assemblymen relative to the Compulsory Health Insurance bill. The California Physicians' Service was then discussed, and the members of the Society were found to be coöperating fully in joining.

Application for membership by Dr. William J. Perry of Willits was received.

Application by Dr. H. O. Cleland of Ukiah for membership was accepted pending a formal request.

It was desired that the dinner meetings as held in the past with the wives be dispensed with to allow more time for routine business matters. The time of the next meeting was tentatively set for July, to be held in Willits.

Dallas L. Wagner, *Secretary*.

⁂

SACRAMENTO COUNTY

The regular meeting of the Sacramento Society for Medical Improvement was called to order by the president, Dr. Manuel Azevedo, in the Auditorium at Twenty-ninth and L streets, on February 2.

Dr. Frank Lee presented a case of a boy nineteen years of age with a congenital heart lesion. An interesting case discovered accidentally during an examination for entrance to a C. C. C. camp. The boy has been doing heavy work. Doctor Lee asked the speaker of the evening to discuss the case.

The paper of the evening was presented by Dr. A. Christie, Instructor in Pediatrics at the University of California. Doctor Christie presented a very interesting talk on *Heart Disease in Children*. Discussion was opened by Doctor Babcock and continued by Dr. F. Reardan.

The applications for new membership of Drs. W. Harding, A. M. Henderson, Jr., and J. Dillon were read for the second time and voted upon. All were elected to membership. The applications of Drs. A. A. Atkinson, Lewis Specker, E. Blunden, and Pearson Kellogg were read for the first time.

Dr. F. Gundrum discussed the matter of postgraduate conferences in this area. The matter was referred to a committee, composed of Drs. M. Azevedo, D. Saeltzer, and G. Millar.

Doctor Dozier made a motion that the Board of Directors or the Secretary be instructed to invite Doctors Dukes and Kilgore to address the Society at a future meeting regarding the California Physicians' Service. Passed.

Doctor Cordes Ankele reported for the Banquet Committee. G. E. Millar, *Secretary.*

⁂

SAN BERNARDINO COUNTY

The meeting of the San Bernardino County Medical Society was held at the Loma Linda Sanitarium in Loma Linda on Tuesday, March 7. Dinner was served at 7:30 p. m., with about eighty-five members and guests present.

The applications for membership of Dr. Elmer O. Carlson of Ontario and Dr. H. S. Eldredge of Lake Arrowhead were favorably voted upon.

Dr. W. W. Roblee, President of the California Medical Association, made a short address regarding *compulsory health insurance bills now before the State Legislature,* and urged physicians to join the California Physicians' Service to aid in defeating these highly undesirable bills.

Doctor Folkins introduced Dr. Margaret Sheerer of the University of California, who is making a survey of rheumatic fever in Redlands. Doctor Sheerer asked for the coöperation of the physicians.

The Chairman then introduced Doctor Butterfield, Superintendent of the Sanitarium, who introduced the speakers on the following program: *Clinical and Pathological Conferences in Cases of Jaundice,* by Dr. Newton Evans, Director of Laboratory of Los Angeles General Hospital, and Professor of Pathology of the College of Medical Evangelists; and *Value and Applications of Fever Therapy,* by Dr. Fred B. Moor, Professor of Pharmacology and Therapeutics, College of Medical Evangelists.

Arthur E. Varden, *Secretary.*

⁂

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society was held on April 6 in the Medico-Dental clubrooms in Stockton. The regular meeting was preceded by the customary supper meeting at the Hotel Wolf at which there were seventeen present. Doctor Barnes spoke on *Early San Joaquin County Physicians.* The regular meeting was called to order at 8:30 p. m. by President Neill P. Johnson.

Dr. Dewey Powell gave an outline of the *work done by the Legislative Committee.* He spoke on *the importance of concentration effort to defeat the Administration Bill for Health Insurance* and stated that he had been requested by the Nurses' Association to appear at Sacramento to speak in favor of the Nurses' Licensary Bill. Because of the stand taken by the California Medical Association against this bill, he made the following motion, which was seconded by Doctor Doughty: That the Secretary be instructed to write to the California Medical Association asking them to change their policy on the Nurses' Bill or to give sufficient reason to the local society for not changing this policy and reasons for Doctor Powell not appearing to speak in favor of the Nurses' Bill. The motion was carried.

Doctor Powell outlined the progress that has been made by the California Physicians' Service in signing up professional members. Up until last night there had been sixty-six members signed up from San Joaquin County. This represents approximately two-thirds of the members in active practice.

The Membership Committee was called upon for a report and Doctor Rixford, Chairman, reported progress. The new By-Laws Committee was called upon for a report and Doctor Eccleston, Chairman, reported progress.

President Johnson announced that Doctor Teel would be in Stockton to speak on April 19. Doctor Teel is from the Harvard obstetrical staff, and his paper will be under the auspices of the Postgraduate Committee.

There being no further business to come before the Society the topic of the evening was then presented by Dr. Delbert Hand of Stanford. Doctor Hand presented a very interesting paper on the *Treatment of Non-Union in Fractures.* This was illustrated by drawings and x-ray films.

The meeting was adjourned at 9:30 p. m. and refreshments were served. G. H. Rohrbacher, *Secretary.*

⁂

SAN MATEO COUNTY

The meeting of the San Mateo County Medical Society was held in the banquet room of the Benjamin Franklin Hotel on March 22, with Dr. N. D. Morrison presiding.

The Chairman announced that Dr. William Roscoe Jepson had been elected to membership in the Society at the last meeting of the Board of Directors. The Chairman further announced that Dr. Alfred Goldman had been elected to associate membership in the Society.

The Secretary made an announcement concerning the present status of the bills for compulsory health insurance now before the State Legislature and mentioned the work of the Speakers' Bureau on this subject. Display boxes of the pamphlet, entitled "Family Doctor or Federal Agent," prepared by Medical Economics, were distributed to the members of the Society, who are requested to place this material in their waiting rooms.

The Chairman then introduced the first speaker of the evening, Dr. Charles Weiss of Mount Zion Hospital, who presented a paper and slides on the subject, *Current Views on Staphylococcus Infection and Immunity.* Doctor Weiss' paper represented a distinct contribution to the problem of control of staphylococcus infections, with especial reference to the use of staphylococcus antitoxin. The second speaker, Dr. John Cline, was introduced by the Chairman, and he presented a discussion on the subject, *The Clinical Application of the Staphylococcus Immunity Reaction.* Doctor Cline discussed the use of staphylococcus toxoid in superficial infections, and in the discussion period following he made mention of results of work with sulfapyridin, the new chemical agent which shows promise of becoming an important adjunct in the treatment of staphylococcic infections. The papers of Doctors Weiss and Cline were received with great enthusiasm by the Society.

J. Garwood Bridgman, *Secretary.*

⁂

VENTURA COUNTY

The regular monthly meeting of the Ventura County Medical Society was held at the Saticoy Country Club on Tuesday, January 10.

President Mosher introduced Dr. Elmer Belt of Los Angeles, who gave a very interesting and instructive talk on *Gonorrhea and Its Complications.* Doctor Belt introduced Doctor Folkenberg of Los Angeles, who discussed the *Treatment of Gonorrhea by Sulfanilamide and Heat*; he also presented the latest methods for culturing the organisms.

The following communications were read: From Committee on Scientific Work regarding a booth devoted to plans and photographs of modern offices of physicians; from the State Medical Library, Los Angeles Division, in regard to journals available; from the Los Angeles Society of Ophthalmology and Otolaryngology regarding a proposed legislative bill to license and regulate dispensing opticians.

Doctor Smolt made a motion that the Society endorse a bill to license and regulate dispensing opticians in the State of California, and that such a bill be presented at the present legislative session at Sacramento, and that the secretary of the California Medical Association be informed by letter. The motion was seconded by Doctor Coffey and was unanimously carried.

After a brief discussion Doctor Shore made a motion that the Society request the Council of the California Medical Association to set up a unit of the California Physicians' Service in this district as soon as expedient. The motion was seconded by Doctor Strong, and carried.

Doctor Shore made a motion that Dr. Louis Packard of Bakersfield be suggested to the Board of Directors of the California Physicians' Service. The motion was seconded by Doctor Smolt and was unanimously carried.

Dr. C. R. Bennett of Camarillo State Hospital was unanimously elected to membership.

The following committee was appointed:

Publicity: Doctors Coffey (chairman), Nelson, Harker, Drace, and Morrison.

At the next monthly meeting Judge Henderson will speak on *Medical-Legal Problems.*

* * *

A special meeting of the Ventura County Medical Society was held at the Saticoy Country Club on Monday, January 23.

President-Elect C. A. Dukes, Secretary George H. Kress of the California Medical Association, and L. A. Packard, Councilor of the Third District, addressed the Society on *California Physicians' Service and other problems of the California Medical Association.*

There was no business meeting.

* * *

The regular monthly meeting of the Ventura County Medical Society was held at the Saticoy Country Club on Tuesday, March 14.

Doctor Boyes gave a very fine illustrated talk on *Infections of the Hands and Their Treatment.*

Mr. Hadenger of Lloyd's spoke on *The History of Malpractice Insurance.* Mr. Reed gave some of the *Legal Aspects and Causes of Suits.*

A report of the Secretaries' Conference was given by the Secretary.

The addition of another physician to work under Doctor Wylie in the Health Department and help with the examination of school children in the outlying districts was discussed. As the hour was late and discussion did not seem to be accomplishing anything, Dr. W. S. Clark made a motion that the matter be tabled. The motion was seconded by Doctor Nielsen, and carried.

Doctor Homer made a motion that a vote of thanks be given Doctor Boyes for a splendid talk. The motion was seconded by Dr. W. S. Clark, and was unanimously carried.

A. A. Morrison, *Secretary.*

Doctor Scanland was a member of the Napa County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION[†]

MRS. CLIFFORD A. WRIGHT..............................President
MRS. FRED H. ZUMWALT..............Chairman on Publicity
MRS. FRANK H. RODIN..Assistant Chairman on Publicity

News Letter

Dear Auxiliary Members:

As the fiscal year draws to a close, we wish to congratulate and thank the officers, chairman and members of each County Auxiliary who have served loyally and have given their best efforts in carrying on the program of education, service and friendship.

May I, as assistant publicity chairman, join Mrs. Fred H. Zumwalt in thanking each and every one who has so efficiently helped during the year by sending in the material used for publicity. Your coöperation has been very valuable and helpful. It has been a privilege and a pleasure to serve you.

To the newly elected officers and chairmen our best wishes for success. The value of the auxiliaries to the county medical societies is being recognized and appreciated through the faithful service, coöperation and understanding given by the members of the auxiliaries.

Reports and convention activities will be published in the following issues of the CALIFORNIA AND WESTERN MEDICINE.

Sincerely yours,
MRS. FRANK H. RODIN.

Component County Auxiliaries

Alameda County

Unusually successful was the Annual Student Loan Fund party given in March by the members of the Woman's Auxiliary to the Alameda County Medical Association.

Over five hundred women met for luncheon at the Claremont Country Club, and to admire the beautiful gowns and costumes modeled by the following charming members: Mesdames Thomas Clark, A. S. Alexander, Dudley Smith, Grant Ellis, Gordon Roberts, C. B. Fowler, Chelsea Eaton, Maxwell Thebaut, James Barr, George Nesche, and J. B. Hollingsworth.

Mrs. William Sargent presided at the microphone and introduced each model as she appeared and walked down the aisle to the soft music of the orchestra.

After the fashion show, bridge was enjoyed by the members and guests. Rose bushes were presented as prizes to the winners at each table.

In keeping with the season, spring flowers in all their glory were in evidence everywhere.

Appreciation and thanks is extended to the very capable chairman of arrangements, Mrs. Wallace Partch. And to Mrs. George Mainwaring, chairman of the fashion show; Mrs. Forest Kracaw, luncheon chairman; Mrs. Grant Ellis, publicity chairman; Mrs. Richard Young, chairman of reservations and Mrs. Suren Babington, bridge chairman.

MRS. GRANT ELLIS, *Publicity Chairman.*

[†] As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Frank H. Rodin, Assistant Chairman of the Publicity and Publications Committee, 2457 Bay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Rodin and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

Fresno County

The addition of thirteen new members to the Woman's Auxiliary to the Fresno County Medical Society was reported by Mrs. W. F. Stein, vice-president and membership chairman. This is outstanding evidence that the doctor's wives are realizing the value of the Woman's Auxiliary.

Thirty members were present at the meeting held April 4, at the University Sequoia Club. Mrs. Otto Dederich, a member of the Auxiliary, reviewed the book *Consultation Room,* by Dr. Frederick Loomis.

Mrs. Charles H. Ingram, *Publicity Chairman.*

⁂

Los Angeles County

The members of the Woman's Auxiliary to the Los Angeles County Medical Association met for luncheon, March 28, at the County Medical Building. The president, Mrs. William H. Leake, presided with 105 members and guests present.

After the business meeting, Dr. George D. Maner, a member of the Committee for Pneumonia Control of the California Medical Association, gave an interesting talk on the *Diagnosis and Treatment of Pneumonia.*

Drs. John Fleude and Clarence Toland spoke in behalf of the drive for the *Control of Cancer,* illustrated by a film entitled *Fight Cancer With Knowledge.*

Mrs. Karl Von Hagen, *Publicity Chairman.*

⁂

Marin County

The March meeting of the Woman's Auxiliary to the Marin County Medical Society was held at the Sleepy Hollow Golf Club.

Twenty-four members met for dinner. After the business meeting Mrs. C. A. De Lancey read a play entitled *Charity Begins at Home.* The play was approved and members of the Auxiliary are rehearsing the parts and the play will be presented at the May meeting for the entertainment of their husbands and friends.

Mrs. C. A. De Lancey, *Publicity Chairman.*

⁂

Monterey County

The Woman's Auxiliary to the Monterey County Medical Association is again happy to have been the hostesses to the members and guests of the woman's auxiliaries who attended the convention of the California Medical Association in Del Monte.

A very active year is reported as follows:

In January a card party at the House of Four Winds in Monterey, the proceeds were used to supply furnishings for the children's tuberculosis unit of the Monterey County Hospital.

In February the members met for luncheon at the Santa Lucia Inn at Salinas.

In April, the retiring president, Mrs. Garth Parker, was the hostess to the members of the Auxiliary at a luncheon at her home.

The newly elected officers are: president, Mrs. A. A. Arehart; vice-president, Mrs. Herbert Archibald; secretary, Miss Elizabeth Merrill, and treasurer, Mrs. G. Eberhardt.

Mrs. A. A. Arehart, *Publicity Chairman.*

⁂

Orange County

The Woman's Auxiliary to the Orange County Medical Society honored three state officers at their March meeting, held at the home of Mrs. G. Wendell Olson. The visiting guests were Mrs. Clifford A. Wright, president; Mrs. E. Eric Larson, secretary, and Mrs. Arthur T. Newcomb, councilor and librarian of the California Woman's Auxiliary.

After the business meeting the program chairman, Mrs. K. H. Sutherland, introduced the guests who spoke on the various activities of the Woman's Auxiliary.

Mr. E. E. Smith of Anaheim spoke on the *Life of Johannes Brahms,* German music composer, and Mrs. Dana Newkirk played several of Brahms compositions.

Mrs. Olson was assisted during the tea hour by Mesdames Harold Gobar, Dale Petteplace, Edwin Kersten and C. F. W. Kohkenberger.

Mrs. G. Wendel Olson, *Publicity Chairman.*

⁂

Riverside County

Mrs. James F. Percy, revisions chairman of the National Auxiliary and parliamentarian of the State Auxiliary, was the guest speaker at the February meeting of the Riverside County Auxiliary. Mrs. Percy discussed the *Aims and Problems of the Auxiliary,* and traced the development of Socialized Medicine in the United States and the part that the doctor's wives should play in the present situation.

The president, Mrs. W. W. Roblee, presided at the meeting, which was held at the home of Mrs. Erwin Miller.

After the meeting the doctors joined their wives for refreshments and entertainment. Mrs. Charles Miller played several of her own compositions on the piano.

Assisting the hostess, Mrs. Erwin Miller, were Mesdames W. K. Templeton and O. M. Wheeler.

* * *

In March the president, Mrs. W. W. Roblee, assisted by Mrs. George W. Coon, was hostess to the members of the Woman's Auxiliary to the Riverside County Medical Society at a very delightful luncheon at her home. About twenty members and guests were present.

After a short business meeting, Mrs. F. G. Lindemuller, chairman of public relations of the San Diego County Auxiliary, gave a most interesting talk on *Practical Problems of the Auxiliary.*

Mrs. T. A. Card, *Publicity Chairman.*

⁂

San Diego County

The Woman's Auxiliary to the San Diego County Medical Society welcomed back their president, Mrs. C. O. Tanner, on her return from a trip to Europe.

Mrs. Tanner presided at the meeting in March, which was held at the University Club.

Very gratifying was the report on the annual bridge benefit. The final arrangements for the annual spring dinner dance were made.

Mrs. H. K. Albertson, *Publicity Chairman.*

⁂

San Francisco County

The members of the Woman's Auxiliary again invited their husbands and members of the San Francisco County Medical Society to a Valentine dinner dance, held in the beautiful home of the Medical Society.

Mrs. William W. Newman was in charge of arrangements, assisted by the following committee: Mesdames Thomas E. Gibson, John Humber, Maurice Korshet, Bernard Cody, Charles Noble, Andrew Stockton, Robert Newell, Edmund Morrisey, Wilbur Swett, Frank Hand, George Becker, Maurice Eliaser, John Sampson and Fred D. Fellows.

Dr. Lawrence R. Custer was Master of Ceremonies. His accordion and entertaining manner were greatly enjoyed.

Mrs. Thomas E. Gibson, president of the Auxiliary, very graciously sang many selections accompanied on the piano by Dr. Clifford A. Dickey. The dialect stories of Drs. Ellsworth F. Quinlan, Donald deCarle, and Dudley Smith were very amusing and entertaining.

The lovely decorations of spring blossoms and flowers and the Valentine motives of red and white added much to the party spirit.

To complete the evening's entertainment, the guests enjoyed the art exhibit, shown in the ballroom, of paintings, sculpture, wood carvings, prints, and photography, etc., which were executed by doctors.

Mrs. Clain F. Gelston, *Publicity Chairman.*

⁂

San Joaquin County

The State President, Mrs. Clifford A. Wright, and her secretary, Mrs. E. Eric Larson, were the honored guests at a luncheon preceding the regular meeting of the San Joaquin County Auxiliary in February.

The meeting was held at the home of Mrs. Vern Ross. Mrs. Wright gave an interesting talk on *How the Doctors' Wives Can Be of Service in Their Community.*

Tea was served after the meeting and the nineteen members present enjoyed meeting the guests and a social hour.

Mrs. G. K. Wever, *Publicity Chairman.*

⁂

Santa Barbara County

Eleven health chairmen, representing various organizations, were the guests of the Woman's Auxiliary to the Santa Barbara County Medical Society at the March meeting, held at the home of Mrs. Frank J. Homback.

Dr. Susanne Parsons gave an interesting and enlightening talk on the *Work of the American Society for the Prevention of Cancer.*

The following officers were elected for the ensuing year: Mesdames Edward L. Markthaler, president; Richard McGovney, first vice-president; O. C. Jones, second vice-president; C. W. Henderson, recording secretary; P. A. Gray, corresponding secretary, and John Van Paing, treasurer.

Mrs. Alfred Wilcox, chairman of the Committee in Charge of Arrangements for the bridge tea, reported on the plans.

After the meeting, tea was enjoyed by the members and guests.

The members of the Auxiliary sponsored a musicale on Easter Sunday afternoon, the proceeds of which were contributed to the Cancer Control Campaign. Mr. Henry Eicheim, noted musician, arranged the program.

Mrs. C. W. Henderson, *Publicity Chairman.*

⁂

Santa Cruz County

Cure and Prevention of Tuberculosis was the subject presented by Dr. J. D. Fuller and Miss Lois Holworth, County Health Nurse, at the March meeting of the Woman's Auxiliary to the Santa Cruz County Medical Society.

Eleven members and two guests met for luncheon at the Appleton Hotel in Watsonville.

Mrs. R. C. Alsberg, *Recording Secretary.*

⁂

Tulare County

The Woman's Auxiliary to the Tulare County Medical Association held its March meeting in Visalia.

Mr. Combs, an attorney, gave a fascinating talk on *Books, the Print and Bindings,* and illustrated same with an interesting display.

Mrs. W. B. Parkinson, *Corresponding Secretary.*

First Pan-American Coöperation Was in Public Health Work.—"The interest, enthusiasm, and occasional criticism aroused by the eighth International Conference of American States at Lima, Peru, recently," says an editorial in *The Journal of the American Medical Association* for April 1, "offer opportunity to point out that when effective Pan-American coöperation in most matters was still a dream of statesmen and scholars it had already been achieved in the field of public health, largely under medical auspices.

"International coöperation of the American republics in this field began at the quarantine conference held in Washington in 1881."

Among the notable accomplishments of the Pan-American Sanitary Conferences, the first of which was held in 1902, was the approval of a Pan-American Sanitary Code in 1924, a model international health charter which was the first Pan-American treaty unanimously ratified by all the republics.

The tenth Conference, held in Bogotá, Colombia, in September, 1938, was one of the most successful because of the completeness of its program, the size and technical character of its delegations, and the extensive scientific reports submitted.

"The eleventh Pan-American Sanitary Conference is scheduled to be held in Rio de Janeiro, Brazil, in about four years and will be preceded by the fourth Pan-American Conference of National Directors of Health, to be held in Washington in 1940," the editorial reports.

"The American Medical Association lent effective and practical support to this movement through the publication of its Spanish edition for a period of ten years (1918-1928)."

Parents Should Pay More Attention to Children's Good Behavior.—If parents would pay more attention to their children's good behavior and ignore their bad conduct, temper tantrums would become much less frequent, William I. Fishbein, M. D., Chicago, suggests in the May issue of *Hygeia,* the health magazine.

When the child has a tantrum, Doctor Fishbein advises, "put him into a room where anything which he may destroy is out of reach, and leave him alone until the tantrum is over.

"Make sure that the child does not attain by the tantrum the object for which he is having it. Control your own temper. Do not scold the child nor punish him for the tantrum.

"Try to keep the legitimate reasons for the child's anger at a minimum. Interfere as little as possible with the child's natural activities. Correct improper behavior promptly with as little fuss as possible. Do not permit today what will be forbidden to morrow."

Any physical source of irritation should be discovered and remedied, Doctor Fishbein points out. However, many parents become unduly alarmed when an angry child holds his breath and becomes momentarily unconscious. "A child has never injured himself during such an attack, and if he is left alone, the breathing begins normally in a few seconds," the author says.

An epileptic attack may resemble breath holding, but a physician can easily tell the difference. Once the parent has been assured that the child does not have epilepsy, he should ignore the breath holding.

We are beginning to recognize that amusement . . . is a commodity as essential to the physical and mental health and well-being of the human animal as lumber, wheat, oil, steel, or textiles.—Milton Sills.

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, St. Louis, Missouri, May 15 to 19, 1939. Olin West, M. D., Secretary, 535 North Dearborn Street, Chicago, Illinois.

California Medical Association, Hotel Del Monte, May 1 to 4, 1939. George H. Kress, M. D., Secretary, 450 Sutter Street, San Francisco.

Nevada Medical Association, Reno, September 22 and 23, 1939. Horace J. Brown, M. D., Secretary, P. O. Box 689, Reno, Nevada.

Medical Broadcasts *

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of May is as follows:

Thursday, May 4—KECA, 10:45 a. m., The Road of Health.
Saturday, May 6—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, May 11—KECA, 10:45 a. m., The Road of Health.

Thursday, May 25—KECA, 10:45 a. m., The Road of Health.
Saturday, May 27—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.

The American Congress on Obstetrics and Gynecology.—The first American Congress on Obstetrics and Gynecology is to be held in Cleveland, Ohio, from September 11-15, 1939. This important meeting comes at a crucial time in American Medicine. The problems associated with human reproduction have become of paramount importance, arousing the intense interest of the public and the profession. The meeting will provide the first opportunity for all the interested groups of workers to assemble together. Doctors, nurses, hospital administrators and public health workers will meet and discuss their mutual problems and correlate their many ideas. A large and representative attendance is necessary to assure the success of this meeting. Already more than 1,400 advance registrations have been received.

We are anxious to have your JOURNAL participate in the medical publicity so that the physicians of your state can be apprised of the coming meeting. We have already had the support of many local and national medical publications. We would appreciate your official editorial comment concerning the meetings. If you could carry a notice of the meeting on the cover of your JOURNAL or in a prominent place in your future numbers, it would help considerably in creating interest among your physicians. Dr. T. Henshaw Kelly, your State Chairman and his committee will be delighted to coöperate with you in every way. For information, address M. Edward Davis, M. D., Publicity Committee, The Annex, 650 Rush Street, Chicago, Illinois.

The American Dietetic Association. — The twenty-second annual meeting of the American Dietetic Association will be held at the Hotel Ambassador in Los Angeles, August 27 through the 31st, 1939.

Miss Mary Northrop, King's County Hospital, Seattle, Program Chairman, has already received acceptances from several well-known West Coast speakers.

Agnes Faye Morgan, Ph.D., of the University of California, will speak on "The Dietitian's Place in the Hospital Research Program"; Albert H. Rowe, M. D., Oakland, will speak on "Allergy"; E. Neige Todhunter, Ph.D., State College of Washington, will talk on "The Newer Knowledge of Vitamin C in Health and Diseases." For further information, address the American Dietetic Association, 185 North Wabash Avenue, Chicago, Illinois.

American Academy of Ophthalmology and Otolaryngology. — The forty-fourth annual convention of the American Academy of Ophthalmology and Otolaryngology will be held in Chicago, October 8-13 at the Palmer House, a bulletin announces.

The academy has a membership of about 2,800 eye, ear, nose and throat specialists and the attendance at meetings is usually well over 2,000. It is said to be the largest organization of specialists in the United States.

About half the program is devoted to formal addresses, but fully half the week's activities consist of "instructional courses," in which the doctors go to school in earnest, with hundreds of eminent specialists as their instructors.

Dr. George M. Coates, Philadelphia, is president this year and Dr. Albert C. Snell, Rochester, New York, is president-elect. For information, address 1500 Medical Arts Building, Omaha, Nebraska.

1938 Said to Be Record Health Year.—The year 1938 is expected to establish an all-time record for low death rates from all causes in the United States, and particularly for tuberculosis, typhoid, diphtheria and infant mortality. This is set forth in a statement issued by the University of California Curricula in Public Health, prepared by Dr. Haven Emerson of the De Lamar Institute of Public Health of Columbia University.

"We are now in fact the possessors of better general health, are less afflicted with diseases known to be preventable, are more secure in the survival and growth of our offspring to maturity and have an average expectancy of life greater than that of any population group in the history of man," the statement said.

The statement suggests that the United States should further put its health house in order "by following the example of Canada and England and a score of other nations in consolidating all of their health services under one department, with a secretary for health in the national cabinet."

State and local health departments "are weary and bewildered by the duplicating and often conflicting proposals of unrelated bureaus and boards of Federal Government, each with ideas, standards and money grants with strings attached for health improvement," the statement said.

"That some people who need medical attention do not receive it will always be true, but the reasons for this are not all due to the inability of these sick to pay for the cost of necessary treatment. It may result from ignorance, superstitions and misinformation," the statement said.

---

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

American Association of Industrial Physicians and Surgeons. — The twenty-fourth annual meeting of the American Association of Industrial Physicians and Surgeons with the American Conference on Occupational Diseases and Industrial Hygiene will be held at the Hotel Statler, Cleveland, Ohio, June 5, 6, 7, and 8, 1939. A program of timely interest and importance will be presented by speakers of outstanding experience in all of the medical and engineering problems involved in industrial health. A cordial invitation is extended to all whose interests bring them in contact with these problems. Information regarding hotel accommodations, etc., may be obtained from A. G. Park, Convention Manager, 540 North Michigan Avenue, Chicago.

Shock Therapy of Benefit But Needs Research.—The development of "shock" therapy for mental disorders is not at present the unbounded success that it has been called in some quarters, although it holds considerable promise and merits the continuation of active research. This is stated by Dr. Nolan D. C. Lewis, director of the New York Psychiatric Hospital, who visited here to advise with the University of California administration in the possible reorganization of the psychiatric services of the University's medical school here.

The use of insulin and the drug metrozol, an ally of camphor, as a therapeutic "shock" source in certain mental diseases has been found of benefit, Doctor Lewis said. However, it is necessary to confine the treatment to certain types of diseases and certain selected patients within these types, and extreme skill is necessary in both the selection of the patients and the administration of either drug, if untoward effects are to be avoided. When such care has been exercised the treatment may effect cures in 60 per cent of the cases treated.

The increase in mental patients has been rapid in the past few years for no exactly apparent reason, Doctor Lewis said. This increase has laid considerable new stress on the psychiatric and neurologic approach to disease in hospitals and has occasioned many new problems for the medical profession.

"We cannot lay this increase to economic unrest and the stresses and strains of life solely," Doctor Lewis said. "The average individual is being bombarded with new experiences and impressions which force him to live a lifetime in a few years. These developments are coming along apparently faster than the delicately balanced and highly organized human nervous system can handle them. It cannot properly integrate them in many instances apparently, and a breakdown follows.

"If the damage has not been too great, rest and a reversal of the former mode of life may be beneficial. Shock therapy is being tried in the more advanced cases with the results noted."

Endocrine Glands Subject of Special Course.—The human endocrine glands, sometimes called "the glands of personality," little masses of cells, controlling the emotions, love and sex, but which may also cause gigantism, dwarfism and other abnormalities, were made the subject of a recent short course for practicing physicians at the University of California Medical Center. The course was decided on in order to give the profession at large new information concerning these glands which has been developed in laboratories and research institutions in the last several months.

The glands are scattered throughout the body. From the blood these little masses of tissue abstract chemicals and transform them into secretions known as hormones. These hormones are poured back into the blood and the glands which produce them are therefore sometimes called glands of internal secretion. The thyroid gland largely governs the rate and completeness with which the oxygen we breathe unites with and burns up foodstuffs. The parathyroids and the adrenals govern, in part at least, the absorption and use of minerals in bones and other tissues. The gonads give the powers and evidences of femininity and masculinity. Parts of the pancreas guide the storage and burning up of sugar in the body. The pituitary, the most complicated of all glands, has been called the "master gland," for its hormones seem to be needed by the other glands if they are to function in a healthy manner. The pituitary has a powerful influence over growth.

The remarkable progress that has been made in the study of endocrine gland function, and the treatment of gland disturbances in the past few years were thoroughly reviewed in the course. The necessity of having a trained physician prescribe glandular extracts was stressed.—University of California Clip Sheet.

Press Clippings.—Some news items from the daily press on matters related to medical practice, follow:

Olson Backs Health Plan

Governor Olson last night devoted his regular Sunday night broadcast to a plea for the proposed compulsory state health insurance law—a measure which would burden California pay rolls with additional levies on both employer and employee.

The Governor pointed out the service would apply to all workers earning up to $3,000 annually and would be financed by a 1 per cent contribution from each worker's salary, plus contributions up to 2 per cent from employers.

He characterized the plan as "a central policy of my administration" and interpreted it as an economy measure in as much as it "will reduce the cost of relief by reducing sickness that finally makes wage earners destitute."—San Francisco *Examiner,* April 10.

* * *

Health Insurance

In his talk broadcast Sunday, Governor Olson said his health program to be financed by a pay roll tax should be adopted because there is need of better health protection. There are many pressing needs, among them modern prisons to take the place of prisons making first offenders habitual criminals, provide hospital facilities for the insane, adequate aid to the blind and crippled to enable them to be self supporting. Yet they must be postponed because no government can satisfy all social needs.

The New Deal tried to do it, with the result tax burdens have become so heavy they exceed the capacity of industry to carry them. Measures designed to aid the ill-nourished, ill-clad and ill-housed, have made their condition worse because they reduced employment in private industry.

The most important welfare interest in California is restoring employment. Taxes are already so high many employers are compelled to reduce their employees to keep out of the red. Another pay roll tax for health would swell the ranks of the unemployed.

The people now have a health service equal to the best in the world. A voluntary group insurance program is being worked out to improve it. Assuming Governor Olson's health program to be desirable, it should be postponed until a sound recovery is achieved.—San Jose *Mercury-Herald,* April 11.

* * *

Health Laws Urged

Olson Upholds Insurance Bills

Examiner Bureau, Sacramento, April 13.—Governor Culbert L. Olson today sent to the Legislature a strong recommendation for passage of two compulsory health insurance bills, drafted by Labor's Non-Partisan League and incorporated in the administration's legislative program.

Arguing for the measure, which would be financed through new pay roll taxes, deductions from wage earners' checks and a general fund contribution from the state, Olson said:

"A fundamental change is needed in the method of meeting the costs of medical care and the risks and loss of sickness, especially for wage earners and others of small or moderate income."

Medical organizations have expressed opposition to Olson's proposal as opening the way for "state medicine," while considerable protest has been heard from small business men, complaining against added pay roll taxes. Department of Employment estimates have set the probable annual taxation cost of such a program at $81,000,000.—San Francisco *Examiner,* April 14.

* * *

Impossible Plan

Medicine, Politics Don't Mix

The compulsory health insurance plan now before the state Legislature is bad legislation.

The bill is badly drawn, vague and full of ambiguities. It mixes politics and medicine in a dose that would soon nauseate the recipients—all persons earning $3,000 a year or less.

It imposes thumping new pay roll taxes both on the worker and the employer. It adds these taxes to the pay roll taxes already imposed on worker and employer for social security and unemployment. In some cases the total pay roll taxes would reach 9 per cent, an impossible burden on labor and business, a sure way to multiply unemployment, thereby necessitating more and more taxes, world without end.

The bill creates a politically appointed "governing authority" and a political "medical director." It sets up an advisory board of three union labor representatives, two business representatives, one representative of California medical schools and one doctor. The advisory board is hokum, being without any real powers.

The politicians would run the show. They would run out all but political doctors. There would be no incentive to careful medical practice, but every incentive to political practice. The doctors with the most political pull would get the most business.

Finally, there is an alternative which deserves at least a trial. The doctors themselves are about to offer a low-cost medical and hospital service, under a voluntary insurance plan, to the same group affected by the compulsory insurance bill.

Let us give the doctors a chance to demonstrate their plan before we burden industry—employer and employee alike—with a new load of taxes and tax-eaters.—Editorial, Los Angeles *Examiner,* April 8.

* * *

Compulsory Health Plan Can Wait

As well intentioned as it may be, this is no time to adopt a compulsory health insurance program for California, as strongly advocated by Governor Olson.

In the first place, the administration-backed measure, indorsed by the C. I. O. Labor's Nonpartisan League, calls for financing by a pay roll tax paid by employers and employees, plus state contributions.

There can be little enthusiasm among the workers for another deduction from their pay checks. At this particular time there are too many misgivings over the status of funds collected through an existing assessment. We refer to the recent intimation that money to pay state unemployment benefits will be exhausted by April 30 because the Federal Government has dissipated the pay roll tax collections and Congress has not made the appropriation to replenish them. With the money in this "trust fund" squandered, another pay roll tax levy must be viewed with disapproval.

Aside from the fact that another pay roll tax for health insurance might force many employers to reduce their employee rolls and create more idleness and hardship, the workers look askance at forced deductions from their pay checks. They dislike the precedent it sets. They fear further levies of the kind. Also the idea of compulsory this and that is becoming increasingly repugnant to Californians and Americans, regardless of the good intentions of those who would saddle them with compulsions.

Furthermore, a voluntary plan of health insurance and medical care is being formulated by the California Medical Association. The Association should be afforded an opportunity to show what it can offer before the state goes into the medical business. Medical circles may not be free from politics, but their brand is infinitely to be preferred to control by politicians in Sacramento. If the medicos' voluntary plan fails to receive support, there will be time enough to consider compulsion. And that time should be in a period when the state can better afford costly experiments than in the hard-pressed present.—Stockton *Record,* April 12.

* * *

An Editor's Viewpoint

What could be more suspicious than legislation, ambiguous in its wording and for the politician rather than for the people in its inception?

What could be more unfair to the great majority of citizens than legislation which demands donations from the class of $3,000-and-less-a-year workers, the same group which already contributes, out of its pay checks, for social security and unemployment insurance, money badly needed, in many instances, for the primary necessities of day by day existence?

What could be more staggering than legislation providing for a tax which, when added to the already existing wage slices, would raise the total pay roll tax rate to nine per cent?

What could be more illogical than legislation which, actually necessitating medically trained administration, would be handled instead by diamond stickpin machine-bought politicians; or would, in effect, compel physicians to become politicians?

We answer our own questions when we urge the defeat of the compulsory health insurance bills, Senate Bill No. 1128 and Assembly Bill No. 2172.—Madera *News,* April 6.

* * *

Health Insurance

We think it is high time that St. Helenans think long and carefully about this matter of health insurance, which is certain to occupy the public attention in the immediate future. Some kind of socialized medicine is bound to come. The question before Californians is the what and how of its administration.

Pending before the Legislature are two bills, Senate Bill 1128, and Assembly Bill 2172, which provide for compulsory health insurance, paid for by additional taxation. Get this additional part clearly, for under the compulsory plan as proposed by the authors of the bills, pay roll taxes up to 9 per cent of the state's entire pay roll can be levied to keep it going, together with the other social security undertakings of the state.

Some 3 per cent alone, of the pay roll of the state, will be taken to operate the plan, and there is no assurance that much higher taxes will not be required, once the machine gets going. How can an overburdened business structure take on more deductions?

But the additional taxation feature of the compulsory state idea is not the worst part of the plan. Bad as that is, it cannot compare with the evils of a new machine set up in Sacramento to dictate to every person whose income is under $3,000. A new bureau added to all the other bureaus is just one more prop in the structure of state centralization whose encroachment our town, as well as most others, has steadily fought.

Such a state compulsory setup is bound, it cannot fail, to be ridden with politics. A glance at the headlines any day is proof that it would be a deplorable mistake to trust the lives and health of the great mass of our citizens to the tender mercies of politicians; the administration of state compulsory health insurance would soon reach the same low level as the present handling of other social welfare functions of the state government. And costs would mount steadily under a bureaucracy determined to keep itself in office and add to its powers. It just isn't in the cards for the state to handle such a setup efficiently.

Fortunately for the idea of low cost social medicine, there is another plan, a voluntary plan, but one which previous trials indicate would work. That is the plan now being perfected by the California Medical Association, and which will be introduced to Californians in the very near future. It avoids the evils of compulsory state machine control.

Under the Medical Association's proposal, persons with an income up to $3,000 annually would receive medical and hospital care for $2.50 per month. In other words, an insurance policy, for which you pay $2.50 monthly, entitles you to go to your own doctor, not one the state appoints for you, and receive medical attention, and hospitalization, if need be, at no further cost.

The plan is administered by a corporation set up by the physicians themselves, you pay the monthly premium to the corporation, and receive what medical hospital attention you need, and the corporation in turn pays your doctor and your hospital from the fund created by the premium payments of others. Based on long time surveys of medical costs in the United States, the plan is acclaimed as financially sound. It has worked on a small scale already.

It has the advantage of low cost adminisration by the physicians themselves, no high salaried politicians with the state's taxing power as a weapon can jack the administrative expenses to unworkable heights. Moreover, the figure quoted, $2.50, is for individuals, according to physicians who have been active in devising the plan, a lower rate for families or for groups is entirely possible and probable.

There is no doubt in our mind which is the preferable plan, and which will offer the best solution to the problem of reasonably priced medical and hospital service to the medium income brackets. Some form of group health insurance is bound to come for the great mass of the people who are not wealthy, yet who are not destitute but upon whom illness bears most heavily.

The choice between a forcible state plan with all the attendant evils of governmental administration, and a workable proposal by physicians themselves is obvious. As St. Helenans study the two plans submitted to Californians they will come to the same conclusion, and that is to bend every effort to defeat any state compulsory idea in order that the more practical voluntary physicians' plan may be given the right of way.—St. Helena *Star*, April 7.

Health Bills Will Be Aired by Committees

Legislative Battle Looms Over Compulsory Insurance Proposals

Sacramento, April 8.—Political maneuvering has started in the legislative battle over compulsory health insurance, with the first open skirmish expected at a joint senate-assembly committee hearing on the evening of April 19.

At that time the assembly committee on unemployment, headed by Assemblyman Fred Reaves of Los Angeles County, will consider A. B. 2172, sponsored by Assemblyman Rosenthal, an Olson administration floor leader, and fifteen other Democrats.

Senator John Phillips of Riverside County, chairman of the upper house committee on social security, pensions and relief, announced today his group will meet with the Reaves committee, by invitation, to listen to the pros and cons of health insurance.

Will Speed Action

Phillips said that if the assembly approves A. B. 2172, the senate committee plans to take it up for action April 27. Otherwise, the senate committee will take up a companion measure, S. B. 1128, by Senators John Shelley of San Francisco and Robert Kenny of Los Angeles.

"A great deal of opposition is developing against these compulsory health insurance proposals," said Senator Phillips, "especially from small business men who claim their operating costs would be increased materially by any such system."

That, judging from reports in other quarters, is the gist of the argument which will mark the anticipated legislative battle.

Olson Backs Move

Governor Culbert L. Olson is definitely committed to the policy of compulsory state health insurance and has told the Legislature so.

Business, or at least a large part of it, apparently is preparing for a determined fight to kill any such legislation. Its major contention is understood to be that employers, already making social security and unemployment insurance contributions, cannot carry any additional pay roll taxes.

Compulsory health insurance, as proposed in the senate and assembly bills set for hearing, would be financed by the contributions of workers and employers, based on pay rolls. . . .

The Shelley-Rosenthal bills call for a plan of compulsory health insurance integrated with the existing state system of unemployment insurance and designed to furnish medical and hospital service to low salaried workers. The bills also provide the same service, on a voluntary basis, for persons within certain age groups who are not eligible under the compulsory program.

Broad Program

The plan is broad enough to include general medical services, hospitalization, specialists' services, nursing, laboratory analyses, x-ray diagnosis, dental surgery and drugs and medicines among its benefits.

Maternity cash benefits are proposed for women wage earners whose annual compensation is not more than $3,000.

Fund contributions would begin, under these two identical bills, next January. Benefit payments would start in January, 1941.

Contributions of employees from their wages and employers from pay rolls are proposed, beginning next January as follows:

On monthly wages under $70—nothing from the workers; 2 per cent from the employer. On wages from $70 to $100—½ per cent from the worker; 1½ per cent from the employer. On wages from $100 to $200—1 per cent from the worker; 1½ per cent from the employer. On wages over $200—1½ per cent from the worker; 1 per cent from the employer.

State contributions would be made after July 1, 1941.

Must Register

Physicians and surgeons wishing to serve state insurance beneficiaries would register under the proposed code for that purpose.

The system would be administered by a bureau of medical service in the state department of employment.

The medical director in charge would be chosen by civil service methods, but would have to be a physician and surgeon with at least ten years of active practice. For the purpose of administration, the state would be divided in medical service districts, each district supervisor having at least five years of experience in medical practice.

A state bureau advisory council would consist of three representatives of labor, two representatives of employers, a physician and a representative of the state's medical schools.

Hit Appropriation

Adversaries of this program expressed elation a few days ago at assembly action for removal of a $200,000 item on health insurance from Governor Olson's budget.

Frankly committed to health insurance legislation, Olson included the $200,000 in his budget to cover initial expenses and open diagnostic laboratory centers.

Critics in the assembly insisted that the appropriation be taken out of the budget and considered later when the actual health insurance measures are taken up. They feared the budget item would commit the Legislature in advance on the controversial health proposition.

Among other pending proposals on various phases of the health insurance question are S. B. 551 and 548, Hollister, and A. B. 2494 and 2501, Garland.—Modesto *Bee and News Herald*, April 8.

* * *

State Health Insurance Program Attacked

Many drug stores will be transformed into soda fountains if the Olson-sponsored compulsory health insurance program becomes law.

That was told the San Francisco Optimist Club yesterday by Dr. Morton R. Gibbons, Jr. Active in civic circles, Doctor Gibbons explained the workings of both the voluntary health insurance plan of the medical association and the state system.

He asserted the Physicians' Health Service would not alter the "physician-patient relationship." The doctor also indicated a higher standard of medical service would be available under the voluntary plan.

The state system would supply drugs to the patient, in contrast to the voluntary plan, and "of necessity" would hurt the druggists, he said.

Doctor Gibbons stated any health program must solve three major problems:

1. The "severe" tragedy when illness strikes a family with an income of less than $2,000.
2. Fixed charges of hospital, laboratory involved in treatment of the patient.
3. Just compensation for reliable physicians, who have spent some $20,000 and eight years in preparing for their profession.

Don B. Wentworth, Optimist president, presided.—San Francisco *Chronicle*, April 13.

* * *

Trimming the Budget

The efforts of the state assembly to trim the Governor's budget resulted in a reduction of some $2,000,000 in the proposed appropriations exclusive of elimination of $500,000 pension increases, but that sum does not make much of a dent in a total of $557,000,000.

The $30,000,000 slash proposed by the minority report of the Ways and Means Committee is the program that needs adoption.

Removal of the $200,000 item for starting compulsory state health insurance, believed to kill this program for the session, is a bigger help than appears on the surface, however, since the sum proposed would merely start an extremely expensive program supported by back-breaking taxation.

Removal of the $73,000,000 relief appropriation from the bill does not itself cut the budget, since relief must then be provided in a separate bill, but it does give opportunity to slice the total and safeguard expenditures so the money will go for relief and not for experiments in state Communism.

A real cut in the budget is urgently necessary because of dropping state revenues. Tax collections are off considerably, including the sales tax receipts, and state indebtednes is soaring to new heights. The state controller says it will be $66,000,000 by July 1 and $85,000,000 by this time next year.

Also, the budget is not the whole story. Appropriation bills in the Legislature outside the budget are said to total $200,000,000. Public pressure must be exercised to prevent their passage.

California is a sound and solvent state, but there is no sense in endangering it by extravagance. The Legislature should do its duty and keep appropriations within proper bounds.—Los Angeles *Times*, April 13.

* * *

State Control of Hospitals

Senate Bill 1874, now under consideration at Sacramento, provides, "The State Department of Public Health is responsible for the control or administration of all public medical care activities . . . in the state."

This is one of those proposals designed to intrude further and further upon local control of local affairs, lodging all public authority and all public jobs in the Sacramento bureaucracies.

Theoretically, by placing every county and other public hospital under Department of Health jurisdiction, standards of practice and treatment would be raised, and, of course, it will be argued that state management would be "more efficient and economical."

We might, or might not, have better county hospitals if they were taken under the wing of the state. But it is extremely doubtful if the cost would be as little as it is now. The bureau would send its own doctors and nurses in. It would, as provided in paragraph E of Section 1 of the bill, "coöperate with counties in promoting expansion of necessary hospitals, clinics and other facilities"—which is throwing the door wide open for grandiose schemes that many little counties could not possibly afford.

The state will do well to place its own house in order before trying to supplant any more county functions and departments.

Government should be as close as possible to the people. Every citizen should be made to feel "The cost of this is coming from my own pocket." Everyone knows the attitude of people towards activities directed from Washington or Sacramento. At such a distance, the average citizen conceives of a governmental agency as a Santa Claus, not as a close neighbor whose every movement is known and understood. And Santa Claus is thought of as having a bottomless sack, filled with gold and blank checks.—Quincy *Feather Inn Bulletin*, April 6.

* * *

Medical Society Opposing Health Program of Olson

Sonoma County Medical Society last night unanimously opposed the Olson administration's compulsory health insurance program and endorsed the California Physicians' Service plan.

Preliminary steps were taken toward calling a joint meeting within a few weeks of professional and business groups in Santa Rosa to explain the reasons for such action, officials explained.

Dr. L. W. Hines, chairman of the society's Public Relations and Legislative Committee, presented his report before action was taken.

The nine contentions given by the society officers for opposing the administration's health insurance program follow:

1. Panel system under which each doctor is given a list of families who must go to him unless they move to another district.
2. No rate of pay per patient as the governing authority sets the fee schedules. The schedules may be changed any time by the authority.
3. Act control is under a governing board comprised of three men from leading labor groups, two representing employers, one from medical schools and one representing panel physicians.
4. Specialty services are not taken care of except in public diagnostic centers by state salaried specialists not conveniently located for all localities.
5. Provides group units of licensed physician (a doctor and staff of low salary men may furnish all kinds of services and be paid special rates).
6. Pay roll deductions probably do not cover cost of adequate medical service in hospitalization as such covers an employee and all dependents.
7. No definition of general practitioner's services. Doctors are paid by the number of names on his files, not by services.
8. Risk from insurance system is placed on the doctor loaded beyond capacity to render sound, qualified medical care.
9. Medical care is placed in the department of employment.

The action of the society was taken against Assembly Bill 2172, Senate Bill 1158 and a measure 551.

The association also went on record opposing the county hospital bill 2499.

The organization voted itself unanimously in accord with the health service plan of the California Medical Association.

D. C. Oakleaf, president, presided at the meeting in the Occidental Hotel.—Santa Rosa *Republican*, April 1.

* * *

Health Agreement Ready for Signing

Final steps for signing of agreements with three nonprofit hospital associations were taken today by officials of the California Physicians' Service.

Actual completion of the agreements, expected within a week, will signalize start of the signing by the physicians' service of groups of patient members.

The hospital groups which already have agreed to coöperate with the physicians' service are the Insurance Association of Approved Hospitals, in San Francisco and Bay area; Intercoast Hospitalization Insurance Association, headquarters at Sacramento, and Associated Hospital Service of Southern California.

Represent 80 Per Cent

They represent 80 per cent of the state's hospitals, with the exception of government institutions and hospitals which do not provide full service, physicians' service officials estimated.

Cost of the rival health plan, Governor Olson's compulsory health insurance program, meanwhile, was estimated at $81,000,000 annually as bills which would launch the state service awaited legislative action.

The estimate was made by the State Department of Employment, which reported $19,677,000 would have to be raised by taxation of employees' salaries, $29,998,500 through additional taxes on employers and $10,000,000 through classification of workers not now affected.—San Francisco *Call-Bulletin*, April 13.

* * *

Hospitals Join Doctors' Group

Three Associations in California Sign Up for Service

San Francisco, April 12 (AP).—The California Physicians' Service, new agency of organized medicine designed to meet the demand for health insurance, today announced it has signed agreements with three large hospital associations.

The announcement said the agreement will make available for the new service about 80 per cent of the hospitals in California, excluding government-owned institutions and those not providing full hospital service.

The associations with which agreements were signed are the Intercoast Hospitalization Insurance Association of Sacramento, the Insurance Association of Approved Hospitals, a group in the Bay area, and the Associated Hospital Service of Southern California, which has the facilities of many institutions in that territory.

The announcement said about 4,700 physicians have signed up to give service. The association previously announced it planned to enlist all licensed physicians in the state, in order that its beneficiary members might have their individual choice of physicians.—Los Angeles *Times*, April 13.

* * *

U. S. P. H. S. Survey Starts; Schools to Be Included

Dr. Francis A. Carmelia, supervising surgeon in charge of the eleven western states for the United States Public Health Service, arrived here on Tuesday morning with three members of his special staff to start the survey of the San Mateo County Department of Public Health.

The survey, he announced, will include the schools. While school nurses are not part of the county department, he explained, the nursing service and physical sanitation of the schools are properly parts of the survey.

Doctor Carmelia met with County Executive Frederick Peterson, members of the board of supervisors, and members of the county board of health prior to taking over the U. S. P. H. S. offices in the service division building back of the court house.—Redwood City *Times Gazette*, April 7.

* * *

Osteopaths Protest Listing by Health Board

Osteopaths and chiropractors protested to the San Francisco Municipal Retiring Board last night against being placed on a panel separate from medical doctors in the city employees' health insurance system.

The Retirement Board took their protests under consideration. Representatives of the two nonmedical groups insisted upon being included in health service plan No. 1, which is now in operation, rather than a proposed special service plan.

The second plan, adopted by the Employees' Health Service Board, would segregate $1 per month from the $2.50 payments of members adhering to it to meet chiropractors' and osteopaths' bills. Fees would be the same as for medical doctors—$2.50 per office visit, $3.50 for home visits and $7.50 for a night visit.

The plan would include the unit rule, under which available funds could be divided among practitioners as far as they would go each month. The fee schedule must be approved by the Retirement Board before it can become effective.

It was brought out that 198 of the 12,000 members of the insurance system had signified a desire to have the services of other than medical doctors. Those electing to be under Plan Two would have the services in case of physicians and surgeons in case of hospitalization.

Attorney Newell J. Hooey, representing chiropractors, and Dr. W. W. Vanderburgh, for the osteopaths, demanded that employees have free choice of physicians, medical or otherwise.

"You cannot mix doctors of medicine and chiropractors," King declared, indicating the same observation went for osteopaths. "We are trying to meet this situation the best way we can."

Miss Murial S. Pettit, Balboa High School teacher, asked that city employees who wish the services of chiropractors and osteopaths be allowed to have them under the existing plan or that such members be allowed to withdraw.—San Francisco *Chronicle,* April 12.

Clubwomen Boo State Medicine Debate Speaker

Criticism of Doctors by Fresnan Proves Unpopular at Convention

Porterville (Tulare Co.), April 13.—Criticism of opponents of state medicine and particularly physicians opposed to such plans by Rev. J. Covington Coleman of Fresno at the convention of the San Joaquin Valley Federation of Women's Clubs here yesterday drew hisses and boos from the delegates.

Dr. Eliot Sorsky of Fresno, opposing state medicine, had charged the plan had failed in other countries.

Rev. Covington's sharp answer, in which he criticized doctors who "first looked at the pocketbooks of their patients," drew the hisses from a large number of the delegates. . . .

Doctor Sorsky opposed the Governor's plan as described by Mrs. Geballe. He said his arguments were based mainly on his study of socialized medicine in England and forty-five other European countries where different methods are in use. He said he did not believe statistics, however accurate, answered the problem. He asserted that if statistics are to be used, it should also be noted that in European countries, having socialized medicine, the death rate from tuberculosis and other diseases is double that in this country. . . .—Fresno *Bee and Republican,* April 13.

Health, Bond Bills Headed for Defeat

Action on Compulsory Medical Insurance Postponed by Committee; Four-Hour Hearing Held; Sheriff Murphy, Rowell, Doctor Armstrong Argue in Favor of Measure

Sacramento, April 20.—Two major points in the program of Governor Olson—compulsory health insurance and revenue bonds—today appeared headed for defeat in the Legislature in the wake of committee hearings.

Coming as a surprise move, the assembly's unemployment committee last night postponed action on the compulsory health insurance bill until next Tuesday, after a four-hour hearing in which proponents and opponents aired their views and received applause from crowded galleries.

Most of the arguments advanced by both sides were familiar ones—advocates of the bill contending it would benefit wage earners and medical men alike and would be a tremendous step forward; opponents insisting it smacked of dictatorship and would, by its tax phases, drive pay rolls out of California.

Among those who advocated the bill were Sheriff Dan Murphy of San Francisco, Chester Rowell and Dr. Barbara N. Armstrong. Opposition speakers included Dr. Sanford M. Moose of the California Dental Association, Dr. Samuel Ayres of Los Angeles and George W. Kemper of the Association of Accident and Health Clubs.

Prospects Are Dim

The committee is 5 to 2 in favor of the administration, and postponement of favorable action on the measure came as a surprise. However, this isn't expected to affect the eventual action of the committee. It undoubtedly will recommend the bill, but there is every indication the measure will be killed once it reaches the floor.

The senate committee, which sat in on last night's hearing, is opposed to the plan, and from all indications, won't even report out a companion measure to the senate. . . .—San Francisco *News,* April 20.

* * *

California Health Bill Is Snagged

Liberal Leaders Admit Measure Cannot Pass

Sacramento, April 10.—In spite of radio pleas on the subject by Governor Culbert L. Olson, liberal leaders in the State Capitol admitted today they had virtually abandoned hope of passing any compulsory health insurance act through this session of the Legislature.

What hope they had held since the administration was forced to agree to take a $200,000 health insurance appropriation out of the budget went glimmering with a ruling from Legislative Counsel Fred B. Wood, who said:

"Any bill making an appropriation passed after the budget bill will be ineffective unless it receives a two-thirds vote, regardless of the number of votes the budget bill itself receives."

Take Out Item

Yielding to a vigorous Republican attack, Assemblyman Ben Rosenthal of Los Angeles, chairman of the Ways and Means Committee and author of the budget bill, announced he would delete the $200,000 health insurance item.

This means that the money must be provided in the actual health insurance bill itself—and according to Wood's ruling under the Riley-Stewart 5 per cent limitation in increased expenditures must get a two-thirds vote of the elected membership of both houses.

Even the most ardent administration supporter today admitted small chance that the controversial compulsory health insurance could get a two-thirds vote, and it was known that Rosenthal was being urged by some to go back on his compromise and put up a fight to keep the item in the budget.

Whatever the fate of health insurance, the Legislature reconvened today after the week-end recess and administration leaders in the assembly pressed on with their fight to save the budget from complete emasculation.

Half Billion Budget

Democrats in the lower house went into session today after individual talks from the Governor, who told them all in no uncertain terms that he expected their support in the budget.

As a record-high half billion dollar budget came up as a special order of business again, however, Republican leaders in the assembly claimed to have enlisted enough support to push through many amendments.—Los Angeles *Herald and Express,* April 10.

* * *

Senate Would Adjourn May 5

Assembly, However, Has Deciding Voice on Resolution

Sacramento, April 13 (AP).—The California senate resolved today to adjourn its fifty-third session May 5. The resolution must be adopted by the assembly before it can become effective.

The senate voted, 26 to 8, in favor of the resolution, introduced by Senator Jerrold Seawell of Roseville, Republican whip.

Speaker Paul Peek of the assembly, chairman of the State Democratic Central Committee, said he sees no possibility of such early adjournment.

Most of the thousands of bills introduced into the Legislature are still awaiting action. The only major legislation enacted so far is the $16,000,000 emergency relief appropriation.

Senator J. C. Garrison, Modesto Democrat, suggested adjournment be set for May 25, and Senator Jesse Mayo, Angels Camp, Republican, commented the Legislature would not be through with its work until June 5.—Los Angeles *Times,* April 14.

* * *

Pre-Marriage Tests Spread

Chicago, April 9 (AP).—The Council of State Governments today reported that six states, Indiana, North Carolina, North and South Dakota, West Virginia and Colorado, have approved pre-marital blood test laws in current legislative sessions, bringing to sixteen the total of states with such measures. The Colorado bill, however, still lacks the Governor's signature. The new laws will become effective either this year or next.

Ten other states had previously enacted blood test laws—Connecticut, Illinois, Kentucky, Michigan, New Hampshire, New Jersey, New York, Oregon, Rhode Island and Wisconsin. Ten additional states ask certificates or affidavits from one or both marriage partners that they are free of venereal disease.—Los Angeles *Times,* April 10.

* * *

Los Angeles Medical Center to Seek Socialized Plan

Sacramento, April 25 (AP).—Establishment of a socialized medicine plan will be sought by the Los Angeles Medical Center, which had filed articles of incorporation with the secretary of state today.

Directors are Norman F. Sprague, Dain L. Tasker and Glenn B. Chadwick of Los Angeles.—San Francisco *Call-Bulletin,* April 25, 1939.

Re: Abos vs. Martyn, D.C.

To the Editor:—We enclose herewith a clipping from the Los Angeles Journal, April 14, 1939, which we think is worthy of reproduction *in full* in California and Western Medicine.

Therein is related that a boy, who subsequently was shown by autopsy to have been suffering from "tuberculosis of the meninges of the brain, or coverings of the brain," was assertedly treated by ———, an advertising chiropractor, who took x-rays and told the parents that the second x-ray showed that the boy's third vertebra was misplaced and that he needed chiropractic adjustments, whereafter Chiropractor ——— assertedly administered several chiropractic adjustments. The boy grew progressively worse and finally died.

The comments made by Harry Graham Balter of the Los Angeles Bar, author of the enclosed article, are very pertinent, particularly his comment on the "apparent inability of society to protect itself from untrained or careless persons who attempt to heal beyond the scope of their training and experience," and his further suggestion that California is unique in its failure to adopt educational safeguards (long urged by you) for adequate training of the nonmedical practitioner in the basic sciences.

The author closes his article with the sentence: "Perhaps the stilled voice of little Leopold Abos will attract powerful social advocacy to right this tragic social danger."

Very truly yours,
C. B. Pinkham, M.D.,
Secretary-Treasurer.

* * *

Case of the Week*

Chiropractors—Malpractice—Wherein a tragic case is presented which should galvanize society into action—but probably won't.

There are probably more doctors per potential patient in this area than anywhere else in the country. Not only do we have the most motley assortment of patients, but as well the choicest collection of practitioners and "doctors" of "off" varieties.

I realize how dangerous it is for one to level criticism at the chiropractor, osteopath, neuropath, and the rest. But when you are presented with a situation such as the Second Appellate District, Division One, dealt with in the case of *Abos* vs. *Martyn* (97 Cal. App. Dec. 26, decided March 27, 1939), how can one help but raise a voice of protest against the apparent inability of society to protect itself from untrained or careless persons who attempt to heal beyond the scope of their training and experience?

In that case the mother of a youngster, named Leopold Abos, noticed that he was "stooping a bit"; the boy said it was painful for him to stand erect since a boy bumped him at school; at about December 1, 1932, the parents took the boy to the defendant, Dr. Clyde A. Martyn, an advertising chiropractor, who took x-rays and told the parents that the second x-ray showed that the boy's third vertebra was misplaced, and that he needed chiropractic adjustments; that Doctor Martyn said, "Don't treat him like a sick person, because he is not sick." Doctor Martyn administered five or six adjustments after which the boy developed fever; that the doctor had the boy put to bed, advising a liquid diet because of his fever, and continued the adjustments regularly until about a week before the boy died, which took place in April, 1933. When the parents became alarmed, Doctor Martyn told them, "No doctor could do more than what I am doing . . . the only thing the boy has is a certain pressure on the spinal cord, on account of the misplaced vertebra, and I am doing the best thing and nothing more could be done for the child."

To add to the tragedy, two or three weeks before the child's death, Doctor Martyn advised the parents that, in his opinion, the vertebra was practically in place and that the child's illness would soon be over. On further questioning at the trial, Doctor Martyn had this to say:

"Q. Did you make any diagnosis of his condition at that time?

"A. In chiropractic, we don't use the term 'diagnosis.' I take it that you want to know if I placed a name on his condition?

"Q. Yes. I want to know if you came to a conclusion?

"A. Yes, I came to a conclusion, but in chiropractic we term it 'analysis,' instead of 'diagnosis.' . . . My analysis was that he had a subluxation of the second cervical vertebra, causing an impingement of the nerves at that point. . . .

"Q. Well, was that an impingement of the nerves or of the cord?

"A. Well, it might have been from both. It was apparent from his condition that there was inflammation of the cord. The inflammation might have been from pressure on the spinal nerves or upon the cord itself.

"Q. So, it was your finding and your conclusion that at all times, from the time of your first treatment to the last, there was some inflammation and congestion of the spinal cord at the region of the cervical vertebra?

"A. Yes."

As a witness for the plaintiff, the autopsy surgeon testified that: "There was no evidence of spinal or other injury. . . . I had been informed that there was some spinal condition existing, and I therefore examined the spine to see if I could find any abnormality, which I did not find." The proper diagnosis, according to the autopsy surgeon, was "tuberculosis of the meninges of the brain, or coverings of the brain."

"Q. What is the medical effect of a chiropractic adjustment upon the cervical vcertebra—particularly the second cervical vertebra, when tuberculosis of the spine exists?

" . . .

"A. It would be detrimental, as rest and quiet would be absolutely indicated in those cases, and that would not pertain to rest and quiet.

"Q. Would it accelerate or increase, in your opinion, the inflammation existing?

" . . .

"A. It would."

Two medical doctors and a chiropractic doctor testified that if the boy's case had been properly diagnosed and had been given proper treatment at the outset he would have recovered.

The verdict of $10,000, based on malpractice, was sustained by the Appellate Court.

The significance of the case lies not in its enunciation of the familiar principles of law which are basic in a malpractice suit (for another recent case discussing these principles see: *Engelking* vs. *Carlson*, 97 C. D. 364, March 24, 1939), but in the dramatic presentation of a dangerous situation.

Must one be accused of being unfair to the nonmedical practitioner if he insists that the healing and treating activities of those not thoroughly trained in medicines and diagnosis must be restricted to administering only to the extent of the basic limitations of their training, and that if such limitation is not adhered to society should enact punitive measures to adequately protect itself?

---

VEGEX

BREWERS YEAST EXTRACT
B VITAMIN COMPLEX
EXTRINSIC FACTOR

SPECIAL PURPOSE FOOD for the VITAMIN B COMPLEX (including antineuritic B_1; riboflavin B_2; antipellagric G; complete vitamin B complex growth factor); the EXTRINSIC FACTOR and available FOOD IRON.

●

INGREDIENTS

A brewers' yeast extract from a salt-enzyme autolyzing process—see analysis—with added pure vegetable flavor and added available iron salt—ferrous malate.

As used, a teaspoonful to a cup of liquid, the salt concentration is less than in toast. The vegetable flavor is of possibly no physiological significance. Meat-like flavor, but entirely meat free. Starch and sugar free for restricted diets; easily borne by infants and patients on liquid diets.

VEGEX ANALYSIS

	Per Cent
Protein (N × 6.25)	32.6
Fat	0.8
Calories per ounce	40
Sodium Chloride	11.1
Phosphorus as P	2.62
Potassium as K	2.18
Calcium as Ca	0.098
Iron as Fe	0.048
Magnesium as Mg	0.13
Copper	0.00275
Manganese	Distinct Traces

B VITAMIN TEST

	Average per Gram
Sherman-Chase B_1	45 units
International B_1	25 units
Sherman-Bourquin riboflavin	35 plus units
B complex full growth	2 to 3 units

Mass clinical use indicates one man unit each anti-beriberi, anti-pellagric and extrinsic factor (anemias) per ounce.

●

Adequate nutrition requires the whole of the vitamin B complex. Vegex supplies it.

THE COMPLETE VITAMIN B COMPLEX

Based on Both Extensive Biological Tests and Mass Child and Man Clinical Use

MAY 15-19 1939
AMA
ST. LOUIS
VISIT US

There are more than two hundred favorable references to the use of Vegex for "vitamin B"—the vitamin B complex—in medical literature; alone, now fifty-seven in the field of the anemias.

The physician, in selecting a dependable B complex product high in B_1, B_2, the whole antipellagric G, and with the extrinsic factor (anemias), can turn to a product with a record of mass child and man clinical results.

A POTENT, NATURAL FOOD SOURCE OF THE ENTIRE B COMPLEX

With the division of the vitamin B complex into B_1, B_2, riboflavin, B_6, etc., there is as yet unsuccessful effort to build up a complete vitamin B complex out of these fractions. The whole "G," including its antipellagric factor and other factors of the vitamin B complex have not been separated and concentrated. The full effect of the larger B_1, riboflavin or other factor seems to be limited by the amount of the rest of the B complex present.

Vegex, the extract of autolyzed brewers' yeast, is a *natural* food source of the *complete* vitamin B complex. It is not a mixture of synthetic vitamins.

Dried brewers' yeast was found to be the richest source of "vitamin B"—the B complex. The B vitamins, proteins and minerals are contained within the tough little yeast cell which requires a high powered microscope to see. Autolyzing, or self-digestion with the yeasts' own enzymes, breaks open the cells and the contents are condensed into Vegex. Chemically and biologically like meat proteins, the yeast proteins take on a meat-like flavor.

MASS CHILD AND MAN TESTS

The relation of the vitamin B complex to mother and child feeding and to disorders due in part to vitamin B complex deficiencies were, to a large extent, pioneered with Vegex-Marmite.

Few, if any, products have had wider biological (pigeon and Albino rat) tests; few, if any, as wide child and man clinical test, under physicians and in the foremost of medical centers.

Research workers have definitely established the presence of a potent anti-anemic principle in Vegex. The extrinsic factor seems to be developed or freed, naturally, in the autolyzing process.

SIMPLE USES

The simple uses are (a) a scant teaspoonful to a cup of hot water, (b) one-half teaspoonful to a cup of hot milk and (c) in broth or soup. It may be given several times throughout the day and before retiring.

In the dilution in which Vegex is regularly consumed, that is, a scant teaspoonful to a cup of liquid, the salt content is less than that of toast.

Vegex and milk is one of the most ideal food combinations known in the science of nutrition, needing in human nutrition added vitamin C. The proteins of both are biologically complete. Vegex is high in phosphates, milk is high in lime. Vegex adds the B complex factors and iron in which milk is low. The dried whole milk adequately supplies vitamin A in the animal tests. It has been found that Vegex increases milk consumption.

Sherman uses two-thirds whole wheat to one-third whole milk in his longevity diet. Five per cent of Vegex with whole milk, in repeated animal tests, Vegex Laboratories, give the best growth producing, reproduction and rearing of the young diet that we have known. Applying this to human nutrition and based on the solids (4 ounces), this means one teaspoonful of Vegex (6 grams) to a quart of milk.

START RABIES TREATMENT

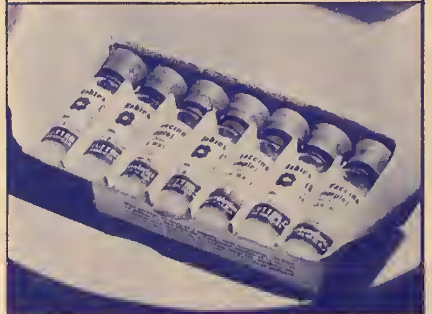
at once

without delaying for laboratory report

1 The biting animal should be held under observation, not killed. Death will ensue within 10 days if suffering from rabies.

2 If the disease is allowed to develop fully, chances for accurate diagnosis are greatly improved. Sever the head and ship to your state hygienic laboratory, preserved with dry ice.

3 The wound should be washed thoroughly—deep wounds opened up—and cauterized with *fuming* nitric acid (if necessary, administered under light anaesthetic).



4 Commence treatment at once according to the schedule indicated. Treatment started after the laboratory diagnosis proves positive may be too late.

Institution of rabies treatment after the delay incident to laboratory diagnosis is poor procedure, yet it is sometimes resorted to in order to spare the patient expense which may prove to have been unnecessary. With Cutter's Rabies Vaccine, in seven dose packages, treatment may be started at once. The cost will have been small if the diagnosis proves negative, for there will be few costly doses to throw away. However, if the diagnosis is positive, the physician can have greater confidence of a favorable outcome.

●

The following schedule will be found generally satisfactory, though modification may have to be made to suit individual cases. It will be safe, however, to make them in the direction of greater rather than lesser intensity.

Licks upon abraded surfaces. Superficial bites through clothing.	ONE DOSE EACH DAY FOR 14 DAYS.
Slight bites on neck or shoulders. Severe lacerated bites. Multiple bites. Bites on parts unprotected by clothing.	TWO DOSES EACH DAY FOR FIRST SEVEN DAYS AND ONE DOSE EACH DAY FOR THE NEXT SEVEN DAYS.
Head bites. Severe bites on neck or shoulders. Severe or multiple bites of hands.	TWO DOSES EACH DAY FOR 14 DAYS.

5 All injections should be given subcutaneously. Many clinicians prefer to make the injections in such areas as the abdominal wall, where the tissues are loose.

6 If the diagnosis proves negative few doses need be wasted. If positive, proper treatment instituted immediately may mean the difference between death and a favorable outcome.

If not stocked by local pharmacist have him wire

Subject: Report on an interesting California medical-legal case.

San Francisco, California,
April 7, 1939.

Re: *Tator* vs. *Pacific Employers Insurance Company,* (also known as *Pacific Employers Insurance Company* vs. *Industrial Accident Commission and Kenneth Tator.*)

To the Editor:—You will recall that in the above entitled action we appeared before the California Supreme Court on behalf of Drs. Quigley, Majors and Cary, who rendered professional services to Kenneth Tator, the injured employee. As previously reported to you, the California Supreme Court decided the case in favor of the injured employee and the doctors and against the Workmen's Compensation insurer. Also, as previously reported, the insurance company then appealed to the United States Supreme Court.

We are advised that on March 27, 1939, the United States Supreme Court affirmed the decision of the Supreme Court of California. We have not as yet been able to obtain a copy of the opinion of the United States Supreme Court, but the following item appearing in the San Francisco *Recorder* on March 28 sets forth the substance of the decision and a brief history of the litigation:

"Washington, March 27.—The Supreme Court of the United States, in a decision written by Justice Stone and announced this morning, affirmed the action of the Industrial Accident Commission of the State of California and the decision of the California Supreme Court in the case of *Pacific Employers Insurance Company* vs. the *Commission* and *Kenneth Tator.* The question involved was one of a conflict between the law of Massachusetts and the law of California, and the Supreme Court upheld the application of the California law.

* * *

"In 1935, Kenneth Tator, a chemical engineer, was sent by his employer, the Dewey & Alma Chemical Company, from its plant in Massachusetts to its plant in Oakland. On October 17, 1935, Tator received a serious injury to his hand while working at the Oakland plant. He filed an application with the Industrial Accident Commission seeking benefits under the California Compensation Act. The Pacific Employers Insurance Company carried the chemical company's compensation insurance in California, and the Hartford Accident & Indemnity Company carried such insurance in Massachusetts. The Pacific Employers contended the liability was that of the Hartford on this ground.

"The Massachusetts Compensation Act provides that one employed in Massachusetts elects to be governed by the Massachusetts Compensation Act for injuries no matter where sustained. The California Compensation Act provides that it governs over all injuries sustained in the State of California regardless of where the contract of employment is entered into.

"The Industrial Accident Commission held the Pacific Employers liable, and that insurance company appealed by writ of review to the California Supreme Court.

"Briefs were filed and the matter argued by Attorneys G. S. Keith and Frank J. Creede in behalf of Tator, and Everett A. Corten in behalf of the Industrial Accident Commission. An amicus curiae brief was filed by Hartley F. Peart and Howard Hassard in behalf of numerous California doctors who wished the action of the Industrial Accident Commission upheld on the ground that California doctors who treat injured men in this state should be able to seek payment of their bills here rather than go to some other jurisdiction.

"The California Supreme Court upheld the award in favor of Tator. The Pacific Employers Insurance Company thereupon obtained a writ of review in the United States Supreme Court. William H. Mullen argued the matter in Washington on behalf of Pacific Employers. Everett A. Corten and Frank J. Creede likewise argued the matter before the United States Supreme Court.

"The Supreme Court has now held that the California law is applicable and the liability is that of the Pacific Employers Insurance Company rather than the Hartford Accident & Indemnity Company."

The decision of the United States Supreme Court now settles once and for all the right of an employee to secure compensation in the state in which he is injured. It further settles the right of doctors who render services to such injured employees to be paid in the state in which they rendered services. This is of great importance to all physicians doing industrial work, because otherwise in many cases it would be necessary to proceed for compensation in distant places.

111 Sutter Street. Very truly yours,
Hartley F. Peart.

Subject: Enforcement of Medical Practice Act.

San Francisco, California,
April 8, 1939.

To the Editor:—We enclose herewith a report by Special Agent Williams dated April 7, 1939, which clearly sets forth the difficulties in enforcement of the Business and Professions Code relating to the practice of medicine.

We thought the information contained in the enclosed letter would be most illuminating for readers of California and Western Medicine.

Very truly yours,
C. B. Pinkham, M. D.,
Secretary-Treasurer.

Re: Henry Wong, Chinese Herbalist.

Dear Doctor Pinkham:

Supplementing my report of February 14, 1939, re: the above Chinese herbalist, whom I arrested in Salinas on March 24, 1939, on two counts of violating Section 2141 of the Business and Professions Code, I am giving you herewith the final disposition of the case.

On March 29, 1939, the above case went to trial before a jury and Harry J. King, Justice of the Peace, Salinas.

Following two days of testimony, most of which was produced on behalf of the prosecution the case went to the jury for deliberation at 5 p. m. on March 30, 1939, and after several hours' deliberation a verdict of not guilty was returned at 9:30 p. m. that day.

Four witnesses testified for the prosecution to the fact that Wong had represented himself as being a doctor; had examined and diagnosed their condition; prescribed and treated for same. Evidence was also produced and corroborated that Wong had used certain anatomy charts showing the cross section of the human organs in his diagnoses and had pointed to the ureters shown on one of said charts and called them prostate glands, telling the patient that they (prostate glands) were the cause of patient's condition.

Mr. ——— of Soledad, California, testified that several months ago he had gone to the defendant. Wong examined him and told him he had gonorrhea. He further testified that Wong treated him over a period of several weeks for which Wong charged $30 a week and that he paid Wong a total of $315 for said treatment.

B——— further testified that, prior to going to Wong, he had been examined by Doctor Chase of Soledad, and Doctor Chase had found no trace of a gonorrhea condition. After going to Wong for many weeks, he spent four days in the University of California Hospital in San Francisco, where urology specialists made thorough examinations and were unable to find any trace of gonorrhea, but that he had a bladder condition which was entirely divorced from a social disease.

B——— did not state as to why he happened to go to Wong in the first place, but did state that his reason for spending so much money with Wong was due to the latter's convincing argument.

The defendant then took the witness stand on his own behalf and virtually admitted everything of which he had been accused. The only part of the evidence against him that he denied was the part that showed he had felt the patient's pulse. He claimed to only shake hands. However, he admitted treating ——— for gonorrhea, prescribing and treating the other patient, who had testified and admitted that he had told the undersigned that his ureters were prostate glands which were infected and causing a serious condition.

At the end of Mr. Wong's testimony, the defense rested its case.

In addition to the testimony of four witnesses, all of which was corroborated by other witnesses and by stipulation, we had a large supply of evidence, which is included in the memorandum of evidence and testimony, produced at the trial, which is attached herewith and is too lengthy to include in another report.

Subsequent to arguments by counsel and instructions given by the judge, the case went to the jury and it was remarked by both the judge and the defense attorney that the jury would return a verdict of guilty. It was further stated by the judge that if they did not find the defendant guilty, it would not be because of lack of evidence, but because "they don't want to." The defense attorney said that the best he could hope for was a disagreement. However, I think we were all quite surprised at 9:30 that evening when the jury brought a verdict of not guilty.

Very truly yours,
Joseph W. Williams,
Assistant Special Agent.

Subject: Pacific Science Congress.

(copy)

National Research Council

Washington, D. C.,
April 3, 1939.

To the Editor:—It may be recalled that since 1920 there has been held in several countries of the Pacific region a series of Pacific Science Congresses of which the fifth was held in 1933 at Victoria and Vancouver, British Columbia, under the auspices of the National Research Council of Canada.

It has recently been determined to hold the sixth congress of this series in the United States of America in 1939, under the general auspices of the National Research Council, and I am happy, on behalf of the Council, to extend to the California Medical Association a cordial invitation to participate in the Congress by the appointment of a number of its members as representatives on this occasion. We shall be appreciative if you will let the Research Council know, when convenient, who these representatives are to be.

The Congress will take place in San Francisco and vicinity between the dates July 24 and August 12, 1939. Certain sessions of the Congress will be held in Pacific House of the Golden Gate International Exposition through the courtesy of the Exposition authorities. Other sessions of the Congress will be held on the grounds of Stanford University, near Palo Alto, and of the University of California at Berkeley, by courtesy of the authorities of these institutions.

Information concerning present plans for the Congress will be provided in advance announcements to be issued by the Council or by the Council's Committee on the Sixth Pacific Science Congress, of which Dean Charles B. Lipman of the University of California at Berkeley is the chairman.

We hope that word concerning the Congress can be given to the membership of the California Medical Association as widely as opportunity may afford, and that the interests of the Association in scientific problems of the Pacific region can be fully represented at the Congress both in the number of members who may attend and in contributions to the program.

2101 Constitution Avenue.

Sincerely yours,
Ross G. Harrison, *Chairman.*

Subject: Use of deceased licentiate's name.

San Francisco, California.
March 28, 1939.

To the Editor:—We thought perhaps the readers of the Journal might be interested in the enclosed opinion (NS1550), dated San Francisco, March 23, 1939, rendered by the Attorney-General, advising that the use of the name of a deceased licentiate is illegal.

Very truly yours,
C. B. Pinkham, M. D.,
Secretary-Treasurer.

* * *

(copy)

State of California
Legal Department

San Francisco, March 23, 1939.

Charles B. Pinkham, M. D.
Secreary-Treasurer
Board of Medical Examiners
San Francisco, California.

Dear Sir:

I have your communication asking whether, in the opinion of this office, a physician may legally use the name of a deceased physician and surgeon.

In reply, this office is of the view no person may use a name other than his own in connection with the announcement of or actual practice of medicine or surgery.

Section 2393 of the Business and Professions Code reads as follows and covers the question asked by you:

> The use of any fictitious name, or any name other than his own, by the holder of any certificate in any sign or advertisement in connection with his practice or in any advertisement or announcement of his practice constitutes unprofessional conduct within the meaning of this chapter.

In the case entitled *People* vs. *Wilkes*, 163, N. Y. S. 659, a licensed physician advertised under the designation "Russian Medical Help. First Consultation Free." The New York law prohibited persons from practicing or advertising to practice under a name other than their own, in much the same language as does our statute.

The Court indicated that the purpose of the statute was to "effect definite identification of the practitioner, so as to prevent injury by fixing responsibility, which may be accomplished by the restraining influence of publicity, as well as by the ready means furnished by subjecting an offender to punitive discipline," and held the law violated.

If the use of such a name in an advertisement in connection with the practice of medicine is improper, so certainly would be the use of the name of a deceased licentiate.

Very truly yours,
Earl Warren, *Attorney-General.*
By Lionel Browne (Signed), *Deputy.*

CALIFORNIA HEALTH RECORDS BROKEN IN 1938

Death rates for typhoid fever, tuberculosis and diphtheria were reduced measurably in 1938 and it would appear that these rates may be approaching an irreducible minimum. The control of typhoid fever constitutes a typical example of the results that may be achieved through the application of standard practical measures that make use of the principles of engineering, sanitation and preventive medicine. In 1906, 32 out of every 100,000 people living in California died of typhoid fever, and in 1938 the death rate was 0.83 per 100,000 population. While the most outstanding reductions in deaths from these diseases occurred prior to 1920, there have been marked decreases since that year. In 1920 the typhoid case rates was 32.8 and the death rate was 4.9, as compared with a case rate of 7.1 in 1938 and a death rate of 0.83.

Let it be remembered that California is dependent largely upon surface streams for public water supplies and surface streams are much more liable of pollution than underground sources. Great vigilance must be observed, therefore, in the protection of public water supplies taken from surface sources. The fact that California has achieved a typhoid rate, under the circumstances, that is comparable to similar rates in states where sources are found mostly in underground supplies, may be considered a matter of pride to state and local health organizations.

Public water supplies are adequately protected and outbreaks due to contaminated milk supplies seldom occur at this time. The custom of irrigating vegetables with water from contaminated sources has been eliminated. However, Mexicans and Orientals commonly drink water from open ditches and other polluted sources. Local health officers occasionally find typhoid carriers and measures are instituted promptly to prevent occurrence of cases of disease through contact with carriers. Group cases occur occasionally but not often. Most cases are sporadic.

The large body of efficient local health officers scattered throughout the state have been trained in their duties and are alert in their activities to prevent the occurrence of cases of this disease. Public water supplies are treated so as to prevent the occurrence of illness through any contingency of contamination that might occur. Safeguards are thrown up everywhere and with the present machinery running efficiently, it is unlikely that an epidemic of typhoid fever will occur anywhere except in the extreme rural districts.

The State Department of Public Health has led these activities through its sanitary engineering, sanitary inspection, and epidemiological functions. The Bureau of Sanitary Engineering, organized in 1915, approves of all plans for disposal of public sewage and for the provision of public water supplies. The Bureau of Sanitary Inspection directs many of its activities toward the protection of domestic water supplies and the abatement of faulty practices in domestic sewage disposal. The Bureau of Epidemiology assists local health officers in diagnosis, epidemiological investigations including detection of carriers and the control of cases of this disease.

Under state leadership, local health departments throughout the state have been instrumental in bringing about the conquest of this disease and they may well be proud of their achievements in practically ridding California of a preventable disease that occurred commonly twenty-five years ago. In the annals of the state's health history, no record is more outstanding than that of typhoid fever control.

DIPHTHERIA

The record in diphtheria control is almost as outstanding as that of typhoid fever control. In 1920 the state's diphtheria case rate was 164.1 per 100,000 population and the death rate was 12.8. In 1938 the diphtheria case rate was 24.3 and the death rate was 1.4. The decreases in the incidence and mortality from this disease have been steady throughout almost two decades, and the results achieved have come through the use of immunization procedures and extension of activities in public health education. More difficulties are encountered, naturally, in the control of a disease that is dependent upon the application of preventive measures upon the individual rather than upon the environment. Typhoid fever has been controlled largely through the correction of environmental conditions while diphtheria has been controlled through education and the application of immunization upon individuals.

In spite of the difficulties encountered, local health officers have been able to apply preventive measures, in their respective territories. The death rate of 1.4 per hundred thousand for this disease in 1938 indicates the efficiency of the program for the control of this disease and the thoroughness with which it is conducted. It was not so many years ago that diphtheria was the greatest scourge of childhood.

INFANT MORTALITY

Since 1920 the California infant mortality rate has been almost cut in half. In 1920 the rate was 75.0 per 1,000 live births and in 1938 the rate was 43.8. The Bureau of Child Hygiene of the California State Department of Public Health has been active in stimulating the adoption of routine procedures throughout California that would provide safeguards against needless deaths of infants. In some communities of the state, where social and racial conditions are particularly favorable, infant mortality rates have been achieved that compare favorably with those of any communities throughout the world. The large Mexican population of California, however, precludes the possibility of reducing the state's infant mortality rate greatly.

Bad sanitary and social conditions, as well as congenital disease, makes the achievement of successful campaigns in the reduction of Mexican infant mortality extremely difficult. Approximately 15 per cent of all births in California are among Mexicans and approximately one-third of infant deaths that occur in California are in Mexican babies. In the 1938 tabulation, excluding the Mexican infant deaths, the rate of infant mortality for all races in California was a little more than 30 per 1,000 live births. In consideration of the fact that, for biological reasons, a certain proportion of infant deaths cannot be prevented, it would seem that the state infant mortality rate is fast approaching a point of stabilization, if not an irreducible minimum. Stimulated by

Social Security funds, activities in local communities for the health protection of mothers and children have increased greatly during the past year. It must be remembered, however, that the infant mortality rate, to a large extent, is affected by conditions that are not under human control and that the annual general trend of the rate is similar throughout most of the country. The activities that are directed toward the saving of infant lives are productive of results, however, in spite of the fact that congenital defects play an important part in the production of high infant mortality rates.

SMALLPOX

In 1936 there were but 2.2 cases of smallpox per 100,000 population reported in California, while in 1920 there were 127.0 cases per 100,000 population. Since the method of prevention in the control of this disease is well known and has been practiced for decades, it is clear that the control of the disease depends entirely upon the thoroughness with which vaccination is applied.

In those communities where 50 per cent of the population is vaccinated against smallpox, the disease never becomes epidemic. The remarkable reductions in the prevalence of smallpox throughout California indicate the thoroughness with which public health measures are enforced by the health officers of California. In those counties where full-time health service is established, the general population has been offered vaccination freely.

In 1937 and 1938 the smallpox case rate has risen to 10.7 and 19.0 per 100,000 population, respectively. These increases are not due to any laxity upon the part of public health authorities in California but rather to the importation of cases into the state by migratory agricultural laborers and spread of the disease in local communities. Contacts with cases in the families of migrants have contracted the disease and the increased prevalence is due to this fact. Although many cases have been brought into the state during the past few years, the State Department of Health, assisted by local health officers, has kept smallpox under control and no serious outbreaks have occurred among migratory agricultural laborers or contacts with cases in migrants. Had the resident population of California not been vaccinated against smallpox, it is certain that through contact with these itinerant cases widespread epidemics of this disease might have occurred.

California's record in the control of typhoid, smallpox, tuberculosis, diphtheria and infant mortality is outstanding and compares favorably with similar results that have been achieved in states that have made far greater expenditures in the protection of their public health. The achievement of these records has been dependent upon the efficiency of organizations and individual workers rather than upon the expenditures of vast sums of money.

The California State Department of Public Health takes justifiable pride in the activities of local health officers, public health nurses, and members of its own staff in the prevention of the diseases and savings in human lives that have come about through these coördinated activities.

CALIFORNIA RATES

WAGNER NATIONAL HEALTH BILL: AN IMPRESSIVE MEASURE*

The Medical Society of the State of New York evidently does not think any too highly of Senator Wagner or of his so-called National Health Bill. Its *Journal of Medicine* says that, "with all due respect to the senior Senator from New York," it would characterize the bill as extremely amateurish, "did we not suspect that this veteran political strategist has purposely drawn it so vaguely that its passage through Congress would encounter the least amount of oppositional friction in its passage toward enactment." In addition to that, the publication thus speaks of the bill:

> It is wholly impractical, it is almost unworkable, it is certainly extremely vague, and absolutely unsuitable from our standpoint. If enacted into law, it will bring the medical profession into such difficulties that it will take decades to extricate ourselves from them. Particularly will it be difficult to evade the bureaucratic interpretations which must be made, perforce, because the bill is full of uncertain terms, and contains too many unprecedented tentative permissive clauses.

The journal's chief complaint against the measure is that the bill does not even meet the major proposals of the National Health Conference; that it makes no provision for the establishment of adequate medical standards; that it gives too much authority to state health officers; that it places the control of medical practice under the supervision of lay heads of political bureaus; that although there is "some vaguely outlined provision calling for the development and education of medical career officials," this may mean the "experimental set-up of an educational system" which ultimately will lead to "straight state medicine." It suggests that in any scheme for the coördination of local community needs care should be taken to keep it out of the hands of a "purely political group" that will never lose sight of the effect its decisions may have upon voters.

Whatever else may be said about the stand thus taken, the *Journal of Medicine* is certainly on firm ground when it argues that legislation of such importance should be precise in its terms. Imprecision in terms is, however, the hot-bed in which bureaucracy most flourishes. No better evidence of that can be found than in the story of another piece of legislation associated with Senator Wagner's name—the National Labor Relations Act.—New York *Sun,* April 4.

WAGNER HEALTH MEASURE CALLED HUGE POLITICAL BRIBE

New York, March 31 (AP).—Frank Gannett, Rochester, New York, publisher and chairman of the National Committee to Uphold Constitutional Government, today said the proposed Wagner national health bill was "in effect a huge bribe to install politically controlled medical service."

Gannett said the act, introduced in Congress recently by Senator Robert F. Wagner (D.), New York, would "have even more damaging results than his (Wagner's) NRA and National Labor Relations Act which have promoted strife in industry and delayed recovery."

The publisher said in a statement that the measure would "put the Federal Government far into the field of medical care from which it will never retreat."

DISEASE OF POLITICS

"Using federal and state funds," he said, "it will set up government hospitals and a vast system of tax-supported medical care that may, in the end, undermine and drive out of existence all private and church hospitals and the private practice of medicine.

"So humanitarian and praiseworthy are the objectives (of the act) that one must be brutally frank to point out that the diagnosis behind them is careless and inaccurate, that the prescription is wasteful and unscientific, and that the 'cure,' instead of achieving the desired result, would infect the practice of medicine with an almost fatal disease.

"That disease is politics.

SEEN AS HUGE BRIBE

"On the face of it, the Wagner Bill does not provide for compulsory health insurance. With almost insidious deft-ness it leaves such a matter to discretion of the states. They must decide whether to adopt insurance or set up a system of tax-supported state medicine; and if they fail to adopt a plan acceptable to the Federal Government, they must do without liberal tax money allotments from the Federal Government.

---

* Concerning Wagner Bill, see page 368.

"Thus in effect, the Wagner Bill is a huge bribe to install politically controlled medical service."—Los Angeles *Times*, April 1, 1939.

UNITED STATES DEBT FORTY BILLIONS AS "CEILING" NEAR

Washington, April 1 (AP).—The treasury's debt passed the 40,000 million dollars mark today, coming within 5,000 million dollars of the statutory limit.

Although the administration has considered increasing the legal debt ceiling to 50,000 million dollars, it has decided against asking Congress to make the change this year.

The debt, largest in the nation's history, now is equivalent to approximately $305 per person. A year ago, the $37,556,302,000 debt equaled $289.17 per capita.

Other milestones were the prewar low of $1,282,044,346, equal to $12.36; the high of World War financing, $25,478,592,113, equal to $250.18; the postwar low of $16,026,087,087, equal to $129.66, and the pre-Roosevelt point of $20,937,350,964 on March 3, 1933.

The debt has increased 2,850 million dollars in the last year alone.

Today's debt is a few millions over 40,000 million dollars because of the customary first-of-the-month borrowing of 50 million dollars from the old age reserve fund. The exact figure for today will not be available for a few days, however.

The treasury debt does not include the 5,400 million dollar obligations of governmental corporations which are guaranteed by the treasury but are excluded from the treasury indebtedness because of the assumption that the corporations will repay them. The guaranteed debts include: Home Owners Loan Corporation, 2,900 millions; Reconstruction Finance Corporation, 810 millions; Federal Farm Mortgage Corporation, 1,385 millions; Commodity Credit Corporation, 205 millions, and United States Housing Authority, 100 millions.

AVERAGE U. S. INCOME TOLD

Earnings of Typical American Family in 1938 Put at $2,116

New York, April 9 (AP).—The average effective buying income of the average American family in 1938 was $2,116, the magazine *Sales Management* said today in its tenth annual survey of buying power.

The average individual American had approximately $492 to spend last year, it added.

DECLINE ESTIMATED

The nation's estimated total income for 1938, at $63,274,609,000, was about 12 per cent less than in 1937, but half again above the acute 1932 depression low of $41,000,000,000, the publication said.

New York was first among states with a family average of $3,069; Nevada was second with $2,777, and California third with $2,733. Other leading states were Massachusetts $2,673, Rhode Island $2,601, New Jersey $2,587, Wyoming $2,584, Connecticut $2,560, Minnesota $2,440, Delaware $2,369, Maryland $2,362, and Washington $2,339.

DES MOINES LEADS

Of major cities, Des Moines was first with a per-family effective spending income of $3,778, followed by Washington, D. C., $3,767, Minneapolis $3,700, New York City $3,609 and Dallas $3,584. Ten next principal cities of the first 15, in order, were Houston, Davenport, St. Paul, St. Louis, Ft. Worth, Kansas City, Miami, Tulsa, San Francisco and Boston.

Thirty major cities in all exceeded the $3,000 mark for per family effective spending incomes.

SIGNIFICANT TO SOUTH

The average white family in the United States last year had $2,252, which was only $136 above the all-family average for the country, a fact of especial interest in southern states, the magazine reported.

In South Carolina, for example, where the average effective buying power of all families was estimated at $1,176, the average buying power of the white family stands at $1,590.

MORTALITY RATE AT ALL-TIME LOW

Observing the thirtieth anniversary of its health program started in 1909 for the benefit of millions of industrial policyholders, the Metropolitan Life today released figures to show some of the results accomplished during those three decades. The following are the highlights of the report:

Death rate among the policyholders dropped from 12.5 per 1,000 in 1911 to 7.7 per 1,000 in 1938, the lowest in their history.

The average length of life of the policyholders is fourteen years longer than it was thirty years ago, having advanced from 47 years to about 61 years.

Some phenomenal reductions in mortality from individual diseases that took place during this period are indicated by declines in their death rates per 100,000 policyholders.

Tuberculosis, from 224.6 to 46.9; influenza and pneumonia, from 131.1 to 58; typhoid fever, from 22.8 to .9; Bright's disease, from 95 to 53.2; accidents, from 77.4 to 48.3.—San Francisco *Call-Bulletin*, April 13.

SOCIAL SECURITY SURVEY REVEALS AVERAGE WAGE

Washington, April 9 (Exclusive).—Analysis of earnings made public today by the Social Security Board disclosed the average American wage for workers coming under the board's old-age security act as $890 annually. John J. Corson, director of old-age insurance, pointed out that wages in excess of $3,000 a year from one employer were not counted under the tabulation.

In a breakdown by states, California with $912, has the twelfth highest average wages per employee of any state.

CALIFORNIA STATISTICS

In California $1,860,464 employees covered by the act received $1,695,163,619 in reportable wages during 1937, the report showed.

The analysis showed that employees receiving less than $3,000 a year constitute 97 per cent of the total number of American earners covered in the survey and their earnings about 90 per cent of the total volume of wages.

Younger workers were found to be more numerous than those in the older-age groups, but the average wage earned by older workers was higher.

ELDER EARN MORE

"Fully 60 per cent of the 30,150,000 employees were between the ages of 20 and 40," the report stated. "Those between the ages of 40 and 60 amounted to only 20 per cent of the total, or less than half the younger group. But the average wage of the older group was $1,185, more than a third greater than the average wage of $860 received by the younger workers."

The average taxable wage of approximately 700,000 employees between the ages of 60 and 65 was $1,086, or almost double the average for some 5,700,000 employees between the ages of 20 and 25, the study showed. The age group showing the highest average wage—$1,204—was that from 45 to 50 years of age—constituting 8 per cent of the total number of employees studied.—Los Angeles *Times,* April 10.

CANCER CONTROL MONTH

With this as its slogan and in accordance with President Roosevelt's proclamation designating April as "Cancer Control Month" more than 600 women this week will take the field under the direction of Mrs. William H. Daniel, Southern California Commander for the Women's Field Army Division of the American Society for the Control of Cancer. The object of the drive will be to teach men and women that cancer is curable in its early stages and to urge preventive measures to reduce the annual cancer mortality of 150,000 in the United States.

More than 100 nurses under the supervision of Mrs. Cullen Ward Irish, lieutenant commander of the Women's Field Army, will be stationed in the drug stores throughout the southland to better acquaint the public with the early symptoms of cancer.

Members of the Women's Field Army led by Mrs. Daniel, through local committees and speakers will stress the fact that 70,000 people might have been saved from death by cancer last year if they had heeded certain early signs of cancer and had early treatment. These early cancer signs are enumerated as: any persistent lump or thickening especially in the breast; any irregular bleeding or discharge from any body openings; any sore that does not heal, particularly about the tongue, mouth or lips; persistent indigestion often accompanied by loss of weight; sudden changes in the form or rate of growth of a mole or wart.

As a part of the campaign to check the spread of cancer and to create a fund with which to fight the disease donations will be asked of the public. Seventy per cent of all monies received will be spent in the state wherein it was raised under the approval of the American Society of the Control of Cancer.

Members of the Southern California executive committee are Clarence G. Toland, past president of the State Medical Association, chairman; and C. R. Robinson, vice-president of the Bank of America, as treasurer; Dr. Hiram C. Weaver, director of the American Society for the Control of Cancer; Dr. William H. Daniel, president of the Los Angeles County Medical Association; Dr. E. Eric Larson, president of the Los Angeles Surgery Society; Dr. Alvin G. Foord, chief of Pathology at the Huntington Memorial Hospital in Pasadena; Dr. Henry J. Ullmann, chief of Radiology Department and Cancer Research, Cottage Hospital, Santa Barbara; Dr. Albert C. Sellery, former chief of staff at the Seaside Hospital, Long Beach; Dr. Orville N. Meland, and Dr. Hall G. Holder of San Diego.—Victorville *News-Herald,* April 7.

PREFERRED PROOFS OF AGE

There has never before been such a demand for proof of age as at the present time. The Veterans' Administration, Social Security Board, Railroad Retirement Board, Civil Service Commission and Department of State, all government agencies, have outlined their preferences in the types of evidence necessary to prove age in their respective departments. The United States Bureau of the Census, with the Social Security Board, has prepared a summary in three preference groups which is reproduced here for the benefit of the large numbers of individuals who demand this information from local registrars of vital statistics. It should be noted that in every department the certified copy of the birth record is given first preference. The birth certificate has become, without doubt, the most useful legal document of the average American citizen.

Demands for proof of age have shown a marked increase during the past few years, largely as a result of governmental requirements. This is especially true for the filing of claims for pensions and other benefits provided under social security legislation.

For proof of age, the most acceptable evidence is a certified copy of a birth certificate filed at the time of birth. A certificate placed on file at a later date, especially if filed at a time when there is a specific purpose for doing so, has comparatively little value as proof of the facts stated thereon. In such cases, other information must be presented. Original census records afford evidence acceptable to courts and other agencies but should be used only as a last resort.

The following summary divides the evidence of proof of age into three preference groups. Group 1, Types Given First Preference, includes only records made at the time of birth or very shortly thereafter. Group 2, Types Given Second Preference, includes records which are usually considered acceptable without corroboration, although evidence from two or more sources may be required if circumstances warrant. Group 3, Types Given Third Preference, includes records which usually require corroboration from two or more sources.

Department of State

(Passport Regulation)

Types Given First Preference

Certified copy of public record of birth.

Certified copy of church record of baptism, provided that these records were created within a short time after date of birth.

Types Given Second Preference

Affidavit of parent, physician, nurse, or midwife who attended birth.

Types Given Third Preference

Affidavit of a reputable person having sufficient knowledge to be able to testify as to the place and date of birth, incorporating briefly therein how and through what source the knowledge was acquired.

Social Security Board

Bureau of Old-Age Insurance

Types Given First Preference

Certified copy of public record of birth, or certified statement of date shown on such public record.

Certified copy of church record of infant baptism.

Sworn statement of two other persons having knowledge thereof.

Types Given Second Preference

Bible or family records.

Certified copies of excerpts from business, fraternal, school, governmental, or other similar records.

Data supplied by government agencies, as authorized.

Other documents (including insurance records and passports), or evidence deemed by board to be of probatory value acceptable to the board.

Types Given Third Preference

No type given.

Bureau of Public Assistance

Types Given First Preference

Accepted without investigation:

Certified copy of public record of birth.

Transcript of birth record.

Types Given Second Preference

Accepted without investigation, unless cororboration seems desirable:

Baptismal and parish records.

U. S. Census records.

Marriage records of applicant or his children.

Records of school, homestead, naturalization, voting registration, and court. Military records.

Immigration papers.

Passports. Poll tax exemption certificates.

Types Given Third Preference

Corroborated from two or more sources usually required:

Family register, town and county histories; records of hospital, midwife, employment, trade union, fraternal organization, tombstone, slave sale, and vaccination.

Bible records; Who's Who.

Fishing, hunting, and drivers' licenses; legal papers; insurance policies.

Railroad Retirement Board

Types Given First Preference

Certified copy of public or church record of birth.
Records of school, insurance, trade union, marriage, naturalization, vaccination, Bible, and family. Passports.
Employers' records.
Fraternal records.
Military records.
Immigration papers.

Types Given Second Preference

Last resort items:

Drivers' permits.
Voting registration records.
Game licenses.
Newspaper and magazine clippings.
Poll tax exemption certificates.
Affidavits.
Other documents considered equally or more reliable.

Types Given Third Preference

No type given.

Civil Service Commission

Types Given First Preference

Certified copy of public record of birth.
Certified copy of baptismal or other church record.
(Above records must be based on information filed at time of birth or shortly thereafter.)

Types Given Second Preference

Original or certified copy of family record was made at time of birth or shortly thereafter. This must be accompanied by affidavit of Notary Public.
Statement from attending physician based upon his professional record.
U. S. Census records showing earliest available record of age.

Types Given Third Preference

School records.
Naturalization papers.
Immigration records.

Types Given Third Preference

Bible or other family record of birth, certified as to date when made.
U. S. Census records.

American Medical Association Annual Reports Published.—According to the By-Laws of the American Medical Association, all reports of officers must be published one month in advance of the annual meeting. In *The Journal of the American Medical Association* for April 8 are published these reports. They give in retrospect the outstanding activities of the Association for the past year. The following is a list of some of the accomplishments named in these reports:

In 1934 there were 98,041 members and 60,714 Fellows. In 1938 these totals had grown to 109,435 and 68,478 respectively and on March 1, 1939, the official membership totaled 112,210 physicians and 69,468 Fellows.

Commenting on these figures in his report, Olin West, M. D., Secretary of the Association, says: "The figures here presented would seem to refute definitely statements emanating from various sources during these five years designed to indicate that there has been great disaffection in the ranks of the physicians of the United States and great diminution in the support of the profession generally for the established policies of the American Medical Association."

Total income in 1938 was larger than in 1937, but the increase in total expenditures was considerably larger than the increase in income, the Board of Trustees reports. Total expenditures were larger than income by the sum of $11,401.51.

The Fifteenth Edition of the American Medical Directory contains the names of 188,916 physicians of the United States and Canada. More than 13,000 new names appeared in this edition, while approximately 8,000 names which appeared in the Fourteenth Edition were dropped because of deaths.

A review of activities of the Council on Foods during 1938 emphasizes again the continued coöperation of members of the food industry. Few products have been accepted without requiring changes in nutritional claims on labels or in advertising and very few products have been rejected because producers were unwilling or unable to meet the requirements. In a study of the comparative value of the vitamin C potency of canned fruit juices it was found that accepted products compare favorably with fresh juices and rate as excellent sources of the antiscorbutic factor. The Council has prepared brief accounts of the principles which underlie the selection of an adequate diet, one such report having been published in the A. M. A. Interns' Manual. In coöperation with the Council on Pharmacy and Chemistry there was published in *The Journal* a series of noteworthy articles on the vitamins prepared by prominent investigators in the field.

Briefly, the important work of the Council on Physical Therapy for 1938 has been directed toward the consideration of radium and radon seeds, artificial limbs, audiometers, hearing aids, x-ray apparatus and the study of radio interference caused by electromedical equipment.

The interference of radio communications by electromedical equipment was one of the important subjects coming before the Council. A joint meeting was held at which members of the medical profession, representatives of the manufacturers of electromedical equipment, of radio manufacturers and of other interested bodies, and officials of the Federal Communications Commission were present.

The Advisory Committee on Advertising of Cosmetics and Soaps has continued to pass on preparations on which its advice has been requested. There is no doubt that a decided change has been noted in the advertising of many of the cosmetic firms, owing in large measure to the advent of the new Food, Drug and Cosmetic Act but in small measure also to the activities of this committee. The committee has been called on for advice from many sources. Although the committee has not published any articles over its name, it is pleased to report that many of the firms with which it has dealt have revised their literature completely and effectively.

The Bureau of Health Education during the year handled 5,474 communications from doctors, medical societies and coöperating agencies, 8,220 inquiries from the lay public and 1,145 pieces of radio audience mail. It broadcast thirty-seven dramatized radio programs in coöperation with the National Broadcasting Company. The radio library furnished scripts to 128 county medical societies and twenty-one state medical associations, distributing a total of 5,540 scripts covering 876 titles.

The Bureau of Medical Economics reports that medical societies in forty-five states and Washington, D. C., are participating in the study of medical care conducted by the American Medical Association under the direction of the Bureau. Already 416 county medical societies in thirty-six states with the coöperation of other agencies and organizations have completed a study of the need and supply of medical care in their communities. . . .

The Committee on Therapeutic Research, a standing committee of the Council on Pharmacy and Chemistry, which encourages scientific investigations in the field of therapeutics or treatment by providing funds for the prosecution of necessary research, reports that during 1938 it issued thirty-seven new grants.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XII, No. 5, May, 1914

From Some Editorial Notes:

The Santa Barbara Meeting.—The annual meeting of the State Society, held last month at Santa Barbara, was a distinctly successful one, and the attendance was rather larger than is usual for Santa Barbara meetings. . . .

The plan presented by the Council for handling the insurance situation (industrial accident), was adopted without the slightest change and, together with the fee bill which was endorsed, will be found on pages 196a, 196b, 196c.

* * *

Ideals.— . . . It is a commonplace observation that the men who are today being graduated from our medical schools come forth far better equipped for the practice of their art than were those mustered into its ranks some years ago. Thus premised, is it not to be deplored that the average medical practitioner is not a man of general culture, as we would have all members of a learned profession be? The world and its work was never better worth preparing for than now, for in science especially a new renaissance is arriving; the mysteries of natural law and human potency are being rapidly unveiled. The knighthood of the "Quest of Life" enrolls in the order of psychic and mechanical investigation and presses on to new accomplishment. Though neither wins the "Grail," each wins nearer to its laws. . . .

Education is to enjoy the best and know the best, as well as to produce the best. The degree of a learned profession should be something better than a meal check. It has been said, with some truth, that the allurements of Mammon are too often permitted to call our ingenuous youth from the proper business of school and college. Short roads tempt them to abandon the broad work of education and to go prematurely to schools of professional and technical instruction. The consequence is, the sending forth of half-educated men to plead the causes, to heal the diseases, and to lead the thinking of this generation.—J. Dennis Arnold.

* * *

The Fee (Industrial Insurance) Schedule.—In looking over and thinking about the fee schedule agreed upon and recommended by the Council of the State Society, there are a number of points to be taken into consideration:

It is not a schedule of flat fees for all cases.

It is a list of minimum fees appropriate for workmen earning not over $1,000 a year.

It does not cover everything; special cases need special consideration.

It is not put out as a contract to flat fees for which physicians must treat everybody injured.

The total amount received by our members per year will be very much more than what they get now.

Any member of the Society may be called in, if he wishes to do the work.

Any member has a chance to keep his patient and treat the injured one, if he wishes to do so, other things being equal.

It is especially understood and provided that unusual work shall receive adequate compensation.

It is essential that all bills be itemized and not "padded." Dressings used should be entered on the bill and a reasonable charge made for them.

All contracts to furnish medical services at wholesale are abolished.

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By Charles B. Pinkham, M.D.
Secretary-Treasurer

News

"Governor Culbert L. Olson has announced the reappointment of Dr. Frederick R. DeLappe of Modesto, Stanislaus County, as a member of the State Board of Medical Examiners. Other appointments include: Dr. Franklin Morris of Oakland as a member of the State Board of Chiropractic to succeed Dr. Roy Labouchotte of Redwood City, San Mateo County; Dr. Charles E. Hobrecht, San Francisco, to the State Board of Optometry, succeeding Dr. Geoffrey Davis of Sacramento; Dr. L. E. Pike of Long Beach to the State Board of Examiners in Veterinarian Medicine, succeeding L. G. Clark, and Mrs. Tillie Klob of Los Angeles to the State Board of Cosmetology, succeeding Mable C. Manzell." (Sacramento *Bee,* April 6, 1939.)

"Of 1,063 foreign physicians who took the state medical examinations in New York during 1937 and 1938, 622 were successful. The largest number of candidates (422) came from Germany, of whom 210 failed to pass. Austria furnished 112, of whom 35 failed. Of 488 graduates of New York medical schools, 5.5 per cent failed and of 285 from schools of other states, 24.9 per cent failed." (*Federation Bulletin,* March, 1939.)

"Dr. John R. Brinkley, who made a fortune from old men seeking the vitality of youth, was denied damages today by a federal jury which decided he was not libeled in Dr. Morris Fishbein's article challenging his abilities as a surgeon. He had asked $250,000 for 'the shame, humiliation and embarrassment' which he charged Fishbein's article caused. The verdict was for the defendant, and Brinkley, from his Little Rock, Arkansas, hospital, said his lawyers will file an appeal immediately. Fishbein's defense was that he wrote the article, published in the American Medical Association magazine, *Hygeia,* as a warning to the public. From the witness stand he reiterated every statement incorporated in it, declared each is 'based on fact.' Brinkley introduced a number of former patients, principally old men, who said he had aided them in their search for sexual revitalization. Brinkley, himself, testified that, while goat gland operations proved successful in the restoration of human vitality, he had long since discarded the technique in favor of 'better' methods." (Sacramento *Bee,* March 30, 1939.) (Previous entries, July, October, 1930; September, 1931; April, 1934; May, 1936.)

"After sixty days of figuring, the municipal employees Health Service System yesterday worked out a balance sheet for its January operation and revealed that doctors received $22,873.69 for service valued at twice that sum, even under the low rates set by the Health Service System. In announcing the 50 per cent reduction, system officials were 'so sorry.' They even expressed the hope that the deficiency might be made up 'some time in the future.' They based their admittedly slim hope on the possibility that the amount of illness among municipal employees would drop greatly during the summer months and thus permit the system to build up a surplus. Meanwhile, the medical director's office was attempting to determine whether a slash of doctors' fees for February service would be necessary. No estimates were available. With hospital and clinical fees totaling $8,923 paid 100 cents on the dollar, the doctors were

and particularly the fact that Colonel Robert H. Elliot of London, England—formerly of the Indian Medical Service, Superintendent of the Government Ophthalmic Hospital of Madras, and Professor of Ophthalmology in the Medical College, Madras, India—will be present as guest of the Society. Colonel Elliot will deliver an address and will demonstrate his operative methods, including his trephining operation for glaucoma.

Other well-known surgeons will be in attendance and a very successful meeting is assured. The officers and committees of the Society extend a cordial invitation to all ophthalmologists and oto-laryngologists to attend the Seattle session. The time is during the most beautiful part of the delightful summer season in the Puget Sound country.

The territory embraced by the membership of the Pacific Coast Oto-Ophthalmological Society includes the states west of the Rocky Mountains and British Columbia. At the last meeting, held in Portland, Oregon, in July, 1913, the program included a paper by Prof. Ernst Fuchs of Vienna. The meeting was most profitable and very enjoyable.

We beg to suggest that in the announcement you give due prominence to Colonel Elliot's coming, as this will undoubtedly interest many, both those who had the pleasure of seeing him during his recent visit to this country and those who were unable to see him.

Thanking you in advance for the courtesy, I am

Yours very truly,
Walter K. Seelye,
Chairman, Program Committee.

From "Deaths Following Injection of Neosalvarsan in Los Angeles."—Last week (the Journal, March 14, 1914, p. 861) we noted the deaths of seven patients in the Los Angeles County Hospital, following intraspinal injection of neosalvarsan. At that time we stated that a fuller report would be published later. We have since received by wire from our special correspondent the following statements from Dr. C. H. Whitman, superintendent of the hospital, and Dr. A. T. Charlton, pathologist, which embody the substance of a report made by them to the Los Angeles County Board of Supervisors: . . .

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 392)

given the $22,873.69 as payment on bills that were just twice that amount. Despite the reduction in the fee payments, the medical men were not given all the money available. The statement reveals a $301.47 'surplus' in the medical fund for the month. Administrative costs totaled $2.321.20 for the month. Included were personal service charges of $1,541.43, which include the salaries of Cameron, his staff, and Dr. W. P. Coffey. The fund showed an accumulated balance of $1,000.18 that may go to doctors to meet their unpaid charges after a year's operation. . . ." (San Francisco *Examiner*, April 5, 1939.)

"Mrs. Lena Mareck has 'beat' another illegal operation charge, Superior Court records disclosed yesterday. The 54-year-old woman. mother of a Folsom lifer, was freed by Superior Judge Alfred J. Fritz of a charge that she performed a fatal operation upon Mrs. Dolly Murray, twenty-one, last December 29. . . . Police had accused Mrs. Mareck after the girl, admitted to Peralta Hospital in Oakland, allegedly had given evidence that she underwent the operation at Mrs. Mareck's address, 819 Ocean Avenue (San Francisco). Mrs. Mareck first was accused

(Continued on Page 36)

HIS FIRST CEREAL FEEDING

The baby's first solid food always excites the parents interest. Will he cry? Will he spit it up? Will he try to swallow the spoon? Far more important than the child's "cute" reactions is the fact that figuratively and physiologically this little fellow is just beginning to eat like a man.

PABLUM is now being fed to infants as early as the third or fourth month because it gets the baby accustomed to taking food from a spoon, but, more important, Pablum early adds essential accessory food substances to the diet. Among these are vitamins B_1 and G and calcium and, equally essential, iron. Soon after a child is born its early store of iron rapidly diminishes and, as milk is poor in iron, the loss is not replenished by the usual bottle-formula. Pablum, therefore, fills a long-felt need, for it is so well tolerated that it can be fed even to the three-weeks'-old infant with pyloric stenosis, and yet is richer than fruits, eggs, meats, and vegetables in iron. Even more significant, Pablum has succeeded in raising the hemoglobin of infants in certain cases where an iron-rich vegetable failed. Pablum is an ideal "first solid food." *Mothers appreciate the convenience of Pablum as it needs no cooking. Even a tablespoonful can be prepared simply by adding milk or water of any temperature.*

Pablum consists of wheatmeal (farina), oatmeal, wheat embryo, cornmeal, beef bone, alfalfa leaf, brewers' yeast, sodium chloride, and reduced iron.

of performing an illegal operation in 1934. That same year she was named in a damage suit claiming she had posed as a doctor to perform an operation in another case. She was named in still another case January 17, but the other woman refused to sign a complaint, police said. . . ." (San Francisco *Examiner,* April 11, 1939.) (Previous entries, February, 1927, and November, 1934.)

"Dr. John E. Baker, former Hollywood police surgeon, was on parole yesterday from San Quentin prison. The surgeon said he will be a research chemist, but declined to explain where he will work. He was sentenced on November 6, 1937, for one to ten years after conviction of conspiring to defraud an insurance company through a fake accident ring." (Los Angeles *Times.* April 5, 1939.) (Previous entries, February, 1935.)

"The United States Circuit Court of Appeals today held that 'wire-tapped' intra-state telephone messages may be admitted in evidence in a decision affirming the conviction of two doctors, a lawyer, and an insurance agent on charges of fraud. The four were found guilty of defrauding insurance companies through the filing of fake disability claims. The decision was the first of its kind in this circuit dealing directly with intra-state messages, and an appeal was expected. The defendants, Dr. Maximilian Goldstein, Dr. George Krupp, Joseph J. Weiss, an attorney, and Martin Gross were convicted by a Federal Court jury March 7, 1938. Weiss and Gross were sentenced to terms of three years and the two doctors were sentenced to a year and a day each." (Associated Press dispatch dated New York, April 10, and printed in the San Francisco *Examiner,* April 11, 1939.)

"A prominent Wilshire district physician and a 35-year-old salesman were indicted by the Federal Grand Jury yesterday on charges of illegal sale of narcotics and conspiracy to violate the narcotics law. Named were Dr. R. W. Harris, fifty, who maintains a large suite of offices at 5410 Wilshire Boulevard, and Harry Cruye, salesman, of 930 Santee Street. . . . George Gyllenhammer, agent in charge of the federal narcotics division here, said Cruye allegedly obtained supplies of drugs from a mixture of opium and olive oil purchased from Doctor Harris." (Los Angeles *Herald and Express,* March 30, 1939.)

"A sentence of a $100 fine or thirty days in jail was imposed yesterday on Vern V. Anson, forty-eight, of San Francisco, accused of practicing medicine without a license. T. P. Hunter, State Board of Medical Examiners investigator who arrested Anson Friday night, told Municipal Judge Theresa Meikle that Anson claimed to treat 141 ailments, varying from itch to malaria, to a stiff neck, with diet and violet rays. Hunter said he had taken some ray 'treatments' from Anson and that his eyes were not protected from the light, with consequent temporary blindness. Anson had an office at 323 Geary Street and lived in a hotel at Jones and Eddy streets." (Oakland *Tribune,* March 26, 1939.)

"Karl J. Weberg, middle-aged chiropractor found guilty by a police court jury of violating medical laws, was sentenced to 180 days in jail, which was suspended, and ordered

to pay a $150 fine Saturday. The doctor was convicted of charges of possessing a hypodermic syringe and needle and advertising himself as a practitioner of naturopathy. . . . The charges of violating medical laws were filed against Weberg after he was acquitted in justice court a few months ago of performing illegal operations. Several years ago Weberg was acquitted of murder charges which were filed against him when a patient upon whom he was alleged to have performed an illegal operation died." (Pasadena *Independent,* March 20, 1939.) (Previous entries, July, August, and September, 1926; February, 1928; April, 1936.)

"Jackson L. Martin, Fresno, was fined a total of $1,000 when he appeared in Federal court here today on charges of income tax evasion. Judge Michael J. Roche fined Martin $200 on each of five counts and assessed an additional $12.50 for the cost of prosecution. The case alleged income tax evasion during the period 1932 to 1936. Martin told the court he had paid the collector of internal revenue $7,953 in taxes, $3,976 in penalties, and $1,800 in interest to cover the alleged evasions. . . ." (Fresno *Bee and Republican,* March 11, 1939.) (Previous entries, December, 1928; February and April, 1939.)

"Arrested for violation of state health laws as part of the drive now being carried on jointly by Dr. J. L. Pomeroy, Los Angeles County Health Officer, and the State Board of Pharmacy and State Health Department, David Hulbert (Hurlbert), age sixty-three, and Olive Hulbert (Hurlbert), age sixty-five, of 2059 Hillhurst, Los Angeles, were today at liberty on $1,000 bail each, pending their jury trial in municipal court March 24. The couple was specifically charged with diagnosing and treating tuberculosis patients without license, violation of the State Medical Practice Act, compounding medicine without permit, violation of state pharmacy laws and violation of the Itinerant Vendors' Act, which prohibits sale of medicine without license. They were also charged with petty larceny with the acceptance of a $25 down payment on a course of treatments for ten weeks at $25 per week. According to Jonathan Kirkpatrick, chief of the Division of Foods and Drugs, Los Angeles County Health Department, who, with Inspector Haydon Dowdy of the State Board of Pharmacy, has been investigating the case for the past two years, the couple has solicited business from advanced cases of tuberculosis and has charged from $350 to $2,000 for a ten months' treatment, promising complete cure. The treatment, it was reported, consisted of the use of coal oil and wintergreen on the chest, coal oil and menthol in the nose, and beef, iron and wine and nux vomica internally. Authorities in the campaign against tuberculosis have received numerous complaints of the operations of the pair, and many cases have been cited in the complaint. The Hulberts were trapped in the solicitation of a patient in Arcadia and then arrested Saturday in Los Angeles upon the acceptance of the $25 down payment and were lodged in Lincoln Heights jail last Saturday, where a few hours later they were released on $1,000 bail each. . . . In addition to the charges already made, another complaint will be filed by the county health department in Arcadia, charging the couple with selling mislabeled and misbranded drugs." (Monrovia *News-Post,* March 3, 1939.)

"A physician and surgeon is legally without authority to use the name of a deceased medical practitioner or use other names than his own in connection with the announcement or actual practice, Attorney-General Earl Warren ruled

yesterday in an opinion requested by Charles B. Pinkham, Secretary-Treasurer of the Board of Medical Examiners. The Attorney-General cited the Business and Professions Code, holding in part that the use of any fictitious name or any name other than his own by a holder of any certificate in advertising or any sign in connection with his practice constitutes unprofessional conduct. Adding weight to his opinion, the Attorney-General discussed a New York court opinion in which a licensed physician advertised under a designation other than his name. The New York law also prohibits such practice. The court in this opinion indicated the purpose of the statute was to 'effect definite identification of the practitioner' so as to prevent injury by fixing responsibility, which may be accomplished by the restraining influence of publicity, as well as by the ready means furnished by subjecting an offender to punitive discipline. 'If the use of such a name in an advertisement in connection with the practice of medicine is improper, so certainly would be the use of the name of a deceased licentiate,' the attorney said in conclusion." (San Francisco *Recorder*, March 25, 1939.)

"Maintenance of a chiropractic ward of fifty beds in the Los Angeles General Hospital is not looked upon with favor by the Hospital Advisory Committee. The committee was asked to study the request of chiropractors by the Board of Supervisors. . . ." (Hollywood *Citizen-News*, March 22, 1939.)

"Legal machinery to compel the Health Service Board of San Francisco to include chiropractic treatment in its service was put in motion yesterday when Lloyd H. Garrison, Chiropractor, and Muriel M. S. Pettit, teacher, brought suit in Superior Court, seeking a writ of mandate. The petition asks that provisions be made in the System for inclusion of the petitioner under Plan No. 1, which is now in operation. Recently members of the System voted against payment of an additional assessment which would finance services by chiropractors and osteopaths. . . ." (San Francisco *Recorder*, March 8, 1939.)

"Similarity of two bank watchman murders—here and in San Diego—offered today possible solution of the two-year-old search for the slayer of Joe Marenco, thirty-seven, janitor at a Haight-Fillmore branch bank. Arrest in San Diego of 'Dr.' Robert Perry, sixty, who confessed the murder of a bank watchman in that city, led local police to reopen the investigation of the slaying of Marenco in 1936 by a 'paper bag' masked bandit. . . . Perry, also known as William A. Wilson, alias D. C. Balfour, was wanted by San Francisco police on a morals charge, and by the State Medical Board on charges of posing as a doctor at the time of his arrest in the south. It was a teletype message to local police asking the charges against him which revealed the similarity in the two slayings. In both cases the slayer donned a paper-bag mask and awaited the arrival of bank employees after killing the watchman and taking his keys. Perry, according to his record in local police files, posed often as a physician and was arrested in Palo Alto May 10, 1930, for violation of the State Medical Practice Act. . . ." (San Francisco *Call-Bulletin*, March 17, 1939.) In the 1931 Annual Report of the Board of Medical Examiners was printed photograph, fingerprint classification, etc., of Robert Perry, then using the alias Donald C. Balfour and falsely claiming to be the well-known surgeon of the same name connected with the Mayo Clinic, Rochester, Minnesota.

For Acidity and Allied Conditions, we suggest ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

A Natural Mineral Water
SHOWING MAIN CONSTITUENTS
By Prof. Sydney A. Tibbetts, *Berkeley*

MANGANESE	1.3 parts per million
IRON	12.5 parts per million
CALCIUM	173.3 parts per million
MAGNESIA	339.3 parts per million
SODIUM	365.0 parts per million
SILICA	93.0 parts per million
CHLORINE	38.3 parts per million
SULPHATE	16.1 parts per million
NITRATE	0 parts per million
PHOSPHATE	.7 parts per million
CARBONATE	1551.4 parts per million
TOTAL	2591.4 parts per million

BOARD OF MEDICAL EXAMINERS

(Continued from Preceding Page)

"Dr. T. Maud Ramer, woman physician, today was free of abortion charges, having been acquitted in Superior Judge Edward J. Kelly's court by a jury of ten women and two men after about four hours' deliberation. Doctor Ramer was alleged to have performed an illegal operation on Mrs. Edith Ann Montieth, young housewife. The defendant brought testimony to show that the young woman had been operated upon two months before she treated her and that her administrations were in no way illegal. The woman physician wept audibly as the jury returned the verdict. The decision was the climax to a trial which lasted nearly three weeks." (San Diego *Tribune,* March 14, 1939.)

"A remedy that assertedly proved far more painful than the ailment provided the basis for a damage suit filed yesterday by an Oakland printer against an East Bay health institute and a staff doctor. Elmer H. Jernigan, forty, of 2125 Thirty-fifth Avenue, charged in his plea for $15,266 damages that J. E. Sivils prescribed a chiropractic treatment at the Basic Health Institute and 'manipulated his body with such force and violence' that he broke Jernigan's sixth rib." (San Francisco *Examiner,* March 23, 1939.)

"Superior Judge Peter J. Shields today refused to tell two Sacramento chiropractors just how far they could go legally beyond the ordinary practice of chiropractic without being arrested. The chiropractors, Percy Purviance and H. B. Clarke, filed a 'friendly suit' designed to force a court opinion setting the limits of the practice of chiropractic in California. 'What they want,' Judge Shields stated in an opinion, 'is to know just what may be done without danger of prosecution. This no court can tell them.' The opinion points out a chiropractor's license gives the holder permission to practice chiropractic 'as taught in chiropractic schools or colleges.' . . ." (Associated Press dispatch, dated Sacramento, March 17, and printed in the San Francisco *Chronicle,* March 18, 1939.) (Previous entries—Percy Purviance—December, 1925; January, February, June, July, September, October, 1926; February, 1927; March, April, July, September, 1928; June, 1932; May, June, and November. 1934; April, August, September, and November, 1935.)

Brain Infection by Fungous Parasite.—The first reported case of infection of the brain by coccidioides (a fungous parasite) in the vicinity of Tucson, Arizona, is described by B. P. Storts, M. D., Tucson, in *The Journal of the American Medical Association* for April 8.

The infection, which occurred in a girl of 4, presented symptoms resembling those of a brain tumor. They consisted of vomiting, headache, unsteady gait, nausea, staggering and pain in the legs.

An exploratory operation showed that a part of the brain, the cisterna magna, was covered by a white opaque membrane. This membrane blocked the passage of spinal fluid and caused a large cyst. The diagnosis was coccidioidal granuloma or tumor. However, the disease could not be checked and the child died. At autopsy it was seen that the membranous growth recurred at the base of the brain and adhered to the brain substance. Also a nodule, containing coccidioidal parasites, was found in the right lung.

The author wonders why this child should have had a coccidioidal infection. She had lived her entire life in Tucson, where the parasite is not generally found. It is of interest that her father maintains a cleaning and pressing establishment and the child frequently rode with him in the delivery wagon, using dirty clothes as a cushion. Parasitic diseases are said to be more common among people engaged in this type of work.

In the treatment of Pernicious Anemia
there are four major reasons
for the intensive use of—

1 cc. CONCENTRATED SOLUTION LIVER EXTRACT

[PARENTERAL]

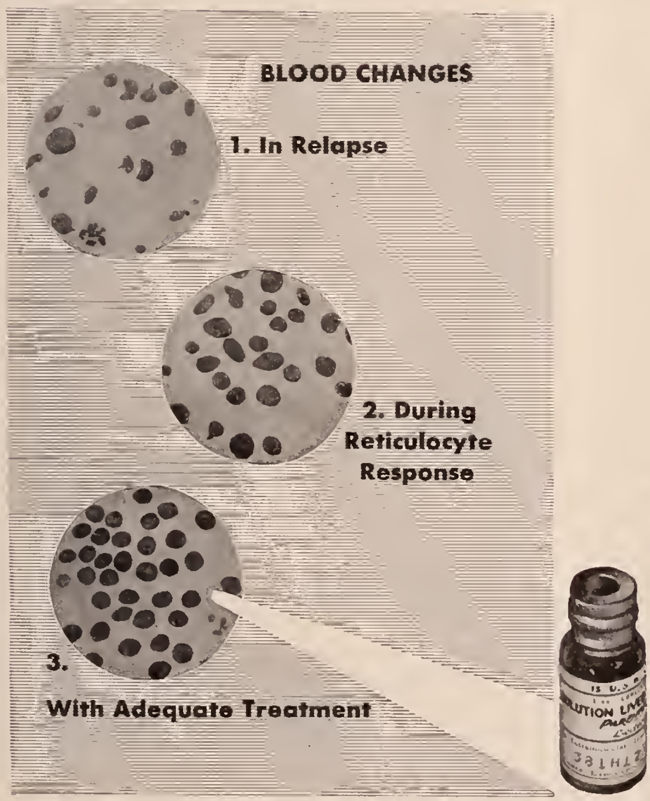
Lederle

1 "1 CC. CONCENTRATED SOLUTION LIVER EXTRACT PARENTERAL *Lederle*" provides sufficient active substance to meet unusual demands—due to colds and other infections, increased activity (mental or physical).

2 "1 CC. CONCENTRATED SOLUTION LIVER EXTRACT PARENTERAL *Lederle*" maintains the red blood cells and hemoglobin at normal levels—now generally considered the best insurance against the development of neurologic changes and for the arrest of those already present.

3 "1 CC. CONCENTRATED SOLUTION LIVER EXTRACT PARENTERAL *Lederle*" minimizes the discomforts of continuous therapy through the small volume and low concentration of solids but a high concentration of active material.

4 "1 CC. CONCENTRATED SOLUTION LIVER EXTRACT PARENTERAL *Lederle*" is economical to use because its potency (15 U.S.P. units per cc.) means that a minimum number of injections per year are required.



A Summary of the Maintenance Treatment of 31 Patients

An injection of one vial (1 cc.—15 U.S.P. units) of liver extract given intramuscularly at the intervals shown.

Number of patients	Period of maintenance WEEKS	Average Interval between injections WEEKS	Average final R.B.C. MILLIONS
10	26- 52	3.3	5.16
4	53-104	3.9	5.26
15	105-156	3.2	5.18
2	157-208	3.9	5.21

Reprinted from "The Use of Concentrated Liver Extracts in Pernicious Anemia" by William P. Murphy, M.D. and Isabel Howard, Jo. A.M.A., January 14, 1939, Vol. 112, pp. 106-110.

Lederle Laboratories made the first American commercial liver extract for parenteral use—introduced approximately eight years ago.

Sold only in packages of 3—1 cc. vials—15 U.S.P. units each.

Operating Room Irradiation Reduces Infection Risks. The killing of bacteria in the air in operating rooms by means of irradiation may prove to be an important addition to efforts for eliminating infections of wounds in clean primary incisions, *The Journal of the American Medical Association* for March 18 says in an editorial on "Sterilization of Air in Operating Room."

Pointing out that modern aseptic technic in the operating room has almost eliminated infection of wounds in clean cases, *The Journal* says, however, that the introduction of major surgical procedures involving exposure of large raw areas for a long time has again raised the problem of occasional infection.

"Recently," the editorial continues, "Deryl Hart, M.D., of the Duke University School of Medicine, has reported studies during the past five years of efforts to eliminate the occasional sporadic operating room infection. After carefully checking all possible sources of infection, Hart concludes that the least controlled source of infection was air-borne bacteria. Most of the infections were caused by Staphylococcus aureus-haemolyticus. The organisms entered the wound from the air rather than from the skin of the patient. The air was contaminated by operating room personnel and patients.

"The personnel of the operating room and the general population were found at times to have Staphylococcus aureus in the nose and throat in as high as 78 per cent of the cases. In every case of infection in which cultures of the air had been taken the organism cultured from the wound was identical with the one cultured from the air during the operation.

"The bacteriologic studies carried on daily convinced the author that the most important source of wound infection was not the bacteria present in the skin but the organisms eliminated from the noses and throats of the operating room personnel. The wearing of thick gauze masks was not apparently an adequate protection against this source of contamination. To eliminate this source the author turned to air irradiation.

"At the request of the author, a special radiant energy apparatus was designed and constructed which answers the requirements. An operating room was equipped with eight of these lamps, each 30 inches long. The author found that it was possible, with eight tubes operating, to kill a lightly sprayed culture of Staphylococcus aureus-haemolyticus on blood agar plates within sixty seconds or a heavily sprayed culture within less than five minutes. Practically all organisms exposed to the radiation from these tubes at a distance of 8 feet from the center of the cluster were killed within less than ten minutes, and at a distance of 10 feet within less than thirty minutes."

In a series of 132 individual stages of chest operations on fifty-nine patients performed in a field of air sterilized by means of bactericidal radiant energy, Doctor Hart was able to report a lowering to one half of mortality due to infected wounds. There was an incidence of 3.8 per cent of skin infections as compared with 33 per cent in a previous series of 100 similar operations. The incidence of elevation of temperature after the operation was lowered so that more than two-thirds of the patients did not have more than two recorded elevations above 100.4 F. as compared to one-third of the patients without radiation in this group.

In a later report, Doctor Hart presents an analysis of the results obtained in 456 clean primary incisions and eighty-six reopened clean incisions out of more than 800 operations performed in field of bactericidal irradiation. The analysis reveals that postoperative infections have been reduced more than 85 per cent. The occasional death anticipated from infection of a wound did not occur. The number of patients with postoperative temperature above 100.4 F. has been reduced in chest operations from 68 to 30 per cent, in mastoid operations from 46 to 34 per cent and in hernia operations from 36 to 22 per cent. The number of patients with a temperature above 99.2 F. for more than four days after operation has been decreased in chest cases from 78 to 22 per cent, in mastoid cases from 54 to 21 per cent, and in hernias from 46 to 14 per cent. There has also been noted a more rapid wound healing, a lessened systemic reaction and a shortened convalescence.

"The bacteriologic studies carried out by Hart and his co-workers, as well as the practical results obtained, seem to establish that air is an important source of contamination in every operative wound," the editorial concludes. "They demonstrated further that sterilization of the air in the operating room can be accomplished by bactericidal irradiation."

A BARRY TRADITION

that continues to save time and money for customers

» » In this age of "production line" printing speed, we have never forgotten that the best basis for a business transaction is *personal interest* in your order. Sixty years ago the founders of our company understood how to serve well and they passed along their knowledge from generation to generation.

Though today you visit our large and streamlined plant—and see the last word in type specimen catalogs, type composition machines, modern presses, stock seasoners, folding and binding machines, and distribution facilities—though all is a brilliant reflection of modernity, you still cannot escape the warmth of personal interest that surrounds our efforts to give you satisfaction in printing.

Every job is the most important job to us. We earnestly solicit your printing business on that one best basis. We ask you to counsel with us on your future printing requirements and we pledge you that the Barry tradition of personal interest will protect your printing investment.

Radio Short Waves Now Used in Giving Fever Treatment.—The use of radio short waves to produce artificial fever for the treatment of disease is a striking demonstration of the relationship of progress in various fields of knowledge, Richard Kovacs, M. D., New York, declares in the May issue of *Hygeia,* the health magazine.

Such diseases as gonorrhea, St. Vitus' dance, some forms of arthritis and of bronchial asthma, sinus disease and neuritis are being successfully combated by short wave treatment, the author points out.

Describing the method employed, Doctor Kovacs explains that local heating of any part of the human body is produced by placing it in the energy field of a short wave radio set.

This method is known as short wave treatment or short wave diathermy. An older method of diathermy involves the placing of plates in direct contact to the body or an extremity and the passing of a high frequency electric current through the afflicted part. The newer form of diathermy has the advantage that it can be applied to practically any surface or part of the body and its heat effect is more uniform.

"Fever treatment must be combined with other recognized forms of treatment, by diet and if necessary by surgery," the author observes. "Experienced medical advice and skilled nursing care are more important in administering artificial fever than the best apparatus in unskilled hands.

"The large majority of medical men agree that it is the well directed and well controlled deep heating effect of radio waves on the human body which brings about relief. The idea that certain wavelengths exert special effects on certain diseases is untenable or at least not proved."

For the man listening to his radio, Doctor Kovacs admits, the use of radio waves for medical treatment is sometimes anything but a blessing. "When some of the apparatus used for treatment is improperly constructed," he explains, "it may become a nuisance not only for every radio set which derives electricity from the same power line, but for those within several miles.

"Steps are under way to abate such nuisance by coöperation of the medical profession and reliable manufacturers of medical equipment. All apparatus may be properly screened to minimize interference, or a special wavelength may be allocated for treatment purposes.

"Induced fever," says the author, "has proved especially effective in diseases caused by so-called 'parasitic' germs. Some germs, such as those of gonorrhea, have become so completely used to living in the human body at its normal temperature that an increase of temperature by a few degrees affects them.

"Artificial fever maintained for some hours either directly destroys the germs of gonorrhea or sufficiently stimulates the natural defensive forces of the body to stop the further growth of germs.

"In joint inflammation or arthritis caused by gonorrhea, almost dramatic relief from pain and swelling can be accomplished by artificial fever. Similar results have been accomplished in gonorrheal inflammation of the eye and in stubborn infections of the pelvic organs in both women and men.

"Fever treatment is also effective in the disease of children, known as St. Vitus' dance, as well as in certain forms of bronchial asthma resisting all other forms of treatment.

"Short-wave diathermy is employed by physicians for treating inflammatory conditions of inner organs and of joints. These include some forms of arthritis, sinus disease, and rheumatic conditions such as neuritis. Repeated treatment by diathermy brings about an increased flow of blood, which speeds up the return of normal function; it also relieves pain due to nerve irritation."

Pneumococcic Meningitis. — Four recoveries out of seven cases of pneumococcic meningitis treated with sulfanilamide are reported by Barbara A. Hewell, M.D., and A. Graeme Mitchell, M. D., Cincinnati, in *The Journal of the American Medical Association* for March 18.

This disease is an infection of the meninges, or membrane coverings of the brain and spinal cord, by a pneumococcic organism.

A review of the literature up to 1927 shows 150 authentic recoveries from this disease, the authors say. Approximately thirty additional recoveries have occurred during the years 1927 to 1937. Most of these have been attributed to spinal drainage and the administration of antipneumococcus serum or the drug, ethylhydrocupreine, but in general results with these treatment measures have been unsuccessful.

The authors point out that "in the ten years preceding 1937 there were in the Children's Hospital of Cincinnati and in the pediatric service of the Cincinnati General Hospital twenty-three children suffering from pneumococcic meningitis, the mortality in this group being 100 per cent. Since the use of sulfanilamide four of seven patients with the condition have recovered."

Stating that there are at least thirty cases of recovery from the disease, including four observed by them, in which part of the treatment consisted in the use of sulfanilamide or related compounds, the authors say that "it appears reasonable to conclude that sulfanilamide was responsible for these recoveries, since the mortality rate was so high with other forms of treatment. Recovery occurred with the use of different compounds, such as prontosil, sulfanilamide and sulfapyridin; that is to say, the data now available do not

permit conclusions concerning the relative merit of these different compounds in the treatment of pneumococcic meningitis.

"There are at least eight cases of pneumococcic meningitis, including three observed by us, in which sulfanilamide was given and in which recovery did not follow.

"Of the patients receiving sulfanilamide who recovered, only one showed pneumococci in the blood culture. Of the eight patients receiving sulfanilamide who died, the blood cultures were positive for seven. This indicates that even with the use of sulfanilamide a blood stream infection with pneumococci is a factor in mortality and perhaps also that with such infection large doses of sulfanilamide should be tried."

Diagnosis of Many Diseases Is Possible Through the Eyes.—Such conditions as diabetes, high blood pressure, inflammation of the kidney, syphilis, tuberculosis, intracranial or brain pressure and optic nerve inflammations often may be diagnosed through the eye long before their presence might otherwise be suspected, Arthur J. Bedell, M. D., Albany, N. Y., says in *The Journal of the American Medical Association* for March 18.

"The background of the eye is the stage on which many of the tragedies of life are enacted," Doctor Bedell states. "By careful repeated examination, early changes can be detected and steps taken to eradicate or diminish the ravages of destructive forces."

This examination is made with a simple ophthalmoscope, an instrument containing a mirror arrangement making possible the examination of the inside of the eye.

The author points out that the recognition of the signs of the above conditions is possible through the major blood

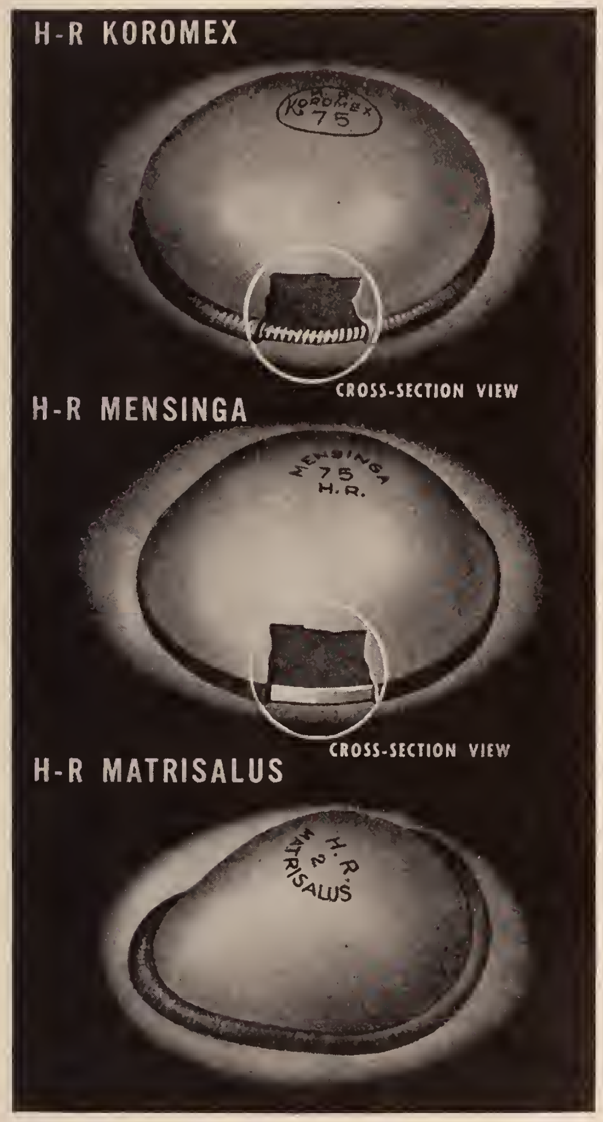
Diaphragms for

EVERY Condition



HOLLAND-RANTOS offers a most complete line of diaphragms. We invite inquiries concerning specific conditions.

The H-R Koromex diaphragm (coil spring type) is available in sizes from No. 50 to No. 105 mm., and is indicated for use in all normal anatomies.

The H-R Mensinga diaphragm (watch or flat spring) is available in sizes from No. 50 to No. 90 mm. including half sizes, and is indicated where there is a slight redundancy of the mucosa of the retro pubic space, or a slight relaxation of the anterior vaginal wall.

The H-R Matrisalus diaphragm is available in sizes—No. 1 to No. 6 corresponding to 65, 70, 75, 80, 85 and 90 mm. This special shaped diaphragm is indicated in cases of cystocele or prolapse where, owing to relaxed vaginal walls, the ordinary diaphragm cannot be retained in position.

vessel changes and alterations which may be found in the fundus or back part of the eye.

Although the correct interpretation of all of the gross pathologic signs of the above diseases is a lifetime study, Doctor Bedell believes that when sufficiently trained every physician should at least be able to recognize them and by constant daily application should steadily improve his diagnostic capacity.

"The ocular funds is one of the most available regions in the entire human body for the recognition of incipient, advancing and destructive processes," Doctor Bedell declares.

"To the initiated, examination of the fundus discloses important clinical signs, which, when gathered together, form part of the life record of the patient. From the knowledge gained by the study of thousands of such reports, accurate prognostic as well as diagnostic conclusions can be drawn."

Early eye signs of hardening of the arteries and high blood pressure are vein displacement, vein indentation, sometimes a dilatation of the vein between the artery constrictions, an increasing visibility of the artery wall and a coppery reflex in the artery which later becomes a silvery gray and still later a white streak; or the entire artery tree straightens and contracts or the reverse happens and the arteries become more tortuous.

Diabetes may be severe, last for years and finally cause the death of the patient without producing inflammation of the retina. On the other hand, the fundus picture of hard, yellow deposits near the disk or macula combined with small hemorrhages may be the first visible evidence of something abnormal and lead to the investigations which disclose the correct diagnosis. While all the changes found in the fundus of the eye of a patient with diabetes can perhaps be duplicated in a nondiabetic person, the author believes that "the picture of yellow deposits arranged without order and not of uniform size, associated with hemorrhage without marked vessel changes, most strongly suggests diabetes.

"The routine ophthalmoscopic inspection of every patient will lead to the earlier detection of glaucoma (a disease of the eye which hardens it and causes blindness), one of the most serious of all eye diseases. Every physician knows that in glaucoma the central depression in the disk increases in size until in the far advanced stage the entire nerve head is a sunken white cup and the patient is incurably blind.

"Elderly patients frequently complain of inability to read; this is often correctly ascribed to faint lens opacities or partial atrophy of the optic nerve, but sometimes it is caused by a degeneration in the macular region. The earliest signs are recurring hemorrhages around the macula in one eye and then after months or years in the other. This eventuates in the destruction of the central retina and, although the patient is unable to do close work, he never goes blind.

"The seriousness of this situation calls for the mobilization of all physicians in an attempt to understand the method of production, the various stages and, if possible, to combat the underlying factors, which at this time seem to be due to changes in the blood vessels and beyond the range of treatment agents."

Suicides by Barbiturates Have Increased Since 1933. The number of suicides in the United States by means of barbiturates has definitely increased since 1933, although the total number from all causes during this same period has decreased, W. E. Hambourger, Ph.D., Cleveland, declares in *The Journal of the American Medical Association* for April 8.

"The total number of suicidal deaths by the barbiturates in 1936 was probably close to 300," Doctor Hambourger

How is Karo Prepared Bacteriologically Safe for Infants?

INFANT FEEDING PRACTICE POINTERS

Answers to Physicians' Questions

1. Q. What is the composition of Karo?

A.

Dextrin	*50.0%*
Maltose	*23.2%*
Dextrose	*16.0%*
Sucrose	*6.0%*
Invert sugar	*4.0%*
Minerals	*0.8%*

(Dry Basis)

2. Q. What are the properties of Karo?

A. *Uniform composition.*
Well tolerated.
Readily digested.
Non-fermentable.
Chemically dependable.
Bacteriologically safe.
Hypo-allergenic.
Economical.

3. Q. What are the Karo equivalents?

A.

1 oz. vol.	*40 grams* *120 cals.*
1 oz. wt.	*28 grams* *90 cals.*
1 teaspoon	*15 cals.*
1 tablespoon	*60 cals.*

Starch is extracted from thoroughly cleaned Indian corn. The colloidal solution is acidified and treated with superheated steam up to a pressure of thirty-five pounds per square inch to effect hydrolysis. The pressure is then released, the product neutralized, filtered, concentrated and refined.

Karo Syrup is adjusted to a uniform composition, heated to 165° F. and poured into preheated cans and vapor vacuum-sealed. The product itself is untouched by human hands from source to completion. This freedom from contamination with pathogenic organisms is a determining factor in superior infant nutrition.

"*Infants Thrive*
ON
Karo Formulas"

ACCEPTED AMERICAN MEDICAL ASSN.

Infant feeding practice is primarily the concern of the physician; therefore, Karo for infant feeding is advertised to the Medical Profession exclusively. For further information, write Corn Products Sales Company, Dept. SJ-5, 17 Battery Place, New York City, N. Y.

(Continued from Page 48)

reports in his study of the promiscuous use of these drugs and the part they play in suicide. The study was made at the invitation of the Association's Council on Pharmacy and Chemistry.

The number of such suicides in 1937 may have approached or even exceeded 400, Doctor Hambourger believes.

"For the five years 1932-1936 the national incidence of suicides by barbiturates represents 4.2 per cent of all poisons (except gases) and 0.66 per cent of all methods used for suicide.

"In seven large cities and their associated counties, for the decade 1928-1937, barbiturates represent 8.1 per cent of suicides by all solid and liquid poisons and 1.25 per cent of all methods used for successfully committing suicide.

"The incidence of suicides by barbiturates is nearly twice as high in large cities as in the country as a whole, ranging from 2 per cent in St. Louis up to 16.7 per cent in Boston.

"The number of suicides by barbiturates has shown a definite upward trend during the past decade, especially marked since 1933, although the frequency of suicides by liquid and solid poisons and that of total suicides have both declined since 1933.

"More than 1,200,000,000 grains (174,188 pounds) of barbituric acid derivatives were sold in the United States in 1936."

The statistics for the study were obtained from the United States census reports and from data furnished by the Metropolitan Life Insurance Company and medical examiners and coroners of several large cities.

A future report will discuss the incidence of nonfatal poisoning by the barbiturates, chronic usage and the rôle that the drug plays in auto accidents and criminal offenses.

At a meeting of the American Medical Association in June, 1937, a resolution was introduced on the "Evils from Promiscuous Use of Barbituric Acid and Derivative Drugs," in which was included the following statement: "The evils of these drugs include habit formations, toxic cumulative action, their substitution for alcoholic beverages for drunken episodes, their use for successful as well as unsuccessful suicidal attempts, their improper use being a recognized causative factor in many motor accidents and their improper use being a recognized etiologic factor in some criminal assaults."

The Unspecified Prescription.—Some physicians are averse to specifying the maker's name of a proprietary product.

"I invariably specify Mead's whenever I can, for I feel that when I do not specify a definite brand, the effect may be the same as specifying that any brand will do.

"By not specifying exactly, I let down the bars to a host of houses, many entirely unknown to me and others deserving no support at my hands.

"When I specify Mead's, I may be showing favoritism, but at least I know that I am protecting my results. If, at the same time, my self-interested act encourages a worthy manufacturer to serve me better, I can see no harm in that."

Mead Johnson & Company, Evansville, Ind., U. S. A., have to depend upon the physician to specify Mead's because they do not advertise their products to the public, either directly or through merchandising channels.

Tuberculosis in Dressed Poultry.—"About 3 per cent of the dressed poultry offered for sale in American markets is infected with tuberculosis," *The Journal of the American Medical Association* for March 18 says.

"In order to test for the possible presence of tubercle bacilli in dressed poultry, W. H. Feldman of the Mayo Foundation removed spleens aseptically from 125 fowls at the time of evisceration by a local dealer. The fowls thus

(Continued on Page 56)

. . . used under proper supervision lengthens lives of diabetic children

PRIOR to the discovery of Insulin, diabetes in a child led to severe restrictions in his mode of life and, in most cases, an early death. Today, in contrast, there are hundreds of happy, active diabetic children—leading practically normal lives with the aid of Insulin.

More institutions, more physicians, and more patients are using Insulin Squibb and Protamine Zinc Insulin *Squibb* than ever before. They rely upon the quality and dependability of these Squibb Products.

● **INSULIN SQUIBB**—An aqueous solution of the active, anti-diabetic principle obtained from pancreas. It is accurately assayed, uniformly potent, carefully purified, highly stable, and remarkably free from pigmentary impurities and proteinous reaction-producing substances. Insulin Squibb of the usual strengths is supplied in 10-cc. vials.

● **PROTAMINE ZINC INSULIN *Squibb***—Insulin Squibb to which protamine and zinc have been added. The product is carefully assayed and conforms to the specifications of the Insulin Committee, University of Toronto.

Protamine Zinc Insulin *Squibb*, 40 units per cc., is available in 10-cc. vials.

The Burden of Proof

The science of electrocardiography is respected universally; its worth in diagnosis and prognosis is firmly established. In the minds of most physicians there is no question as to the desirability of owning an electrocardiograph; they ask only, "Which one should I choose?"

It has always seemed to us that the first consideration should be Consistent Accuracy, followed by dependability, sturdiness, economy and universality of operation, portability, and reasonable price. Such an instrument is the G-E Model "B" Electrocardiograph.

It produces clean-cut tracings of full diagnostic value, and does this with a minimum expenditure of time and energy on the part of the operator. It is consistently accurate because of correct design and care in manufacture. Its all-metal construction and compactness give it ruggedness, dependability, and portability. A heavy production schedule makes possible the low price at which it is offered.

The G-E Model "B" Electrocardiograph will operate anywhere, for it incorporates its own power supply. Hence, its use is not restricted to one room in an institution or to the office of the physician.

We accept the burden of proof; at your convenience and in your own office we will demonstrate the features which have made the G-E Model "B" Electrocardiograph the outstanding instrument in its field. Just write to us: "I want to make an electrocardiogram." Address Department A55.

PROPADRINE HYDROCHLORIDE

in the symptomatic relief of hay fever patients

...PHARMACOLOGICALLY SIMILAR TO EPHEDRINE

...CLINICALLY SUPERIOR TO EPHEDRINE

PROPADRINE HYDROCHLORIDE is a bronchodilator and local vasoconstrictor, with pharmacological properties similar to ephedrine. Its clinical superiority has been emphasized by independent investigators in these statements:

1. Propadrine Hydrochloride may be administered in therapeutic doses with relative freedom from nervousness or insomnia.

2. Tachycardia and palpitation, which have been fairly common symptoms associated with the administration of ephedrine, were rarely observed in this group of patients.

3. Propadrine Hydrochloride has proved a very satisfactory and valuable therapeutic agent in the treatment of allergic manifestations.

4. While the relief obtained from a single dose is equal to that produced by ephedrine, the absence of nervousness and insomnia makes it possible to use propadrine at frequent regular intervals and obviates the necessity of combining with it a sedative. Used in this manner, the results are definitely better than can be obtained by the usual irregular use of ephedrine.

5. The use of propadrine every three or four hours gave more relief to the patients suffering with urticaria and angio-neurotic edema than any other medication these investigators found.

6. In children, Propadrine Hydrochloride is not likely to produce restlessness or walking or talking in their sleep.

Propadrine Hydrochloride (phenyl-propanol-amine hydrochloride) is supplied as indicated under the illustration.

CAPSULES: ⅜ grain—bottles of 25, 100 and 500; ¾ grain—bottles of 25 and 100.

SOLUTION: 1% (isotonic)—1-ounce and pint bottles; 3%—1-ounce and pint bottles. (For topical application as a vasoconstrictor in reducing congestion of nasal mucous membranes.)

NASAL JELLY: in ½-ounce tubes containing 0.66% Propadrine Hydrochloride.

Colfax School for the Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

(Continued from Page 50)

examined included sixty-six young chickens, thirty mature hens, eighteen domestic ducks, four turkeys, three capons and four wild ducks.

"Each spleen was emulsified in 5 cc. of sodium chloride solution, and 1 cc. of the resulting emulsion was distributed over the surface of four tubes of egg yolk glycerin agar. The tubes were incubated at 37 C. for ten weeks.

"Positive growths of acid-fast bacilli were obtained from four spleens. One young chicken, two adult hens and one domestic duck were the sources of these four organs. Subcultures from each of the four cases were inoculated in duplicate into guinea pigs, rabbits and chickens.

"All guinea pigs were without macroscopically demonstrable lesions when killed from six to eight weeks later. Three of the eight rabbits died within two to eighteen days, presumably from intercurrent infection. The five remaining rabbits died or were killed from one to two months later. At necropsy each of the five showed extensive tuberculous lesions. The eight chickens died or were killed at the end of from six to eight weeks, all showing extensive tuberculosis of the so-called Yersin type.

"From this evidence the investigator concluded that each of the four positive spleens was the carrier of virulent tubercle bacilli of the avian type. Since virulent tubercle bacilli are thus present in about 3 per cent of apparently normal fowls and since no practical method of postmortem inspection will disclose their presence, Feldman concludes that the rearing of fowls for food markets should be prohibited in environments known to be infected with avian tuberculosis."

To preserve health is a moral and religious duty, for health is the basis of all social virtues. We can no longer be useful when not well.—Johnson.

Henry J. Ullmann	Santa Barbara	1942

Communications for the Cancer Commission should be addressed to the Secretary, Otto H. Pflueger, M. D., Room 2004, 450 Sutter Street, San Francisco.

(Roster lists of officers of scientific sections, component county societies, Woman's Auxiliary. A. M. A. delegates, special committees, etc., are continued on advertising pages 4 and 6.)

Decholin
REG. U.S. PAT. OFF.

A True Choleretic
●
A Single Chemical Entity
●
Virtually Nontoxic

In Chronic Cholecystitis

Through its intense choleretic influence, Decholin—c. p. dehydrocholic (triketocholanic) acid—steps up bile secretion by the liver cells as much as 200%. This intensified flow clears the biliary passages, lessens gall-bladder tension, reduces absorption of toxic metabolites, improves gall-bladder function, hastens recovery. To initiate choleresis more quickly, many physicians begin therapy with intravenous Decholin sodium (3 c.c. of the 20% solution), continuing therapy with Decholin 3¾ gr. tablets, one or two t. i. d. Physicians are invited to send for the second edition of the comprehensive brochure "Biliary Tract Disturbances."

ACCEPTED AMERICAN MEDICAL ASSN.

Riedel-de Haen, Inc.
105 Hudson Street New York, N. Y.

Underlying Causes of Child's Poor Posture Should Be Attacked.—Instead of constantly exhorting their children to stand up straight, parents should attack the underlying causes of poor posture as well as provide the child with definite posture training, Alvia Brockway, M. D., Los Angeles, advises in *Hygeia*, the health magazine, for June.

The child who slumps generally does so because, for some reason, he is fatigued. In some instances this reason may simply be that he is not getting enough rest to supply his needs for energy. Too many picture shows or radio programs in the evening frequently interfere with proper rest.

The tired demeanor in other cases may be due to enlarged adenoids, diseased tonsils or sinuses, faulty vision or poor elimination.

It is not sufficient, however, to remove sites of infection or to provide good habits for the bad ones which have caused the poor posture. The body curves that have become more or less permanent during the months or years of faulty posture must be realigned.

These children with faulty posture habits can be greatly helped by orthopedic and posture training. They need individual instruction and must be shown over and over again, under direct supervision, which muscles to work and which to relax.

Some of the unfortunate effects of poor posture, aside from the unpleasant appearance produced, are the crowding of the vital organs of the chest and abdomen, which may make the victim especially susceptible to colds and bronchitis, and the crowding of the digestive and eliminative organs in the abdominal cavity, which may result in digestive disturbances and constipation and, if continued for years, may even lay the foundation for colitis, hemorrhoids and gall-bladder disturbances.

ISOPHRIN
TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is ¼% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel's.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

Secretary, C. V. Bernardini, Medico-Dental Building, 233 A Street, San Diego.

Meeting, *Second Tuesday, El Cortez Hotel.*

San Francisco County Medical Society
2180 Washington Street, San Francisco

President, Edwin L. Bruck, 384 Post Street, San Francisco.

Secretary, Stanley H. Mentzer, 2180 Washington Street, San Francisco.

Meetings, *Every Tuesday, 8:15 p. m., 2180 Washington Street, San Francisco.*

San Joaquin County Medical Society

President, N. P. Johnson, Medico-Dental Building, Stockton.

Secretary, George H. Rohrbacher, Medico-Dental Building, Stockton.

Meeting, *First Thursday, 8:15 p. m., Medico-Dental Club Rooms, Stockton.*

San Luis Obispo County Medical Society

President, J. B. V. Butler, 722 Marsh Street, San Luis Obispo.

Secretary, E. M. Bingham, County Health Department, San Luis Obispo.

Meeting, *Third Saturday, 6:30 p. m., Gold Dragon Cafe, San Luis Obispo.*

(Roster lists continued on advertising page 6)

San Mateo County Medical Society

President, N. D. Morrison, 205 Third Avenue, San Mateo.

Secretary, J. Garwood Bridgman, 205 Third Avenue, San Mateo.

Meeting, *Fourth Wednesday, Benjamin Franklin Hotel, San Mateo.*

Santa Barbara County Medical Society

President, W. H. Johnston, 1515 State Street, Santa Barbara.

Secretary, D. H. McNamara, 317 W. Pueblo Street, Santa Barbara.

Meeting, *Second Monday, Cottage Hospital.*

Santa Clara County Medical Society

President, Cletus S. Sullivan, Bank of America Building, San Jose.

Secretary, Leslie B. Magoon, 652 East Santa Clara Street, San Jose.

Meeting, *Third Wednesday, 8 p. m., Medico-Dental Building, San Jose.*

Santa Cruz County Medical Society

President, John T. Harrington, 10 Cooper Street, Santa Cruz.

Secretary, Samuel B. Randall, 84 Walnut Avenue, Santa Cruz.

Meeting, *First Monday, 7:30 p. m., Club Rio del Mar, Aptos.*

Shasta County Medical Society

President, B. F. Saylor, Redding.

Secretary, Morton J. Murphy, 1542 Market Street, Redding.

Meeting, *Second Monday.*

Siskiyou County Medical Society

President, J. B. McGuire, Mt. Shasta.

Secretary, Victor W. Hart, 113 No. Oregon Street, Yreka.

Meeting, *Sunday on call.*

Solano County Medical Society

President, Ream S. Leachman, 727 Sonoma Street, Vallejo.

Secretary, John W. Green, Box 539, Vallejo.

Meeting, *Second Tuesday, 8 p. m., Casa de Vallejo Hotel, Vallejo.*

Sonoma County Medical Society

President, D. C. Oakleaf, 301A West Street, Healdsburg.

Secretary, T. E. Albers, 600 B Street, Santa Rosa.

Meeting, *Second Thursday.*

Stanislaus County Medical Society

President, John A. Cooper, 1024 J Street, Modesto.

Secretary, Hoyt R. Gant, 403 Beaty Building, Modesto.

Meeting, *Second Friday, 7:30 p. m., Hotel Hughson.*

Tehama County Medical Society

President, O. T. Wood, Red Bluff.

Secretary, R. G. Frey, Red Bluff.

Meeting, *At Call of President.*

Tulare County Medical Society

President, Newton Miller, 231 No. Main Street, Porterville.

Secretary, Ray Cronemiller, Exeter.

Meeting, *Sunday Evening once a month.*

Ventura County Medical Society

President, W. F. Mosher, 34 No. Ash Street, Ventura.

Secretary, A. A. Morrison, 625 Main Street, Santa Paula.

Meeting, *Second Tuesday, Ventura County Country Club.*

Yolo-Colusa-Glenn County Medical Society

President, H. G. Potter, Winters.

Secretary, W. J. Blevins, Jr., Woodland.

Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society

President, P. E. Thunen, I. O. O. F. Building, Marysville.

Secretary, Leon M. Swift, I. O. O. F. Building, Marysville.

Meeting, *First Tuesday.*

Accidental Discovery

Gelatinized Milk DECREASES INCIDENCE OF UPPER RESPIRATORY INFECTIONS IN INFANTS

Many a useful discovery has resulted from a chance finding by a keen observer.

Two years ago a group of university workers fed milk containing 1 and 2% plain, unflavored gelatine to a group of infants. There was a lower incidence of vomiting, diarrhea, and constipation than in control groups. As a corollary, they noticed that those receiving the gelatine formula suffered fewer upper respiratory infections. This was interesting enough to demand further study. The work* was recently repeated in two different clinics and the results substantiated. Knox Gelatine (U.S.P.) was used. It is 100% pure U.S.P. Gelatine—85% protein—in an easily digestible form—contains no sugar and should not be confused with factory-flavored, sugar-laden dessert powders.

*Further Clinical Observations on Feeding Infants Whole Milk, Gelatinized Milk, and Acidified Milk. C. Loring Joslin, M.D., F.A.A.P.; Bulletin of the School of Medicine, University of Maryland; Jan. 1939.

A CONVENIENT OFFICE TREATMENT FOR TRICHOMONAS VAGINITIS

SILVER PICRATE
Wyeth

THIS simple treatment requires but two office visits, a week apart, for insufflations and the nightly insertion of a Silver Picrate suppository for twelve nights.

Complete remission of symptoms and removal of the trichomonad from the vaginal smear usually is effected following the Silver Picrate treatment for trichomonas vaginitis.

JOHN WYETH & BROTHER, INCORPORATED, Philadelphia, Pa.

No Congressional Definition of Naturopathy.—Pointing out the falseness of claims that an act of Congress had defined naturopathy, *The Journal of the American Medical Association* for February 25 says:

"In 1933, naturopaths in Iowa sought special privileges from the legislature in the form of a law to enable them to ply their trade without possessing qualifications adequate to protect the public health. Their bill, which failed of enactment, proposed to define naturopathy 'according to the definition of naturopathy, enacted by the Congress of the United States of America and the District of Columbia.' In the same year, and no doubt in other years, a self-styled 'Examining Board of Naturopathic Physicians, Arizona District,' incorporated under the laws of Arizona, issued so-called 'certificates' to naturopaths, purporting to authorize certificants to 'pursue the practice of naturopathy within the corporate powers of this association.' It claimed to be acting 'under the authority of the American Naturopathic Association' and 'by virtue of the definition of naturopathy as set forth in and by an Act of Congress approved on February 27, 1929, and verified in and by an Act of Congress approved on February 7, 1931, which Act defines naturopathy.'

"In 1938 a petition, which the court denied, was filed in the circuit court of Jackson County, Missouri, to form a corporation with various and sundry powers, including the authority to establish naturopathic schools for the training of students in naturopathy 'as defined by Congress under the provisions of House Bill No. 12169 passed and approved by the Seventy-First Congress of the United States in the year 1930.' On February 8, 1939, a bill was introduced in the legislature of North Dakota proposing to define naturopathy 'as provided by an Act of Congress of 1929.' There seems little reason for doubt that similar statements have been made by naturopaths at other times in other places.

"The fact is, the statements of naturopaths to the contrary notwithstanding, the Congress of the United States has never defined naturopathy. A Healing Arts Practice Act for the District of Columbia was approved on February 27, 1929, which provided for a board of naturopathic examiners. This Act did not define naturopathy, but authorized the Commission on Licensure to Practice the Healing Arts to do so. The definition formulated by the Commission was unsatisfactory to the naturopaths, and on May 5, 1930, they caused to be introduced in the House of Representatives of the Seventy-First Congress a bill, H. R. 12169, to define naturopathy more broadly than it had been defined by the commission. This bill passed the House of Representatives on February 7, 1931. In the Senate it was referred to the Committee on the District of Columbia, where it died with the adjournment of the Seventy-First Congress. No other bill has since been considered by the Congress proposing to define naturopathy.

"The fact that naturopaths have apparently thought it necessary to resort to trickery of this sort to gain their objectives indicates their disbelief in the inherent merit of their cause. It should be an added reason, in any event, why their appeals should receive scant consideration."

The required methods of work are no secret; for they have been employed by thinking individuals ever since the time of Socrates. Here one cannot build without laying foundations. One cannot, for example, be a radio expert without the principles of electricity. One cannot be a business expert without economics. One cannot be an engineer without getting a knowledge of mathematics. Thus it runs throughout the cycle of subjects. Successful work is a kind of development; so before going far one must master its preliminary and prerequisite stages. There is no other valid way. One cannot build a tower without first laying a solid foundation.

COÖPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY — FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

THE NEW YORK POLYCLINIC

MEDICAL SCHOOL AND HOSPITAL (Organized 1881)

(The Pioneer Post-Graduate Medical Institution in America)

Obstetrics and Gynecology

A full-time course. In Obstetrics: Lectures; prenatal clinics, witnessing normal and operative deliveries; operative obstetrics (manikin). Gynecology: Lectures; touch clinics; witnessing operations; examination of patients, pre-operatively; follow-up in wards post-operatively. Obstetrical and Gynecological pathology. Regional anesthesia (cadaver). Attendance at conferences in Obstetrics and Gynecology. Operative Gynecology on the cadaver.

UROLOGY

A combined full time course in Urology, covering an academic year (8 months), will be inaugurated on October 1, 1939. It will comprise instruction in pharmacology, physiology, embryology, biochemistry, bacteriology and pathology, practical work in surgical anatomy and urological operative procedures on the cadaver; regional and general anesthesia (cadaver); office gynecology; proctological diagnosis; the use of the ophthalmoscope; physical diagnosis; roentgenological interpretation; electrocardiographic interpretation; dermatology and syphilology; neurology; physical therapy; continuous instruction in cysto-endoscopic diagnosis and operative instrumental manipulation; operative surgical clinics; demonstrations in the operative instrumental management of bladder tumors and other vesical lesions as well as endoscopic prostatic resection.

FOR INFORMATION ADDRESS: MEDICAL EXECUTIVE OFFICER • 345 West 50th Street, New York City

Specialization Is Changing Graduate Medical Education.—"Hospital internships, residencies, and fellowships have gained further prominence of late in view of their relationship to the certification of specialists," *The Journal of the American Medical Association* for March 11 says in an editorial:

"Internships were first to become firmly established as an essential period of hospital training following graduation. They acquired official recognition in 1914, when 508 general hospitals were approved for intern training by the Council on Medical Education and Hospitals of the Association. Since that time there has been a steady expansion of educational facilities, until at present 7,373 internships are available in 734 approved hospitals.

"The certification of specialists, which has held the attention of the medical profession during the last few years, has wrought conspicuous changes in the field of graduate medical education. Most significant has been the rapid increase in number of residencies and fellowships, the change in length and character of training, the introduction of basic science requirements and the evident desire on the part of hospitals to supply instruction on an approved basis. A steadily increasing number of young physicians are seeking the direct approach to specialization without an intervening period of general practice. Their search for specialized training is causing more and more hospitals to enter on courses of graduate instruction. Residencies are of comparatively recent origin and have not yet attained the degree of stability and uniformity which characterizes the intern field.

"In 1927 a separate residency classification was established when 278 hospitals and 1,776 individual residencies were approved. The rapid expansion of educational opportunities has increased the approved hospitals to 503 and the residencies and fellowships to 3,977. Last year the Council extended the residency classification to include fellowship training. In spite of the large number of approved positions there is no indication that a saturation point has been reached in any of the specialties.

"Another development of profound significance is the close coöperation that has been established between the Council on Medical Education and Hospitals, the Advisory Board for Medical Specialties and the individual certifying the boards. Coöperation has already been developed with the American Board of Radiology, the American Board of Pathology, and the American Board of Anesthesiology. As soon as possible a similar procedure will be inaugurated with each of the remaining boards, that uniformity in the investigation and appraisal of educational opportunities may be accomplished. With the aid of the specialty boards a complete revision of the 'Essentials of Approved Residencies and Fellowships' is in process. The educational requirements of individual specialties will then be more definite and more clearly apparent."

CHILDREN'S HOSPITAL

4614 Sunset Boulevard
LOS ANGELES, CALIFORNIA

Physical Therapy Course. 18 months. Tuition, $150.00. Given for graduates of accredited Schools of Nursing and Physical Education. Course opens September, 1939.

For benefit of physicians, institutions, and therapists, the School maintains Bureau for placement of therapists fulfilling the requirements of American Medical Association.

Effect of Alcohol on Kidney Function Reported Negligible.—Alcohol had no significant permanent effects on kidney function in a series of patients with kidney disease studied by Maurice Bruger, M. D., S. Arthur Localio, M. D., New York, and Nobel W. Guthrie, M. D., Hot Springs National Park, Arkansas, they report in *The Journal of the American Medical Association* for May 6.

Their investigation was made, they state, in view of the somewhat conflicting evidence as to the effect of alcohol and alcoholic beverages on the normal and the diseased kidney. Sixteen persons with diseased and five with normal kidneys were examined.

The function of the kidney remained unchanged after the taking of alcohol by persons with acute and chronic diffuse inflammation of the kidney. Alcohol did not delay the recovery of patients with acute diffuse inflammation of the kidney, who showed a gradual improvement in kidney efficiency. Impairment of the function of the kidney was increased temporarily by alcohol in patients with shrunken inflamed kidneys.

Alcohol rarely augmented the proteinuria (protein in the urine) in patients with albumin in the urine (Bright's disease). A moderate increase in urine was frequently induced (this occurred even in patients with marked impairment of the function of the kidneys).

Alcohol did not increase the number of red blood cells and casts in the urine of persons with acute diffuse or with chronic diffuse inflammation of the kidneys.

All subjects were kept at complete bed rest. In subjects with normal kidneys the taking of alcohol was occasionally followed by an increase in the excretion of red blood cells, white blood cells and casts (albumin) in the urine, but the values were rarely elevated above the average normal range. Proteinuria was not induced, nor did any measureable impairment of the function of the kidney occur.

COACHING FOR STATE BOARDS — MEDICAL AND Dental. Arthur H. White, M. D., Suite 1005, Flood Building, San Francisco.

OTOLARYNGOLOGIST SEEKS CALIFORNIA LOCATION with group or individual. Able make moderate investment. Have license. Certified American Board, Member College of Surgeons. Excellent training here and abroad, including bronchoscopy. Address, Box 300, California and Western Medicine, 450 Sutter Street, San Francisco, California.

WANTED — POSITION AS LOCUM TENENS DURING month of September. Four years of hospital work plus two years of practice. Qualified in surgery. Address, Box 600, California and Western Medicine, 450 Sutter Street, San Francisco, California.

Physicians as Artists.—"From time immemorial, medicine and art have been closely associated. The same skill that makes the surgeon's fingers deft with scalpel and ligature is at work in the beautiful examples of sculpture and carving shown in this book. The eye that so quickly and accurately evaluates the gradations in color and texture between normal and pathologic tissue coördinates the hand that wields the painter's brush. The man who chooses medicine as his life's work is largely motivated by a love for his fellow man, else he would select a vocation offering greater monetary reward. From the beginning, he is trained to exercise his powers of observation, and in time develops imagination, sympathy, understanding, philosophy and reverence, all of which are the very essence of art. Moreover, he deals with that most exquisite form of divine art and beauty, the human body.

"An artist-physician has said: 'The tendency of most persons is to regard the artist with awe as a superman endowed with talents not vouchsafed to the ordinary mortal. Most doctors have a latent artistic sense which may be developed to a remarkable degree by constant practice. When opportunity affords, slip away to the park or country, sit down on a camp-stool and practice sketching from nature. At first the results may not be satisfying, but in course of time you will be gratified to notice a marked improvement. An ample sketching kit may be purchased for a small sum and any local artist will be glad to give you instruction.'

"At the least, every physician is able to develop a sensitiveness to and an appreciation for fine art. He can also cultivate a hobby which if not one of the fine arts, is in the class of 'work by the side of work.' Dr. Charles A. Dana, who has always stressed the value of cultural medicine, has advised: 'Be a collector, for example, of stamps or automobiles, or old books, or neckties or pins; or find diversion in some collateral branch of science; the lore of birds, of fishing and shooting. Make a garden or cultivate shrubs and flowers. These kinds of activities will make your life happier and your professional character more attractive and effective.' "—quoted from "Parergon," published by Mead Johnson & Company, Evansville, Ind. Free copy available on request.

Stabisol: Squibb Bismuth Subsalicylate in Oil.—An improved suspension of Bismuth Subsalicylate in a specially developed oil vehicle has been introduced by E. R. Squibb & Sons, New York, under the trade name, Stabisol.

Each cc. of Stabisol contains 2 grains (0.13 Gm.) Bismuth Subsalicylate, equivalent to 75 mg. metallic bismuth, with 3 per cent Chlorbutanol (local anesthetic) and 0.03 per cent Mercurated Chlorxylenol (antiseptic). The vehicle is 80 per cent specially treated, decolorized olive oil and 20 per cent ethyl oleate, containing small amounts (about 0.015 per cent) of calcium oleate and water to aid in stabilizing the suspension.

Stabisol is supplied in 60 cc. diaphragm cap containers. Advantages of the container are: ease of handling, neatness, avoidance of any contact between metal and solution, and minimum chance of contamination.

The average dose of Stabisol is 1 cc. once a week in courses lasting 8 to 12 weeks, depending upon the individual need and reaction.

A sound mind in a sound body; if the former be the glory of the latter, the latter is indispensable to the former.—Tryon Edwards.

GENERAL OPERATIVE SURGERY

Courses now in session » Students may enter at any time » Thursdays, 11 a. m. to 2 p. m.

The principal operations of general surgery will be included. The work will consist of the surgery of the stomach and gall-bladder, intestines and colon, urogenital organs, hernias, goiter, amputation of the breast, bone and tendon surgery, amputations, etc.

Every part of the course will be preceded by a thorough foundation of the anatomy. Opportunity will be given to have demonstrations of operations on the living.

The privilege will be given to perform certain minor operations and have demonstrations in the various clinics. The dissections and the technic of the operations will be done by the students themselves.

Fee—$15 per month

Applicants must be graduates of schools approved by the State Board of Medical Examiners

TWENTY-FIVE YEARS AGO

(Continued from Text Page 464)

and energy of its president, Doctor Peers, who got together a splendid program for the whole of Wednesday; a program of sufficient interest to fill the room completely during nearly all of the various sessions and to hold the interest and attention of the audience present. . . .

From an Original Article on "Address of the President at the Forty-Fourth Annual Meeting of the Medical Society of the State of California—Santa Barbara, April 14. 1914," by Fitch C. E. Mattison, M.D., President.— . . . Social and industrial insurance claim a large share of the public attention at present, and it is but fair to assume that in all lines of industries that the cost of production should include in such costs certain fixed charges to insure those engaged in such industries against accident, sickness, and death. . . .

The National Insurance Act of Great Britain was first introduced into the House of Commons after a period, it is said, of two and a half years of study and preparation by its author, Honorable Lloyd George, Chancellor of the Exchequer, on May 4, 1911. The Act includes in its scope some fifteen million people from the age of sixteen to sixty-five of both sexes, whose incomes do not exceed $800 per annum. . . .

The commercialization of medical and surgical services by some of the casualty companies by offering fees approximating 25 to 30 per cent less than the fee tables adopted by the Industrial Commission, should not be permitted by members of the State Medical Society. . . .

From "Report of the Secretary and Editor."—Membership.—At the close of the year 1913, there were 2,396 members; at the close of 1912, there were 2,278 members on the roll; during 1913, thirty-four members died; thus, it is evident that the membership had 152 accessions during the year. The present plan of requiring all membership reports to be sent in early—before March 1—has worked admirably, and this year, up to April 1, something over 2,340 members have been reported and paid for and additional names are being sent in all the time. By the end of the year the membership will be at least as large as last year, in spite of the fact that the assessment is $6 this year as against $4 in previous years. . . .

In General.—The general tone of the Society was never better or more promising than at the present time; it seems to have come to the appreciation of an overwhelming majority of our membership that their Society is really doing something for them and is a power in certain ways. Doubtless this is largely due to the work of our legal department in medical defense. . . .

From "Twelfth Annual Report of the Council."—To the President and Members of the House of Delegates: . . .

Medical Defense.—The number of demands, threatening letters, threats of suits and suits actually filed, increased in 1913 over the large number in 1912. There is every reason to believe that the accident insurance law, which went into effect on January 1, 1913, and which will be referred to later, will cause a marked increase in such suits. The law prevents the bringing of a suit against the employer and consequently many cheap lawyers will be deprived of the pleasure of bringing such "contingent" suits. It does not prevent an action against the doctor, however,

and so we may look for many such actions. It is said that in some states the number of suits for alleged malpractice increased as much as ten times, after similar industrial accident insurance laws went into effect. For this reason, as well as for others, it should be carefully considered by county units, as a matter of policy, whether it is not better to somewhat restrict membership and scrutinize carefully the professional standing and ability of applicants for membership. . . .

Industrial Accident Work.—We present to you herewith a plan for dealing with many of the problems which have arisen under the new industrial accident law, and a schedule of fees to apply to surgical work under that law, and we recommend that you adopt the plan and approve the schedule.

The general plan, which follows, was formulated at a number of conferences between Doctor Jones, representing the State Society, Doctor Kugeler, representing the San Francisco County Society, Doctor Parkinson, representing the Council and Sacramento, Doctor Gibbons of the Industrial Commission; and representatives of a number of insurance companies; it has been approved by the Adjustment Board, representing fifteen companies. The plan is the development and logical extension of the suggestions which have been made by Doctor Jones and published editorially in the last four issues of the JOURNAL. . . .

From "Fee Schedule."—These fees represent a minimum. Fees higher than schedule will be approved when warranted by extraordinary difficulties encountered by the surgeon.

Unusual cases and procedures not specified are entitled

(Continued on Page 18)

NASAL CONGESTION *Is Not Confined to Winter*

Rapid changes in temperature, the wearing of light apparel, and the recent innovation of artificial weather conditions in theaters, trains and office buildings appear to increase the incidence of nasal congestion in the summer months.

The so-called "summer catarrh," as well as rose fever, hay fever, and other conditions accompanied by a "running nose" and mouth breathing demand relief just as much as the head colds of winter.

Since so many of these nasal congestive disorders extend over a period of weeks or months, it is gratifying to know that the physician has at his command a vasoconstrictive agent which is active on repeated application, is both prompt and prolonged in action, and seldom displays undesirable side reactions.

NEO-SYNEPHRIN Hydrochloride

(laevo-alpha-hydroxy-beta-methyl-amino-3-hydroxyethylbenzene hydrochloride)

offers the following advantages in nasal decongestion:

—freedom from sting
—more sustained action than epinephrine or ephedrine
—less toxic in therapeutic dosage than epinephrine or ephedrine
—stability—may be sterilized by boiling
—in dosage recommended, Neo-Synephrin does not usually produce "nervousness" or insomnia.

to same fee as specified procedures of approximately equal magnitude.

Note.—Bills must be itemized, showing date of each visit, dressing or operation, and charge for same.

The (name of company) is fully aware of the difficulties and inequalities of an inelastic fee schedule for surgical service. The schedule here presented is designed for use in connection with medical services rendered an individual with an average earning capacity of $1,000 per annum. To this class belongs the bulk of citizens which the Boynton Act is intended to protect and relieve. . . .

From "Minutes of the House of Delegates at the Forty-Fourth Annual Meeting, Santa Barbara, April 14, 15, 16, 1914."—First Session: Tuesday, April 14, 1914. The house was called to order at 8:30 p. m. by the president, F. C. E. Mattison.

The roll call disclosed the presence of fifty-one delegates, and the President announced a quorum and the house in session and ready for business.

* * *

Reference Committee.—The President announced the appointment of the usual Reference Committee on New Business as follows: George H. Kress, Los Angeles; Rene Bine, San Francisco; George A. Hare, Fresno.

The report of the Secretary was then read and referred to the Reference Committee. . . .

* * *

Medical Defense.—The following communication from the chief counsel of the State Society, which accompanied his voluminous report, was then read by the Secretary and referred to the same committee:

"San Francisco, Cal.,
April 11, 1914.

To the Medical Society of the State of California, San Francisco, California:

Gentlemen:—In connection with my report as to the malpractice suits during the year 1913, I have to advise you as follows:

Twenty-three cases for malpractice have been commenced in various parts of the State, as shown by my report and Mr. Morrow's report. In more than twenty cases, litigation was threatened, but no action was brought.

I believe that the widespread knowledge of the defense accorded free of charge by the Medical Society to all doctors in good standing, contributes very largely to diminishing the cases that are actually brought, when so many threats are made. I think that many more cases are never heard of because of the medical defense.

All lawyers know that they cannot settle with the doctors for the costs of a trial, and the attorneys' fees the doctor would have to pay, and this deters a certain class of attorneys from commencing these suits.

The increase in suits, and threatened suits, has been very marked, not only in California but, as I am informed, in other states in the Union. . . .

These good offices are freely tendered, at the expense of time and trouble, and this assistance given in thorough

WHY
THE EMULSION...
Petrolagar
FOR CONSTIPATION

#3

Does not coat intestinal mucosa. Petrolagar is an aqueous suspension of mineral oil—oil in water emulsion.

1. Petrolagar is more palatable. Easier to take by patients with aversion to plain oil—may be thinned by dilution.
2. Miscible in aqueous solutions. Mixes with gastro-intestinal contents to form a homogeneous mass.
4. No accumulation of oil in folds of mucosa.
5. Will not coat the feces with oily film.
6. Does not interfere with secretion or absorption.
7. Augments intestinal contents by supplying an unabsorbable fluid.
8. More even distribution and dissemination of oil with gastro-intestinal contents.
9. Assures a more normal fecal consistency.
10. Less likely to leak.
11. Provides comfortable bowel action.
12. Makes possible five types of Petrolagar to select from to meet the special needs of Bowel Management.

Petrolagar — Liquid petrolatum 65 cc. emulsified with 0.4 Gm. agar in a menstruum to make 100 cc.

Petrolagar

New Business.—The following communication relating to advertising in the State Journal was read and referred to the same committee:

"535 North Dearborn Street
Chicago, April 10, 1914.

Dr. Philip Mills Jones, Secretary,
Care of Hotel Potter, Santa Barbara, Cal.

Dear Doctor:—If you have a minute can you see a chance during the convention to get a word to the delegates on 'Patronizing Advertisers'? If so, urge that all advertisements are guaranteed, clean and good.

Also ask readers when answering advertisements to use the coupon or key numbers, so your Journal will get credit for the inquiries. Very truly yours.

Coöperative Medical Advertising Bureau.
E. W. Mattson."

✓ ✓ ✓

The following preamble and resolutions were presented by the Secretary at the request of R. L. Wilbur, and were referred to the same committee:

WHEREAS, The Congress of the United States entrusted to the City of San Francisco and the State of California the task of holding a Universal Exposition of the Arts, Sciences and Industries of the world as a means of celebrating the completion of the Panama Canal, uniting the two great oceans and establishing new routes of commerce; and . . .

Resolved, That the Bureau of Conventions and Societies of the Exposition, in coöperation with the officers of the American Medical Association, the American Society of Tropical Medicine, the American Public Health Association and affiliated bodies, be urged to set aside a distinctive two weeks' period for meetings of the congress and organizing bodies, to the end that all members of the medical profession, at the expense of one trip to San Francisco, may attend meetings of the associations of which they are members, and also take part in the proceedings of the congress; be it further

Resolved, That telegrams be sent to the officers of these several organizations, inviting them to hold their 1915 meetings in San Francisco and arrange for the proposed Congress on Tropical Medicine and Hygiene; be it further

Resolved, That copies of these resolutions be forwarded to the officers of the American Medical Association, the American Society of Tropical Medicine, the American Public Health Association and affiliated bodies.

Howard Morrow, A. W. Meyers, William Palmer Lucas, Herbert C. Moffitt, W. Ophüls, R. L. Wilbur, Frederick P. Gay (Chairman), Special Program Committee for Medical Societies, representing the American Association for the Advancement of Science. . . .

Resolved, That the By-Laws of the Eye, Ear, Nose, and Throat Section as herewith presented be approved. Referred to the same committee.

Constitution

Article 1. Name. The name of this Section shall be the Eye, Ear, Nose, and Throat Section of the Medical Society of the State of California. . . .

* * *

Election of Officers

President.—Harry M. Sherman of San Francisco was nominated by Dudley Tait, and there being no other nominations, it was moved, seconded, and carried, that the nominations close and the Secretary cast the ballot of the House, which was done, and the President announced that Harry M. Sherman had been elected president for the ensuing year. . . .

Report of the Reference Committee . . .

Doctor Graves, in discussing Section 22 of the report, introduced the following as a substitute for the committee recommendation:

Resolved, That the Medical Society of the State of California favors an amendment to the present Industrial Insurance Act that will provide for the payment of a sum equal to the present indemnity plus the cost to the state of surgical attendance and hospital care. All money to be paid directly to the injured individual, who shall select his own medical attendant. No claims for indemnity will be honored unless accompanied by the certificate of the attending surgeon, who must be a duly licensed medical graduate of this state.

This resolution was declared out of order and deferred to new business.

After considerable discussion, a vote was taken on the adoption of Section 22 as presented (and as hereinafter published), and the motion to adopt was carried by a large majority.

Wallace I. Terry moved a reconsideration of the vote to adopt. Asked by the President if he had voted in favor of the passage of motion, he replied that he had. The President then put the motion to reconsider to the House, and it was defeated by a large majority.

PAN-PACIFIC SURGICAL CONGRESS
HONOLULU, HAWAII . . . SEPTEMBER 15 TO 28, 1939
A Scientific Program by International Authorities
Presiding, Dr. J. Hardie Neil, Auckland, New Zealand; Dr. Frederick Reichert, Chairman of Council, San Francisco; Dr. Edgar Gilcreest, Vice-President, San Francisco.

It was then moved to return to the regular order of the recommendations in the report and proceed to their consideration. This was carried and the various sections adopted as presented and with minor modifications which were accepted as made and are included in the report as it appears below.

The report as a whole was then, on motion duly made, seconded and carried, adopted. . . .

From "Report of the Committee on Public Health."— . . . In this connection we are pleased to report that the United States Public Health Service has detailed Surgeon P. M. Carrington to make investigation of the tuberculosis problem in California.

The investigation has for its object the following:

1. To ascertain the extent and direction of the migration of tuberculous persons from other states into California south of San Francisco.
2. The effects of travel on tuberculous persons themselves.
3. The bearing of such migration on the health of other travelers and on employees of common carriers.
4. The conditions under which tuberculous persons live in localities resorted to for changes of climate, and the effects of these conditions on the progress of their disease.
5. The bearing of the presence of these persons on the health, social, and economic status of the communities to which they have migrated. . . .

From "Lassen-Plumas Counties."—On the evening of March 25, with the help of Doctor Bering, the Lassen-Plumas Counties Medical Society was organized, and adopted the Constitution and By-Laws prepared by the Committee on Organization of the American Medical Association. The following officers were elected: President, Dr. W. E. Dozier of Susanville; Vice-President, Dr. Ernest E. Wilson, Greenville; Secretary-Treasurer, Dr. R. W. T. Garner, Susanville; Delegate, Dr. E. S. Drucks, Susanville; Alternate, Dr. F. J. Davis, Westwood; Board of Censors, three-year term, Dr. F. D. Walsh, Susanville; two-year term, Dr. B. B. Bolton, Edgemont; one-year term, Dr. B. J. Lasswell, Loyalton. . . .

From an Original Article on "The Los Angeles Deaths from Intraspinal Neosalvarsan Injections," by Eugene S. May, M. D., Oakland.—The recent fatalities at Los Angeles following the intraspinal injection of neosalvarsan forcibly call to our attention the fact that intraspinal injection of toxic substances cannot be made without grave danger to life. In the Los Angeles cases, neosalvarsan (1-2-3 milligrams) was added to blood serum, the salvarsanized serum was then injected into the lumbar arachnoid space. Eight patients received the injection and died. One patient who lived two weeks received the first and largest dose of the salvarsanized serum. The important question arises: "What caused these deaths?" . . .

From "Society Reports."

Northern District Medical Society.—The Northern District Medical Society will hold a meeting at Marysville. June 9, 1914, 10:30 a. m., Liberty Hall. All members are requested to be present.

J. W. James, President.
F. C. Turner, Secretary.

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 464)

by using the names of prominent persons on prescriptions but asserted he had not sold them or used them for commercial gain. . . ." (Los Angeles *Daily News*, May 5, 1939.)

"Everett H. King, forty-seven, who identified himself as the owner of the Basic Science Institute at 41 North Calaveras Street, early last evening was arrested on a warrant charging him with practicing medicine without a license. He pleaded guilty today in police court and was fined $200 and granted 360 days' probation. T. P. Hunter, special agent for the State Board of Medical Examiners, and Detective Sergeant J. A. Scott said King claimed to be a graduate chiropractor although he admitted not having take an examination from the State Board of Chiropractic Examiners. . . ." (Fresno *Bee and Republican*, April 21, 1939.)

"A special Iowa Senate investigative committee today reported 'immorality running rampant,' gay drinking parties and sex orgies at five institutions under the State Board of Control's supervision. In a written report, backed by piles

(Continued on Page 26)

"Vitamin B can be stored in the body to only a slight extent. It must be replenished by daily ingestion."*

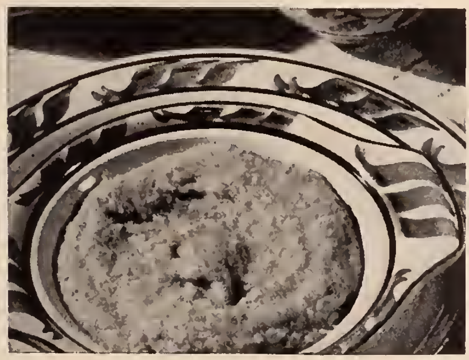
*Taub, Vitamin Manual

How daily servings of RALSTON WHEAT CEREAL protect against Vitamin B_1 deficiency

DOCTORS AGREE that infant diets must be strictly regulated. Unregulated diets often result in Vitamin B_1 deficiency, since each infant requires 50 International Units daily.* The diet prescribed must replenish this, day by day, to protect against deficiency.

**U. S. Dept. of Agriculture, Miscellaneous Pub. No. 275, page 22.*

ADULTS AND ADOLESCENTS normally require 200 International Units of Vitamin B_1 daily.* However, since most children, and many adults, ingest an *abnormal* amount of carbohydrates, their daily requirement is much higher. This is not available in American diets, which may contain little more than the minimum required to protect against actual *deficiency.*



RALSTON, THE HOT WHEAT CEREAL . . .

added to most diets, protects against Vitamin B_1 deficiency. Made from whole wheat, with only the coarsest bran removed, it is enriched with wheat germ, which contains 7 times as much Vitamin B_1 as whole cereal or eggs... 16 times as much as spinach... 40 times as much as milk. It supplies, *in one serving,* about ½ of the infant, and ¼ of the adult and adolescent daily requirement. Ralston also contains abundant energy producing elements, wheat proteins, minerals and carbohydrates.

Ralston cooks in 5 minutes — costs less than 1¢ a serving. Delicious in flavor, it is THE hot wheat cereal children really like to eat.

BOARD OF MEDICAL EXAMINERS

(Continued from Page 24)

of affidavits and testimony, the committee told of . . . an abortionist, convicted in California, on the staff of the State School of Feeble-minded at Glenwood. (He was dismissed since his exposure by the investigating committee.) . . ." (Press dispatch dated Des Moines, Iowa, April 11, printed Los Angeles *Herald-Express,* same date.)

"After claiming on the witness stand he could cure toothaches and grow fingernails, as well as cancer and tuberculosis, with his medicine, Vivogen, W. S. Yoemans was found guilty of false and fraudulent therapeutic claims by Judge E. P. Woods, Montebello Township Court. Yoemans, who manufactured the product, was fined $50 and ordered to cease selling Vivogen as a cure for any disease, according to Jonathan R. Kirkpatrick, Chief of the Division of Food and Drugs, Los Angeles County Health Department, who, with F. F. Unfred, Inspector in the Division of Food and Drugs of the State Health Department, declared that the asserted medicine was only a weak solution of lime water and had absolutely no curative value. This was the first case to be tried in connection with the drive being waged by Dr. J. L. Pomeroy, Los Angeles County Health Officer, against a number of distributors in Los Angeles County falsely claiming medicinal values in their products." (East Los Angeles *Belvedere Citizen,* April 21, 1939.)

"Miss Petrea Askov, twenty-five, former office aide and secretary to Dr. E. S. Cassady of San Pedro, today faced prospects of restoring $1,400 taken from office funds over a two and a half year period and appropriated to her own use while employed by the physician and surgeon. Under terms of a municipal court sentence, where she was convicted on three counts of petty theft, Miss Askov was given eighteen months in the county jail suspended, with the understanding that she is to repay $800 immediately and $25 per month for two years, during which time she will be on probation. . . ." (San Pedro *News-Pilot,* April 20, 1939.)

"Overlapping appointments by former Governor Merriam and Governor Olson to the State Board of Chiropractic Examiners were unscrambled by Attorney General Warren yesterday. On December 31, just before he left office, Merriam appointed an entire new board of five. His appointees included Dr. Roy G. Labachotte. On April 15 Governor Olson named Dr. Franklin Morris to succeed Doctor Labachotte. The latter refused to budge, insisting that he had been appointed for a three-year term. But yesterday, Warren advised the board that, whether Doctor Labachotte and Merriam knew it or not, Doctor Labachotte had merely been appointed to fill a term which expired February 10; that hence, Doctor Morris is the lawful member of the Board." (San Francisco *Chronicle,* April 28, 1939.)

"Mrs. Lena Mareck, fifty-four, charged with the illegal operation death last December of Mrs. Bertha Murray, Oakland housewife, was ordered released from the County Jail yesterday by Superior Judge Fritz. The court order came after a petition for the woman's release on a writ of habeas corpus, filed by Attorney Nate Coghlan, had been granted. Judge Fritz allowed the contentions of the writ, which asserted police failed to establish any public offense had been committed in their complaint against Mrs. Mareck. She was arrested last December following the death of the

Cosmetics and Your Patient's Morale

THE DOCTOR IS OF NECESSITY A STUDENT OF LIFE Each new patient presents a new study, a new problem. Psychology plays an important role in the course of treatment he prescribes With some patients he must be frank to a point of harshness, with others he must be gentle and coaxing The nature of the illness and, more particularly, the nature of the patient determine his attitude He knows from experience the value of bolstering his patient's morale As a student of psychology he knows that few things are more depressing to a woman than the fear that she is losing her charm, that when she no longer cares how she looks the chances are she has lost touch with a vital interest in life. And because he appreciates the importance of a sensible interest in personal appearance he quite rightly encourages his patients to look their best at all times. FINE COSMETICS appeal to that interest That is why they deserve to be recommended by doctors who are, after all, greatly concerned with their patient's morale.

LUZIER'S, INC., MAKERS OF FINE COSMETICS & PERFUMES

KANSAS CITY, MO.

21-year-old Mrs. Murray in an Oakland hospital. Police charged the young woman died after an illegal operation. (San Francisco *Chronicle*, April 11, 1939.)

"Dr. Donaciano Trevino, 64-year-old San Bernardino physician, was arraigned yesterday by L. M. Cox, United States Commissioner, on a charge of conspiracy to violate the Federal Narcotics Act. Doctor Trevino was arrested by David E. Hayden, U. S. Marshal. His arrest followed that of three women and one man, who were taken into custody earlier in the week on a charge of possession of narcotics. After arraignment Doctor Trevino was bound over to the Federal Court in Los Angeles for trial. He is being held in the County Jail in default of $1,000 bail." (San Bernardino *Sun*, March 12, 1939.)

"William A. Van Buren, fifty-three, 1240 San Mateo Avenue, Menlo Park, was arrested at his home yesterday afternoon on a San Francisco bench warrant charging him with violation of probation in connection with a 1939 charge of practicing medicine without a license. According to the arresting officer. T. P. Hunter, representing the State Board of Medical Examiners, Van Buren operated an advertised medical clinic at 702 Market Street, San Francisco. He pleaded guilty in November of last year. He was given a suspended jail sentence and ordered to pay a $200 fine in $35 monthly installments. Hunter said Van Buren was $50 behind in payments and that he failed to remove the advertising signs from his 'clinic'." (Redwood City *Tribune*, April 25, 1939.) (Previous entry September, 1938.)

"The appellate division of the Supreme Court of New York handed down a decision on January 11 upholding the refusal of the Board of Regents of the University of the State of New York to endorse the Italian license or diploma to practice medicine of Dr. Gustave G. E. DeLuca. The Board refused to endorse the license on the ground that there is great uncertainty as to whether the standards of the European institutions today are comparable with what they were when the law was enacted, which gives the Commissioner and the Board of Regents authority to endorse foreign licenses without examination. The Board offered the petitioner in this case the opportunity to take the licensing examinations." (*The Diplomate*, April, 1939.)

In an article published in *Medical Economics*, May, 1939, headed "The Refugees Dig In," comment is made on the problem of the foreign physician, which confronts the various states. "New York is no less concerned with the seriousness of its refugee doctor problem. Medical Society officials there point with alarm to the fact that native licensees for the year ending June 30, 1938, were outnumbered 556 to 419 by foreigners. Meanwhile the Department of Education reports that the total number of applications for its next medical examination will reach an all-time high. New York physicians find some solace in the Appellate Division's defense of the Board of Regents' right to reject foreigners seeking licenses by endorsement. Reversing an order of Supreme Court Justice Sidney F. Foster, the court has denied licenses to aliens Paul Erlanger and Julius Levi. Although they failed the examinations, the latter insisted they were entitled to licenses anyway. Reminding them that the standard of German medical schools is below that in New York, Justice Christopher J. Heffernan commented:

" 'The state has the right to demand that those who seek to practice medicine shall pass a satisfactory examination as evidence of skill and competence. Such a requirement is neither unreasonable nor discriminatory.'

BOARD OF MEDICAL EXAMINERS

(Continued from Preceding Page)

"Meanwhile, New York Assemblyman L. A. Lawrence has introduced a bill requiring citizenship for practice. A similar proposal is before the New Jersey legislature." Records indicate Austria specifically demands citizenship for medical license. Germany, France and Switzerland demand of foreigners that candidate's entire education, medical, premedical and secondary, be obtained in their own schools, thus effectively shutting out citizens of the United States who have received any part of their education outside respectively of these countries.

Police reports indicate that James T. Murray, M. D., was arrested in Los Angeles, April 12, 1939, as an alleged narcotic addict. (Previous entries, December, 1930.)

How to Prevent Tooth Decay*

What to Do

Eat Proper Foods.

Select nutritious foods with well-balanced mineral and vitamin content.

Drink a glass of milk with every meal.

Eat vegetables and fruits (cooked and raw), fruit and vegetable juices, meat, fowl, fish, eggs, cheese, whole-grain bread, butter, and any other special items your physician has advised.

Get your sweets from raw sugar, dates, figs, honey, fruit juices.

Select some of the coarser foods at each meal to strengthen the jaws and aid in the natural cleansing and exercising of the teeth.

Drink enough water.

Chew your food thoroughly.

Brush the Teeth Twice a Day.

Brush up and down—the way teeth grow. Brush in all directions to cleanse the grooves on the grinding surfaces.

Dedicate at least five or ten minutes out of the twenty-four hours to this important activity.

Equal parts of table salt, soda, and powdered borax make a good tooth powder. If flavoring and sweetening are desired, add a little oil of peppermint or menthol and saccharine.

If you prefer a prepared dentifrice, see that the seal of the Council on Dental Therapeutics of the American Dental Association appears on the package.

The brushing, and not the powder or paste, is what cleans the teeth.

Look in the mirror to see that the brushing has been thorough. Have sufficient light so that you may see well.

Rinse the mouth well with warm water to flush out all loosened débris and plaques.

Use a medicinal mouth wash only on the dentist's recommendation.

Be suspicious of dark spots on the surfaces or in the grooves of the teeth.

Be suspicious of chalky spots on the teeth.

Be suspicious of too red or too white an appearance of the gums.

Check up on other members of the family, especially the children, on the condition of the teeth and gums.

Consult a dentist (of sound ethical standing and good repute).

At least every six months (after seeing your dentist, mark your calendar ahead so that you won't forget when your next appointment is due).

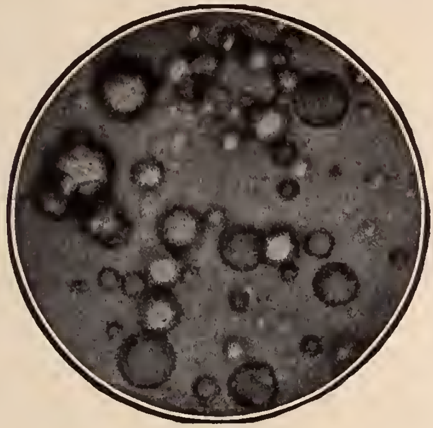
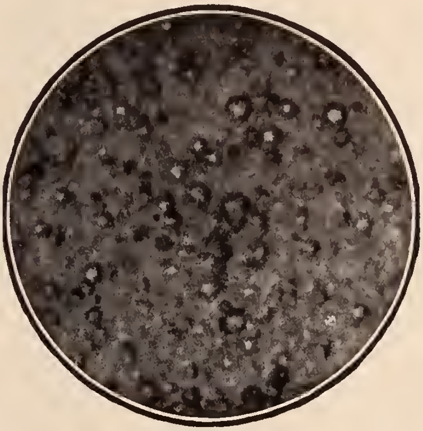
More Easily Tolerated



Cod Liver Oil Concentrate Globules and Butter Fat Globules . . . before Homogenization



Cod Liver Oil Concentrate Globules and Butter Fat Globules . . . after Homogenization

Special Morning Milk is homogenized under great pressure **after** the cod liver oil concentrate is added. Through this process the cod liver oil concentrate globules and butter fat globules are reduced to about 1/10 their normal size, offering a greater area for the gastric juices to work upon. Thus Special Morning Milk is more easily tolerated than evaporated milk and cod liver oil fed separately.

The homogenization process also brings about complete and permanent emulsification of the cod liver oil concentrate throughout the body of Special Morning Milk, making vitamin D available to the infant in a more dispersed form.[1]

Not Advertised to the Laity -:- No Formula Instructions on the Label

BECAUSE THERE IS NO COD LIVER OIL TASTE IN SPECIAL MORNING MILK, THE ADMINISTRATION OF VITAMIN D IS GREATLY SIMPLIFIED.

Also, at first sign of blemish on teeth; at first sign of pain or discomfort; for dental prophylaxis treatments (deposit removal and polishing).

For instructions as to when and how to correctly use dental floss and mouth wash (kinds of mouth wash).

To have tiny breaks and cavities in the enamel of teeth filled at once, even if only with a temporary filling. Have permanent work done as soon as possible.

To have frequent (at least every two or three years) x-ray examinations made.

The dentist may then see the condition, not only of the teeth and other tissues, but also the condition of the previously inserted fillings and restorations.

Children's crooked teeth should be straightened while they are young enough for this kind of treatment.

WHAT TO AVOID

The danger of becoming accustomed to an unclean mouth and offensive breath.

Brushing the teeth laterally (since this wears grooves and notches at the necks of the teeth).

Harmful dentifrices and mouth washes.

Dental patent medicines and tooth bleaches.

Biting hard substances, thread, fingernails; cracking nuts; opening containers with teeth, etc.

Toothpicks; pencils in mouth, pins, etc.

Leaning weight of the head on hands or sleeping on hands or arms (since this pressure causes crooked teeth).

Too much cooked cereal (especially in the children's diet).

Carbonated beverages, candy, tobacco.

Rapid change of excessive heat and cold (*i. e.*, hot coffee and ice cream).

Constipation.

Diseased tonsils and adenoids.

For Diseases of the Chest *Monrovia, California*
AN INSTITUTION FOR DIAGNOSIS AND THERAPY

CHOICE rooms and bungalows at rates ranging from $35 per week up, including medical service, general nursing, x-rays, routine laboratory examinations, ordinary medicines and therapeutic pneumothorax.

A few accommodations as low as $25 per week assigned on special application in selected cases.

In the foothills of the Sierra Madre Mountains, thirty-five miles from the ocean. Surrounded by beautiful gardens.

Close medical supervision. Aside from tuberculosis, special attention is given to asthma, bronchiectasis, lung abscess and kindred diseases.

For particulars address:

THE POTTENGER SANATORIUM AND CLINIC, Monrovia, California

Always do those things that strengthen good health habits (since bodily ill health adversely affects the teeth).

Be on the lookout for suggestions, facts, and pictures from authentic sources about what is best for your mouth health.

Do not waste time worrying about it; do something about it.

"Be true to your teeth and they will not be false to you."

Erysipelas Mortality Rate Reduced by Sulfanilamide. The death rate from erysipelas has been greatly reduced by the use of sulfanilamide in its treatment, John Nelson, M.D., Harvey Rinzler, M.D., New York, and M. P. Kelsey, M.D., Temple, Texas, state in *The Journal of the American Medical Association* for March 18.

In 406 cases of erysipelas treated at Bellevue Hospital, New York, during the winter of 1935-1936 with erysipelas antitoxin the death rate in adults was 9.2 and in children 37.5 per cent. From January to July, 1937, 344 patients with the disease were treated with sulfanilamide and the mortality in 313 adults was 1.44 per cent and in thirty-one children it was 12.9 per cent.

Erysipelas is a contagious disease, characterized by fever, chills, insufferable itching and burning, painful swelling and spreading patches of redness of the affected part or parts.

It is another of the many varieties or types of streptococcic infections which apparently are effectively treated by sulfanilamide.

Adverse reactions (nausea, cyanosis, dizziness, vomiting and jaundice) may occur with sulfanilamide treatment. However, these reactions should not prevent or prohibit its use, but it is readily seen that the drug should be given only by an experienced physician and that the patient with this disease should be hospitalized.

OUR FRIENDLY CHALLENGE

In your files are doubtless many Audiograms of patients who have not been able to obtain satisfaction from the application of a Hearing Aid—particularly persons with a severe nerve type of deafness. You are cordially invited to send these persons to us for a scientific fitting of the new

CRYSTALIC ACOUSTICON
With Thermionic (vacuum) Tubes

By pitting our instrument against your most difficult cases, we believe we can prove to you the truth of the statement that this "is the greatest advance in Hearing Aids for the past twenty years."

Consultation is private—and entails no charge or obligation. We will gladly prepare an Audiogram for any patient for whom you request such service—showing his hearing range *without* and also the increased range *with* the CRYSTALIC ACOUSTICON. Both graphs will be plotted on the same chart, so you can judge for yourself the improved and corrected hearing accomplished.

ACOUSTICON
705 Foreman Bldg. LOS ANGELES
457 Powell St. SAN FRANCISCO

Acousticon is accepted by the Council on Physical Therapy of the American Medical Association.

CRITERIA—Standards of Judging

Criteria for judging medicinal products should include the identifying mark of the manufacturer. Pharmaceuticals and biologicals bearing the Red Lilly invite confidence when judged by criteria of potency, uniformity, stability, and purity.

For Parenteral Treatment of Pernicious Anemia

Ampoules Solution Liver Extract Purified—contain 15 U.S.P. units per cc. Supplied in packages of three 1-cc. rubber-stoppered ampoules and in packages of one 10-cc. ampoule.

Ampoules Solution Liver Extract Concentrated, Lilly—contain 2 U.S.P. units per cc. Supplied in 10-cc. rubber-stoppered ampoules and in packages of four 3.5-cc. rubber-stoppered ampoules.

Ampoules Solution Liver Extract, Lilly—contain 1 U.S.P. unit per cc. Supplied in 10-cc. rubber-stoppered ampoules.

CALIFORNIA AND WESTERN MEDICINE

OFFICIAL JOURNAL OF THE CALIFORNIA MEDICAL ASSOCIATION

VOL. 50 JUNE, 1939 NO. 6

California and Western Medicine
Owned and Published by the
CALIFORNIA MEDICAL ASSOCIATION
Four Fifty Sutter, Room 2004, San Francisco, Phone DOuglas 0062

Address editorial, business and advertising communications to Dr. George H. Kress as per address above.

EDITOR . . . . GEORGE H. KRESS

Advertisements.—The Journal is published on the seventh of the month. Advertising copy must be received not later than the fifteenth of the month preceding issue. Advertising rates will be sent on request.

BUSINESS MANAGER . . . . . GEORGE H. KRESS

Advertising Representative for Northern California
L. J. FLYNN, 544 Market Street, San Francisco (DOuglas 0577)

Copyright, 1939, by the California Medical Association

Subscription prices, $5 ($6 for foreign countries); single copies, 50 cents.

Volumes begin with the first of January and the first of July. Subscriptions may commence at any time.

Change of Address.—Request for change of address should give both the old and the new address. No change in any address on the mailing list will be made until such change is requested by county secretaries or by the member concerned.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the Journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this Journal. New copy must be sent to the editorial office not later than the fifteenth day of the month preceding the date of publication.

Contributions—Length of Articles: Extra Costs.—Original articles should not exceed three and one-half pages in length. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—CALIFORNIA AND WESTERN MEDICINE has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested that contributors to this Journal write to its office requesting a copy of this leaflet.

EDITORIALS[†]

SIXTY-EIGHTH ANNUAL SESSION OF CALIFORNIA MEDICAL ASSOCIATION

Del Monte Annual Session of 1939.—Once again, the members of the California Medical Association have held an annual session, the sixty-eighth, replete with many gatherings and conferences on scientific and organization problems of more than usual importance. When one is called on to provide all the immediate and accessory needs for the various meetings of an annual session, the many activities of the working units in the State Association make a special impression. This, however, need not be a matter of surprise, since the California Medical Association has more than six thousand members; and also because, at its annual conventions, the medical work requires detailed provision for twelve well organized scientific sections, and also for activities depicted by the scientific exhibits presented by individual members. Related work of affiliated groups was portrayed at three well attended microscopic and x-ray conferences held on the Sunday preceding the session proper, under the auspices of the Cancer Commission. Of value also were the clinical conferences under the lead of the California Heart Association. And not to be forgotten are the technical or commercial exhibits.

In addition to the above expressions of scientific medicine, and of equal interest and importance, were those relating to organized medicine, as manifested in the meetings of the House of Delegates and Council, with the practically all-day sessions of its reference committees, before whom members appeared to discuss questions of policy. Of equal allure were the general meetings at which guest speakers and officers of the Association brought affairs of pertinent interest to the attention of the entire membership.

In surveying the proceedings of the last Del Monte session, therefore, it may be said that recent years, marked as they have been in medical circles by marvelous advances in scientific knowledge, and also by increasing complexity and unrest in economic and social welfare matters, have added increasing responsibilities for California Medical Association members. Our Society, itself the outward or manifest expression of the organized physicians of the State, brought into being to promote the standards of public health and of medical practice, in these latter years has therefore no other recourse—whether it wishes or not—than to try to solve the problems which a rapidly changing civilization has brought to the fore and thrust upon it.

[†] Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

* * *

Special Features of the Recent Session.—Laying aside, now, these general reflections on trends in scientific and organized medicine, it may be in order to comment briefly on other phases of the recent annual session. The attendance was the largest ever recorded at Del Monte, and the scientific, organization, and social features all measured up to the best standards of former years. In spite of the hard times, the technical or commercial exhibits brought in the largest financial return yet registered for the Association. The dinner to Retiring President Roblee was marked by a peak attendance in the Hotel Del Monte dining room, with almost nine hundred places occupied. The Woman's Auxiliary, also, held its well attended meetings at the beautiful Del Monte Lodge. Everywhere, in fact, expression was given concerning the value of the 1939 session; and to all who lent aid in the arrangements, thanks are again tendered. The official proceedings may be gleaned by a perusal of the minutes of the House of Delegates and Council.*

* * *

Good Wishes to Newly Elected Officers.—To the newly elected officers, greetings and best wishes for successful terms are extended by the members of the Association.

Dr. Harry H. Wilson of Los Angeles is the recipient of the great honor, that of being President-Elect of the California Medical Association, his career of service to scientific and organized medicine already covering many years of loyal and efficient endeavor in movements designed to advance the profession's best interests. His broad general training will make him a valuable executive in times such as the present; and, with other officers who were elected, he may be assured of everyone's whole-hearted support.

At the close of the Wednesday evening meeting of the House of Delegates, Dr. William W. Roblee of Riverside laid aside the responsibilities of the presidential office to welcome as his successor his 1895 classmate of Cooper Medical College, Dr. Charles A. Dukes of Oakland. To Doctor Dukes, also, is given the pledge of generous coöperation in the arduous work ahead.

Medicine in California may be faced, in days to come, with many serious problems; but with just causes, clear thinking, loyal support and keen leadership, it need have little fear concerning the future, remembering, however, that at the present time, as never before, a generous and united support is necessary for the successful advancement and attainment of policies decided upon.

PROPOSED COMPULSORY HEALTH LAW FOR CALIFORNIA: A.B. 2172

A. B. 2172 Fails of Passage in the Assembly: However, a Special Election Is in the Offing.—Press dispatches, of which several are given space in this issue,* indicate that Assembly Bill 2172, providing for a compulsory, capitation health insurance statute, will fail of passage in the present Legislature, which body may adjourn before this June issue of the OFFICIAL JOURNAL is placed in the mails. For such a nonenactment, members of the medical profession in California may heave a sigh of relief, temporary though that ease may be. For, if the prognostications of the leaders among the proponents of such legislation may be accepted, it is more than probable that a compulsory health bill will be on the state election ballot of November, 1940, as an initiative measure.

If Governor Olson calls a special election within the next several months (and, it is reported, he so intends, to permit citizens to again vote on the "$30 every Thursday" initiative), and if he includes in that call a compulsory health insurance law, it will then be necessary for the physicians of California to gird themselves for immediate battle on the issue.

* * *

Attitude of the Press.—The seriousness of the problem is one of the reasons so much space has been given for "Press Clippings" in recent numbers of CALIFORNIA AND WESTERN MEDICINE; since it must be evident that, in a battle against a law that would have such a devastating effect upon medical practice and public health standards, it is most important that every member of the California Medical Association should have had the opportunity to acquaint himself as fully as possible not only with the major facts and principles involved, but also with the attitude of fellow citizens as reflected in the daily newspapers. The press dispatches in the present issue are of a hopeful nature, so far as immediate legislative action is concerned; but they also mention the imminence of the forthcoming initiative struggle which will call for united and whole-hearted action, both individual and collective, and this to be given without stint. There will be required, in addition, the expenditure of considerable sums to provide the educational literature at once needed in such a campaign. If, therefore, Governor Olson includes compulsory health legislation in the special session he has stated he would convene, members of the California Medical Association may expect to be called upon for an expression of strenuous civic activity such as they have never yet been requested to give.

* * *

Recent Article by Mr. Chester Rowell.—Attention has been directed to the "press clipping" pages, in part because comments will here be made concerning Editor Chester Rowell's syndicated article of May 20, which has been given place, on page 454.

---

* See page 454.

It is to be hoped that every reader of California and Western Medicine will take the time to peruse what Mr. Rowell recently wrote, particularly since he is the chairman of Governor Olson's Compulsory Health Committee, and presumably speaks with authority on the plans of the Administration, and also of the Committee and the other proponents of a compulsory system for California.

Having been present at speeches made by Mr. Rowell before the Commonwealth Club, having read many of his articles on the subject, having heard him and his supporters at the April 19 meeting in the Assembly Chamber at Sacramento, and listened also to the Administration's spokesmen when the "41 against" and "33 for" vote was taken in the Assembly on Tuesday, May 16, we confess that we were somewhat surprised on reading some of the statements in Mr. Rowell's article of May 20, referred to above.

Thus, the assertion:

"The only practical issue, therefore, was which way the vote of the people should be taken, and the Legislature has determined that it shall be by initiative."

Such a statement by Mr. Rowell must be construed as nothing else than one of editorial license. As a matter of fact, the Legislature made no commitment concerning an initiative, and did not vote on such a procedure. What took place was this: the Assembly indicated, by a vote of 41 to 33, that the compulsory health bill, as submitted in amended form on May 16, did not have its approval. What the proponents of the measure may have had in mind as regards an initiative was a matter not before the Assembly or Senate for vote.

The comment of Editor Rowell, in the paragraph immediately following the above and on the possible nature of "radical" and "conservative" initiatives, is of special interest, in that it seemingly indicates that these proponents are determined to force a vote on some kind of compulsory health law—whether good or bad, elastic or frozen, presumably not being in their minds of much importance. Remembering the expostulations heard from some of the advocates on the humanitarian needs of a compulsory capitation system, the "inhumanity" of forcing forthwith a possibly inelastic and harmful measure, with dire results to the very citizens whom they claim need more adequate medical care, certainly is indicative of inconsistency by such advocates. The attitude of some of these proponents seems to be that, having committed themselves to a certain type of compulsory health insurance, they are determined to bring the matter to final and immediate determination, without regard to whether there is urgent need therefor, or whether their much-amended and emasculated measure (for vote-getting purposes, supposedly), as by them expounded, will fulfill its exploited purposes. The thought comes to mind that there is here involved a certain amount of personal egotism by some of the propositional supporters. Certainly the issues at stake should transcend the will to be successful in the purely political battle.

Did space permit, one could continue with other exceptions to some of Mr. Rowell's statements. Members of the Association may well take the time to read the clipped excerpts in this issue, not only of his news, but of those of others. Their perusal will make for better presentation of the subject, when its various phases are taken up by physicians in the weeks to come, with both discerning friends and patients.

CALIFORNIA'S NEED FOR A BASIC SCIENCE LAW

California Has Three Examining Boards.—California is a State of "multiple examining boards." That is, it has legally authorized three different examining boards for healing art practitioners:

1. A board for nonsectarian practitioners holding the degree of Doctor of Medicine;
2. A board for the sectarian group known as Osteopaths; and
3. A board for another sectarian group catalogued as Chiropractors.

A third cultist group that has been knocking at the legislative doors for years is that whose members call themselves Naturopaths. This year, those belonging to this sect have put up a particularly strenuous fight and they may be counted upon again to present their statute in the 1941 Legislature asking for legal recognition.

In the present unsettled state of the public mind, common to lawmakers and the electorate, it is a question whether such a law, that would give necessary legal recognition by California to a third cultist group, could not, in the near future, go on to passage and enactment!

* * *

California Needs a Basic Science Law.—Which suggests, again, the great need of a Basic Science law for California—a subject that has been repeatedly commented upon and advocated in California and Western Medicine.

Such a law, to be of value in California, and to ensure application to existing healing art examining boards, and any that may come into being in the future, must be enacted by initiative vote of the people.

Several drafts of a Basic Science law, adapted to California's requirements, have been made, and have been submitted to the Council. The Council, unfortunately, at several state elections was not in position to authorize action, partly because of the expense involved—about thirty thousand dollars being needed for the educational campaign and to secure the more than 200,000 signatures with precinct allocations, identified by notary. Other factors, also, have operated to postpone action, as when, in the November, 1938, state election, the antivivisection initiative was deemed of such paramount importance that the Council was again obliged to forego submittal of the much-wanted initiative.

It has been shown that in the commonwealths in which such statutes have been enacted there is a better maintenance of healing art standards, and that therefore Basic Science laws make for real conservation of the public health. In California, most of the component county societies, and also the great majority of members, have expressed their approval of a law as proposed; and the 1940 state election ballot should include a Basic Science law among the initiative measures which will then be submitted to the people for vote. It is our belief that it would receive a most favorable vote of the electorate.

C. M. A. SPECIAL ASSESSMENT

Action of the House of Delegates.—Rapidly changing times are apt to create new and imperative needs. For the first time since the reorganization of the California Medical Association in 1902, its House of Delegates, in annual session assembled, has deemed it necessary to levy a midyear special assessment upon the members. From component county societies in different portions of the State, resolutions for such a purpose were presented by their respective delegations; and both purpose and scope of the contemplated "public health and welfare" work received earnest consideration before the reference committees and in the House.

The text of the resolutions adopted by the House of Delegates, and other informative material have been sent to every member of the Association, and in this issue of the Official Journal the minutes of our legislative bodies chronicle the action that was approved. Obedient to the direction of the supreme legislative body of the Association, the Council has issued instructions to carry through the mandate of the House.*

CONCERNING "INITIATIVE LAWS" ON THE CALIFORNIA MEDICAL HORIZON

Three Proposed Initiative Laws.—Whether they wish it or not, the next two years will place before the physicians of California proposed legislation, having to do with medical practice, which cannot be indifferently thrust aside. Every physician, then, who fails to meet his obligations merely places on the shoulders of his fellows an increased burden. This thought should be taken to heart by every medical licentiate in California.

What are these initiative problems?

1. The initiative for a revision of the Chiropractic Practice Act, which will be on the ballot of the special state election as early, perhaps, as next October.

2. The Compulsory Health Insurance Initiative. Such an initiative has been threatened by the proponents of a compulsory health insurance law, both before and since they failed to secure such legislation at Sacramento. If the special state election is not held until October, the advocates of a compulsory health insurance statute may be able to secure the necessary signatures for an initiative in time for placement on the ballot. Otherwise, it will probably appear on the 1940 state ballot.

3. Basic Science Initiative. The California Medical Association House of Delegates has instructed the Council of the Association to arrange for the placement of such an initiative on the state election ballot. The regular election in 1940 will precede the next legislative session in 1941. A Basic Science law could well wait, therefore, until November, 1940, for submittal to the electorate.

The above measures have not only a momentous relation to scientific medicine, but an even more intimate connection with the economic phases of private practice. No M.D. licentiate in California, therefore, but has an important stake in the legislation noted above.

Component county societies are urged to give these matters their very earnest attention. Bluntly phrased, it may be stated that, for the time being, these measures transcend discussions of scientific topics, no matter how intriguing the latter may be.

CALIFORNIA PHYSICIANS' SERVICE

Gratifying Registration Under C. P. S.—The large registration of members of the State Association for California Physicians' Service is a widespread evidence of the earnest desire of doctors of medicine to make possible adequate medical care for all social groups of the State; and in keeping with its known policies, California and Western Medicine has endeavored to promote this C. P. S. organization work by giving generous space to commendatory articles that have appeared in California newspapers, such press items usually reflecting, in many ways, the current thought of the more than six million human beings making up the population of the Golden State. To afford this extra space has naturally meant an increase in both the folios and the expense of their printing as part of the Official Journal. The issues at stake, however, are of such great importance that the additional costs seem negligible and justified.

The reports at the Del Monte annual session from officers of the California Physicians' Service and heard by the delegates representing the component county societies have no doubt, by this time, been transmitted by the delegates to their local colleagues, who will have learned that California Physicians' Service is moving forward as rapidly as the conventions of safety in procedure permit. Members may certainly rest assured that the officers of C. P. S. are alert to their grave responsibilities, and that full information will be sent to all physicians as soon as certain fundamental requirements are met.

C. M. A. WELCOMES A NEW COMPONENT UNIT

Inyo-Mono Counties Medical Society, the New Addition to the Fold.—Years have elapsed since a new county medical society has been welcomed into the fold of component units of the California Medical Association; this because the field for such extension work had practically been covered.

---

* In this issue, see page 446, Item 11. For Official Notice, see page 426.

For some time, however, we have been hoping to see the counties of Inyo and Mono represented by a county medical society to better fulfill in their territory the needs of scientific and organized medicine; and this hope was realized when at Del Monte the Inyo-Mono Medical Society submitted its by-laws and made application for a charter, the petition being promptly and cordially granted by the House of Delegates. While recording this historical item, it may be observed that it is not without interest that these two counties, with little more than ten thousand population, are represented at Sacramento by their own state senator, while, in contrast, Los Angeles County, with almost three million in population, has in the California Senate of forty members, likewise only one representative. It may be added that the House of Delegates placed Inyo and Mono counties in the second or Los Angeles district, the roads from Los Angeles County being the best for travel.*

Good wishes are extended to this new unit which was formed through the foundation of a local medical society some months ago at a meeting sponsored by the State Association Secretary and Officers of the Los Angeles County Medical Association.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 426.

---

* See Resolution No. 10, on page 438.

Council Issues Revised Statement on Sulfanilamide.—Another revision of the statement of the Council on Pharmacy and Chemistry of the American Medical Association regarding the actions, uses, and dosage of sulfanilamide is published in the February 25 issue of *The Journal* of the Association. The Council says that its first statement on the drug appeared in *The Journal,* July 31, 1937, and a revised statement on October 30, 1937.

"The enormous amount of work which has been done with the use of this product warrants a second revision of the article," the Council says.

The more recent clinical evidence indicates, states the Council, that its action has been extended so that sulfanilamide becomes a still more useful drug with promise of value in some rare conditions. In treatment, particularly of streptococcic infections, results have been most striking in most patients, while in others, for reasons not yet known, the drug has not proved especially efficacious.

The Council again points out that the drug is one which should be used only under conditions which require caution and careful observation, particularly in view of side reactions. Because of its toxicity, patients to whom the drug is to be given should have daily attention by a physician. Many patients have shown some degree of development of a slate-gray type of cyanosis, first apparent in the lips and nail beds but afterward diffusing over the entire body. The exact nature of this cyanosis is unknown, but in the opinion of most observers it is not as serious a complication as it was once thought.

As the Council previously has warned, sulfanilamide should preferably be given alone, and not with other drugs unless specifically indicated.

EDITORIAL COMMENT†

PREVENTION OF SERUM SICKNESS

If confirmed, the studies of "inverse anaphylaxis" in man, currently reported by Voss and Hundt[1] of the Children's Clinic, Heidelberg, Germany, may lead to successful methods for the prevention of serum sickness, and may conceivably necessitate revisions of current theories of protein sensitivity.

The Heidelberg pediatrician drew blood from patients convalescent from serum sickness following routine administration of antidiphtheritic horse serum. From 1 to 10 cubic centimeters of the resultant convalescent human serum were injected intravenously in other children at various periods after therapeutic administration of diphtheria antitoxin. No allergic symptoms were noted if the convalescent serum was injected within twenty-four hours after administration of the diphtheria antitoxin. If, however, the convalescent serum injection was delayed till the third or fourth day, an "inverse anaphylactic reaction" was noted. This was shown by a generalized erythema, which usually disappeared within a few hours. If the convalescent serum injection was delayed till the eighth day, *i. e.,* till the end of the usual incubation period of spontaneous serum sickness, the inverse anaphylactic reaction was of "shock-like intensity."

Following these induced allergic reactions, the patients were completely desensitized, and did not react to subsequent injection with even massive doses of antidiphtheritic horse serum. Moreover, spontaneous serum sickness did not develop in these desensitized children after completion of the usual incubation period. Their findings suggest that intravenous injection of convalescent serum-sickness serum, given about the third day, might be a feasible method of preventing serum sickness. Whether or not earlier (symptom-free) injections would be equally effective was not determined.

From the theoretical point of view their studies of "inverse Prausnitz-Küster reaction" are even more suggestive. This "inverse Prausnitz-Küster reaction" was performed by injecting 0.1 cubic centimeter of dilute diphtheria antitoxin (or normal horse serum) subcutaneously in normal children. From eight to twelve hours later these children were given an intravenous injection with 1 to 5 cubic centimeters human convalescent serum-sickness serum. Within thirty minutes, marked edema and erythema developed in and around the area injected with horse proteins. The unsuspected result, however, was their observation that this "inverse Prausnitz-Küster reaction" is not specific for horse proteins. Control skin areas injected eight to twelve hours previously with ox or sheep proteins, reacted equally promptly and with equal intensity.

---

† This department of CALIFORNIA AND WESTERN MEDICINE presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

[1] Voss, A. E., and Hundt, O.: Ztschr. f. Immunitätsforsch., 94:281 (Nov.), 1938.

To explain these apparently illogical results, Voss and Hundt postulate a secondary relatively nonspecific "serum-sickness antigen," formed or liberated as a result of interaction between alien proteins and normal human tissues, with secondary antibodies formed against these hypothetical secondary antigens. This is a renaissance of a tentative theory of primary, secondary, and tertiary antigens and antibodies suggested, several years ago, to account for certain allergic phenomena.[2] That entirely new or "hybrid" specificities can be formed as a result of interactions between proteins of different animal species has been demonstrated by Zoet[3] of Stanford University Medical School. A simple method for the preparation of such "mixed" or "hybrid" proteins or "secondary antigens" has been recently perfected by European biochemists.[4]

Stanford University.

THE ADRENOGENITAL SYNDROME*

There seems to be an urgent need for a more rational evaluation of the adrenogenital syndrome. Clinical diagnosis and treatment is being handicapped by confusion as to the pathogenesis of this disease.

Various degrees of intersexuality are relatively common. Virilism characterized by hirsutism, obesity and ovarian dysfunction in the female, and feminization of the male has been widely, though none too clearly discussed.

Diagnosis of these sex-reversal states is being materially helped by sex hormone assays [1-4] and x-ray visualization of the adrenals,[5] so that tumor cases (*i. e.*, with positive x-ray and sex hormone assay evidence) may be readily segregated from the relatively very common benign functional or subclinical varieties of the adrenogenital syndrome.[6,7] Though the etiology of the anomaly be quite obscure, recent evidence promises to clarify the clinical evaluation of the disease.

Recent biologic observations clearly point to a congenital polyglandular dysfunction as the underlying basis for the adrenogenital syndrome, as well as for the majority of cases of intersexuality. However, there seems to be a universal failure to appreciate the essential polyglandular character of this disease, and the usual clinical approach is limited to the surgical exploration and occasional resection of what appears to be a hyperplastic adrenal or gonad (ovary and testicle). Surgery is justifiable when a tumor can be demonstrated, but certainly is illogical and unwarranted in those cases without the clinical evidence of tumor (as seen with the special x-ray and hormone studies).

Indications for surgical exploration have been based on rather loose clinical judgment. The hazardous adrenal surgery for the functional self-limited forms of the disease should be condemned. Surgical morbidity and mortality from adrenal shock may run very high.

From present evidence[8,9] the pituitary, adrenal, and gonad are all vitally involved not only in the development of normal sex patterns, but in the genesis of the adrenogenital syndrome. To emphasize the widespread pathologic physiology which characterizes the adreno-genital syndrome it may be well to point out that anomalous sex development arises from abnormal sexual differentiation, not only of the ovary, testicle and adrenal cortex, but also of the adenohypophysis. Pfeiffer[8] has demonstrated experimentally that the pituitary, like the gonad, is bipotential at first, and is capable of being differentiated as either male or female types, depending on whether a fully differentiated ovary or testis is present; after puberty the sex type is relatively stable, so that experimental efforts to change it have failed. All of this means that anomalous sex patterns arise from some abnormal development of the adreno-gonadal apparatus which, in turn, conditions adversely the pituitary sexual differentiation. Anomalous development is particularly apt to occur in the ovary because of a normal "masculine phase" in the sequence of female differentiation. Broster and Vines[9] point to this "element of instability" as the cause for the greater frequency of intersexuality in the female.

One may then speculate that if the normal embryologic transition from the brief ovarian masculinization to a fully differentiated female gonad should be retarded or impaired to any degree, so that the ovary remains partially masculinized, then the "sex typing" of the pituitary may likewise be defective. Future pituitary gonad-tropic physiology would, therefore, be partly masculine or intersexual in its function. If this concept of a polyglandular disorder be valid, then any therapeutic consideration must, obviously, include the adenohypophysis, as well as the adrenogonadal apparatus in the pathogenesis. From this standpoint the usual clinical aproach, whether it be medical or surgical, is certainly inadequate and in many respects futile.

To cope successfully with the subclinical adrenogenital syndrome, based on widespread functional pathology, remains a great therapeutic problem. But in the meantime let us refrain from ill-advised surgical attempts, unless a tumor of the adrenal or gonad can be clinically demonstrated.

1930 Wilshire Boulevard.

Samuel J. Glass,

DIAPHRAGMATIC HERNIA: RESULTS OF SURGICAL TREATMENT IN 210 CASES*

By Stuart W. Harrington, M. D.
Rochester, Minnesota

I

THE subject of the diagnosis and treatment of diaphragmatic hernia has received more consideration in recent years because its more frequent recognition has changed its status from a rare condition to one that is not infrequently encountered. However, I believe that this subject deserves more general interest and consideration than it is now given, since in many instances the diagnosis is not made until complications have occurred. This subject is of interest to the clinician because the diagnosis is of first importance, the symptoms are often complex and the condition frequently must be considered in the differential diagnosis of diseases of the upper part of the abdomen and lower part of the thorax. It is of interest to the roentgenologist because the roentgenologic recognition of diaphragmatic hernia is often the only means by which a definite diagnosis can be established clinically. The treatment is of primary concern to the surgeon as operative replacement of the herniated viscera, and repair of the abnormal opening in the diaphragm are the only treatments that promise complete relief of symptoms.

Diaphragmatic hernia occurs more commonly than is generally thought. A review of the records of The Mayo Clinic revealed that, from January 1, 1908 to December 31, 1938 inclusive, a diagnosis of diaphragmatic hernia was made roentgenologically or at operation in 514 cases. Of the 514 patients, 247 were males and 267 were females. The oldest patient was eighty-two years of age and the youngest patient was three months of age. The average age of the patients was 43.7 years. In the first case that was observed at the Clinic the hernia was of the esophageal hiatus type, and was discovered at operation in 1908. The first roentgenologic diagnosis of a diaphragmatic hernia at the Clinic was made in 1911. This hernia was of the traumatic type. The first roentgenologic diagnosis of an esophageal hiatus hernia at the Clinic was made in 1921.

The more frequent recognition of diaphragmatic hernias in recent years is exemplified by the fact that a review of the cases observed between January 1, 1908 and December 31, 1925 inclusive, revealed that a diagnosis of this type of hernia was made in only thirty cases observed at the Clinic. In fourteen of the thirty cases the patients were treated surgically. From January 1, 1926 to December 31, 1938 inclusive, 484 patients received a diagnosis of diaphragmatic hernia, of whom I operated on 210. This study, therefore, disclosed that sixteen times as many diaphragmatic hernias were recognized in the last thirteen years as had been recognized in the previous eighteen years. I believe that the condition is even more common than the present records indicate. I have examined the diaphragm in the course of other abdominal operations and occasionally have found a small hernia that had not been recognized clinically or roentgenologically before operation.

This more frequent recognition of the condition in the last two decades has been attributed primarily to the development in roentgenologic methods of diagnosis. The clinical study of cases of proved diaphragmatic hernia has established rather definite symptoms which have enabled the clinician to diagnose the condition or to suspect its presence and request a special roentgenologic examination. I do not believe that the entire credit for the more frequent recognition of this condition is due the roentgenologist. I believe that he must share this credit with the clinician. A greater proportion of the responsibility for the establishment of the correct diagnosis must rest on the clinician. He is the first to see a patient, and the subsequent course of the examination and the treatment depend on his interpretation of symptoms.

Recognition of a diaphragmatic hernia clinically is often difficult because of the complex symptoms, which simulate those of other organic disease of the abdomen and thorax. This, I believe, is one of the most important clinical considerations of diaphragmatic hernia. It is particularly true in cases in which the hernias are progressive and the symptoms vary, depending on the degree and type of herniation. In such cases several clinical diagnoses can be made because of the changing symptoms. The condition may be termed the "masquerader of the upper part of the abdomen," because the symptoms frequently simulate those of other diseases. A study of the 210 patients on whom I operated between January 1, 1926 and December 31, 1938 inclusive, disclosed that an average of more than three previous erroneous clinical diagnoses had been made before the correct diagnosis was established. The most common erroneous diagnoses, in order of frequency, were cholecystitis, cholelithiasis, gastric ulcer, duodenal ulcer, hyperacidity, secondary anemia, cardiac disease, cancer of the cardia, stricture of the esophagus, appendicitis, and intestinal obstruction. This was of particular surgical significance, because in twenty-three of these cases the patients had been operated upon previously for other conditions, without complete relief of symptoms, and were completely relieved following repair of the hernia. Of these twenty-three patients, thirteen had undergone cholecystectomy, four had undergone cholecystostomy, three had undergone appendectomy, two had undergone pyloroplasty, and one had been subjected to a gastro-enterostomy. Five of these patients—two who had been subjected to operation for duodenal ulcer and three who had undergone an operation for

TABLE 1.—*Data in 210 Cases of Diaphragmatic Hernia in Which Operation Was Performed*

Site of Opening	Cases	Cause	Cases	Content of Hernia	Cases
Esophageal hiatus	153	Congenital (history of trauma, 12 cases)	153	Stomach (omentum) Stomach, omentum and spleen Stomach and colon	144 3 6
(Short esophagus type)	11	Congenital	11	Stomach only	11
Hiatus pleuroperitonealis	4	Congenital	4	Colon and small bowel Colon, small bowel, stomach and spleen	3 1
Absence posterior fourth left diaphragm	4	Congenital	4	Stomach, colon, small bowel and spleen Small bowel and colon	3 1
Foramen Morgagni	2	Congenital	2	Colon and omentum	2
Left diaphragm	35	Trauma (indirect injury, 25 cases; direct injury, 6 cases) Inflammatory necrosis, 4 cases	35	Stomach only Stomach and colon Stomach, colon and small bowel Stomach, colon and spleen Stomach, colon, spleen and small bowel Stomach, colon, small bowel and liver Stomach, colon, small bowel, spleen and liver	5 10 5 2 9 2 2
Right diaphragm	1	Trauma (direct)	1	Stomach, colon, small bowel, liver (gall bladder) and head of pancreas	1
Total	210		210		210

gall-stones—had obtained partial relief of symptoms but had continued to have distress from an unrecognized esophageal hiatus hernia. This again emphasizes the importance of examining the diaphragm in the course of all operations on the upper part of the abdomen, particularly when the clinical syndrome has not been typical, or when the operative findings elsewhere than about the diaphragm do not adequately explain the patient's symptoms.

CLASSIFICATION

The conditions that influence the symptoms of diaphragmatic hernia depend to some extent on the type of hernia, whether it is congenital or acquired, and whether or not trauma has been an etiologic factor.

From a clinical standpoint, the history of preceding injury is helpful in establishing the clinical diagnosis and in determining the type of hernia, the urgency of the condition and the prognosis when operative treatment is employed. Because of the clinical and surgical significance of trauma as an etiologic factor, I have suggested that diaphragmatic hernia should be classified in two main groups—nontraumatic and traumatic—and I have subdivided these according to the various types.

A nontraumatic diaphragmatic hernia may be congenital or acquired. If congenital, the hernia is attributable to embryologic deficiency and usually does not have a hernial sac. The most common sites of a congenital hernia, in the probable order of frequency of occurrence, are: (1) through the hiatus pleuroperitonealis (foramen of Bochdalek), (2) through the dome of the diaphragm, (3) through the esophageal hiatus, (4) through the foramen of Morgagni, and (5) through the gap left by partial absence of the diaphragm, which is usually in the posterior portion of the muscle.

If the hernia is acquired after birth, the sites of occurrence are: (1) through the esophageal hiatus, with a type having a hernial sac, (2) through the region of fusion of the anlage of the diaphragm, and (3) at sites named under the congenital type.

Traumatic diaphragmatic hernia may be caused by direct or indirect injury, or by inflammatory necrosis of the diaphragm.

In case of indirect injury of the diaphragm, the hernia may occur at any point, including points of embryologic fusion; but the most common sites are the dome and posterior half of the left part of the diaphragm, or it may occur in the right part of the diaphragm. It usually is the result of a severe, crushing injury and the hernia may or may not have a sac. When the hernia occurs through the esophageal opening there is a sac, but when it occurs through the leaf of the diaphragm there usually is no sac.

In case of direct injury of the diaphragm, the hernia may occur at any point and is usually the result of penetrating wounds, such as those inflicted by a gun or a knife.

Rupture of the diaphragm may be the result of inflammatory necrosis which, in turn, has been caused by a subdiaphragmatic abscess, or rupture may follow necrosis caused by drainage tubes introduced into empyema cavities. In these cases the opening usually is in the posterior part of the diaphragm and there is no hernial sac.

Table 1 shows the sites of the opening in the diaphragm, the probable cause, and the contents of the hernias in 210 cases in which I operated for diaphragmatic hernia.

In a general way the various types of diaphragmatic hernia can be divided clinically into two main classes, depending on the abdominal viscera which are involved. In the first class the stomach is the only abdominal viscus incorporated in the hernia; the hernia usually occurs through the esophageal hiatus. In the second class, the intestines, with or without the stomach and other abdominal viscera, are included in the hernia. These hernias are usually of traumatic origin and are caused by laceration of a normal diaphragm. They also may be of congenital origin and may result from structural deficiency of the diaphragm.

Esophageal hiatus hernia is the most common kind of hernia through the diaphragm that is found among adults. This type of hernia is slowly progressive and constitutes a sliding herniation of the stomach into the posterior mediastinum. It may push into either or both thoracic cavities, but does not enter the pleural cavity. The stomach is usually the only abdominal viscus involved in the hernia. This type of hernia may progress until the entire stomach is contained within the hernial sac, and the colon, omentum, and occasionally the spleen may also be drawn into the hernial sac.

SYMPTOMS

The symptoms of esophageal hiatus hernia may begin at birth or at any time in life. This kind of hernia produces more uniform symptoms than do hernias elsewhere in the diaphragm. The symptoms are those of intermittent, and usually progressive, incarceration and obstruction of the stomach. It is because of the progressive character of the hernias that the symptoms vary, depending on the amount of stomach that becomes incorporated in the hernia, the degree of interference with the diaphragm as well as the size of the hernial orifice, and the occurrence of associated complications such as traumatic ulcer and incarceration of the stomach. At first the symptoms may be mild in character and consist of mild distress in the lower part of the substernal region. This distress occurs while the patient is eating and it often produces a sensation of obstruction to food entering the stomach. It is often accompanied by pain, which is situated in the midline of the epigastrium to the shoulder, and is projected through to the back. The symptoms are more marked after the patient has eaten heavy meals and in many instances they are particularly noted at night. They are usually relieved by belching of gas or by vomiting. As more of the stomach becomes involved in the hernia, the symptoms become progressively more severe. The epigastric pain and distress are often severe enough to simulate gallbladder colic. If traumatic erosions have occurred, there is often an associated gastric hemorrhage which may be noted in the vomitus, but it more commonly is evidenced by the presence of occult blood in the stool. A marked secondary anemia is present in about 10 per cent of cases; this was one of the chief symptoms observed in the cases at the Clinic. In cases of this type the symptoms often simulate those of peptic ulcer so closely that the patient is given ulcer treatment. In cases in which the hernia is extensive, the pressure of the herniated stomach on the pericardium and the reflex nervous disturbance cause symptoms which simulate heart disease that is associated with palpitation, dyspnea and pain that extends to the shoulder and neck through the phrenic nerve.

In cases in which the hernia has been present for a long time, there may be marked ulceration in the lower end of the esophagus, which later causes a stenosis as a result of cicatricial contraction. Patients who have esophageal hiatus hernia, of which the predominating symptoms are those of esophageal obstruction, are of particular interest and require careful clinical study. The symptoms may be attributable to an entirely unassociated lesion of the lower part of the esophagus, such as cardiospasm, carcinoma or diverticulum, or they may be the result of ulceration or stricture of the esophagus that is caused by the hernia. Because of the possibility that there may be a lesion in the lower end of the esophagus, which is caused by or is unassociated with a hernia, I believe an esophagoscopic examination is advisable in all cases in which the presence of a diaphragmatic hernia is suspected.

The chief symptoms of esophageal hiatus hernia depend, to some extent, on the time in the course of the disease at which the patient is examined, on the rapidity with which the hernia has been produced, on the amount of fixation of stomach in the thorax, and on the amount of disturbed function of thoracic organs.

The symptoms of traumatic hernia or of nontraumatic, congenital types of hernia, in which only the stomach is involved in the hernia, are essentially the same as those described, but they are usually more severe and acute and do not last. Cases of this sort are relatively rare, because in these types of hernia the large and small bowel, as well as the stomach, spleen, and occasionally the liver, usually are involved in the hernia. There is no limiting sac, and the herniated abdominal viscera are in direct contact with the lung and pericardium. The condition in these cases may be more properly termed "evisceration of the abdominal organs into the pleural cavity" rather than a "true hernia."

In cases of traumatic hernia the symptoms progress very rapidly, are severe in character, and are attributable to the mechanical interference with function of the herniated viscera as well as to marked interference with function of the heart and lungs. The symptoms in these cases are even more severe than those in congenital types of hernia because of the sudden alteration of the intrathoracic pressure as well as the mechanical interference with the function of the organs involved. The most marked immediate symptoms are usually those of respiratory and circulatory embarrassment. Later, severe hemorrhage from the gastro-intestinal tract may occur as a result of incarceration or strangulation of the hollow viscera. If the patient survives the acute condition, the later symptoms depend on the viscera involved. The symptoms may consist of obstinate constipation, the occurrence of large quantities of gas in the colon, and attacks of partial or complete intestinal or gastric obstruction. The sudden onset of symptoms in cases of traumatic hernia usually is related directly to the injury, and there is no question as to the clinical diagnosis. Surgical treatment is demanded because of the danger of cardiac and respiratory failure or of intestinal strangulation.

CHRONIC ULCERATIVE COLITIS*

By ALFRED C. REED, M.D.
San Francisco

PART I

SEVERAL reasons have conjoined to lead investigators to consider that so-called idiopathic chronic ulcerative colitis might have a bacterial cause. Among these reasons may be noted the frequent occurrence of fever, the frequently observed precedence in time of an undoubted bacterial infection, the isolation of various bacteria of probable pathogenicity, favorable reports on the use of complete or partial vaccines, increased sedimentation rate, and the nature of the gross and microscopic pathology.

BACTERIOLOGY OF CHRONIC ULCERATIVE COLITIS

Against the supposition of a bacterial cause are to be considered the noncontagious endemiology, the lack of characteristic blood reactions, the great variety of bacteria suspected by different observers, the great differences in bacterial findings in different geographic areas, the frequent tendency to remission with and without treatment, the frequent ineffectiveness of vaccines, the common disagreement of careful bacteriologic findings in the same geographic area, and the postulation by proponents of any one bacterium that innumerable bacteriologic analyses are necessary to rule out the particular bacterium being considered. This last point deserves explanation. If twenty cultures are necessary before the discovery of the suspected organism, it does not at all follow that that particular organism has been present, undiscovered, throughout the series, nor does it follow necessarily, or even logically, that that organism has any etiologic relationship. It is equally, or even more reasonable to suppose that the suspected organism is temporarily in transit through the bowel, or is an inconsequential commensal or that, if the search is continued long enough, almost any organism may eventually be found, as in the case of B. dysenteriae in monkeys. The rich and highly variegated flora of the colon is constantly receiving additions by mouth and undergoing adaptations and transmutations in the constantly changing culture medium of the intestinal contents. Bacteria, whose origin lies in an extra-intestinal focus or portal of entry, as, for instance, the tonsils, sinuses, kidneys, and genital tract, are shed irregularly from the bowel. Analogy with the long search properly advised for protozoal parasites is completely illogical because of the sharp and extreme incommensurability of their respective biologic life cycles.

In spite of these contradictions and inconsistencies, a bacterial cause for chronic ulcerative colitis has been a proper field for investigation, and has attracted a rapidly increasing mass of study and number of workers. The chief bacterial theories can be summarized for our purposes here in brief terms. None has passed the stage of theory and some can only be regarded as hypotheses. An exhaustive listing is neither practical nor possible, nor is it possible to review the immense literature of the subject. Enough can be given briefly, however, to throw light on our own findings.

ETIOLOGIC THEORIES

I. *Chief Theory.*

The chief theory that has challenged attention and vigorous debate is the proposition that chronic ulcerative colitis is a continued infection with some type of dysentery bacilli, with a chronic course attended by exacerbations and often long remissions, inconstant appearance of bacilli in the stools, and either beginning as a bacillary dysentery of varying severity or resulting from an implantation of such bacilli on a different process, and a gradual localized build-up to the threshold of symptoms. It is impossible to consider all the literature on this thesis. Illustrative examples may be taken from papers by Hurst and others in England, Mackie, Felsen and others in New York, Zweig in Germany, and Throlakson in Canada, omitting numerous others.

A. F. Hurst[1] has discussed repeatedly the relation between bacillary dysentery and ulcerative colitis. He states that in 1921 he was so impressed by the similarity in appearance of the colonic lesions of bacillary dysentery and ulcerative colitis that he revived the suggestion of Saundby[2] made in 1906, and of Hawkins[3] made in 1909, to the effect that ulcerative colitis might be due to dysentery bacilli. In 1927, Hurst wrote that in no case had his colleagues been able to isolate B. dysenteriae in such cases from stools or with sigmoidoscope, and in no case had a positive agglutination reaction been obtained. He went on to state that he is doubtful if any other form of severe colitis exists except amebic, bacillary and chronic ulcerative.

In 1919, in the belief that ulcerative colitis was really an aberrant form of bacillary dysentery, Hurst administered polyvalent serum intravenously in large, repeated doses, with remarkable therapeutic results in the first case. Since that he has often used serum with excellent results, although occasionally with little or no effect. He notes the possibility of nonspecific protein reaction, and states that even severe reactions are never dangerous. In regard to the Bargen-Logan vaccine, in case the original infection is cured, Hurst asks what value results if there is left a residual secondary infection.

Thorlakson,[4] in Winnipeg, gives an interesting clinical experience which led him to the conclusion that ulcerative colitis is caused by dysentery bacilli. He secured his specimens for culture with the use of a small, sharp spoon-curet through the sigmoidoscope. He felt that the inclusion of some tissue from the ulcer bases by this method resulted in the easier finding of dysentery bacilli in culture.

Hern[5] discusses pathogenesis in a very complete fashion. He states: "As sole and primary cause, infection by intestinal flora is quite untenable. Ulcerative colitis bears no clinical or pathological resemblance to the few conditions in which the intestinal flora attack the large intestine—appendicitis and diverticulitis." He goes on to say that the relation of bacillary dysentery to ulcerative colitis is "altogether peculiar." "The two diseases are closely allied and may be one and the same. Even if not the same, the pathology of dysentery has a very direct bearing on the subject." He finds, however, that there is no substantial evidence in favor of the theory, and he finds it difficult to accept favorable serum therapy as confirmation.

---

* From Division of Preventive Medicine, University of California Medical School.

Presented before San Francisco County Medical Society, December 6, 1938.

Mackie[6] has given an excellent review of the relationship of dysentery bacilli to chronic ulcerative colitis, and has reported one case of the latter with heavy infection of Flexner-Y bacilli which was completely cured by autogenous vaccine. In discussing this case, he notes that the Flexner-Y group of dysentery bacilli may cause mild clinical attacks which may not be epidemic. This is fully in accord with our own and other published experience. Mackie notes further that some such cases may become chronic, with lower bowel ulceration, even though the initial attack was very mild. He calls attention to the similarity or identity in kind of the lesions of chronic bacillary dysentery and many cases of chronic ulcerative colitis, and remarks on the intermittance of the shedding of bacilli as a characteristic of chronic Flexner-Y type infection.

In discussing the relationship of chronic ulcerative colitis to chronic bacillary dysentery, Mackie[7] notes frequent involvement of the small intestine, which then shows motor changes suggestive of acute exudative inflammation. In eighty-three cases, he recovered dysentery bacilli in 20.4 per cent, and obtained serologic evidence in an additional 21.6 per cent. In 102 controls, dysentery bacilli were recovered in two and positive agglutination was present in seven. He concludes that the evidence does not support the idea of a unitary cause of chronic ulcerative colitis, but he considers that a certain group of cases are due to chronic infection with dysentery bacilli.

Penner[8] believes that the available evidence indicates that about 10 to 15 per cent of cases clinically diagnosed as idiopathic ulcerative colitis, rightfully belong in the group of chronic bacillary dysentery, and the remainder are still of unknown etiology. He notes the preponderance of ulcerative colitis in the third and fourth decades, and its rarity in childhood, when bacillary dysentery is most common. Its occurrence, twice as often in women as in men, is against a bacillary cause, and also the relative infrequence of chronic ulcerative colitis among the males of central Europe, where bacillary dysentery was exceedingly prevalent during the Great War. He comments also on the noncontagiousness of chronic ulcerative colitis.

Felsen[9] attempts to relate nonspecific ulcerative colitis, acute bacillary dysentery, distal ileitis, ileitis and nonspecific granuloma, as various stages of one disease. He notes that cases of acute bacillary dysentery, lasting more than three weeks, seemed to persist due to nonspecific secondary infection. Much of his diagnosis, as in the case of many other writers, was based on blood agglutinations which are notoriously unreliable, if not useless. Felsen[10] admits that in nonspecific ulcerative colitis, the specific organism has usually died out and been replaced by secondary invaders, usually an enterococcus and B. coli.

WHAT CAN ONE EXPECT FROM RADIATION IN CARCINOMA OF THE RECTUM AND ANUS?*

By Orville N. Meland, M.D.
Los Angeles

Discussion *by William H. Daniel, M. D., Los Angeles.*

I AM sure that every one of us has been confronted by patients who have had cancer of the terminal portion of the intestinal tract and who have asked, What may I expect from x-ray and radium therapy? Such a question is logical and one that should be answered with ease, especially since radiation has been a method of treatment in carcinoma for over thirty years. However, it is much more difficult than it first seems. In order to answer the question intelligently, it will be discussed in two parts—as it applies to carcinoma of the rectum, and to carcinoma of the anus. Though these forms of cancer are both found in the lower 15 centimeters of the large bowel, the problems involved are distinct as to anatomic relations and spread, and as to histologic structure.

COMMENTS ON THE LITERATURE

In reviewing the radiologic literature, one is struck by the absence of any appreciable mention of five-year cures. Sheddan, in reviewing the use of radium in rectal cancer, and presenting his results, has no five-year cures, but has two patients living at three and four years, respectively, with no evidence of disease. He mentions the various techniques used throughout the world, and he lists nine—evidence of the fact that no one of them is satisfactory. Bowing and Fricke report sixteen three-year cures and five five-year cures out of 286 cases. The workers in St. Mark's Hospital in London, namely, Lockhart-Mummery and Sir Charles Gordon Watson, used radium alone in a series of cases. Their results were very disappointing, since they had no five-year cures. However, the method of using radium was largely through the technique of Neumann and Coryn, in which the coccyx is removed and the bowel exposed so that platinum needles containing radium are implanted outside the rectum at the level of the tumor. Such a procedure is almost as formidable as the radical operation and has resulted in much postoperative shock, with death from the operation in some instances or a slow painful convalescence, usually complicated by prolonged infection, sloughing, and frequent recurrences. Mummery says that this procedure has been given up; and though he cites no five-year cures, he has had recoveries in early cases where he has used gold radon seeds intrarectally. Brinkley has also reported five-year recoveries following radon seeds and x-radiation at the Memorial Hospital.

---

* Read before the Radiology Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

AUTHOR'S OBSERVATIONS

In reviewing our experience during the past fifteen years, our results are similar to those obtained by other workers in this field. During that time we have treated 237 cases, which fell into the following groups:

(*a*) Inoperable: 167 cases, 40 of whom had colostomies.

(*b*) Recurrent: 32 cases, all of whom had had radical excision of the rectum.

(*c*) Operable: 38 cases, three of whom had colostomies.

In these patients no definite or set technique was followed. In the early cases many of them were inadequately treated, according to our present-day conception. We had no past experience to fall back upon, and the dosages used compared favorably with those employed in other parts of the body. Some were treated with low voltage x-ray, others with high voltage x-ray, while at present we are using supervoltage x-rays. Likewise, when surface applications of radium were used the radium was filtered through brass and rubber, while now it is filtered through gold and rubber. Some had interstitial radiation obtained from steel needles, but at present needles are used with .5 millimeter of platinum. Finally, some were treated with radon seeds made up with glass, but now these are of gold. We had no definite idea as to tumor dosage, since our conception of radiosensitivity was hazy. No accurate attempt was made to estimate the radiation absorption in the tumor obtained from either external or surface radiation. Even at that we did obtain some results that were encouraging.

INOPERABLE GROUP

In these patients one cannot hope for anything but palliation, as manifested by (*a*) diminution in size of the tumor; (*b*) relief from pain; and (*c*) cessation of bleeding, with resultant prolongation of life; for even in massive pelvic involvements the degree of benefit has at times been striking. The average length of life after the patient was first seen was one year, though many were followed for two and a half years and some for as long as four years before they succumbed to liver metastasis. Those patients who had colostomies did much better than the others, as radiation therapy could be carried out more effectively since infection was less and the bowel was at complete rest. In those individuals refusing colostomies, we resorted to electrocoagulation through the proctoscope. While the immediate results are good as far as the obstruction is concerned, fibrosis and contracture take place later which necessitates its repetition on one or more occasions. The occasional use of radiation preoperatively, especially radium, has resulted in transforming an inoperable case to an operable one. Bowing and Fricke speak of its use in this connection. Whether these patients exhibit a low rate of recurrence and a high rate of five-year curability is too early to state.

The histories of the following patients in this group are of interest.

REPORTS OF CASES

Case 1.—E. D. A. Seen in 1929. Sixty years of age. Complains of rectal bleeding and backache. Two months ago he had a colostomy elsewhere for obstruction and a carcinoma was found that had involved the posterior wall of the bladder, the prostate, and the sacrum. He was given three courses of high voltage x-ray therapy and two applications of radium in the rectum, filtered through brass and rubber. His bleeding and pain disappeared; he gained weight. He played golf every day, and was comfortable up to six months before he died—four and a half years after he was first seen.

* * *

Case 2.—J. F. D. First seen in 1932. Age, 51. He had had rectal bleeding for six months. Twelve days ago his physician had cauterized the growth and a colostomy was done. He was given supervoltage x-ray therapy and radium therapy in the form of radon seeds. He lived in comfort, carrying on his work as a pattern maker for three and a half years, when he died of liver metastasis.

* * *

Case 3.—H. G. First seen in 1933. Age, 55. He had rectal bleeding for four months. Two weeks earlier his surgeon had cauterized the growth, and a colostomy was done. Histologically, it was an adenocarcinoma, Grade IV. He was given two courses of supervoltage x-ray therapy, and radon seeds were plunged into the growth. He lived in comfort for two and a half years, when he suddenly died of brain metastasis. Autopsy revealed that the rectum was free from any evidence of carcinoma, grossly and microscopically.

* * *

Case 4.—B. D. First seen in 1936. Age, 50. Complained of intense backache and rectal bleeding of four months. Rectal examination showed a tumor mass partially obstructing the rectum, fixed to the anterior wall of the sacrum. Histologically, the tumor was an adenocarcinoma, Grade II. He was advised to have a colostomy, which he refused. He was given two courses of supervoltage x-ray. Radium platinum needles were plunged into the base of the tumor after the obstruction was relieved by electrocoagulation. Pain and bleeding ceased, and for two years he has been comfortable. He gradually developed an obstruction which necessitated a colostomy at the Veterans' Facility, where he died a week after the operation.

RECURRENT GROUP

In this group treatment was given to control growth and to relieve pain. All patients died within a two-year period, usually from infection in the operative field, though a few died from liver involvement.

OPERABLE GROUP

Here the problem is different. The lesion may be large or small and is not fixed. Our experiences in this group have been obtained by the use of radiation alone, or combined with electrocoagulation and colostomy. The following histories illustrate the point.

REPORTS OF CASES

Case 5.—Mrs. R. P. First seen in 1930. Age, 65. Three months ago she noticed rectal bleeding. There was a lesion two centimeters wide on the posterior wall of the rectum. Histologically, it was an adenocarcinoma, not graded. Radon seeds were implanted with disappearance of the tumor. She remained well until in February, 1938, when she died of liver metastasis. Locally, there was no evidence of tumor.

* * *

Case 6.—A. A. First seen in 1927. Age, 44. Complained of rectal bleeding of seven months' standing. Two weeks before, his physician had partly destroyed an adenocarcinoma with the cautery. Radium, filtered through brass and rubber, was placed on the base. A severe reaction took place, but the patient recovered and was living in 1938.

* * *

Case 7.—Mrs. P. D. First seen in 1935. Age, 45. For three years she had had rectal bleeding. A biopsy showed an adenocarcinoma. The surface of the tumor was cauterized, and radium, filtered through gold and rubber, in a surface application, was placed against it. At present she is well, two and a half years, with no evidence of tumor.

In this group we have also two individuals, both patients of Dr. E. C. Moore, on whom preliminary colostomies were done, after which radium was used.

Case 8.—Mrs. E. C. First seen in 1937. Age, 55. She had an adenocarcinoma 3 by 4 centimeters, 3 centimeters above the sphincter. Platinum needles, containing 2 milligrams each, were inserted beneath the tumor, with complete disappearance of the growth. This patient has been well one year and her colostomy has been closed.

* * *

Case 9.—W. L. First seen in 1937. Age, 63. He had a rectal tumor 2 centimeters in diameter, which was an adenocarcinoma. After colostomy, platinum needles, containing radium element, were inserted into the base of the tumor, and this was followed by its complete disappearance. His colostomy has been closed.

EPITHELIOMA OF THE ANUS

Carcinoma of the anus, which is really epithelioma of the anus, is discussed separately from the rectum, since the growth is of a different variety histologically, and because it metastasizes to the inguinal nodes, rather than to the lumbar nodes. It is accessible and, as such, may be removed by surgery or cautery with good results, but this usually results in destruction of the sphincter with its loss of control. Since epitheliomas on the skin, in the mouth, and on the cervix are successfully controlled by radiation, we feel that they can be treated just as successfully at the anal margin by the same method. Combined x-radiation with interstitial or surface radium in our hands have been very successful, as illustrated by the cases listed below. Even Mummery, who is an advocate of the radical operation for carcinoma of the rectum, says that epithelioma of the anal region is better treated by radium, and in such cases he always advises radium.

Our experience in this type of case is limited to twelve patients. Of these we have adequate records in nine. Two of the patients were advanced and died of metastasis after the primary lesion was controlled. The others all had complete disappearance of their tumors and have been followed from two to seven years. They are in good health and have complete control. The following histories are typical of this group.

REPORTS OF CASES

Case 10.—Mrs. F. L. First seen in 1932. Age, 65. Inside the anal margin is a nodular bleeding tumor 3 by 3 centimeters. Section shows it to be a squamous-cell epithelioma, Grade III. She was given a course of high voltage x-ray, and radium, filtered through gold, was applied to the base. Except for a stricture she has been well for six years.

* * *

Case 11.—E. W. R. First seen in 1934. Age, 68. For three years he has had a prolapse of the rectum. Recently an ulcer came on and biopsy showed that it was due to a squamous-cell epithelioma. Platinum needles were inserted around the anal margin. There was complete healing of the ulcer, with no anal disturbance. He is well now almost four years.

* * *

Case 12.—Mrs. F. K. First seen in 1936. Age, 52. Three months ago she began to have rectal bleeding and pain. On the anterior rectal wall, involving the sphincter, there was a bleeding tumor mass 4 centimeters in diameter. Section showed it to be a squamous-cell epithelioma, Grade III. She was given a course of supervoltage x-ray, and platinum needles, each containing 2 milligrams of radium, were inserted under the base. There was complete healing and for two years she has been well.

* * *

Case 13.—W. B. M. First seen in 1935. Age, 77. He has had fistulae and discharging sinuses around the anus for many years. He had a nodular infiltrating tumor completely surrounding the anus. It was 12 by 15 centimeters, and there were multiple fixed nodes in both groins. Histologically, it was squamous-cell epithelioma, Grade II. He was treated by supervoltage x-ray alone. The primary tumor disappeared, though the patient died six months later of general metastasis.

COMMENT

Despite the fact that rectal carcinoma carries an operability of only 50 per cent, and radical resection is followed by a mortality varying from 10 to 50 per cent—depending upon the type of operation—surgery offers the greatest hope of recovery. While many patients have recovered from radiation alone, they are the exceptional case and not the rule. However, up to the time that the radical operation was standardized, surgical end-results were extremely unsatisfactory, not only from the viewpoint of mortality but also from the standpoint of recurrence and five-year end-results. So, too, with radiation therapy: the technique has been in a flux, constantly changing, as our ideas of carrying out the procedure have changed. We now have improved equipment which will give greater depth doses from x-ray, while our knowledge of radiation effects and sensitivity have progressed greatly in the last decade. For these reasons one should expect better results in the future.

From a statistical viewpoint, the crux of the question is dependent on what the definition "oper-

Fig. 2.—Section (male) below symphysis pubis.

ability" means. This must be based on not only the extent and size of the lesion, but also the pathological grading of the tumor. Tumors graded III and IV are obviously more prone to recurrence than I and II when attacked surgically. As a matter of fact, a patient with a Grade IV tumor, no matter how early it is recognized, does not recover from a surgical attack, but the tumor will disappear after radiation. What constitutes "operable," then, is a matter of personal judgment. Obviously, patients who develop and die from recurrence locally were operable technically at the time of operation, but histologically not.

Curability.—Curability, as defined in the literature, is based on operability. All statistics are based on this factor—ignoring the vast host of patients who do not fall into this group. The patient who comes into your office, and who knows that he has cancer, is not interested in what artificial classification he falls into; he wants to know what can be done! (All statistics should be based on absolute figures.) Viewed in this manner, then, the quoted curability figures would be decreased by 50 per cent, and would only run from 10 to 15 per cent. While surgery does give us a better outlook in the strictly operable case, especially in Grades I and II tumors, it is time that both surgeon and radiotherapist should no longer be rivals but allies in this field. When Grades III and IV tumors are under investigation, the radiotherapist should be consulted before the operation regarding preoperative treatment in these groups; and, if possible, he should be an assistant so that he can be fully familiar with the existing conditions in the particular patient under consideration.

Adenocarcinomas in this region are deep-seated and are more or less inaccessible. While they have the reputation of being radio-resistant, I do not believe that cells of this type in this region differ greatly from those found in the breast or the uterus. Many will be found to be sensitive; the difficulty rests in getting enough radiation into the desired area. Knowing that squamous cell epitheliomas need about ten erythema doses to destroy them, it is reasonable to assume that adenocarcinomas will need this and more. Such dosage will naturally result in more or less fibrosis. Since the bowel wall is only 2 or 3 millimeters thick, and if the lesion is encircling and infiltrates the circular muscles, its disappearance will be followed by stricture formation and partial obstruction.

In order to attain a proper dosage, it is necessary to get the benefit of both x-ray and radium. This can be done by an estimation of the location of the tumor so as to be able to calculate the dosage from x-radiation. Referring to Figures 1 and 2, which represent tumors in two different locations in the rectum, we may see what must be expected. If four or five ports be used with 1800 r to each port, except the perineal, then a tumor dosage of three and a half erythema doses is obtainable in the average individual. If one desires, one may push the total dosage up to the skin-tolerance dose of 2400 or 3000 r over each port, with corresponding increase in tumor dose; but this may be followed by late undesirable sequelae in the skin and in the bladder. The difference between ten erythemas and three and a half or six and a half erythema doses must then be made up by the use of radium. Whether one should use radium as a surface application or interstitially, as radon or in platinum needles, will depend on the individual case; its dosage is easily calculated from the Quimby-Martin tables.

Colostomy.—While many patients may be successfully treated without a colostomy, the more one sees these individuals the more one feels that a preliminary colostomy should always be done with the understanding that if the treatment is successful and there is no fibrous stricture, the colostomy may be closed after a year. The colostomy puts the rectum at rest, the inflammation subsides, and the danger of infection and radiation necrosis is reduced to a minimum. Furthermore, since peristalsis and the presence of fecal matter is done away with, it is much easier to retain the radium in the desired location as long as it is needed.

With such improvements in technique, many operable cases of rectal cancer may be justifiably treated by radiation under the following conditions:

(*a*) Where the patient refuses operation.

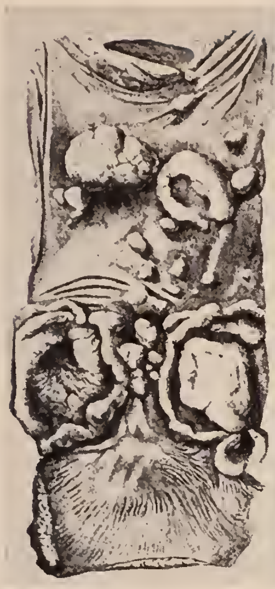

Fig. 3

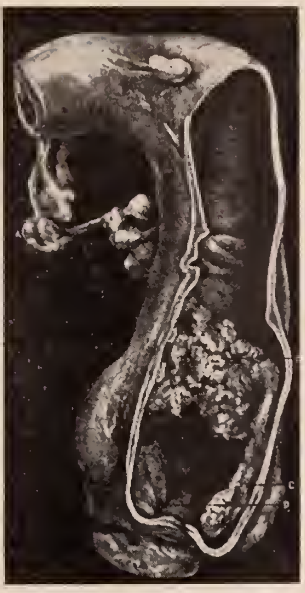

Fig. 4

(*b*) Where age and other complications preclude the radical operation.

(*c*) In the operable patient who has a small tumor of high-grade malignancy, which does not encircle the bowel and one in whom the proctoscope passes by readily. Here adequate dosage sufficient for complete destruction is obtainable by radon seeds or platinum needles. However, those operable cases that do not allow the passage of the proctoscope are not particularly suitable, since one cannot estimate the extent of the disease—as shown in Figures 3 and 4. In them it is impossible to use radon seeds with accuracy. Surface applications may be used, but the size of the area to be treated and the dosage must be a matter of conjecture. If radium is used in a contact applicator in order to get depth effect in a tumor from one-half to one centimeter thick, caustic effects are obtained on the surface, which add to the difficulties, as it results in necrosis, infection and rectal tenesmus. Since rectal cancers are slow-growing, and it has been estimated by various observers that a year elapses before the disease passes beyond the muscular coat, a trial of radiation, especially radium locally, will not jeopardize the patient's chances of recovery. If the radiation does not control the growth, the radical operation can still be carried out.

SUMMARY

In carcinoma of the rectum, radiation will stop bleeding and relieve pain in the majority of individuals. Occasionally, the inoperable case may become operable following its use. Though radiation therapy has been disappointing in the operable case when, computing five-year cures as compared with radical surgery, many patients are cured by its use; however, the percentage is not large. This may be improved by paying more attention to histologic structure of the tumor, by developing a better technique and by careful selection of suitable cases. Where treatment is contemplated, colostomy should be carried out, if possible, in operable as well as in inoperable cases.

In epithelioma of the anus, radiation stands on a par with surgery in end-results. While successful surgery invariably results in destruction of the sphincter, radiation is preferable, as the curability is high and sphincter control is retained. Therefore, radiation therapy should be the method of choice in this region.

1407 South Hope Street.

DISCUSSION

William H. Daniel, M. D. (1930 Wilshire Boulevard, Los Angeles).—We all regret that radiation has not given us the results in carcinoma of the rectum that we had hoped for. Very thorough and detailed treatment has been carried out by many workers in different parts of the world. The results reported correspond very closely to those Doctor Meland has recounted here. I have seen several patients who have been treated with deep therapy and who remained fairly comfortable for several months or longer. There is still some variance of opinion whether radiation will affect the metastases at some distance from the tumor. There is also dispute as to the value of preoperative and postoperative treatment.

My personal experience with radiation treatment has been limited. I have had the opportunity to follow some cases treated by this means, and some cases which had had only preoperative radiation and some postoperative radiation. Several years ago, when the high voltage was first used, I was not impressed with the results. With the newer methods of treatment, I am convinced that there is value in selected cases, and I am positive there is a field for this procedure in the poor risk, or inoperable case. In cases that are distinctly operable, or borderline, I still feel that surgery alone is the best procedure.

In epithelioma of the anus, which constitutes less than 5 per cent of the total, I have been convinced that radiation by radium and x-ray is to be considered as efficacious as surgery alone. My results with surgical treatment, even with radical procedures, have been disappointing due to recurrence or early metastases. These cases are apparently more malignant than the adenocarcinoma. A combination of radiation and surgery might, in these cases, answer the problem.

SULFANILAMIDE: SOME IMMUNOLOGICAL STUDIES*

By Paul Michael, M.D.
Oakland

Discussion *by John Dougherty, M. D., Oakland; Albert M. Meads, M. D., Oakland; Angus Wright, M. D., Los Angeles.*

The history of sulfanilamid dates back to 1908 when Gelmo,[1] a German dye chemist, synthesized the compound for that industry. In 1909, Hoerlein, Dressel, and Kothe[2] prepared the first azo dye stuffs with sulfanilamid radicles, but no pharmacological investigations were conducted. In 1917, Jacobs and Heidelberger,[3] of this country, synthesized meta-amino-benzene-sulfonamid and para-chlor-acetyl-amino-benzene-sulfonamid, and combined it with hydrocuprein through the azo linkage.[4] They stated that their colleague, Dr. Martha Wollstein, would discuss the bactericidal properties of these drugs in a subsequent paper. This, unfortunately, was never published. In 1932, Mietzsch and Klarer[5] patented a new dye now known as prontosil. Domagk,[6] working in conjunction with these dye chemists, demonstrated the therapeutic value of prontosil rubrum in mice streptococcal infections. These same chemists later were successful in the synthesis of the more soluble compound, which is the prontosil solution now in common use. That these dyes were broken down in the tissues to para-amino-benzene-sulfonamid, now known as sulfanilamid or prontylin, was postulated by Tréfouel and coworkers.[7] This was substantiated by Fuller,[8] Marshall, Emmerson and Cutting,[9] who found sulfanilamid in urine of patients after having received an intravenous injection of prontosil. The efficacy of these drugs in certain infections is widely accepted even though the mode of action has never been solved. Marshall, Emmerson and Cutting[9] have shown that the optimum concentration for the action of this drug on organisms *in vitro* is 10 milligram per cent. They have also demonstrated that only by a prolonged dosage of 80 grains a day can this accepted blood level of 10 milligram per cent be maintained in human beings. Osgood,[10] on the other hand, has shown that the concentration of one milligram per cent of sulfanilamid is effective against Beta hemolytic streptococci in human bone-marrow culture. Fuller[8] believes that effective therapeutic results *in vivo* have been obtained with only a concentration of one milligram per cent in the blood.

---

* Read before the Pathology and Bacteriology Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

Attempts to correlate *in vitro* experiments with *in vivo* therapeutics, in order to achieve a clear conception of the mode of action of the drug, leads to innumerable pitfalls. For instance, it has been shown that sulfanilamid has no effect *in vitro* against B. aertryke, B. typhosus, B. paratyphosus B., and pneumococcus, whereas the drug protects mice against these infections. Furthermore, Long and Bliss[11] have demonstrated bacteriostatic effects *in vitro* for alpha and gamma streptococci, and yet treatment of these clinically has given very discouraging results. Kenny, Johnston and Von Hoebler[12] found that urines containing para-amino-benzene-sulfonamid were bacteriostatic to some strains of B. coli, but other strains were unaffected *in vitro,* yet were successfully controlled in human infections. In the hope of a possible contribution along these lines, numerous experiments were conducted in the Peralta Hospital laboratory during the past year in an attempt to evaluate the importance of phagocytosis and bacteriostasis of para-amino-benzene-sulfonamid or sulfanilamid.

PHAGOCYTOSIS EXPERIMENTS

The organism used was a fast-growing strain of gonococcus. It was grown in hormone broth containing 0.5 per cent glucose and 25 per cent ascitic fluid, and also on blood-agar slants. In the former case the organisms were separated by centrifugalization and resuspended in physiological saline. In the latter case the organisms were harvested from a thirty-six-hour slant with physiological saline. In both instances the heavier aggregates of organisms were removed by the centrifuge at low speed. The supernatant suspension was diluted to contain one-half billion organisms per cubic centimeter.

Five cubic centimeters of human blood were collected with a drop of 20 per cent potassium oxalate, to prevent clotting. Heparin 1-2,000 and 0.4 per cent sodium citrate were used also in a few instances without appreciable differences. To 2 cubic centimeters of blood in a test tube was added 0.1 cubic centimeter of 0.4 per cent para-amino-benzene-sulfonamid (Eastman) in physiological saline. To a control tube containing 2.0 cubic centimeters of blood was added 0.1 cubic centimeter of saline, and to both these tubes 2.0 cubic centimeters of bacterial suspension were added. The experimental tube now contained 10.0 milligram per cent of the drug. The two tubes were placed in a water bath at 37 degrees, attached to and mechanically shaken by an electric shaking device to maintain constant motion. Every three minutes capillary pipettes were inserted in the tubes and blood smears made from both. The smears were stained by Wright's stain, and the number of organisms phagocytized by 50 polymorphonuclear leukocyte neutrophils were counted.

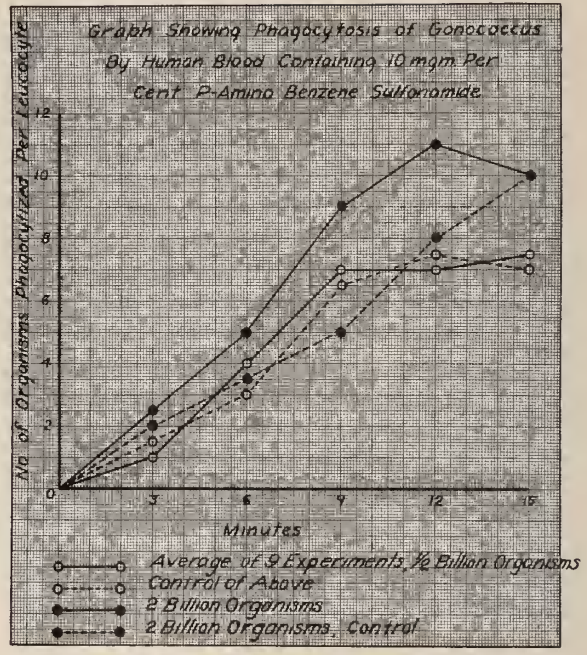

Chart 1

There was no appreciable difference seen between the control and experimental tubes in any of the experiments. In the experiments in which two billion organisms per cubic centimeters were used, there was some increase in phagocytosis over the control. The obvious probable error in manipulative technique with such a large inoculum minimizes the significance of the apparent slight increase in phagocytosis. The results of the above experiment are recorded in Chart 1, showing a composite of the many experiments. Smears made at one-hour and two-hour intervals (not shown in the graph) showed the same proportions between experimental and control tubes, although a larger number of organisms had become phagocytized.

BACTERIOSTASIS EXPERIMENTS

Strains of alpha, beta, and gamma streptococci, B. coli, Staphylococcus aureus and gonococcus were next investigated in the presence of sulfanilamid. One-tenth of a cubic centimeter quantity of twenty-four-hour cultures was inoculated into flasks holding 20 cubic centimeters of glucose-hormone broth containing 1.0, 10.0, and 100.0 milligram per cent para-amino-benzene-sulfonamid. The culture media for gonococcus included also 25 per cent ascitic fluid. Control tubes contained the same inoculum of organisms, but no drug. In order to determine the effect of acidity or alkalinity, these experiments were conducted at a PH of 5.3, 6.0, 7.4, and 8.2. The results of these experiments were tabulated in Table 1. In only one instance was there any bacteriostatic effect noted. Gonococcus was partially inhibited by one milligram per cent of the drug and completely inhibited by 10 and 100 milligram per cent. In none of the other experiments was the drug effective in causing inhibition of growth. This result naturally raises the question of selective and specific action of sulfanilamid on the gonococcus. This would assume, then, that the drug acts on some organisms in one manner, and on other organisms in another manner. Such a concept does not conform to the accepted ideas of immunity or therapeutics, for its mode of action should be consistent against all organisms.

In one set of experiments, rabbits varying between 1 and 4 kilograms in weight were injected over a period

TABLE 1.—*Bacteriostatic Effect of Prontylin at Several Hydrogen Ion Concentrations*

Organism	pH	Prontylin 1 Mg. Per Cent	Prontylin 10 Mg. Per Cent	Prontylin 100 Mg. Per Cent	Control
Gonococcus	7.4	2+	Negative	Negative	4+
Beta hemolytic streptococcus	5.3	4+	4+	4+	4+
	6.0	4+	4+	4+	4+
	7.4	4+	4+	4+	4+
	8.2	4+	4+	4+	4+
Staphylococcus aureus	7.4	4+	4+	4+	4+
	5.3	4+	4+	4+	4+
	6.0	4+	4+	4+	4+
	8.2	4+	4+	4+	4+
B. coli	5.3	4+	4+	4+	4+
	7.4	4+	4+	4+	4+
	8.2	4+	4+	4+	4+
Alpha streptococcus	6.0	4+	4+	4+	4+
	7.4	4+	4+	4+	4+
Gamma streptococcus	7.4	4+	4+	4+	4+

of three days with a total of 4 grams of the drug in physiological saline. Three and one-half cubic centimeters of blood were collected from the heart and defibrinated. The concentration of the drug, as determined by the method of Marshall, Emmerson and Cutting,[9] was found to be 2 milligram per cent. The blood was next added to an equal value of hormone broth containing alpha, beta streptococci and Staphylococcus aureus. There was no inhibition noted in the growth of any of these organisms. As this is the blood level achieved in most clinical studies wherein satisfactory therapeutic results have been reported, it is probable that the beneficial effects obtained are not due to a direct bacteriostatic action.

COMMENT

Many paradoxical experimental results are cited in the literature of the variability of para-amino-benzene-sulfonamid on different strains of organisms. On the other hand, many explanations have been offered for the mode of action of the drug. To date, they include:

1. Germicidal action.
2. Specific action on the carbohydrate capsules of organisms.[13]
3. Increased phagocytosis.[11]
4. Bacteriostasis.[11]
5. Combination of bacteriostasis and phagocytosis.
6. Antitoxic effects.[10]

Most workers are convinced that para-amino-benzene-sulfonamid in safe therapeutic concentrations is not bactericidal, and that it is more effective on the noncapsulated organisms than on those with capsules. We are left, therefore, with the other theories which, at the present time, seem to be the most logical and plausible, either in part or in combination. The results of the experiments herein cited in this paper do not bear out the claims cited by Long and Bliss[11] on the phenomenon of phagocytosis. On the other hand, these same authors claim that sulfanilamid has bacteriostatic action on Clostridium welchii, both *in vivo* and *in vitro*. In other words, according to them sulfanilamid, by its bacteriostatic action, slows down the multiplication of organisms, allowing more thorough and effective phagocytosis. With the exception of a definite inhibition of growth of gonococcus in the presence of the drug, we were unable to show any bacteriostatic effects on several organisms.

Osgood,[10] working on human bone-marrow cultures, concluded that sulfanilamid is effective on the beta hemolytic streptococcus by virtue of its antitoxic properties. According to this theory, however, sulfanilamid is dependent upon the production of an exotoxin by the organism in question. This method of Osgood opens up a very interesting avenue of research on the problem, but leaves many questions unanswered.

It is our feeling that this problem, as it exists at the present time, is far from solved. There is too large a gap between the experimental data and the analogies and theories of explanation. It is our thesis that the experimental data accumulated so far end with an unsatisfactory explanation. Our experimental work to date leads us to believe that the action of sulfanilamid is not explained on the basis of its bactericidal, bacteriostatic, or phagocytic action *per se*, but probably from some chemical or immunological reaction yet to be determined.

IN CONCLUSION

1. Pertinent literature on para-amino-benzene-sulfonamid (sulfanilamid) is reviewed.

2. No stimulation of phagocytosis of human neutrophils for gonococci by para-amino-benzene-sulfonamid could be demonstrated *in vitro*.

3. Concentrations of 10 milligram per cent and 100 milligram per cent of para-amino-benzene-sulfonamid inhibited growth of gonococcus in culture.

4. One hundred milligram per cent of the drug did not inhibit the growth of alpha, beta, or gamma streptococci, Staphylococcus aureus, or B. coli *in vitro*.

5. Rabbits' blood, containing 2 milligram per cent of para-amino-benzene-sulfonamid by intravenous injection, did not become bacteriostatic to alpha, beta, and gamma streptococci.

6. No theories are put forth as to the probable action of sulfanilamid, and the question is raised as to our present concept.

DISCUSSION

John Dougherty, M. D. (3115 Webster Street, Oakland).—Since the use of sulfanilamid has become routine in the treatment of gonorrhea it has been apparent that there was a wide variation in the clinical response of the gonococci to this drug. With a view of estimating the frequency of the difference in its behavior, a study was made of seventy-five cases of acute gonorrhea. Inasmuch as in certain complications of gonorrhea (peri-urethral abscess, prostatic abscess, etc.), sulfanilamid seems to be ineffectual, we were careful to select only those cases which were free from complications. These seventy-five men were then given sulfanilamid, orally, in the dosage of grains thirty in twenty-four hours. No other treatment was administered, except a twice-weekly irrigation with potassium permanganate. The patients, all of the clinic variety, were seen at the Oakland Health Center, and the conclusions here drawn are subject to the usual objections due to the type of coöperation one encounters in such material.

With this condition in mind, the following observations were noted: Number of cases, 75. Discharge ceased in three to seven days, 12; in seven to ten days, 7; in ten to fifteen days, 23. No change, 25. Reaction, 8. Treatment changed.

Of the twenty-five cases which showed no response, thirteen were thought to be getting worse and were put upon other treatment. The remaining twelve, who were unimproved, were put upon 50 grains daily in divided doses. Of these only one showed any improvement. All the patients who tolerated the drug in small doses were able to tolerate the increased amount. In this study the therapeutic efficiency of sulfanilamid seemed to be as great in the small as in the larger doses. It is further to be noted that the resistance strains of gonococci were not affected by the change in amounts administered. If this be true it is suggested that, until the pharmacology of sulfanilamid be understood, the interests of conservatism might best be expressed in the smaller doses.

Albert M. Meads, M. D. (251 Moss Avenue, Oakland). The remarkable response of certain infections to sulfanilamid therapy has made its acceptance by the medical profession as spectacular as that of salvarsan or insulin. The treatment of acute infections of the urinary tract, particularly, has been so improved under the use of this new drug that the time of treatment has been greatly reduced and instrumentation almost eliminated, except for diagnostic purposes. Many chronic infections, where no foreign body or anatomical distortion exists, clear up almost over night, after baffling the physician for months under the older methods of attack. So remarkable have been the results following sulfanilamid therapy that the profession at large has accepted the new drug for its face value, leaving to the laboratory to thresh out the why of its action in the body. The fact that it works is ample cause for its use in the clinical mind.

However, most of us welcome an explanation of the action of any drug in producing its therapeutic effect. So in the case of sulfanilamid we have accepted the statement that the "bactericidal properties are greatly in excess of anything encountered in normal blood and serum" when sulfanilamid therapy has been employed. Also, we have considered that the "infecting organisms are rendered more susceptible to phagocytosis." Both of these statements were questioned by Doctor Michael and have been disproved, apparently, as far as his experiments are concerned.

That a certain high concentration (10 milligrams per cent) level is necessary for clinical results has been emphasized. Clinical experience, however, in urologic infections has definitely proved that smaller doses than were originally advised will bring about the desired result with less chance of toxic complications. Excepting gonococcal infections, five grains, four times a day, is the average dosage used by us, and the results have been most satisfactory. One remarkable case of proteus infection, treated at intervals for three years under the older methods without any appreciable change, absolutely cleared up in three days under the above dosage, and, believe it or not, has remained pus-free and bacteria-free ever since.

In spite of the fact that the mode of action of sulfanilamid in the body is still a debatable question, and that the work of Doctor Michael has changed one's view as to the accepted theory of its bactericidal properties, the clinical results are so positive that we shall continue to use it while awaiting the solution of this problem.

⁂

Angus Wright, M.D. (657 South Westlake, Los Angeles).—It is heartening, in face of the widespread and all too frequently indiscriminate use of sulfanilamid, to see efforts directed toward determination of the mode of action of the drug.

As Doctor Michael has indicated, there are discrepancies between the *in vivo* and *in vitro* action of the drug on certain organisms. Explanation of the cause for this difference in action in the test tube and in tissue—if it is an actual one—offers an intriguing problem and one which, if solved, might open an entirely new field in chemotherapy.

On the basis of the phagocytosis experiments it is evident that there is nothing in sulfanilamid which enhances phagocytosis, either *per se* or through augmentation of opsonins. It would certainly be out of line with established observations in immunology if a chemical added either *in vitro* or *in vivo* could increase either one of these fundamental defensive mechanisms.

As a discussant, it is easy to apply interpretations which the essayist might well be more chary of. I feel, however, that Doctor Michael's results on bacteriostasis, as well as other published work and clinical observation, indicate that the primary and probably the only action of sulfanilamid is purely on the basis of its chemotherapeutic action. I think it likely that the apparent paradoxes in behavior will be explained on the basis of differences in experimental method rather than in action of the drug. The fact that in clinical pathology we see most effective results with sulfanilamid in cases where the blood level of the drug is high would seem to favor the opinion that efficacy of the drug is due to its direct chemical action.

FOREIGN BODY IN THE IMMATURE VAGINA

By Goodrich C. Schauffler, M.D.
Portland, Oregon

Discussion *by Alice F. Maxwell, M. D., San Francisco; Roy Fallas, M. D., Los Angeles.*

In spite of the rarity of this condition as a clinical entity, its discussion is deemed important for two reasons: First, because its occurrence masquerades as vaginitis or vulvovaginitis and is mistaken for this condition, when the patient is needlessly and harmfully treated as a victim of gonorrhea; and, second, because in each of four instances there has been noted a bloody component to the vaginal discharge, which, if not pathognomonic, is highly suggestive. Its occurrence is here signalized as of notable importance in differential diagnosis.

CLINICAL MATERIAL

Out of a series of 319 immature females treated for vulvar and vaginal disorders, 266 presented vaginal discharges requiring complete investigation. Out of this group, four, or .015 per cent, were proved to have a retained foreign body in the vagina (Fig. 1). Although three of the patients had formerly been seen by physicians (one patient by two doctors), the correct diagnosis had in no case been suggested prior to our investigation. Two of these children had had active treatment in the form of vaginal instillations and irrigations over a period of weeks to months. In one case a supposedly definite diagnosis of gonorrhea had been made, with the psychic trauma to child and family which inevitably follows. In three of these individuals, smears had been taken repeatedly—this procedure apparently not in any case indicating the proper diagnosis. It is hardly necessary to signalize the harm and injustice which may occur as a result of such faulty diagnosis in this connection.

These children ranged in age from three to twelve years. Two were definitely from the underprivileged group, one in the high middle class, another from a family of some social standing. It is of interest that, whereas a reasonably careful psychological study was made in each instance, and in three instances a fairly complete past history, including environmental factors and excellent follow-up was available, only one of the three appeared to be the "naughty little girl" type. The other two were, so far as we could determine, ingenuous, well behaved, and entirely above suspicion of conscious wrongdoing. These children—and, incidentally, a number of others whom we have seen in the course of other conditions involving the genitalia—were in all respects normal, apparently in this instance motivated by curiosity or an exploratory bent, such as dictates the insertion of foreign bodies into the nose or the ear. In no instance had the child announced the possibility to its parents. From two of the children, when the matter was brought to their attention, an apparently frank admission was obtained. A third child had been a problem child to its parents for something over a year. She was a confirmed masturbator, had been frequently involved with little boys in the neighborhood, and apparently had a definite fixation in relation to her genitalia. Interestingly enough, this child consistently denied that a safety pin could have been inserted into her vagina even when the object was produced. This was an older child, seen five years ago, at the age of twelve, and has since acquired gonorrhea, had an illegitimate pregnancy, and undergone a severe postabortal infection. The fourth patient was seen so briefly—merely for the removal of the foreign body—that the psychologic background could not be investigated.

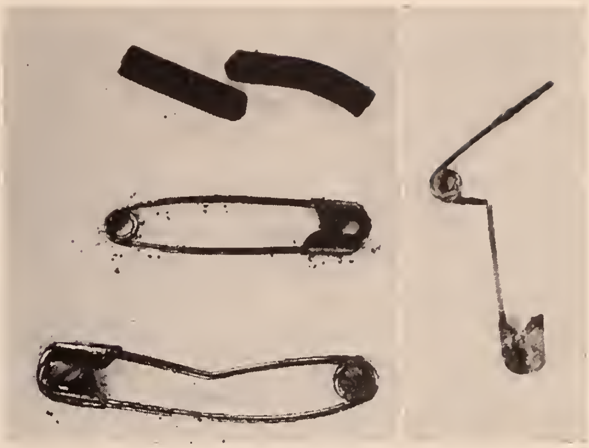

Fig. 1.—Foreign bodies removed: (a, upper left) a red crayon from a child aged five—duration a few weeks; (b, middle left) a safety pin from a child aged twelve—duration unknown; (c, lower left) a safety pin from a child three years of age—duration at least three months; (d, right) a safety pin removed from the vagina of a child aged seven. Note erosion, loss of tip. Safety pin had to be bent and removed open. There was definite embedding, with areas of vegetation. Duration at least eight months, possibly two years. Recovery immediate and complete.

DIAGNOSIS

A single observation, consistent in each of these four instances, by itself justifies the publication of this report. In each case there was a definite bloody component to the vaginal discharge noticed almost from the beginning of the complaint. In other respects the clinical picture differed so little as to be routinely mistaken for typical so-called vulvovaginitis. That the admixture of blood in the vaginal discharge is not common to infections of the immature vagina—even in virulent acute gonorrheal infections—is attested by our observations in 266 instances. Rarely (in only three instances) did we note slight transient bleeding due to demonstrable vulvar erosion or cracking. This condition was not persistent and so was quickly amenable to local treatment. The only other instance of persistent serosanguinous vaginal discharge occurred in a child, age 13, who had a virulent trichomonas vaginitis. Occasional instances of transient cervical oozing due to instrumentation have been noted. Otherwise, persistent serosanguinous vaginal discharge has been restricted exclusively to the cases of foreign body. We believe that the observation is one of considerable importance in this connection, especially since the diagnosis seems to be so easily overlooked on the basis of commonly recognized symptoms.

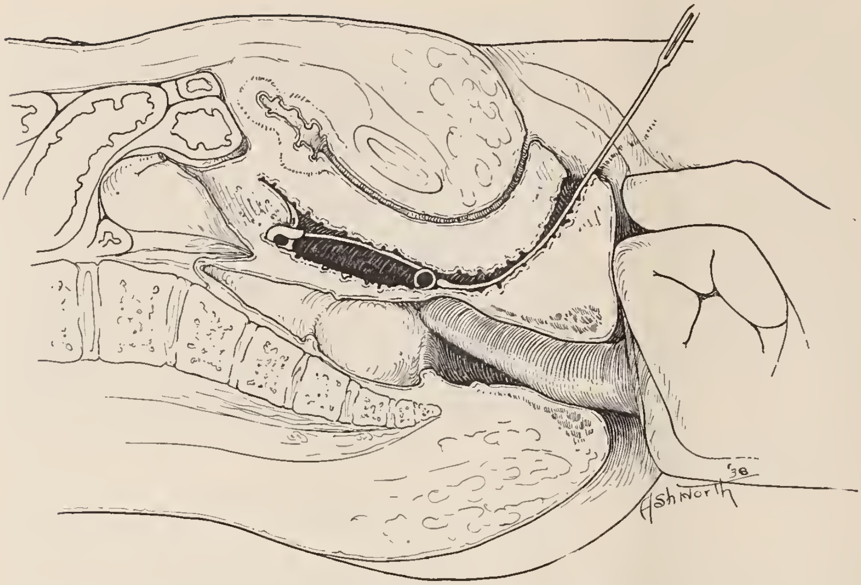

Fig. 2.—Schematic drawing illustrating diagnostic method and methods of removal, with little finger of left hand in the rectum. The rectal finger greatly facilitates location of the foreign body and appears definitely to distract the child's attention from the vaginal manipulation. Small forceps may be used for extraction in the same way.

In our entire experience we have never obtained an admitted or suspected history of foreign body prior to its diagnosis. The history, therefore, except in so far as masturbation or vaginal manipulation may indicate the type of child, is seldom helpful. The presence of a profuse, irritating, non-specific vaginal discharge, not affected by the usual type of treatment, should cause immediate suspicion. If beyond this there is a persistent bloody component to the discharge, foreign body should be suspected. It is our practice to investigate the vagina under direct vision through a small urethroscope in every instance where routine treatment is not reasonably effective. Should such an instrument not be available, or the patient's reactions unfavorable, the following method will be of assistance: A small caliber, dull-nosed metal probe may be introduced into the vagina without notable disturbance. Should there be a metal foreign body, the probe will be fairly felt to click against the metal. This sensation is almost unmistakable, but may occasionally be similated by the catching of the probe in the vaginal crypt with its sudden escape. If the foreign body is not metallic, the method is not helpful, although in one case (where a red crayon had been inserted) a small particle of the colored material was brought away on the end of the probe. A more effective method which we have devised is as follows (Fig. 2): The little finger of the left hand, well lubricated, is inserted into the rectum. The metal probe is then carefully carried up the vaginal wall, its course being followed by the finger in the rectum. Irregularities and impediments to the passage of the probe may then be investigated. In two instances, foreign bodies have been clearly outlined between the probe and the rectal finger—once after the passage of the probe alone had not revealed the object. Diagnosis is thus made easily and relatively painless. It should be pointed out that this procedure seldom alarms or distresses the patient, the probe being passed more easily with the rectal finger in place; whereas the urethroscope is occasionally difficult to use without heavy restraints or anesthesia. This method is particularly valuable in smaller children.

TREATMENT

In older children (say five years or over), who are reasonably coöperative, the removal of a foreign body may be undertaken without anesthesia. In our patient, age three, a large encrusted safety pin was removed without complaint. A special grasping instrument, such as is used in the bladder or the kidney pelvis, may be used through the vaginoscope. In general, however, a rectal finger will guide a small hemostat successfully to the object, which may be grasped and removed with care. Should the patient be uncoöperative, it is, of course, highly desirable to induce anesthesia with nitrous oxid or ethylene. In the case of metal objects, particularly safety pins (which seem popular), care must be exercised in relation to whether or not the pin is open. This should be suspected, particularly if the history is of long duration. In a recent instance, for example, the protected end of the pin had eroded away completely, so that the pin had sprung and presented itself with the open end downward. It could only be removed by bending, and with some injury to the soft tissues (Fig. 1). In two instances where we found metallic parts of the safety pin partially embedded in the vaginal wall, their removal entailed considerable bleeding. The vegetations in the areas involved, however, have almost immediately absorbed without further complication.

Intravaginal instillations or douches have not been used in our four patients following the removal of the foreign body. The vagina was distended with bland antiseptic ointment in two of the children. In all instances, within two or three days, the vaginal discharge has decreased. Within a week, except in one instance, it has disappeared; the external irritation has also disappeared, and the condition has returned to normal within two weeks. Visual examination has shown complete restoration of the vaginal walls, and a normal vaginal reaction, together with normal flora, has returned.

It should be pointed out that the psychic composure of the patient appears to be little upset except by her reaction to alarm or deep concern on the part of the parents or physician. It is our impression that the management of this condition should be surrounded by an air of nonchalance, such as accompanies any other painful and unpleasant medical procedure. The morbid aura which is so often allowed to invest an episode of this sort is particularly harmful in childhood. Since the child's attention is already no doubt somewhat centered upon its genital apparatus, it is my belief that the lightest possible psychic touch is required. As we have stated before in relation to vaginitis, any sort of complicated psychotherapy seems more indicated for the parents than for the affected child.

IN CONCLUSION

1. Because out of four cases of foreign body in the vagina of female children (0.015 per cent of 319 patients examined for vaginal and vulvar complaints), three were previously unrecognized by physicians, two of the patients being strenuously treated for vaginal infections, one stigmatized with an incorrect diagnosis of gonorrhea, this clinical note is deemed justified.
2. The constant presence of a persistent bloody component to the vaginal discharge—rarely noted in other conditions—is established as an important contribution to early diagnosis.
3. A discussion of diagnosis and treatment is given in sufficient detail to be helpful.
4. Psychological factors are briefly considered.

548 Medical Arts Building.

DISCUSSION

Alice F. Maxwell, M. D. (University of California Hospital, San Francisco).—This is a report of particular interest since it emphasizes two important points, namely, the relative infrequency with which foreign bodies are found in the vagina of children, and secondly, the necessity of an accurate diagnosis of a purulent bloody vaginal discharge in individuals of any age.

The presence of foreign bodies (peas, beans, buttons, etc.) in the aural and nasal passages of children is so common as to excite little comment. The assortment of objects which have been removed from the bladder of individuals, usually adult, arouses speculation as to the ingenuity and disregard of pain which permitted the introduction of safety pins, crochet hooks, gauze, rocks, etc. The rectum has, likewise, served as a receptacle for foreign bodies. The relative ease of accessibility of the vagina, and the fact that even in children the structures in its neighborhood are associated with sensations of sexual stimulation (judged by the frequency of masturbation), would justify the assumption that self-exploratory investigation of children should lead to the discovery of the vaginal canal frequently. The reports in the literature of such occurrences are rare, yet the careful observations of the author disclosed this situation in four of 319 children whom he had under observation for vaginitis.

It is difficult to explain a physician's negligence in establishing a diagnosis and casual attitude in treating a child with a bloody vaginal discharge, since it has long been recognized that this sign usually indicates a malignant lesion in the pelvic organs. With this possibility in mind, a most thorough investigation of the pelvic organs is imperative: had a careful examination been made in three children, the diagnosis would have been obvious. It is not unreasonable to expect that the medical attendant would have an investigative urge at least comparable to that of his young patients.

The author is to be congratulated for directing our attention to an interesting problem and for emphasizing the necessity of establishing an accurate diagnosis.

⁂

Roy Fallas, M. D. (1930 Wilshire Boulevard, Los Angeles).—Although, as stated by the author, a foreign body in the immature vagina is very uncommon, all gynecologists should be properly equipped for making a careful visual examination as painlessly as possible, in all cases of persistent vaginal discharge.

It has been my practice to use a small Kelly endoscope, through which topical applications can be made, as well as foreign bodies appropriately dealt with.

The wonder is that foreign bodies are not more frequently found, particularly when it is realized that negro children, at least in certain parts of this country, are taught by their mothers the art of masturbation for the purpose of keeping them from crying and being a nuisance to their parents.

Doctor Schauffler has, I believe, offered an ingenious method of investigation by probing the vagina over a finger in the rectum. However, in the case of a metallic foreign body, its presence or absence can be readily and painlessly established by an x-ray picture.

I believe that in all cases of persistent, chronic, vaginal discharge, the possibility of a foreign body should be ruled out.

DIPHTHERIA*

A STATISTICAL REPORT OF 3,344 CASES

By J. C. Geiger, M.D.
R. W. Burlingame, M.D.
and
Hilda F. Welke, A.B.
San Francisco

In consonance with other cities in these United States, the morbidity and mortality of diphtheria in San Francisco have undergone considerable fluctuations over the period 1917–1937, inclusive.

SAN FRANCISCO DIPHTHERIA MORBIDITY RATES IN DIFFERENT YEARS

The morbidity in 1917 showed a case rate of 172.0 per 100,000. The rate, however, rose to 309.84 in 1923, the highest ever recorded, and the periods 1921–1924, inclusive, could be considered epidemic years for diphtheria, or, at least, those in which the disease offered the most difficulties for the establishment of control measures. In 1925, a decided downward trend prevailed, and the decline in rate per 100,000, from 108.02 in 1925 to 7.65 in 1937, is more than gratifying to health officials. The mortality rate per 100,000 in 1917 was 13.60, and reached its highest in 1923—26.84. The decline in mortality rate noted in 1925 to 6.41 has been steadily maintained until in 1934 the all-time low of 0.15 was reached; and in 1935 and 1936 the rate was 0.58. In 1937, however, due to a sharp outbreak of the disease in adults in several subnormal and crowded lodging houses, and delay in reporting and hospitalization, the rate rose to 1.15. The number of cases reported for 1937 was fifty-three, and if the measures for control now in use are maintained, this disease as a clinical entity will probably disappear in San Francisco, or will have reached the terminology of the irreducible minimum. The importance of immunization with toxin-antitoxin or toxoid has been stressed in such recorded reduction of morbidity. Immunization was started in San Francisco about 1920. It was only routinely adopted, however, by the then San Francisco Board of Health for the children in the Well-Baby Centers and in the schools in May, 1924. The number of school and preschool children immunized has increased each year since 1924, when the number recorded was 1,605. In 1937, the immunized group was 4,701. This figure does not, however, present a fair picture of immunization.

---

* From the Isolation Division, San Francisco Hospital.

In the report of the committee of the San Francisco County Medical Society, which constituted a complete survey of hospitals, clinics, and records of private psysicians, the conclusion was reached that 80 per cent of preschool, and 60 per cent of children in elementary schools are immunized. Moreover, this committee pointed out that, though mass immunization of such groups is desirable, the responsibility of early immunization was placed on the practicing physician. In investigation of the students of medical and dental schools of San Francisco, it was shown that 65 per cent of these groups had positive reactions with the Schick tests, and comparatively few gave histories of immunization.

ANALYSIS OF CASE RECORDS: PERIOD OF TWENTY-ONE YEARS

The Department of Public Health has maintained an Isolation Division in the present San Francisco Hospital for nineteen years. It was considered important to analyze statistically such cases treated in this institution for the period of 1917 through 1937. In all, the records of 3,344 cases were studied, which number is approximately 25.5 per cent of the total number of cases reported in San Francisco for the period under discussion. It may be of interest to note, however, that the number of cases treated in the Isolation Hospital has steadily risen from 26.7 per cent of the total number reported in 1917 to 58.5 per cent in 1937. This may be considered a definite trend toward concentration of such cases in institutions of this character. Of the 3,344 cases, the smallest number occurred under one year, but the percentage case mortality in this group reached 30.8, while the percentage case mortality in the hospital as a whole was approximately eleven. Of the child age group, the case fatality was lowest in the nine-year group, where it was 7.2 per cent. In the adult-age groups, the lowest case fatality was between twenty-five and twenty-nine years, and the rate practically doubled in the cases over thirty years. Diphtheria, therefore, though generally a serious disease, has a higher case fatality in the very young and in the adult groups above thirty years. The case fatality rate for the Isolation Hospital of 11.0 (despite the fact that many cases reach this hospital after several days' illness, and quite often undiagnosed and untreated; in other words, the seriously ill cases), is statistical evidence of its value to the community. The total case fatality for the city as a whole for the period 1917 through 1937, inclusive, was 6.3 per cent of the clinical types of cases treated.

TREATMENT

Of the 3,344 cases treated in the Isolation Hospital, 2,485 were diagnosed as pharyngeal with a percentage fatality of 6.4; laryngeal type, 538, with a percentage fatality of 21.4; nasal type, 185, with a percentage fatality of 20.9; the types of the remaining cases were not stated. Tracheotomy was done on eleven patients, five of whom died. Intubation was performed on 347 patients, when 81 died. There were 484 patients classified with complications of which number 207 died. The clinical complications noted were varied: heart 183, of which 149 died; measles; scarlet fever; nephritis; pneumonia; paralysis of palate; chickenpox; pregnancy; smallpox; syphilis; tuberculosis; vaginitis; whooping cough; and mumps.

Of the 3,344 cases treated in the Isolation Hospital, antitoxin was administered in 3,256. Of the latter number (3,256) antitoxin was administered intravenously in 2,625, with a percentage mortality of 9.3; intramuscularly in 631, with a percentage mortality of 11.7. Of greater interest, however, was the fatality rate taken on the basis of the number of days of illness elapsing before administration of antitoxin. For instance, in 424 cases antitoxin was administered *intravenously* on the first day, with a percentage fatality of 4.6; second day, 574 cases with a rate of 6.6; third day, 485 cases and rate of 10.1; fourth day, 277 cases and rate of 14.8; fifth day, 147 cases and a rate of 16.3; sixth day, 49 cases and a rate of 12.2; and seven days and over, with a rate of 11.1. When antitoxin was administered *intramuscularly,* on the first day, there were 85 cases with a percentage fatality rate of 2.4; second day, 111 cases with a rate of 8.1; third day, 103 cases with a rate of 9.7; fourth day, 77 cases with a rate of 9.1; fifth day, 46 cases with a rate of 13.0; sixth day, 32 cases with a rate of 25.0; and seven days and over, 72 cases with a rate of 16.7. As is to be expected, early diagnosis and early administration of antitoxin is essential if a low case fatality rate for diphtheria is to be maintained. Certainly, the statistical data quoted here are indicative that delay of one or two days in the administration of antitoxin will considerably elevate the fatality rate.

IMMUNIZATION

The effect of immunization on the morbidity and mortality rates for diphtheria has been stressed. It is of decided interest to analyze these data in the 3,344 cases occurring in the period 1917–1937, inclusive. In this number there were recorded sixteen cases that had received either toxin-antitoxin or toxoid. One fatality occurred among the sixteen cases. It could be stated that one clinical case of diphtheria occurred each year in those previously immunized, with the exception of 1918, when two occurred, and 1923, when three occurred. No information was available as to the Schick test in any of the cases.

When the curve of incidence of diphtheria by months in San Francisco is studied, there is noted no complete or definitely appreciable diminution in any month of cases received in the Isolation Hospital. In other words, diphtheria occurs continuously in San Francisco, with elevations of incidence in the fall months, the greatest occurring in December.

IN CONCLUSION

Statistical data are presented for 3,344 cases of diphtheria treated in the Isolation Hospital Division of the San Francisco Hospital of the Department of Health for the years 1917–1937, inclusive. Historically, these data are of interest, since there are facts presented showing the progressive decline of the disease in San Francisco, with information as to immunization against, and as to treatment of cases of diphtheria.

THE LURE OF MEDICAL HISTORY†

MEDICINE IN COLONIAL AMERICA

By DAVID HARRIS, Ph.D.
Stanford University

II*

PUBLIC HEALTH DURING COLONIAL DAYS

THE early history of the colonies seems, at times, to be an unbroken record of misery, suffering, and death. Added to natural exposures of pioneering and the menace of hostile Indians were disease and pestilence both old and new. When the first settlers established themselves at Jamestown in the delightful time of early spring, they were pleased with the new place which did "well agree with the English constitucions." But at the end of the summer their joy was gone. George Percy, one of the first settlers, wrote as follows: "Our men were destroyed with cruel diseases, as swellings, flixes, burning fevers, and by wars, and some departed suddenly. But for the most part they died of mere famine. There were never Englishmen left in a foreign country in such misery as we were in this new discovered Virginia. We watched every three nights lying on the bare cold ground, what weather soever came; warded all the next day which brought our men to be most feeble wretches. Our food was but a small can of barley sod in water to five men a day; our drink cold water taken out of the river, which was at flood very salt, at a low tide full of slime and filth, which was the destruction of many of our men. Thus we lived for the space of five months in this miserable distress, not having five able men to man our bulwarks upon any occasion. If it had not pleased God to put a terror in the savage's hearts, we had all perished by those wild and cruel pagans, being in that weak estate as we were; our men night and day groaning in every corner of the fort most pitiful to hear. If there were any conscience in men, it would make their hearts bleed to hear the pitiful murmurings and outcries of our sick men, without relief every night and day for the space of six weeks; some departing out of the world, many times three or four in a night, in the morning their bodies trailled out of their cabins like dogs to be buried."

Not markedly different was the plight of New England. Indeed it seemed as if a pestilence among the Indians had been timed to prepare a place for the bold adventurers, for friendly natives told them of a fatal malady that had raged from 1616 to 1620, almost literally destroying the various tribes in the New England country. The nature of this scourge has never been definitely determined.

Into this devastated region the Pilgrims came in December, 1620. After three months but fifty of the one hundred who landed survived. Bradford believed this high death rate due to their "being Infected with ye Scurvie and other diseases, which this long vioage & their Inacomodate condition had brought upon them; so as there dyed some times 2 or 3 of a day, in ye foresaid time."

Probably the most disastrous journey ever made to the New World was the voyage to Virginia, in 1618, of one hundred eighty emigrants from Amsterdam under the leadership of Francis Blackwell, one of the leading Puritans of the city. Before the small, crowded vessel reached Virginia one hundred thirty people, including Blackwell himself, had fallen victims to disease. The *Lion's Whelp,* the vessel on which William Penn made a "short and speedy" passage of six and one-half weeks, lost thirty from smallpox during the voyage.

Scurvy from time immemorial had been the great scourge of people living on the diet of the sea, taking a dread toll in suffering and death. But after surviving the discomforts and perils of the long sea voyage, and settling in the new country, the immigrants were attacked by many and terrible sieges of disease. These troubles were due largely to the weakened condition in which the people arrived, lack of proper food, rigorous climate, and crowded conditions.

SMALLPOX

One of the worst of the afflictions of the colonies was smallpox. Introduced into the West Indies in 1507 by the Spanish and perhaps later brought to the mainland from other parts of Europe as well, smallpox entered into almost every home of the period at one time or another and demanded its heavy share in the mortality list. Because the disease was so general and unremitting, it seems futile to emphasize any particular date; but the records indicate epidemics of more than usual intensity in 1633, 1666, 1668, 1677, 1688, 1690, 1702, and 1721. The first medical publication in North America was a "Brief Rule to guide the Common People of New England, How to order themselves and theirs in the Small Pocks, or Measles," written in 1777 by Thomas Thacher, a clergyman-physician of Boston.

INOCULATION FOR SMALLPOX

In 1721 Lady Mary Wortley Montagu returned to England from Turkey, bringing with her the story of inoculation for smallpox as it was practiced in Constantinople. The English, as a result of her enthusiasm, were led to experiment on condemned criminals and finally on others.

Cotton Mather, in the colonies, read of this new treatment just six weeks after it was introduced in London, and sought the medical aid of Dr. William Douglass, the one physician of Boston's ten at the time who held a degree; but the idea was too novel for Douglass. Cotton Mather did find an able second, however, in Dr. Zabdiel Boylston, who began the actual work of inoculation in America. His first experiment was done on his own son, a boy of thirteen, and two negro servants; but soon the number had grown to 250, and of this number only six died, while in the same period, of 5,759 who took smallpox in the normal manner 844 died.

---

† A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago is printed in each issue of CALIFORNIA AND WESTERN MEDICINE. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

* Part I of this series was printed in May, 1939 issue, page 355.

But the persecution that followed the introduction of inoculation is unbelievable. The medical men of the city attacked Boylston as a rash, unscrupulous quack, and the press, led by Benjamin Franklin's brother, declared that death from inoculation was murder; the mobs abused Boylston and the Massachusetts legislature drew up a bill to prohibit this obnoxious practice.

The following is a copy of the resolutions passed by the Justices of Peace and Selectmen, called together by the physicians, as reported by Thomas Hutchinson: "That it appears by numerous instances that inoculation has proved the death of many persons soon after the operation, and brought distempers on many others, which in the end have proved deadly to them. That the natural tendency of infusing such malignant filth in the mass of blood is to corrupt and putrify it, and if there be not a sufficient discharge of that malignity, by the place of incision or elsewhere, it lays a foundation for many dangerous diseases. That the continuing the operation among us is likely to prove of the most dangerous consequences."

This radical departure in inoculating was too astounding for the common people; the medical men were bitter in their criticisms, and the ministers besought the wrath of Jehovah against the wicked who were subverting the decrees of Providence and resisting the punishments of God. In 1732 the Reverend Mr. Massey preached from the text of Job ii:7: "So Satan went forth from the presence of the Lord and smote Job with sore boils from the sole of his foot unto his crown," and concluded that "the cutaneous disease of Job was produced by inoculation from the hands of the devil, and the whole art was of infernal invention." Cotton Mather, as the spirit back of the whole trouble, was abused mercilessly; one opponent carried the antagonism so far as to throw a bomb through his window.

VINDICATION OF COTTON MATHER AND DOCTOR BOYLSTON

But the facts could not be denied. Boylston lost only one patient in forty-eight; the normal ravages of smallpox took one in every seven. The pioneer had finally, by his persistence, vindicated himself, and the storm of condemnation was turned into a hymn of praise. In London he was honored and made a member of the Royal Society. Back in America he retired, secure in fame and fortune.

YELLOW FEVER

Another scourge of the colonies which modern science is banishing from the world was yellow fever. Appearing first in 1647 as the Barbadoes distemper, its epidemics made heavy inroads on the colonists. Quarantines were established, but nevertheless disastrous waves swept over Charlestown and Philadelphia in 1699. Concerning its effects, the Journal of Thomas Story says: "Great was the fear that fell upon all flesh. I saw no lofty or airy countenances, nor heard any vain jesting; but every face gathered paleness, and many hearts were humbled." In 1702 a fearful epidemic in New York drove the Assembly to Long Island, and subsequently it swept various parts of the country at various times.

OTHER DISEASES

But it is wearisome to list the gamut of colonial afflictions. Measles, scarlet fever, diphtheria, dysentery, influenza, and all the rest of the dread horde came and conquered their thousands and slew their ten thousands.

IN THE COLONIAL PERIOD, AMERICA WAS IN THE BACKWASH OF SCIENTIFIC ENDEAVOR

At the beginning of the colonial experience, America scientifically was in the backwash of a world that had hardly broken the shackles of the Age of Faith, and laid her ideas and theories on the altar of scientific procedure. Science can come only when the pioneer has put away his gun and escaped from the plowshare; hence the New World was necessarily far behind the most advanced notions of the day, and constrained to struggle with the decadent theories and rule-of-thumb methods that were being discredited in the centers of civilization. In Europe some of medicine's most brilliant students lived in the sixteenth and seventeenth centuries—one has but to mention Harvey, who discovered the circulation of the blood; but it was impossible that the barber-surgeons, the bone setters, the "practitioners of physick," as well as the parish preacher-doctor and the jack-of-all-trades who served as medical adviser, should have incorporated into their work many new things in science.

GRECIAN CONCEPT OF FOUR ELEMENTS IN THE HUMAN BODY

There still lingered in the popular mind the old notion, handed down from the Greeks, that the human body consisted of four elements, earth, air, fire, and water. In the body were to be found four humors or liquids, bile or choler, blood, melancholy or black bile, and phlegm. Anne Bradstreet (1612-1672), one of the first of New England's poets, expressed this belief in these verses:

> But first they showed their high descent,
> Each eldest daughter to each element;
> Choler was owned by Fire and Blood by Air,
> Earth knew her black swarth child, and Water her fair.

OTHER VAGARIES

Disease, it was commonly believed, came from an excess of one or another of the humors, or from excessive heat or cold or moisture or dryness. It was estimated by one writer in 1603 that eighty thousand diseases could be produced in this manner.

Such a system of thought was responsible for the building up of an elaborate system of drastic cathartics, made drastic because of the necessity for evacuating those humors which "had a depraved way of going wrong and sending up poisonous vapors to the brain, to the injury of those imaginary 'animal spirits.' " The various medicines used were thought to act specifically on the different humors. One type was necessary for phlegm; quite another was needed to dispel the black bile that weighed on the spirits of a hypochondriac.

DOCTRINE OF SIGNATURES

A second strange theory that also had come down through the ages, and which colored professional and lay thought, was the old Doctrine of Signatures. This doctrine was a part of the supernaturalism of the time and an outgrowth of the homocentric conception of the universe. Things had value only in their relation to man. The world was one great pharmacy and God had placed on each substance some cryptic signature to indicate the disease for which it was good. Man's duty was to decipher this label by noting color, odor, form, and other marks. "Like by like is to be cured—that is, similar ulcers by similar forms," said Paracelsus, the renovator of the Doctrine in the Middle Ages. For example, the porus leaves of St. John's-wort which had spots resembling perforations was of obvious value in cases of abrasion, either external or internal. Its illusory appearance of holes left no doubt of its efficacy in cases of hallucination, madness, and assaults of the devil. Such a treatment was called "curing by the assimulate," and along with it was its opposite, "contraries by contraries."

This doctrine had many expressions in America, and its influence is to be found in a number of current prescriptions and methods of healing. Some of the favorite remedies sent by Dr. John Stafford of London to Governor Winthrop of Connecticut serve to illustrate. At times Stafford gave milk as a remedy for jaundice; milk, being white, would attack the black humors. But the treatment suggested to Winthrop was of the "cure by the assimulate" type: "For the yellow Jaundise or Jaunders—Boyle a quart of sweet milke, dissolve therein as much bay-salt, or fine Sal-peter, as shall make it brackish in taste; and putting Saffron in a fine linen clout, rubb it into ye Milke, untill ye Milke be very yellow; and give it ye patient to drinke."

Another: "For paines in ye Brest or Limnes: Weare a Wilde Catts skin on ye place grieved."

STAFFORD'S "BLACK POWDER"

His great prescription, however, and also an example of the old theory, was his "black powder," to which there are many references in the early letters. It was made of toads because toads were poisonous; and since all poison drew poison to itself, this remedy was logically most effective. But because of the warts on the toads, it was to be regarded as an especially valuable treatment in smallpox and other eruption cases.

The "black powder" Stafford prepared as follows:

"In the Month of March, take toads as many as you will find alive; putt them in an earthen pott; so that it may be half full; cover it with a broad tyle or Iron plate; then overwhelme the pott so that the bottom may be uppermost; putt charcoales round about it and over it. . . . Sett it on fire and lett it burne out and extinguish of itself; when it is cold take out the toads; and in an Iron mortar pound them very well." Then came a second cooking which reduced this brown toad powder to harmless animal charcoal, but the good doctor never suspected it. "Moderate the dose," he wrote, "according to the strength of the partie." And he went on with these strange words: "Nota bene. No man can with a good Conscience take a fee or a reward before ye partie receive benefit apparent; and then he is not to demand anything, but what God shall putt into the head of the partie to give him. And he is not to refuse anything that shall be so given, for it comes from God." He closed his letter by adding, "These receipts are all experimented."

MEDICAL PROBLEM OF A "UNIVERSAL REMEDY"

The medical problem which continued to intrigue the popular fancy was the preparation of a universal remedy. From antiquity had come the story of the versatile Mithradates, King of Pontus, who, by experiments on criminals, discovered what medicaments would neutralize all poisons and put these together into his universal antidote, making finally a compound containing more than sixty-five components. Andromachus, physician to Nero, is reputed to have made a slight alteration of the prescription by adding the powdered flesh of the viper, apparently on the principle of curing like by like. During the Middle Ages it was generally called *theriac,* and was known in England usually as Venice treacle. It is interesting to note that this remedy was expelled from the British Pharmacopeia only in the middle of the eighteenth century. In America it was put up in less complicated forms occasionally, and the European viper's rôle was taken by the American rattlesnake.

The Bezoar, or Bezar, stone was another universal remedy in favorable repute. The stone is a mass of hair coated by calcareous salts, and is found in the stomachs and intestines of ruminants. Stones brought from the Orient were held in highest regard, but there arose a definitely established hierarchy in therapeutical value and price, based, obviously, on distance from America. In the East the bezoar was originally worn as an amulet; in America it was powdered for internal use. There is recorded the story of a skillful woman physician of Virginia who, in 1690, gave "pulverized oriental bezoar stone" to a man bitten by a rattlesnake. This remedy was followed by a decoction of dittany, the same in name, at least, as the remedy which Venus applied to the wounds of Aeneas.

This dittany, because of its mythological aura, was a famous "cure" for poisons, for extracting bits of wood or bone from wounds.

But in America its qualities were transferred to the indigenous pennyroyal. Captain Silas Taylor once told a meeting of the Royal Society that in 1657 he had held to the nose of an unwilling rattlesnake some leaves of "wild Pennyroyal" or dittany of Virginia, and the serpent died from its effect in half an hour.

EARLY "CURE-ALLS" IN AMERICA: "RUBILA"

Perhaps we of America find our interest most attracted by the first recorded of the cure-alls originating in America. This remedy was a concoction perfected by John Winthrop, Jr., Governor of Connecticut, and was called by him "Rubila." The ingredients of this famous compound were kept from the public by the use of a secret code which was not deciphered until Oliver Wendell Holmes undertook the task. Some of the ingredients were "four grams of (diaphoretic) antimony with twenty grains of niter with a little salt of tin making rubila." Doctor Holmes believed something was added to redden the powder, as there are references in Winthrop's writings of rubifying or viridating his prescriptions. This was a common practice when the prescriptions appeared too much like plain sugar. The supposition that something was purposely omitted from the written prescription is justified by reference to letters published later in which Winthrop wrote to his son, Wait, that the powder he was sending was not ground enough. Wait, in writing of some rubila of his own preparation, said that it was "not enough ground," "half ground," or "grossly beaten." Elsewhere he wrote: "It is best to make it before the weather be hot." And again: "The dog dayes will not be so good to meddle with rubila in, so it must be deferred at present."

Some idea of the quality and efficacy of rubila might be gleaned from excerpts from Winthrop's correspondence: "Poor little Tome taken yesterday with a great pain in his stomach, belly, and side, like a plurettick feaver; your mother and most of the house up with him all night. He took rubila this morning and hope he is better." One might well suppose, as has been suggested, that the family had to work with him all night, tiring him down, before he could be persuaded to accept the heroic treatment. Further light is shed on this remedy in another letter. A certain Mr. Stone was ill and was advised to take rubila, but the prescriber did not find him "inclinable, though he was burthened in his stomach." From the same letter we find that Governor Newman once took rubila, "but hath not been willing to take it again, nor his wife that he should, though we persuaded and encouraged him thereunto." It is hardly astonishing that Wait Winthrop wrote that "for feaverishness and restlessness" he knew "nothing helps like rubila when there has been strength to bare it."

In still another letter, "poor little Tome's" hesitations appeared to be shared by another sufferer: "For Ashbyes extreemely sweld leggs if he would be persuaded to take rubila in such a proportion as would work with him though the fever be not over and to take it every day for som time, it would insensibly and by degrees take away both the swelling and every evill symptom; he may begin with a grain, or halfe a grain, and so increase halfe a graine every day till it begins to make him a little quamish, and then the next time decrease halfe a grain, and then keep to that proportion."

Relative to taking the medicine we have this letter:

> Guilford June 22, 1655.
>
> Sir, you were pleased to furnish my wife with more cordiall powders by John Crane for Graciana but no directions within or amongst the papers can we find; but truly one of the most needful directions is how to make her willing & apt to take it, for though it seemes very pleasant of itself yet is she grown so marvellous aukward & averse from takeing it in beer. Wherefore I would entreat you to prescribe to us the varyety of wayes in which it may be giuen so effectually; we doubt else it may doe much lesse good, being giuen by force only.

In 1667 John Davenport, pastor at New Haven, wrote that his wife was refractory in taking "pilles" and rubila. "My wife tooke out halfe of one of the papers, but could not beare the taste of it, and is discouraged from takeing any more. I perceive that some speech from yourselfe would best satisfie her, but if God's providence puttes a bar in the way, we are called to submit thereunto." But Governor Haynes was more kindly disposed. In his experience "it wrought very kindly alwaies both causing vomiting and purdginge." Samuel Gorton of Rhode Island was complimentary. "The cordiall and soveraighne powders" had affected him so that he found his body "to be little differing from that which it was before the distemper seized" upon him. He wondered consequently "that a thing so little in quantity, so little in sent, so little in taste, and so little to sence in operation, should beget and bring forth such effects."

CLINICAL NOTES AND CASE REPORTS

HELIUM AND OXYGEN MIXTURE

AN ECONOMICAL AND SIMPLE METHOD FOR ITS USE

By Edward Matzger, M.D.
San Francisco

The use of 80 per cent helium and 20 per cent oxygen mixture as a therapeutic gas originated with Dr. A. L. Barach. He reported his findings in the Proceedings of Society for Experimental Biology and Medicine, 32:462, 1934. Subsequently he has reported clinical studies in its use for asthma, pneumonia and cardiac failure, as well as obstructive lesions of the respiratory tract, with satisfactory results.

Its widespread use, however, has been limited, due to two facts. First of all, the apparatus was expensive and required a specially trained person to operate it; and, secondly, the helium was expired into the air, necessitating the use of such large quantities as to make the cost almost prohibitive.

On May 12, 1938, it occurred to me that I could put helium in my basal metabolism apparatus, thereby recirculating it without loss. The use of helium and oxygen mixtures for divers demonstrated clearly that the helium was inert. Using it, therefore, in the closed system of any basal metabolism apparatus having a gas capacity over two liters the helium would remain in the system theoretically with no loss. As a matter of fact, if the patient removes the mask at the end of inspiration there is a loss, but a $3.75 tank of helium will last over a period of many months. I leave in the soda lime and add one part of oxygen for each four parts of helium, and substitute an ordinary anesthetic mask for the usual basal metabolism nose-gag and mouthpiece. In this way the patient, unaided, may use the apparatus when, if, and as he feels the necessity of it, without hazard of helium asphyxiation, because the patient himself controls the inhalation and can remove the mask at will.

As the patient breathes the mixture the total volume diminishes at the rate that oxygen is used up in an ordinary basal metabolism test. The expired carbon dioxid is absorbed by the soda lime, and I find it necessary only to replace oxygen into this system.

I have had many satisfactory results, most frequently in promoting the expectoration of the usually "difficult to raise" sputum. I believe that this technique will find use for many chest diseases.

CUTANEOUS HISTAMIN REACTION IN DIAGNOSIS OF HYSTERIA

By Max J. Goodman, M.D.
Eureka

OUT of the study of peripheral vascular diseases has come the cutaneous histamin reaction, so useful in diagnosis and prognosis of these conditions, and of such great value in aiding the surgeon to determine the level at which he must amputate an affected limb. When histamin phosphate (1/1000) is injected intracutaneously, the response of the tissues occurs in three stages: first, the trauma of the needle and the contact of the histamin produces a small red area which is immediately (within one minute) masked by a wheal resembling a mosquito bite. This second reaction is due to the irritation of the drug locally and is entirely independent of the nerve supply. It is associated with a change in permeability of the small vessels, allowing fluids to go from the blood into the wheal. Within five minutes after appearance of the wheal a reddened area surrounds it. This is called the arterial flare and is due to capillary dilatation. It is purely a reflex phenomenon, and will occur only if the peripheral sensory-nerve circuit through the dorsal root is intact. If the nerve is sectioned or destroyed by disease, or if the dorsal root is destroyed by a lesion extending from the spinal cord, the arterial flare does not appear, allowing eight days for degeneration of the nerve and loss of reflex arc.

In peripheral vascular disease there is a sensory nerve degeneration which parallels the vascular obliteration, and because of this the test has been useful in determining the extent of the disease. More recently, however, the test has come into use for the diagnosis of traumatic neurosis and hysteria. In addition to the medical value, it may also be useful in medico-legal work because of simplicity of administration, and because there is something which, if shown to a jury of laymen, will mean more than mere verbal expert testimony.

The following case is one in which this test was used to confirm a diagnosis of hysteria:

REPORT OF CASE

The patient, a male, age forty-four, German, married. Occupation, blacksmith. In June, 1937, he sustained a compound fracture of the right tibia and fibula. The external wound healed without infection, and the fractures were well united. He continued to complain of pain over the fracture site, so in February, 1938, an exostosis was removed from the anterior tibial surface at the fracture site. Following this operation, there was some relief of pain. Progress was uneventful until March 28, 1938. While celebrating the purchase of a saloon the patient celebrated too diligently and, in the course of events, sustained an injury to his right upper extremity, including several abrasions on the right hand. On April 4, 1938, suppurative glands in the right axilla were incised and drained. At this time the patient began to show his tendencies by attempting to induce (unsuccessfully) the insurance company to pay for his hospitalization for the care of his arm injury. He made an uneventful recovery from this last injury. On April 29, 1938, his case was closed and he was apparently cured.

On July 18, 1938, he reappeared in our office, stating that he had been having severe pain in his right leg and arm for the past week. This was within a few days after he had unsuccessfully tried to induce the insurance company to reopen his case. Examination at this time showed that motor function in all extremities was good, except for a slight limp in the right leg. There was a coarse tremor in the right hand. Reflexes were normally active. Wassermann was negative. There were no visual disturbances. Eye movements were normal. Eye grounds were normal. Pupils reacted normally. Spinal fluid was negative. Blood pressure, 140/80. An interesting fact, and one not mentioned by the patient, was that there was an anesthesia on the entire right side of the body, excluding the face. The left side of his body was hypersensitive. A diagnosis of hysteria was made.

The patient was checked by the histamin reaction in the following manner: The drug used was histamin phosphate (1/1000). One minim was injected intracutaneously in three places in both lower extremities, one place on both sides of the abdominal wall, and in two places on the upper extremities. The wheal appeared within one minute. About eight minutes later the arterial flare appeared bilaterally in all points of injection except one. This latter was at the site of the original injury and near the operative scar, where we would normally expect some nerve destruction. However, in all other areas, the reaction proved an intact nerve circuit. We know that the patient is not malingering, because with his inability to stand pain he could not have tolerated the severe pain tests to which his affected side was subjected. The test seemed to confirm our diagnosis of hysteria.

COMMENT

When the cutaneous histamin test reacts normally by the formation of its third stage, the arterial flare, we have conclusive evidence that the peripheral sensory nerve to that part is not degenerated. However, the test must be performed after the eight-day period required for nerve degeneration to take place. The reaction is, therefore, of value in differentiating between anesthesias due to organic lesions and hysteria. In conclusion, we wish to emphasize that we do not feel that this test is entirely diagnostic, but that it is an excellent means of confirmation after the diagnosis of hysteria has been established.

SENSITIZATION TO SULFANILAMIDE

REPORT OF CASE

By Robert A. Steven, M.D.
San Francisco

FEVER resulting from a large amount of sulfanilamid, either given in one large dose or repeated smaller doses,[1, 2] has been reported several

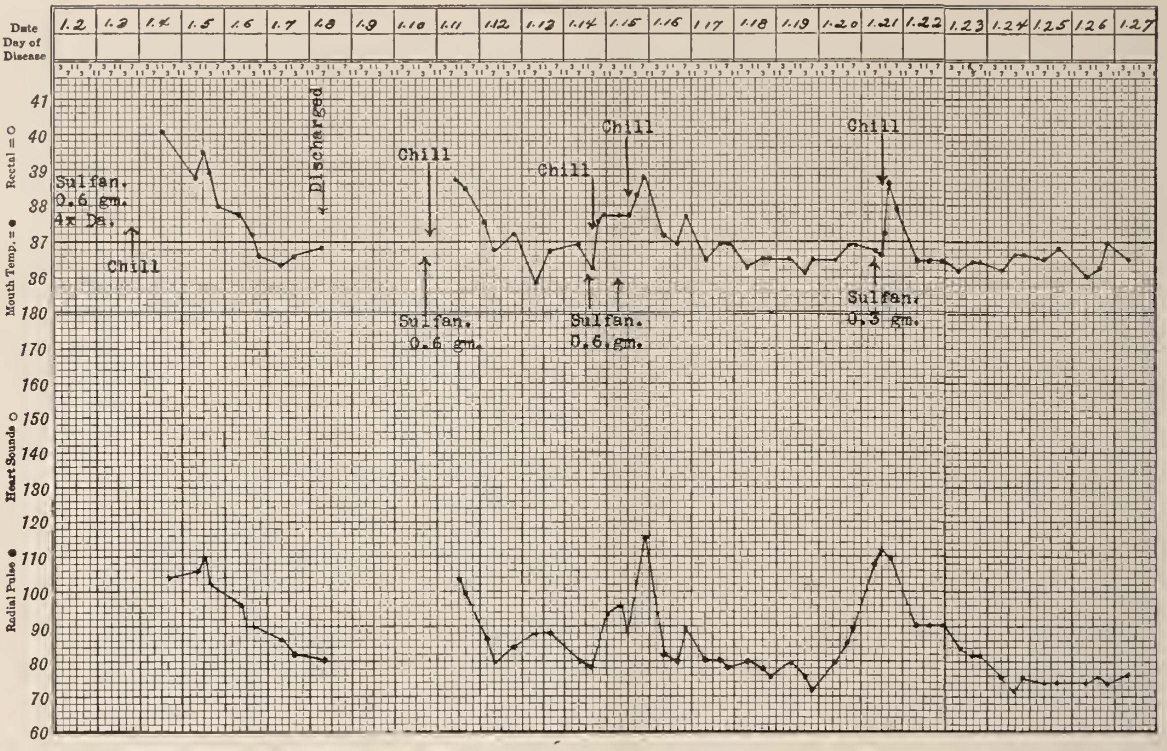

Chart 1.—Graphic record, showing temperature rise after sulfanilamid.

times. When we began to write up this case report, we had been unable to find an instance of chills and fever from a single small dose. More recently, however, Gillette[3] reports: "Sulfanilamid in total dosages, varying from 60 to 420 grains, caused chills and fever in about one per cent of patients. If a patient once developed chills and fever from the drug, small doses would invariably cause reappearance of the symptoms, even when given some five or six days after the sulfanilamid had been discontinued." This coincides exactly with our experience in this case.

REPORT OF CASE

Mr. H. C., married, Polish tailor, age 50, entered on the medical service of the Franklin Hospital on January 4, 1938, complaining of a head cold (one month), muscle and joint pains (three weeks), loss of appetite (three days), and some loss of weight. He denied G. C. Positive physical findings were: Temperature, 104 degrees; appearance flushed and sleepy; very carious teeth; uvula red and edematous; slightly increased splenic dullness and sharp splenic edge palpable one-quarter inch below costal margin. Laboratory reports were: Urine—Albumin, one plus and occasional white blood cells. Blood count—Hemoglobin, 14.2 grams; red blood cells, 4.12; white blood cells, 8,200; polymorphonuclear neutrophils, 68 per cent; lymphocytes, 27 per cent; large monocytes, 5 per cent; blood Wassermann and Kahn negative; blood culture negative; no agglutination of typhoid, Paratyphoid A and B, or melitensis. He recovered rapidly, and was discharged on January 8 with a diagnosis of influenza.

He was readmitted on January 11, when he admitted pertinent facts previously denied. He had contracted gonorrhea four weeks prior to first entry, and had been taking sulfanilamid, .6 gram, four times daily for one week prior to first entry, and on the evening before his first entry he had lost his appetite, had diarrhea, and a definite chill followed by fever. On the day before his second entry, he took one dose of the drug (.6 gram) and two hours later had a chill, felt hot, and had abdominal distress. On entry, temperature was 102 degrees; spleen was somewhat larger; hemoglobin was 11.8 grams, red blood cells, 3.47; white blood cells, 14, 100 with 88 per cent polymorphonuclear neutrophils and 10 per cent lymphocytes; urine showed one to three white blood cells and red blood cells. Patch test with sulfanilamid was negative.

After getting this history we decided, with his permission, to give the patient test doses of sulfanilamid at suitable intervals to determine, if possible, the etiologic rôle of the drug in these reactions. The procedure and results are clearly set forth in the accompanying graphic record. We had intended to proceed further with minute doses, but the patient had to return to work. He had taken no more of the drug and had had no further fever when contacted on July 15.

We believe that the reactions described here are manifestations of an acquired sensitization to sulfanilamid.

384 Post Street.

Dangers of Snuff.—Snuff is a primary irritant and causes a burning feeling when first inhaled, *The Journal of the American Medical Association* for May 6 says. Later on, as the habit is formed, the burning feeling is replaced by a sense of exhilaration. When the snuff is inhaled there results, as with the inhalation of all irritating materials, an excess flow of mucus and serum, which is followed immediately by sneezing and blowing of the nose, thus clearing the passages. However, there are three dangers in the use of snuff. In long continued cases there is a tendency to chronic inflammation of the mucous membrane of the nose; polyps (soft, tumor-like growths) seem to occur rather frequently in users of snuff, and because of the excess of sneezing and blowing there is a distinct liability to infection of the sinuses.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

REFRACTION

I. PROBLEMS IN REFRACTION

A. Ray Irvine, M.D. (727 West Seventh Street, Los Angeles).—It seems especially fitting to discuss this subject at this time. The so-called "eyesight specialists" and "eye-exercise experts," by means of the radio and newspapers, are constantly broadcasting to the innocent public the dire consequences of neglected eyestrain. Many of them promise to relieve all the troubles and prevent blindness and many diseases, by proper and newer methods of fitting glasses correctly. Others promise, by some sort of electric treatment and muscle exercises, to improve the eyes to the extent that glasses will no longer be necessary. We would be surprised to know how many thousands of people go to one class of advertisers and spend thousands of dollars to have glasses fitted, only to be disappointed and later go to replenish the coffers of the other class by having the glasses removed, and submit themselves to further pocketbook depletion by a series of expensive exercises and light treatments or what-nots. Errors of refraction do not cause any serious pathological conditions. Per contra, pathologic conditions do cause visual disturbances and asthenopic symptoms.

There are a great number of people with pathological conditions who will not be cured by fitting of glasses, and there are an equally great number of people with both pathology and errors of refraction, who should be diagnosed, treated and refracted properly. It seems logical, therefore, that all who have eye symptoms, or visual discomfort or disturbances, should consult a well-trained ophthalmologist in order that the former may not be overlooked or neglected. There are conscientious optometrists who are able to do accurate refractions, but do not recognize pathology. The general practitioner has a special responsibility in this matter, as he realizes the importance of early treatment of eye diseases, while the layman makes no distinction between oculist and optometrist, and often believes that a change of glasses will miraculously eliminate all his symptoms.

The taxpayers' burden to take care of the blind in this state is already in the millions and increasing rapidly. Alleviation of this burden can be attained by early recognition of the disease conditions which cause the blindness.

Visual disturbances may be caused by any of the following: glaucoma, acute and chronic; retinal exudates, hemorrhages, detachments, neoplasms; inflammatory conditions, including optic neuritis and edema of the nerve in intracranial disease; degenerative changes, anemias, diabetes, tuberculosis, syphilis, toxemias, arteriovascular changes in hypertensive disease, lens changes (cataracts and dislocations), pupillary membranes, congenital defects and birth injuries, hemianopsias and quadrant field defects, corneal changes (conus), muscle paresis, squints, etc. Since patients with these conditions often present themselves for refraction, some of the most important will be considered in the following paragraphs.

Of the children with manifest convergent strabismus only 50 per cent can be cured by glasses and exercises. The other 50 per cent can be cured by surgery alone, or surgery combined with exercises and correction of refractive errors. Often the squinting eye is found to be amblyopic, but the vision will improve if a proper correction is worn and the sound eye is occluded. In all these cases a cycloplegic is necessary for accurate examination.

Acquired phorias and squints occurring suddenly in older people may be due to cerebral accidents (hemorrhages). The annoying diplopia may be relieved by prisms in glasses. As the hemorrhages are absorbed, the prisms may be removed. Such patients should be completely examined by an internist.

Blurred vision which comes and goes, burning, fatigue, and sometimes ocular aches, due to accommodation and convergent difficulties, occur in toxemias and metabolic rate changes. When these are corrected, the symptoms disappear. Correction of refractive errors is important, but not sufficient to relieve the patient.

Aching eyes and headaches in frontal and temporal regions, with blurred vision, sometimes watery eyes without inflammatory signs, haloes seen around lights, should always require careful field charts and tension curves, as many early cases of glaucoma may thus be detected. Every oculist sees many such cases, where patients were fitted and refitted with glasses until serious pathologic changes have taken place. Chronic glaucoma is a very common disease and its early recognition is of prime importance to salvage vision and prevent blindness.

Patients come for glasses complaining of severe localized headaches, with nausea at times, dizziness, a feeling of unsteadiness, and a tendency to bump into things on one side. Glasses are changed frequently with no relief. A careful history, an exact perimetry study, fundus examination, and a neurological checkover and general examination, often reveal intracranial tumors. One such case, recalled by the author, revealed a meningioma of the olfactory groove producing pressure on the chiasm with optic nerve and field changes. The vision was restored after surgery. Many such cases are seen by the oculist.

Conical cornea is a condition which frequently occurs in comparatively young people. It may be early detected by frequent changes in astigmatism and increase of myopia. Many times the first symptoms are blurred vision, with history of sudden onset. Keratometer readings are especially important in these cases, inasmuch as early corneal changes may here be easily recognized. Slit-lamp examination may show incipient thinning of the cornea, sometimes with apparent thickening of the corneal nerve fibers. Careful endocrine and metabolic studies should not be overlooked. Treatment other than glasses is indicated. In early cases of conical cornea it is usually possible to obtain useful vision by the use of a strong cylindrical or myopic correction. In more advanced cases of keratoconus, in which the ordinary lenses do not improve the vision, resort to contact lenses may be made.

Time and space will not permit further detailed discussion of the many pathological conditions to be discovered in patients presenting themselves for fitting of glasses.

Besides failure of visual acuity, symptoms accompanying refractive errors include all imaginable manifestations of eye discomfort, from the mildest to the most severe. Among the most common are momentary blurring of vision, doubling of images, annoyance or exhaustion in using the eyes for prolonged work. The eyes may feel tired, strained, hot or uncomfortable, or even painful. Low-grade infections, congestion of the lids and conjunctiva, may accompany eyestrain. Referred symptoms include headaches, dizziness, nausea and even indigestion.

Experience has shown that there is a complete lack of correlation between the number and kind of symptoms, and the number and degree of defects. Given two people with the same refractive error or muscle imbalance, one may have every symptom named above, while the other has none. Likewise, given any of the above symptoms reported by two individuals, one may have practical emmetropia while the other may show some refractive errors. Then, what are we to conclude in regard to asthenopia? First, that symptoms may or may not accompany refractive errors, depending upon the nervous state of the patient, and, second, that the symptoms reported are in no case an indication of what may be wrong.

As for the reasons for eyestrain, the strain comes from the effort to secure clear vision, and when the defect is such as to preclude correction, symptoms are not found. For example, gross errors of refraction and strabismus give less trouble than minor errors and phorias. A certain strain accompanies the dissociation of related functions, such as accommodation and convergence. The hyperope uses accommodation in excess of convergence, the myope uses convergence in excess of accommodation. In anisometropia the correcting effort is unequally distributed to the two eyes. In astigmatism the effort is irregular. Exophoria or deficient convergent power causes extra effort to secure clear binocular vision. Small amounts of hyperphoria are most difficult to correct and frequently cause severe symptoms.

Perfect emmetropia and orthophoria are rare. Small variations from these states are the rule, and minor errors of refraction when accompanied by good vision by no means require correction. Since refraction is an art as well as a science, the oculist must decide in each case what constitutes a minor error or what constitutes a moderate error of refraction. This depends upon the age, physical condition and nervous state of the patient. The neurasthenic patient is most subject to discomfort and suffers from the most numerous and unusual varieties of symptoms. Undoubtedly the largest percentage of asthenopias are due to psychoneuroses, to which the refractive errors are more or less secondary.

* * *

II. HEADACHE AND REFRACTION

S. F. Boyle, M.D. (490 Post Street, San Francisco).—Ocular headaches are those related to the use of the eyes or resulting from disturbance of the physiology of the eyes.

Webb Weeks states that headache due to functional disorder of the visual apparatus is a reflex produced by stimulation of the nasal branch of the fifth cranial nerve, being reflected along other branches of this nerve. Changes in the eyeball are felt as pain in the brow along the branches of supraorbital nerve, and pain felt deep in the skull is reflected along the dural branches of the fifth nerve.

Felton assumes that the delicate network of sympathetic fibres surrounding the vessels in and about the eye, controlling the vasomotor tone, record pressure, edema, and hyperemia, associated with the presence of toxins from body waste, fatigue, perverted metabolism or other sources. These sympathetic fibres, by means of their intercranial connections and through vasomotor disturbances, may accentuate the headache reported by the fifth nerve and its branches.

In the midbrain the trigeminal establishes complex connections with the optic, the eighth and tenth nerves. Regarding the latter, Duke Elder believes that the vagal connections probably account for the cardiac and abdominal disturbances which accompany ocular disease such as glaucoma. Moreover, the low distribution of the ophthalmic division of the fifth nerve explains the frequency of the suboccipital headache in eye diseases, since the great occipital nerve reaches the same level in the cord as the first division of the fifth nerve.

The suboccipital headache of hyperphoria has also been explained on the basis of cervical muscle cramp, really minor degrees of head tilting in an effort to maintain single binocular vision more easily.

It is claimed that from 20 to 60 per cent of headaches are functional; and that 70 per cent or more of the patients who come to ophthalmologists complain of headaches in varying degrees.

Kirshner believes that an etiological lead may be had from the location of headache. He classifies the types of headaches according to their situation. He claims that frontal or supraorbital headache frequently indicates hyperopia; occipital headache points to muscle imbalance; temple pain may mean astigmatism and frontotemporal pain in common in hyperopic astigmatism.

Michaelson's studies indicated that ciliary headache, that is, the headache caused by dysfunction or fatigue of the ciliary body in accommodating or focusing, is the same type of referred pain we find in angina pectoris and cardiac dysfunction.

Complete ophthalmic examination serves a negative function in that it rules out headaches that are not of ocular origin and is useful, at times, in discovering such conditions as glaucoma, optic atrophies, choked discs, hemianopsias and retinitis of albuminuric, diabetic or arteriosclerotic origin.

If the eyes must work against difficulties such as are seen in the hyperopic, or far-sighted person, the continued use of the eyes for near work frequently produces headache. This is especially seen in the presbyope who may tax the accommodative power beyond its natural reserve. The same holds true for the astigmatic patient and symptoms frequently arise in youth during the high school or college days if the eyes are used excessively for study. Although some of these patients will not accept a glass if refracted without drops, the use of a cycloplegic frequently discloses the presence of hyperopia or astigmatism.

Apart from the ciliary type of headache due to excessive accommodation or that caused by cramp of the accommodative apparatus, headaches may arise from impaired motility of the eyes or lack of easy coördination. The occipital headache of hyperphoria, vertical imbalance, has been mentioned, but poor convergence or even weak divergence can produce the sensations of eyestrain frequently manifest in the form of headache.

In convalescence from an illness or in any debilitated state the accommodation may be weakened and continued effort to read may produce headache that can readily be relieved by prescribing glasses. When general health of the patient improves the ciliary muscle regains its tone and the use of the glasses may be discontinued. A similar headache arises from overuse of the eyes combined with lack of outdoor exercise. There are limits of endurance even for an organism such as the ciliary body which, under normal conditions, has excellent reserve power. The headaches of ocular origin are, then, most frequently those associated with hyperopia, astigmatism, presbyopia or muscle imbalance. These can in almost every case be relieved by careful refraction and the prescribing of suitable lenses. There are other cases in which the refractive error may be partially responsible for the complaint of headache, and, although other causes of headache are eliminated, the patient may not be free from symptoms. It is in such cases that the correction of a small refractive error may be necessary before the headache can be completely relieved. A cycloplegic is especially indicated in such cases.

* * *

III. REFRACTION VERSUS GENERAL HEALTH

Samuel V. Abraham, M.D. (3875 Wilshire Boulevard, Los Angeles).—A careful and detailed eye examination is essential to appreciate the part played by the eyes in the production or the exaggeration of any symptoms. In addition, the results of a thorough general examination should be available to the ophthalmologist. Only then can the physician properly stress the deserving factors, and avoid undue emphasis on minor or unrelated factors.

It is important for the eye physician to keep in mind that almost everybody will show an error of refraction when properly examined under cycloplegia.[1] * At birth, almost everyone is hyperopic, less than 1.0 per cent showing any myopia. As the age increases, there is a definite tendency for the hyperopia to decrease and the myopia to increase, along with an increase in the size of the eyeball. The relation of this tendency to the general growth factors is indicated by the gradual increase of the myopia during the growing years, so that by the age of 20, myopia found may be as high as 24.7 per cent. Repeated examinations in the same patients over a period of many years tend to confirm this relationship. This is especially true during the adolescent years. After the twentieth year, the change is ordinarily minimal.

Whether or not an individual will show a myopia as an adult depends not only on the growth factors, but to a considerable degree on heredity. Whether a child will show a high or a low degree of hyperopia or astigmatism depends greatly on the error of refraction in one or both parents. Naturally, the myopia due to normal growth processes will tend to be more frequent in those children who start with lower degrees of hyperopia. Myopia has been shown to be considerably more frequent in the offspring of parents when at least one of them is myopic. When both parents are myopic, the chances for myopia in the child are greatly increased.

The symptoms caused or exaggerated by errors of refraction differ somewhat with the error of refraction. They differ also with the various patients. The same patient may have different symptoms at different times, depending on his general health, occupation, and age. Where uncorrected hyperopia is a factor in the complaints, the symptoms may be headaches, chiefly frontal in character, and difficulty on near use of the eyes or at movies, especially if the patient is ill, or has recently been ill. If the condition remains uncorrected, there is a continuous drain on the nervous energy of the body, with resultant additional complaints of photophobia, tiredness, redness of the eyes, styes, general increased irritability, nervousness, insomnia, nausea, anorexia, malaise, and occasionally, blinking. The headaches may be so severe as to suggest even a brain tumor. In children the headaches may not be the prominent symptom. There may be lack of interest in school work, and psychic disturbances in addition to the above symptoms. In adults, too, psychoneurotic disturbances may be present. The accommodative muscle, being more active in the early years, permits the symptoms of eyestrain to be masked for long periods. It is therefore important, particularly in young children, to do a cycloplegic examination in the presence of any complaints not explained by a thorough physical examination, and even in many of these, when the condition does not yield promptly to general care. It may be possible to help considerably by preserving energy being wasted because of an unsuspected amount of hyperopia. It should always be borne in mind that the psychological problems that may be introduced by the prescribing of glasses must be compensated for by a real need for these glasses. In a child under twelve years of age, for example, a hyperopia under 2.00 diopters may be wasteful of energy, but may still be unrelated to the complaints given. Unless there is evidence of a need for the help to be given by glasses, as in asthenic individuals, etc., 2.00 diopters of hyperopia should not be given major blame for any considerable trouble, in view of the 10 diopters or more of accommodation present in these years. When the amount of hyperopia is high, say over 5.00 diopters, the patient may not make a serious effort to overcome the defect. In these cases the visual acuity is frequently found to be subnormal. The early correction of these cases is imperative to prevent the influence that poor vision and eyestrain may have upon the development of the mind, and upon the general hygiene. The marked improvement in the mentality of these cases following correction of refraction has been demonstrated frequently.

---

* References will appear in the reprints.

The symptoms in myopia may be similar to those complained of in hyperopia, especially in early cases. However, in well established cases, the patient's chief complaint is one of poor distance vision. Near vision is good. The patient is frequently overstudious and of sedentary habits. The headaches when present are likely to be occipital or diffuse in character, and not definitely increased by near use of the eyes. There may also be increased photophobia, as the pupils may tend to be more sluggish in their responses. In the growing years there seems to be a definite relation to the general health. . . .

Correction by accommodation of the blurred vision caused by astigmatism is generally considered improbable. However, the constant effort to clear the vision when astigmatism is present, may lead to all the symptoms found in uncorrected hyperopia. The symptoms may be considerably exaggerated. Both distant and near vision may be unsatisfactory. There is frequently an attempt to decrease the size of the palpebral fissure (and thus the pupillary opening) as the blur is thus decreased. Any trauma to the cornea or lens of the eye, or any disease affecting the health of either, may cause a change in the refraction.

In keratoconus the astigmatism is usually irregular in character, becoming more so as the condition advances. Ordinary glasses do not give much help in these conditions. The wearing of contact glasses gives excellent improvement in vision. However, at best contact glasses are far from a desirable solution. . . .

As is well known, the power of accommodation naturally decreases with age. The ability to overcome uncorrected hyperopia becomes less, therefore, with age, and the amount of the error as well as the factors affecting the accommodative ability become increasingly important with age. This fact is of importance even in patients with low degrees of hyperopia or with emmetropia around the fortieth year, as at this time the amount of accommodation in reserve is usually insufficient to assure comfort in near use of the eyes over a prolonged period. (Presbyopia has arrived.)

General conditions, both functional and organic, may affect accommodation. Diphtheria may produce permanent or temporary loss of this function. Focal infections may be factors requiring attention. Local inflammations, due to diabetes, syphilis, tuberculosis, etc., may produce a spasm in accommodation and thus change the refraction of the eye. In some of these cases even atropin does not completely relax this spasm, as indicated objectively by the difficulty in maintaining a dilated pupil. Fatigue, acute or chronic illnesses, convalescence, psychic disturbances, excessive smoking, certain chemicals such as arsenic, etc., may lead to weakness in the activity of the accommodation. There may be an increased irritability of the ciliary muscle due to increased effort to use a weakened function. In the presence of a decreased ability of the ciliary muscle to function, whatever the cause, it becomes increasingly important to give greater attention to low errors of refraction (hyperopia). It may even be desirable to give premature aid to the accommodative function in near use of the eyes. Both these helps may be temporary, and may be found unnecessary when the general health factor responsible is removed. Symptoms of errors of refraction may be present in such cases even when no error is present. . . .

Under certain conditions, such as anisometropia, or antimetropia (in which there is a difference in the refraction of the two eyes), the fusional acts of the eyes are made more difficult, if not impossible. The extra strain involved varies considerably in the individual cases, and may be responsible for many and varied nervous disorders. . . .

The two problems, strabismus and amblyopia, while closely related to the subject of refraction and the general health, require extensive discussion. It is desired here to emphasize that proper and early attention to the refraction is important as a prophylactic measure in the prevention of these two conditions. Early correction of moderate and high errors of refraction is of considerable therapeutic value. In early cases, frequently, no further therapy is required. More important than the refraction in these cases is the general health factor. The frequency with which a parent relates the onset of the strabismus to the previous existence of an illness, emphasizes the importance of this factor. The disturbed progress in the development of a normal fusion, which may result from any weakening condition, is similar to the retardation in the development of other cerebration processes. When the error of refraction and the general health are both factors to be considered, the likelihood of a strabismus is increased. This probably accounts for an increase in the frequency of higher errors of refraction (hyperopia) in the squinters than in the nonsquinters of the same age group. The neuropathic type of individual, in whom one sometimes sees a congenital nystagmus, may be given considerable help by proper early refraction. The high errors of refraction frequently found, together with the elimination of the nystagmus in some cases by glasses alone, justifies considering this mode of therapy at the first opportunity.

The error of refraction may be a considerable factor in determining the general physical and mental condition of the patient. The general physical and mental condition of the patient may be chiefly responsible for the symptoms, or for a precipitation of the symptoms given by the patient. It is not always easy to determine which is the major cause of the symptoms. . . .

Since the refraction findings depend to a considerable extent on the method of examination, it should be emphasized that only complete cycloplegia gives the basic findings. Any modification of the method is a compromise for practical reasons only. Any patient who requires a refraction deserves the most accurate one that we may be able to give him, even though the lack of accuracy may not be detected by the patient. Further, it is desired to point out that the so-called dangers of cycloplegics or mydriatics are far from real. A statistical study of more than 500,000 cases seen and examined with cycloplegics by fifty-one reputable eye men revealed that acute glaucoma may occur in less than 0.022 per cent of cases so treated in those over 30 years of age. Cases of patients under 30 occur with even greater infrequency. In the hands of competent eye physicians, the likelihood of any such complication is very slight, and when it does occur it may logically be interpreted as an indication of the existence of an early glaucoma which otherwise would probably have been neglected.

While no major harm may result from prescribing glasses after careful examination, and in fact some benefit may accrue to the patient from the saving of energy, the emphasis should be on the major trouble. An eye doctor must be more than a refractionist. He must be in a position to evaluate the refraction findings in the light of the complaints and the general findings—in short, he must above all be a physician. The patient must be treated as a patient, not simply as a pair of eyes!

Recent Progress in Treatment of Nervous Diseases Reviewed.—Some conception of the astonishing growth during recent years of specific and effective forms of treatment for diseases of the nervous system is contained in a review of modern methods of treating such diseases by Tracy J. Putnam, M. D., Boston, in *The Journal of the American Medical Association* for May 6.

Pointing out that it has not been many years since neurology was widely considered a purely diagnostic specialty, Doctor Putnam says that "one can look through the pages devoted to nervous diseases in almost any textbook of medicine written before the war and find scarcely a single suggestion of treatment beyond arsenic, strychnin, bromides and electricity, aside from the more obvious indications for surgery.

"It is perhaps natural that pain should be the symptom of disease of nerve tissue which earliest demanded and first received specific relief. The use of opium dates back to prehistoric days and no real substitute for it has ever been found."

From that early treatment of pain Doctor Putnam continues with outlines of some of the many advances made in the field of neurology, from operations interrupting the nerve pathways, their resection or surgical removal, on down to the injection of alcohol into the spinal column.

While scattered "cures" have followed the use of any one of a thousand different remedies for epilepsy, he points out, only a few measures have come to be accepted in modern practice. One of these is the use of bromides (heart and brain depressants). On the whole, the most successful treatment for the majority of patients suffering from convulsions of unknown origin is the use of phenobarbital (a drug having a sedative effect). The drugs at present in use for the treatment of convulsions all were primarily introduced as hypnotics (sleep-producers), and the discovery of their anticonvulsant effect has been rather accidental.

"The recognition of syphilis of the nervous system is a relatively modern feat," Doctor Putnam says. "It was doubtless treated with mercury even before it was recognized. According to F. H. Garrison, M. D., the identity of the man who first introduced mercury into therapeutics (treatment) is unknown. It is probable that, as far as neurosyphilis at least is concerned, its reign is almost over.

"The story of the introduction of arsphenamin by Paul Ehrlich in 1910 is familiar to all (his 605 formula which failed and number 606 which succeeded). As a treatment for neurosyphilis it has largely been replaced by a modification—tryparsamid, first prepared in 1917.

"The use of artificially induced fever in the treatment of neurosyphilis has a long history in the life of one man. Wagner von Jauregg apparently first noticed its effect in dementia paralytica (chronic syphilitic nerve disease of the brain) in 1887 but he dropped the subject and returned to it only during the war. His first brief paper specificaliy recommending the use of malaria was published in 1918. Since then the method has become a standard one.

"A few years later (1921) the use of bismuth was proposed by Sazerac and Levaditi. The salts of this metal have largely taken the place of those of mercury. Up to the close of the war, once neursyphilis was established, there was little hope of arresting its course. At present the majority of early cases can be cured."

Meningitis, next to syphilis, Doctor Putnam points out, is the most common form of infection of the nervous system. The value of spinal puncture in its treatment is not yet fully recognized. A specific antiserum for infections with the meningococcus was introduced by Jochmann in 1906. Although widely used, its value still is in some doubt. In the last two years, synthetic drugs of the type of sulfanilamide have become a standard treatment, which is amazingly effective not only against infections by the meningococcus but against other pyogenic (pus-producing) infections.

"An increasing number of diseases of the nervous system now are being recognized as due to vitamin deficiency," Doctor Putnam states. "Not only 'alcoholic' polyneuritis (inflammation of many nerves at once) but also the characteristic confabulatory (delusional) psychosis often associated with it appear to be due in part to a vitamin deficiency. How effective treatment of these conditions will be remains to be seen. The practical understanding and treatment of nervous and mental diseases still are in an expanding stage."

If you are working indoors all day, using your brain instead of your brawn, remember to take some form of active exercise outdoors every day to balance the indoor activity.—*Hygeia.*

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

OFFICIAL NOTICE OF SPECIAL TEN-DOLLAR ASSESSMENT

Under date of May 15, 1939, an official notice concerning a special ten-dollar assessment levied on all members of the California Medical Association having the status of active members, was sent to every California Medical Association member. Notices follow:

* * *

(COPY)

CALIFORNIA MEDICAL ASSOCIATION
FOUR FIFTY SUTTER
SAN FRANCISCO

Notice of Special Assessment Levied Pursuant to Direction of House of Delegates, on All Active Members of Association, Payable June 1, 1939

To all Active Members of the California Medical Association:

You will please take notice that the House of Delegates of the California Medical Association at the second meeting of its sixty-eighth regular annual session held Wednesday, May 3, 1939, at the Hotel Del Monte, Del Monte, California, directed the Council to levy, and that pursuant thereto the Council, at its meeting held at the same place May 4, 1939, levied a special assessment upon all active members of the Association in the sum of Ten ($10) Dollars, payable on the first day of June, 1939, or within sixty (60) days thereafter.

The special assessment so levied must, therefore, be paid on or prior to the thirty-first day of July, 1939.

You will please further take notice that failure to pay the special assessment levied by direction of the House of Delegates will, pursuant to resolution adopted by the House of Delegates, result in automatic loss of membership.

In order to facilitate collection and record keeping, please make payment to the secretary of your component county society, because the California Medical Association By-Laws, Chapter X, Section 1(b), stipulate that all dues and assessments must be collected by the secretaries of the component county medical societies. Your county society secretary will forward your special assessment to the office of the Association.

By direction of the Council:

KARL L. SCHAUPP, *Chairman*,
GEORGE H. KRESS, *Secretary*.

Dated: May 15, 1939.

Explanatory Statement Concerning Notice of Special Assessment Enclosed Herewith

To the Active Members of the California Medical Association:

Enclosed herewith you will find a copy of a notice of a special assessment in the sum of Ten ($10) Dollars, payable June 1, 1939, or within sixty (60) days thereafter.

This assessment was levied by the House of Delegates at Del Monte, California, May 3, 1939. The assessment was contained in a resolution adopted by the House of Delegates providing for the creation of a Committee on Public Education and for the employment of a full-time public relations counsel. The resolution states that the purpose of levying a special assessment is to secure sufficient funds with which to carry on a campaign of public information and education with respect to "public health and welfare."

The resolution of the House of Delegates definitely "earmarked" the funds received under this special assessment as follows: "All moneys collected under this resolution shall be carried in a special fund and used only for the educational purposes contemplated in this resolution." In addition, any moneys remaining in the special fund, after discharge of the Committee on Public Education by the House of Delegates, is to be returned pro rata to the then members of the Association who paid the special assessment.

The resolution specifically directed the Council of the California Medical Association to arrange for the collection of the $10 special assessment.

The chairman of the Council (with the approval of the Council) is directed to appoint five members of the Association to the Committee on Public Education (the House of Delegates named the Speaker and the Chairman of the Council as two additional members). Also, the Council is authorized to levy further special assessments, and is directed to do so if funds are found to be necessary by the Committee on Public Education.

The full text of the resolution adopted by the House of Delegates at the Del Monte annual session on Wednesday, May 3, 1939, is printed below.*

Signed:
THE COUNCIL OF THE
CALIFORNIA MEDICAL ASSOCIATION.

Dated: May 15, 1939.

* * *

RESOLUTION

Adopted by the House of Delegates, May 4, 1939.

WHEREAS, The education of the public and public officials in those things which concern the public health and welfare, the standards of the scientific practice of medicine, must be conducted on a wide basis by those who are most qualified to carry on such an educational program; therefore be it

Resolved, By the House of Delegates of the California Medical Association in annual session at Del Monte, California, May 1-4, 1939, that the Council of the California Medical Association is hereby empowered and directed to create a committee of public education, under the supervision and direction of a committee of seven, to consist of the Chairman of the Council, the Speaker of the House of Delegates, and five members of the California Medical Association, appointed by the Chairman of the Council, with the approval of the Council. Said Committee to employ a full time public relations counsel skilled in public relations work and to carry on a state-wide program of education in matters of public health and welfare, on approval of the Council; and be it further

---

† For complete roster of officers, see advertising pages 2, 4, and 6.

* For Resolution No. 6, with action of House of Delegates, see page 437; for Council action, on page 446; for Official Notice, see this page, left column.

Resolved, That the Council of the California Medical Association is hereby empowered and directed to levy on and collect from each and every active member an assessment of ten dollars ($10), payable June 1, 1939. The Council is also empowered and directed to levy such assessment or assessments thereafter, payable monthly as may be necessary to accomplish the objectives of this Committee on Public Education, after due submission of plans, and budget approved by the Council; and be it further

Resolved, That failure to pay any of said assessments within sixty (60) days after the date on which each thereof is payable, shall forfeit the membership of a member, provided that the Council shall have the power to reinstate a member as provided by Chapter II, Section 2, Paragraph (b) of the By-Laws; and be it further

Resolved, That all moneys collected under and pursuant to this resolution shall be carried in a special fund and used only for the educational purposes contemplated in this resolution; and be it further

Resolved, That the only compensation received by members of this committee shall be their actual necessary expenses while on committee business; and be it further

Resolved, That any moneys remaining in this special fund at such time as the House of Delegates shall discharge this committee, and its work discontinued, shall be properly allocated and returned to those members from whom they have been collected.

HOUSE OF DELEGATES MINUTES*

Minutes of the Thirty-Sixth Annual Session of the House of Delegates of the California Medical Association

Held at Hotel Del Monte, Del Monte, California, Monday, May 1, 1939, and Wednesday, May 3, 1939

FIRST MEETING

Monday, May 1, 1939

1. **Call to Order.**—The meeting of the House of Delegates of the California Medical Association was called to order in the Auditorium of the Hotel Del Monte, Del Monte, California, Monday, May 1, 1939, at 8:30 p. m., by Speaker Lowell S. Goin of Los Angeles.

* * *

2. **Announcement of Personnel and Report of Credentials Committee.**—Speaker Goin announced that the Credential Committee was A. A. Morrison, Chairman, Ventura; F. J. Gundry, Kern; and G. W. Walker, Fresno.

Credentials Committee Chairman Morrison reported seventy-three delegates and twenty-three alternates qualified for representation in the House. The report of the Committee was accepted, and the Secretary proceeded to call the roll.

* * *

3. **Announcement of Reference Committees.**—Speaker Goin announced the appointment of the following Reference Committees:

Reference Committee No. 1, Reports of Officers and Standing and Special Committees—R. S. Kneeshaw, Chairman, San Jose; S. J. McClendon, San Diego; and Dorothy Allen, Oakland.

Reference Committee No. 2, Report of the Council and Report of Secretary-Treasurer—L. A. Alesen, Chairman, Los Angeles; Edwin L. Bruck, San Francisco; Lyle G. Crain, Los Angeles.

Reference Committee No. 3, Resolutions, Amendments to the Constitution and By-Laws, and New and Miscellaneous Business—Dewey Powell, Chairman, Stockton; John W. Cline, San Francisco; and William H. Daniels, Los Angeles.

* * *

4. **Sergeants-at-Arms.**—Speaker Goin appointed Roy Hammack and John Cline sergeants-at-arms.

5. **Address of President William W. Roblee.**—President Roblee addressed the House on problems confronting medicine, including legislation and the changing trends of medical practice.

The address of the President was referred to Reference Committee No. 1.

* * *

Report of the Council

6. **Report of the Council.**—Karl L. Schaupp, Chairman of the Council, presented the following as the Council's report to the House of Delegates:

The Council of the California Medical Association begs leave to submit its report on Association activities for the fiscal year May, 1938 to May, 1939, as follows:

Consolidation of the Offices of Secretary-Treasurer and Editor.

The Council, at its annual organization meeting held on Thursday, May 12, 1938, at Pasadena, consolidated the offices of secretary-treasurer and editor, as indicated in the minutes of meetings printed in CALIFORNIA AND WESTERN MEDICINE, November, 1938, on pages 392–400.

State Humane Pound Act.

The proposed Humane Pound Law, which appeared on the November 8, 1938, State election ballots as Initiative Proposition No. 2, was defeated after a very intensive campaign by education.

County Hospital Problems.

During the last year, the Council came to the full realization of the fact that the interests of the State Medical Association are closely related to those of the farmers of the state in many instances. Subcommittees of the Council met with representatives of the Allied Farm groups on numerous occasions. In the exchange of opinion in these joint sessions, it became evident that many problems could be cleared up by better understanding. Our greatest success has been in an increase in mutual understanding and trust.

Hospitalization Plans.

The Intercoast Hospitalization Insurance Association of Sacramento, the Insurance Association of Approved Hospitals of Oakland and San Francisco, and the Associated Hospitals Service of Southern California, with headquarters in Los Angeles, have each rendered pioneer service of great value to their respective sections, and to the Medical Association. They are working with increasing harmony, one with the other, and as a group they are coöperating in the attempt to coördinate medical and hospital service plans of the California Physicians' Service.

Medical Service Plans.

The Council, following the instructions of the House of Delegates on December 17 and 18, carried to a conclusion the organization of the California Physicians' Service for the purpose of making available to the people of California periodic payment for medical service. The first formal report on this project was made this morning by the officers of the California Physicians' Service.

New Tax Assessment Against the California Medical Association and Its Official Journal.

In the Council minutes and in the Pre-Convention Bulletin (page 39), the new taxes levied by Federal and State authorities have been discussed. Payments have been made under protest for the period under question.

Herzstein Bequest—Cancer Exhibit at the Golden Gate International Exposition.

The sum of $5,000 has been allocated from the Herzstein Bequest and has been used to present an exhibit on cancer at the Golden Gate International Exposition.

Postgraduate Activities.

Presentation of Postgraduate education is of necessity limited by the funds available for this purpose. Local Postgraduate Committees are urged to make every effort to promote a good attendance, also to plan ways and means whereby the expenses could be partially shared by the physicians who attend the session.

---

* Secretary's Note.—The following is a digest of the stenographic record of both meetings of the House of Delegates. The official and detailed record, as electrically recorded, is on file in the Central Office of the California Medical Association, 450 Sutter Building, San Francisco.

Technical-Commercial Exhibits.

Members of the Association are reminded that the exhibitors in technical-commercial exhibits division have entered their exhibits and paid the Association for the privilege of your attention. Our exhibitors are from among the best-known firms in the United States. It is hoped that the members will extend to them every courtesy to which they are entitled.

Scientific Exhibits.

An innovation in the Scientific Exhibits Division is the arrangement for the presentation of many medical films. It is hoped that the start made this year will lead to a large development of this feature of annual sessions.

Three prizes will be given: First prize, "Award of Special Merit"; second prize, first honorary mention; third prize, second honorary mention. Prizes will be of framed diploma type.

Inyo-Mono Counties Medical Society Charter.

The Council recommends to the House of Delegates that the charter applied for by the newly formed medical society—Inyo-Mono Counties—be granted and that Inyo and Mono counties be removed from the Fourth District allocation and placed in the Second Councilor District.

Membership.

On December 31, 1938, the membership of the California Medical Association was 6,101, which is the largest membership ever attained by this organization.

It is estimated that approximately 85 per cent of eligible doctors of medicine are now members of the Association.

California and Western Medicine.

The monthly issues of the Official Journal carry to the members, no matter how far remote or isolated, with the contributions of their fellows to scientific medicine, the story of the problems organized medicine is being called upon to solve. CALIFORNIA AND WESTERN MEDICINE has given generous space not only to California, but to other medical service plans and has played an important rôle in the efforts to have members of the California Medical Association work unitedly and harmoniously to promote the interests of California Physicians' Service.

County Secretaries' Conference.

As during the last few years the conferences of the secretaries have been held with the officers of the Association, the Council appreciated the effort made by these men in the interests of the members of the Association.

Visitation Tours by the Ranking Officers.

Attention is called to the value accruing to both organized and scientific medicine, through the visitation tours to the component county societies by the President, President-Elect, Councilors, and Association Secretary. Such presentation and exchange of informal opinion make for solidarity and united action from one end of the state to the other.

Woman's Auxiliary.

Appreciation and praise are due the Woman's Auxiliary and its component county units, not only for efficient aid rendered in the antivivisection and other legislative campaigns, but for the increasing influence the members of the Auxiliary are exerting among lay groups and organizations. The Auxiliary is in California to stay.

The Council recommends a vote of thanks to the members of the Woman's Auxiliary in appreciation for their loyal understanding and support.

Financial Problems and Needs:

An inspection of the financial budget of the present, in comparison with that of one or two decades past, reveals at once the increasing number, complexity and seriousness of the problems, organized and scientific medicine are called upon to solve. For instance, the proposed antivivisection act, a proposed law that would almost have wrecked many phases of scientific research in California, and which was defeated by organized medicine, but not without severe drain upon Association funds.

Note also, that the institution of medical service plans, even though on a nonprofit basis and with altruistic background, cannot be brought about except with the expenditure of very considerable sums of money.

Before us, perhaps in the near future, if a special election is called, comes across our paths the proposed Chiropractic Initiative which, if enacted by vote of the people, would give the group an increase in the scope of practice that would practically create a new group, namely, chiropractic physicians and surgeons.

In the Legislature, the naturopaths have again presented statutes that would give legal recognition to their group. In due time, it may be taken for granted that some high pressure publicity group will persuade this group to strive for legal recognition through initiative vote of the people, after the manner of their chiropractic fellows.

Which brings to our attention the need of a basic science law as a desirable means of preventing the enactment of laws, through either the Legislature or by vote of the people, for cultist groups of healing-art practitioners. The Council regrets the unforeseen circumstances that have arisen in different state election years that have prevented it from placing a basic science initiative on the ballot.

With this report is submitted to the House of Delegates a budget for the next fiscal year, which begins at the close of the present sixty-eighth annual session.

Dues.

The Council recommends that the dues for the calendar year 1940, be twenty dollars ($20) per member.

Proposed Budget.

The budget for the calendar year 1940, presented to the Council by the Auditing Committee, has been carefully considered and is herewith submitted to the House of Delegates:

BUDGET*

I. "Estimated" Income

1. Membership dues	$60,000.00
2. Advertising sales	25,000.00
3. Journal subscriptions	800.00
4. Reprint sales	2,500.00
5. Earned interest	250.00
6. Addressograph service	150.00
7. Miscellaneous	5,000.00
Total	$93,700.00

II. Expense Allocations Recommended

8. Rent	$ 3,425.00
9. Telephone and telegrams	750.00
10. Postage	750.00
11. Stationery and printing	1,000.00
12. Office supplies	500.00

---

* The budget as first submitted by the Council was based on annual dues of twenty dollars per member. However, the House of Delegates made the annual dues ten dollars per member. Had the twenty dollar dues been adopted, the sum of $60,000 (6,000 members at ten dollars each) would have been added to the "Estimated" Income, the figure then becoming $153,700 instead of $93,700.

In the Expense Allocations recommended, the $60,000 so received was carried under Item 21 (a) for "Unpredictable Needs and Public Policy." The original budget report as above indicated is in the files of the Central Office. To avoid confusion the budget, as finally adopted on the basis of annual dues of ten dollars, is here given.

The special assessment levied by the House of Delegates and due and payable on June 1, 1939, will be kept in a separate fund and be administered by a Special Committee, as outlined in the resolution thereon adopted by the House of Delegates. For resolution, see page 426.

13. Office expense	300.00
14. Salaries: Clerical	9,900.00
a. Social Security, Title 8, Old Age	225.50
15. Salary: Secretary-Treasurer, Director Public Relations	8,000.00
16. Travel Expense:	
a. Officers	1,000.00
b. Council	1,500.00
c. Executive Committee	750.00
d. Secretary	500.00
e. American Medical Association delegates	1,000.00
17. Department of Public Relations	1,000.00
a. Cancer Commission	500.00
18. Council Expense	300.00
19. Postgraduate expense	2,000.00
20. Expense of committees	1,000.00
21. Public policy and legislation	5,000.00
22. Annual session	3,000.00
23. Legal Department:	
a. Retainer	4,000.00
b. Extra fees	300.00
c. Expense	300.00
d. Extra clerical expense	900.00
24. Donations to libraries	3,000.00
25a. "California and Western Medicine" printing	25,000.00
26b. "California and Western Medicine" postage prepaid	1,500.00
27c. Advertising commissions	4,000.00
28d. Discounts, "California and Western Medicine"	250.00
29e. Editor's salary, "California and Western Medicine"	4,000.00
30f. Postage and expense	150.00
31g. Illustrations, "California and Western Medicine"	700.00
32h. Sundries, "California and Western Medicine"	200.00
33i. "California and Western Medicine" sales tax	2,200.00
34j. Addressograph expense	200.00
35. Reprint expense	2,000.00
36. Women's Auxiliary	200.00
37. Miscellaneous	1,000.00
38. UNEXPENDED BALANCE	1,399.50
Total	$93,700.00

Resignation of Dr. J. B. Harris.

I have now to report to you some of the saddest news that we can have in our California Medical Association. I will read to you: "Dear Doctor Schaupp:—After long and deliberate consideration, I hereby submit to you my resignation as councilor-at-large of the California Medical Association. Very truly yours, (Signed) J. B. Harris."

The above completes the report of the Council.

Respectfully submitted,

The Council.

By Karl L. Schaupp, *Chairman.*

Speaker Goin referred the report of the Council to Reference Committee No. 2.

* * *

7. **Report of the Trustees Of The California Medical Association.**—Karl L. Schaupp, President of the Trustees Of The California Medical Association, stated that the report was printed in the Pre-Convention Bulletin. With the consent of the House, the Speaker referred it to Reference Committee No. 2.

* * *

8. **Report of the Auditing Committee.**—T. Henshaw Kelly, Chairman of the Auditing Committee, reported that the report was printed in full in the Pre-Convention Bulletin.

With the consent of the House, the report was referred to Reference Committee No. 1.

* * *

9. **Report of the Legal Department.**—General Counsel Peart directed attention to the formal report of the Legal Department, as printed on page 42 of the Pre-Convention Bulletin, and outlined verbally certain important matters which had received the attention of his department.

Speaker Goin referred the report of the Legal Department to Reference Committee No. 1.

10. **Reports of Committee on Public Relations, and Standing and Special Committees.**—Association Secretary Kress informed the Speaker that all reports of Standing and Special Committees had been published in the Pre-Convention Bulletin.

Speaker Goin, with the consent of the House, referred the reports to Reference Committee No. 1.

* * *

11. **Tribute to Deceased Members.**—At this point the House rose in silent tribute to the seventy-three members of the Association who had died during the past year.

* * *

RESOLUTIONS

12. Introduction of Resolutions.

(a) *A Resolution Amending Article VII, Section 1, of the Constitution.* Introduced by William Voorsanger, San Francisco, for the San Francisco delegation. Resolution follows:

Resolved, That Section 1 of Article VII of the Constitution of this Association, California Medical Association, be and is hereby amended as follows:

By striking out all of the third paragraph of said Section 1 of Article VII, reading as follows:

> "The nine district councilors shall be elected as follows: Prior to the time set for the election of District Councilors, the delegates of each councilor district for which a councilorship is about to become vacant, shall meet, organize and in due form elect one or more members of the said councilor district, as a nominee or nominees for the said vacancy in such councilor district. Such nomination or nominations shall be submitted in writing, signed by at least two delegates who were present at such meeting, and shall be given to the Secretary-Treasurer, by him to be transmitted to the House of Delegates. The House of Delegates may make additional nominations from the floor of the house, and in the event that the delegates from a councilor district fail to submit a nomination or nominations, shall on its own account proceed to make nominations for each district councilor vacancy; and a vote shall then be taken by the House of Delegates to determine who shall be elected to the vacant councilorship."

and by inserting in lieu thereof the following:

> "The nine district councilors shall be elected as follows: Prior to the time set for the election of District Councilors, the delegates of each councilor district for which a councilorship is about to become vacant, shall submit in writing to the Secretary-Treasurer the names of one or more nominees to fill the said vacancy. The Secretary-Treasurer shall transmit the names of such nominee or nominees so submitted to him to the House of Delegates on or before the time set for the election. A vote shall be taken by the House of Delegates upon the nominee or nominees so submitted and, in the event that only one nominee has been submitted, the House of Delegates may, by a majority vote, either elect or refuse to elect said nominee. If the House of Delegates shall reject the sole nominee of the delegates from the councilorship district concerned, then said delegates must immediately thereafter submit an additional nominee or nominees and the House shall proceed to vote thereon; if there is but one nominee, the House may elect or reject. If, after such time as the Speaker may allow, delegates within such councilor district fail to submit an additional nominee or nominees, the House of Delegates may then proceed to make nominations from the floor of the House and a vote shall then be taken by the House of Delegates to determine who shall be elected to the vacant councilorship. All nominees for district councilorships must be members in good standing residing within the district in which the vacancy exists."

Speaker Goin stated that, in accordance with constitutional provision, this amendment to the Constitution would lie over for one year and would be considered at the 1940 session of the House.

* * *

(b) *Resolution No. 1, Survey of Association Offices.* Introduced by William Voorsanger, San Francisco, for the San Francisco Delegation.

Referred to Reference Committee No. 3.

(See page 435.)

(See page 439.)

* * *

(q) *Resolution No. 16, Expenses of Officers and Councilors.* Introduced by A. A. Morrison, Santa Paula.

Referred to Reference Committee No. 3.

(See page 439.)

* * *

13. **Approval of Minutes.**—On motion of William Voorsanger, San Francisco, seconded by Eric Larson, Los Angeles, and carried, the President of the Association, the Speaker of the House of Delegates, and the Secretary of the Association were authorized to edit and approve the minutes of the House.

* * *

14. **Meetings of Reference Committees.**—Speaker Goin announced the meeting places of the three Reference Committees.

* * *

15. **Recess.**—At this point the Speaker declared the House in recess until the second meeting, to be held at 4 p. m. on Wednesday, May 3, 1939.

SECOND MEETING

Wednesday, May 3, 1939

1. **Call to Order.**—The House was called to order by Speaker Lowell S. Goin at 4 p. m., Wednesday, May 3, 1939.

* * *

2. **Organization and Roll Call.**—A. A. Morrison, Chairman of the Credentials Committee, reported ninety-four delegates and sixteen alternates qualified to be seated. The Secretary then called the roll and, a quorum being present, the Speaker declared the House duly constituted for the transaction of business.

* * *

3. **Resignation of Vice-Speaker John H. Graves.**—Speaker Goin presented the resignation of John H. Graves of San Francisco as Vice-Speaker of the House of Delegates. On motion of George G. Reinle of Oakland, seconded by Calvert Emmons of Ontario, the resignation of Vice-Speaker John H. Graves was accepted with regret.

* * *

4. **Announcement of Place of 1940 Annual Session.**—The Secretary announced that the Council recommended that the 1940 annual session be held at Hotel del Coronado, Coronado. The recommendation was approved by the House.

* * *

5. **Election of Officers.**

Speaker Goin announced that the next order of business would be election of officers.

(a) *President-Elect.*—Carl R. Howson of Los Angeles nominated Harry H. Wilson of Los Angeles as president-elect. The nomination was seconded by Alson R. Kilgore of San Francisco. There being no further nominations, the Speaker declared the nominations closed. The Secretary cast the ballot of the House for Doctor Wilson. Doctors Vincent Askey and Samuel Ayres of Los Angeles escorted President-Elect Wilson to the platform.

(b) *Speaker of the House of Delegates.* — President Roblee, acting as chairman *pro tem.*, called for nominations for Speaker. S. J. McClendon of San Diego nominated Lowell S. Goin of Los Angeles to succeed himself as Speaker of the House of Delegates. There being no further nominations, President Roblee declared the nominations closed. On motion of T. Henshaw Kelly of San Francisco, seconded by Calvert Emmons of Ontario, the Secretary was instructed to cast the ballot of the House. The Secretary did so cast, and President Roblee announced the election of Lowell S. Goin as Speaker of the House for the ensuing year. Doctor Goin then took the chair.

(c) *Vice-Speaker of the House of Delegates.*—Louis A. Packard of Bakersfield nominated Dewey R. Powell of Stockton as Vice-Speaker of the House of Delegates. The nomination was seconded by A. E. Anderson of Fresno.

Frank W. Ott of Los Angeles nominated Charles Hayes of Los Angeles as Vice-Speaker of the House of Delegates. The nomination was seconded by John W. Cline of San Francisco.

There being no further nominations, the Speaker declared the nominations closed and appointed Russell Lee of Palo Alto and Robert Stone of San Francisco as tellers. A vote by ballot was taken.

Dewey R. Powell of Stockton having received the majority of the votes cast, the Speaker declared him elected Vice-Speaker of the House of Delegates for the ensuing year.

* * *

6. Election of Councilors.

(a) *Councilor for the Second District.*—Samuel Ayres, Jr., of Los Angeles nominated George D. Maner of Los Angeles as councilor for the Second District. The nomination was seconded by T. Henshaw Kelly. There being no further nominations, the Speaker declared the nominations closed. The Secretary cast the ballot, and the Speaker announced the election of George D. Maner as councilor of the Second District for a period of three years; term expiring in 1942.

(b) *Councilor for the Fifth District.*—Secretary Kress stated that he had received written notification that the delegates of the Fifth District had nominated C. Kelly Canelo as councilor. The nomination was seconded by T. H. Kelly of San Francisco. There being no further nominations, the Speaker declared the nominations closed. The Secretary cast the ballot and the Speaker announced the election of C. Kelly Canelo of San Jose as councilor of the Fifth District for a term of three years; term expiring in 1942.

(c) *Councilor for the Eighth District.*—Secretary Kress stated that he had received written notification that the delegates of the Eighth District had nominated Frank A. Macdonald of Sacramento as councilor. The nomination was seconded by T. Henshaw Kelly. There being no further nominations, the Speaker declared the nominations closed. The Secretary cast the ballot, and the Speaker announced the election of Frank A. MacDonald as councilor of the Eighth District for a term of three years; term expiring in 1942.

(d) *Councilors-At-Large.*—Wendell Olson of Fullerton nominated Herbert A. Johnson of Orange County as councilor-at-large to succeed C. C. Tanner, term expiring. Allan Bramkamp of Riverside seconded the nomination.

S. J. McClendon of San Diego nominated C. O. Tanner of San Diego as councilor-at-large. Lyell C. Kinney of San Diego seconded the nomination.

There being no further nominations, the Speaker declared the nominations closed and instructed the tellers to proceed with the ballot of the House. The majority of the votes being cast for C. O. Tanner, the Speaker declared Doctor Tanner elected councilor-at-large for a period of three years; term expiring in 1942.

(e) William Voorsanger of San Francisco nominated Elbridge J. Best of San Francisco as councilor-at-large to succeed T. Henshaw Kelly, term expiring. John Hunt Shephard of San Jose seconded the nomination. There being no further nominations, the Speaker declared the nominations closed. The Secretary cast the ballot of the House, and the Speaker declared Elbridge J. Best elected councilor-at-large for a period of three years; term expiring in 1942.

(f) Junius B. Harris of Sacramento nominated Frederick N. Scatena of Sacramento as councilor-at-large to succeed Junius B. Harris, resigned. The nomination was duly seconded. There being no further nominations, the Speaker declared the nominations closed. The Secretary cast the ballot of the House for Dr. Frederick N. Scatena, and the Speaker announced the election of Frederick N. Scatena as councilor-at-large to fill the unexpired term of J. B. Harris; term expiring in 1940.

* * *

7. Delegates to the American Medical Association.

(a) On nomination of George Reinle of Oakland, seconded by T. Henshaw Kelly, Elbridge J. Best of San Francisco was nominated delegate to the American Medical Association for the sessions of 1940 and 1941, to succeed Elbridge Best, term expiring. There being no further nominations, the Speaker declared the nominations closed. The Secretary cast the ballot of the House, and the Speaker declared Elbridge J. Best elected delegate to the American Medical Association for the sessions of 1940 and 1941.

(b) A. J. Cooper of San Diego nominated Lyell C. Kinney of San Diego as delegate to the American Medical Association for the sessions of 1940 and 1941, to succeed Lyell C. Kinney, term expiring. The nomination was seconded by Irving Ingber of San Francisco. There being no further nominations, the Speaker declared the nominations closed. The Secretary cast the ballot of the House, and the Speaker declared Lyell C. Kinney elected delegate to the American Medical Association for the session of 1940 and 1941.

(c) L. A. Alesen of Los Angeles nominated Lowell S. Goin of Los Angeles as delegate to the American Medical Association for the sessions of 1940 and 1941, to succeed J. P. Nuttall, term expiring. The nomination was seconded by T. Henshaw Kelly of San Francisco. There being no further nominations, President Roblee acting as chairman *pro tem.*, declared the nominations closed. The Secretary cast the ballot, and President Roblee declared Lowell S. Goin of Los Angeles elected delegate to the American Medical Association for the sessions of 1940 and 1941.

* * *

8. Alternates to the American Medical Association.

(a) Zera Bolin of San Francisco nominated Robert S. Stone of San Francisco as alternate to Delegate Elbridge J. Best to the American Medical Association for the sessions of 1940 and 1941, to succeed Robert S. Stone, term expiring. The nomination was seconded by T. Henshaw Kelly. There being no further nominations, the Speaker declared the nominations closed. The Secretary cast the ballot and the Speaker announced the election of Robert

Stone as alternate to Delegate Best to the American Medical Association for the sessions of 1940 and 1941.

(b) F. E. Toomey of San Diego nominated Bon O. Adams of Riverside as alternate to Delegate Kinney to the American Medical Association for the sessions of 1940 and 1941, to succeed Bon O. Adams, term expiring. The nomination was seconded by Lyell C. Kinney. There being no further nominations, the Speaker declared the nominations closed. The Secretary cast the ballot, and the Speaker announced the election of Bon O. Adams as alternate to Delegate Kinney to the American Medical Association for the sessions of 1940 and 1941.

(c) Howard West of Los Angeles nominated Roy E. Thomas of Los Angeles as alternate to Delegate Goin to the American Medical Association for the sessions of 1940 and 1941, to succeed F. M. Pottenger, term expiring. William H. Brownfield of Los Angeles seconded the nomination. There being no further nominations, the Speaker declared the nominations closed. The Secretary cast the ballot, and the Speaker declared Roy E. Thomas of Los Angeles elected alternate to Delegate Goin to the American Medical Association for the sessions of 1940 and 1941.

* * *

9. **Tribute to Retiring Officers.**—At this point the House paid tribute to retiring officers of the Association.

* * *

10. **Standing Committees.**

On request of the Speaker, Secretary Kress read the Council's recommendations on membership of Standing Committees. The House unanimously approved the Council's recommendations for membership. (See advertising page 2 in the Official Journal, for membership of committees.)

* * *

11. **Recess.**—At this point the House recessed until 8 p. m.

* * *

12. **Reconvening of the House.** — The House reconvened at 8 p. m. in the Auditorium of Hotel Del Monte, Wednesday, May 3, 1939.

* * *

13. **Call to Order.**—The Speaker announced that, a quorum being present, the House would proceed with its business.

* * *

14. **Prize Awards for Scientific Exhibits.**—The Association Committee on Scientific Program for the sixty-eighth annual session, through its chairman, Doctor Kress, reported that three awards had been made by a special subcommittee, consisting of three members of the Association, each unknown to the other, who had handed in sealed reports. The joint rating as based upon the reports submitted, gave the first prize, "Award for Special Merit," to the exhibit on "Gastroscopic Studies," which had been presented by Doctors Allan L. Cohn, Alfred White, and Rubin Gold, all of San Francisco, in conjunction with the Mount Zion Hospital of San Francisco.

The second prize, "First Honorary Mention," was awarded to the exhibit on "Gastro-enterostomy and Jejunoplasty Transparencies." This exhibit was contributed by Doctors Carl L. Hoag, John B. Saunders, Harold H. Lindner, and John M. Moore, all of San Francisco.

The third prize, "Award of Second Honorary Mention," was given to the exhibit on "Reconstructive Plastic and Oral Surgery." This exhibit had been presented by Doctors Arthur E. Smith and James B. Johnson of Los Angeles.

REPORT OF REFERENCE COMMITTEE NO. 1

15. **Report of Reference Committee No. 1, Reports of Officers and Standing and Special Committees:**

R. Stanley Kneeshaw, Chairman of the Committee, submitted the following report for his Committee:

To the Speaker and Members of the House of Delegates:

Your Committee on Reports of Officers and Standing and Special Committees,* submits the following report:

The Report of the President.—The California Medical Association has been very fortunate in having a man, as President, who has been so willing to work as Doctor Roblee has been. His long term as Speaker of the House and his close association with the functions of the California Medical Association has fitted him well for the office which he has so ably filled.

Doctor Roblee met with a severe accident which made it difficult for him to visit all of the medical societies this last year, but even under this handicap he was able to visit all of the component societies, familiarizing the men in those districts with the problems of the medical association and promoting a better feeling among the entire membership.

We commend Doctor Roblee for his excellent work in striving to promote this good feeling among the medical profession. We are sorry to see him go—he has been a great leader.

Your Committee recommends the adoption of the President's report. *Carried.*

* * *

Report of President-Elect.—Dr. Charles A. Dukes has ably carried out his duties as president-elect, and we may expect as much or more from him as president.

Your Committee recommends the adoption of the report of the President-Elect. *Carried.*

* * *

Report of the Speaker of the House of Delegates.—Dr. Lowell S. Goin has ably fulfilled his duties as Speaker of the House of Delegates and has rendered efficient service on all of his committee appointments during the year.

We commend Doctor Goin and recommend the adoption of his report. *Carried.*

* * *

Report of the Vice-Speaker of the House of Delegates.—Our able Vice-Speaker, Dr. John H. Graves, has performed his usual duties of vice-chairman in a pleasing manner.

Your Committee moves the adoption of the Vice-Speaker's report. *Carried.*

* * *

Report of the Chairman of the Council.—Dr. Karl L. Schaupp, Chairman of the Council, has been outstanding in the work that he has done this year—his duties have been many and he has fulfilled them all well. His guarding of the finances of the Association is to be commended, as is his work in many fields, which work he has undertaken this year for our benefit.

Your Committee recommends the adoption of the report of the Chairman of the Council. *Carried.*

* * *

Treasurer's Report.—The report of the Treasurer is lengthy and is printed in the *Pre-Convention Bulletin*, as a matter of public record.

Your Committee recommends the perusal of this report by the members of the House of Delegates, so that they may acquaint themselves with the financial standing of the Society. We look with alarm at the increasing expense of the Society each year, particularly the expense of the publication of the CALIFORNIA AND WESTERN MEDICINE, and would suggest a careful analysis of this situation and all other additional expected expenditures, by the Association.

Your Committee recommends the adoption of the Treasurer's report, with the suggestion that a committee be appointed by the Chairman of the Council, to carefully review the status of CALIFORNIA AND WESTERN MEDICINE, with a view of placing it on a more business-like basis.

On motion, this section was laid on the table for later consideration.

---

* Committee consisted of R. Stanley Kneeshaw, San Jose; S. J. McClendon, San Diego, and Dorothy Allen, Oakland.

Report of the Secretary.—Your Committee notes with interest and approval, the report of the Secretary, as submitted in the *Pre-Convention Bulletin,* and commends Dr. George H. Kress on the earnest and diversified work that he has done in the past year as Secretary.

Your Committee recommends the adoption of the Secretary's report.

On motion this section was adopted.

* * *

Report of the Editor.—The report of the Editor is a lengthy report and is printed in the *Pre-Convention Bulletin,* and your Committee hopes the members of the House of Delegates will acquaint themselves with the contents thereof.

Your Committee commends Dr. George H. Kress, as Editor, and for carrying out the policies of CALIFORNIA AND WESTERN MEDICINE; however, reiterates the suggestion that the matter of CALIFORNIA AND WESTERN MEDICINE be surveyed by a committee, with the viewpoint of placing it on a better basis financially.

Your Committee recommends the adoption of the report with the suggestion above.

On motion, this section was tabled.

* * *

The Report of the Legal Department.—The Legal Department is to be highly commended on its very able work during the past year, particularly with reference to its work on the case of *Engelking* vs. *Carlson* (*Res Ipsa Loquitur* Case)—also involving corporate practices and legal details of an extremely strenuous nature in connection with the incorporation of California Physicians' Service.

Your Committee recommends the adoption of the report of the Legal Department, as submitted by Hartley F. Peart, General Counsel. *Carried.*

* * *

Reports of the District Councilors.—The reports of the District Councilors give ample evidence that these men have fulfilled their duties well and have given of their time willingly during this last year, especially, due to the added amount of work that the Council has had thrown upon it through the California Physicians' Service—and each Councilor is to be commended.

Your Committee recommends the adoption of the reports of District Councilors. *Carried.*

* * *

Reports of Councilors-at-Large.—Your Committee has noted the reports of the Councilors-at-Large, and note with regret the resignations of Dr. Junius B. Harris and Dr. T. Henshaw Kelly.

Your Committee would suggest that the House of Delegates adopt a resolution commending Doctors Harris and Kelly for their years of service to the California Medical Association, as officers and councilors-at-large.

It is hoped that Doctors Harris and Kelly may see fit, at a later date, to return to the active work which they have so ably been carrying on.

Your Committee recommends the adoption of the reports of the Councilors-At-Large. *Carried.*

* * *

Report of Executive Committee.—The Executive Committee of the Council is to be commended on its excellent work this year, particularly because of the added work that has been thrown upon it because of California Physicians' Service.

Your Committee recommends the adoption of the report of the Executive Committee. *Carried.*

* * *

Report of Auditing Committee.—The Auditing Committee of the Council is to be commended on its work during this year.

Your Committee has noted the report as filed by the Chairman, Dr. T. Henshaw Kelly, and recommends its adoption. *Carried.*

* * *

Report of Committee on Associated Societies and Technical Groups.—The Committee on Associated Societies and Technical Groups is to be commended for their efforts in coördinating the various affiliated societies during the past year.

Your Committee recommends the adoption of the report of the Committee on Associated Societies and Technical Groups, as submitted by the chairman, Dr. John V. Barrow. *Carried.*

* * *

Report of Committee on Health and Public Instruction. The work of this committee, especially with reference to the establishment of a "Pneumonia Control" group in the State, during the past year, is to be commended.

Your Committee notes the rising interest of the medical societies in public education, and strongly urges the continued efforts to establish a Speakers' Bureau in the larger county units of the State, to promote a better understanding on the part of the public, of the work of the medical profession.

Your Committee recommends the adoption of the report as submitted by Dr. Fred B. Clarke, Chairman. *Carried.*

* * *

Report of Committee on History and Obituaries.—This report has been noted.

It is the recommendation of your Committee that the report, as submitted by Dr. Frank R. Makinson, Chairman, be adopted. *Carried.*

* * *

Report of Committee on Hospitals, Dispensaries and Clinics.—This committee did not meet during the past year.

No action taken.

* * *

Report of Committee on Industrial Practice.—This committee is to be commended on its efforts to liberalize and make broader the provisions of the State Compensation Insurance Act, and its efforts to give the working man better service and better medical and surgical care.

Your Committee recommends the adoption of the report of this Committee as submitted by Dr. Philip Stephens, Chairman. *Carried.*

* * *

Report of Committee on Medical Defense.—The work of this committee is to be commended, in view of the fact that an alarming number of malpractice suits are being filed in the State of California.

Your Committee recommends the establishing of a medical defense committee in each component county unit, so that these problems may be properly adjusted.

Your Committee recommends the adoption of the report of the Committee on Medical Defense—with the suggestion as above—Dr. George G. Reinle, Chairman of said committee. *Carried.*

* * *

Report of Committee on Medical Education and Medical Institutions.—This committee has had an active year and is to be commended for its furtherance of postgraduate work in the State.

Your Committee recommends that the report of this committee, as submitted by Dr. L. R. Chandler, Chairman, be accepted. *Carried.*

* * *

Report of Committee on Membership and Organization.—Your Committee commends the Membership Committee on their efforts in obtaining increased membership, so that at the present time the membership stands at an all-time high in the State.

Organized medicine depends on numbers for effectiveness in combating any unfavorable legislation.

Your Committee recommends the adoption of the report as submitted by Dr. George D. Maner, Chairman. *Carried.*

* * *

Report of Committee on Postgraduate Activities.—Your Committee commends this committee on its efforts during the past year, but regrets that the program as outlined by the committee has not been made more readily available to the component county units, and it is hoped that the program will materialize more definitely in the next year.

Your Committee recommends the adoption of the report as submitted by Dr. John C. Ruddock, Chairman. *Carried.*

Report of Committee on Publications.—Your Committee commends the efforts of the Committee on Publications for their efforts during the past year.

Your Committee recommends the adoption of the report as submitted by Dr. Ralph B. Eusden, Chairman. *Carried.*

* * *

Report of Committee on Public Policy and Legislation.—The efforts of this committee are to be especially commended, due to its increased activities during the legislative year.

Your Committee would like to especially commend the Chairman of this Committee, Dr. Junius B. Harris of Sacramento.

Your Committee recommends the adoption of the report as submitted. *Carried.*

* * *

Report of Committee on Public Relations.—The work of this committee has been extremely valuable during the past year, particularly in the campaign against the State Humane Pound Act, which was defeated largely through its efforts.

Your Committee recommends the adoption of the report as submitted by Dr. George G. Reinle, Chairman. *Carried.*

* * *

Report of Committee on Scientific Work.—This committee is to be especially commended on the excellent program which has been made available to the members at this session.

This program has been one of the outstanding ones in the entire history of the organization.

Your Committee recommends the adoption of the report. *Carried.*

* * *

Report of Cancer Commission.—The Cancer Commission is to be commended on its program of clinical conferences at this session, and for its continued efforts in education throughout the state, and its coöperation with the Women's Field Army campaign of the American Society for the control of cancer.

The continuation of such conferences meets with the hearty approval of the membership, and this committee urges the continuation of such conferences. *Carried.*

* * *

Report of Committee on Medical Research.—This committee, under the able leadership of Dr. P. K. Gilman, was largely instrumental in the successful campaign against Proposition No. 2 on the ballot last election, and he and his committee should be especially commended on their efforts.

Your Committee recommends the adoption of this report. *Carried.*

* * *

Report of Committee on Local Arrangements: Annual Session at Del Monte.—The local committee has contributed to make this an enjoyable meeting. We express our appreciation to both the local and central committee members.

Your Committee recommends the adoption of this report as submitted by Dr. Mast Wolfsohn, Chairman. *Carried.*

* * *

Report of Special Committee on Hospitals.—The work of this committee is to be especially commended, particularly in the establishing of a cordial relationship between the Farm Bureau Federations and Allied Groups with the California Medical Association.

Your Committee recommends the adoption of the report of the Committee as submitted by Dr. Louis A. Packard, Chairman. *Carried.*

* * *

Report of Special Committee on Pneumonia Control.—This committee has done commendable work and has been instrumental in the dissemination of much needed knowledge in the State and we urge its continuation.

Your Committee recommends the adoption of the report as submitted by Dr. Roy E. Thomas, Chairman. *Carried.*

Report of Special Committee on Syphilis.—This committee is to be commended on its work in furtherance of the Venereal Disease Control program, administered by the Bureau of Venereal Diseases, of the State Department of Health, and for contributing to the educational program throughout the State, in the control of venereal diseases.

We emphasize the importance of making proper reports, of investigating sources of infection, and a continuation of the work.

Your Committee recommends the adoption of the report as submitted by Dr. Howard Morrow, Chairman. *Carried.*

* * *

Report of Special Committee on a Basic Science Law.—The work of this special Committee on a Basic Science Law, is to be commended, and the need for such legislation should be stressed.

We urge the Council to proceed with a Basic Science Initiative for the next General election.

Your Committee recommends the adoption of the report as submitted. *Carried.*

* * *

Report of Special Committee on Cancer Exhibit at the Golden Gate International Exposition.—Dr. T. Henshaw Kelly, Chairman, and members of the committee, should be commended on the effectiveness of this Cancer Exhibit, as an educational feature, and we feel that the money spent in preparing this exhibit has been well expended. The committee should be complimented on their initiative in establishing the Cancer Exhibit.

We urge that this Cancer Exhibit at the Golden Gate International Exposition be visited and publicized.

Your Committee recommends that the report be adopted. *Carried.*

* * *

Report of Trustees of the California Medical Association.—Your Committee has carefully reviewed the financial statement submitted by the Council, through the Certified Accountants, Ernst & Ernst.

Your Committee moves acceptance of the Auditing Committee report. *Carried.*

Robert Newell of San Francisco moved that the report as a whole, and as amended, be adopted. *Carried.*

* * *

REPORT OF REFERENCE COMMITTEE NO. 2

16. Report of Reference Committee No. 2, Report of the Council and Report of the Secretary-Treasurer.*—

L. A. Alesen, Chairman of the Committee, submitted the following report for his committee:

To the Speaker and House of Delegates:

PREAMBLE: The year just drawing to a close has been one in which the members of the Council, the Secretary-Treasurer and all other officers of the California Medical Association have been unusually alert and active in its behalf. Long-heralded threats of governmental encroachment upon and interference with the practice of medicine in our State have, during this year, materialized into specific legislative proposals having the support of several pressure groups whose sponsorship has been loud and clamorous. The constant desire on the part of the poorly qualified individual to engage in the practice of the healing art and the misdirected and maudlin sympathy of the uninformed have been once more united in an attempt to throttle scientific investigation and treatment through the perennial antivivisection measure.

These emergencies have been ably met by the Council, the Secretary-Treasurer and the other officers of the Association, but their contravention has required skill, time and money. Our officers have generously and effectively given of their skill and time. We, the membership, must show our appreciation and approval of their efforts by a more generous contribution of our personal and financial aid.

Taxes.—Your Committee wishes to place particular emphasis upon the matter of new taxes levied by State and Federal authorities upon the California Medical Association for old age and unemployment insurance. Notwithstanding the fact that the Commissioner of Internal Revenue has previously held the Association to be exempt from certain taxes because of its nature as a nonprofit scientific and educational organization, this, his own, ruling was reversed on September 9, 1938, and the Association was billed for back taxes for the years 1936, 1937 and 1938, together with interest and penalties. This is obviously unsound and unfair. It illustrates most forcefully government by bureaucratic decree instead of government by law, and represents a threat in national life which should be resisted at all costs.

---

* Committee consisted of L. A. Alesen, Los Angeles, Chairman; Edwin L. Bruck, San Francisco, and Lyle G. Craig, Los Angeles.

The Committee moved the adoption of this portion of the report. *Carried.*

* * *

Scientific Exhibits.—The scientific exhibits in this session are particularly meritorious. Your Committee feels that this phase of professional activity should be encouraged and increased in the future.

The Committee moved the adoption of this portion of the report. *Carried.*

* * *

Inyo-Mono County Charter.—The recommendation of the Council that the charter requested by the newly formed Inyo-Mono County Medical Society be granted and that these counties be removed from the Fourth Councilor District and placed in the Second District is approved. This action is contemplated by the resolution introduced by Dr. Joseph Stevens; hence, no further action on this resolution is required if the Council's report is adopted as recommended.

The Committee moved the adoption of this portion of the report. *Carried.*

* * *

Financial Problems and Needs.—Under this heading, the Council's report outlines the past drains upon the Treasury caused by efforts to combat legislative proposals inimical to scientific medicine and the public health. It further indicates the necessity for more funds because of definite measures arising in the near future. To make available an emergency fund for this purpose, the Council recommends that the dues for the year 1940 be raised from the current ten-dollar rate to twenty dollars. Your Committee heartily approves of this proposal in principle. It feels, however, that such an increase in dues would not render available the necessary funds during the coming months of this year when such need is sure to arise. It is therefore recommended that the Council be authorized to levy one or more assessments, preferably in amounts not to exceed ten dollars at a time, and the total amount of these assessments not to exceed twenty-five dollars for the coming year, the time and circumstances requiring these assessments to be left to the discretion of the Council. Your Committee further recommends that money so raised shall be placed in a special fund earmarked for public education in the matter of health safeguards.

The Committee moves that, inasmuch as Reference Committee No. 3 has several resolutions dealing with this matter, that this part of the report be tabled and considered in connection with that report. *Tabled.*

* * *

Budget.—The budget as submitted meets with the approval of your Committee with the exception noted in the preceding paragraph, which contemplates retaining the annual dues at the rate of ten dollars per year as present, with the provision for special assessments as required.

The Committee moved that this part of the report be also tabled and considered in connection with the report of Resolutions Committee No. 3. *Tabled.*

* * *

Resignation of Doctor Harris.—The resignation of Dr. Junius B. Harris from the Council of the California Medical Association is received with extreme regret. It will be impossible to fill satisfactorily the place of this man who has served us long and extremely well.

The Committee moved that this part of the report be adopted. *Carried.*

* * *

Life Membership.—The Council's recommendation that a committee be appointed to study the matter of a life membership to be purchased at the age of sixty is approved for passage.

The Committee moves the adoption of this section of the report. *Carried.*

Reports of the Secretary, the Treasurer and the Editor. The reports of the Secretary, the Treasurer and the Editor are concise and self-explanatory. They evidence excellent and painstaking work directed in an intelligent and capable manner in the conduct of the Association's business. The format and literary excellence of CALIFORNIA AND WESTERN MEDICINE have long been matters of favorable nation-wide comment and should continue to be the source of pride and satisfaction on the part of the entire membership.

Your Committee moves the adoption of this section of the report. *Carried.*

* * *

Report of the Trustees of the California Medical Association.—The report of the Trustees reflects the soundness of our Association, as well as the fact that our fiscal affairs have been placed in the hands of able and conscientious leaders.

The Committee moves the adoption of this section of the report. *Carried.*

The Committee moved the adoption of the report as a whole, with the exception of those sections which had been tabled. *Carried.*

* * *

REPORT OF REFERENCE COMMITTEE NO. 3

17. **Report of Reference Committee No. 3, Resolutions, Amendments to the Constitution and By-Laws, and New and Miscellaneous Business.***—Dewey R. Powell, Chairman of the Committee, submitted the following report for his committee.

Your Committee on Resolutions has given careful consideration to the resolutions placed before them. We have consulted, in most instances, with the authors of those resolutions and with other interested delegates and members of the Association, and herewith present for your consideration our report.

(a) *Resolution No. 1, Survey of Association Offices.* Presented by William Voorsanger for the San Francisco delegation:

WHEREAS, The people of California are faced with increasing attempts on the part of certain agitators to foster inadequate and politically dominated type of "health insurance"; and

WHEREAS, It is more important than ever that we, the organized medical profession, maintain an efficient and united approach to the solution of this and kindred problems; and

WHEREAS, The active directing force of the California Medical Association functions through the central offices of the Society (which offices include the secretarial, editorial, and public relations division); be it

Resolved, That a constructive study of the functioning of those offices be prepared for the members of this House, said study to be conducted by a special committee of three, to be appointed by the Speaker of this Session; and be it

Resolved, That a report of this study shall be placed in the hands of the Council as soon as possible (preferably before September, 1939) in order that that body may initiate such changes as are indicated; and be it

Resolved, That a copy of the study and a report of the Council's action thereon shall be printed in the 1940 Pre-Convention Bulletin.

* * *

Comment.—The Committee feels that, in view of the increasing complexity of the Society's business efforts, the many economic and legislative problems confronting medicine, and the multiplicity of activities that fall upon the Central Office, that it is time to consider a careful survey as to whether or not the present structure is sufficient to efficiently carry on these manifold responsibilities.

It seems, therefore, advisable that a committee be appointed to undertake a survey to determine the most efficient set-up, what changes, if any, are necessary to carry on the business of our Association with its public relations contacts in the most modern and efficient manner.

Therefore, we recommend that this resolution do pass. *Carried.*

---

* Committee consisted of Dewey R. Powell, Stockton, Chairman; John W. Cline, San Francisco, and William H. Daniel, Los Angeles.

(b) *Resolution No. 2 Committee on Standards, Hours, and Compensation for Municipal, County, State, and Federal Medical Employees.* Presented by William Voorsanger for the San Francisco delegation.

WHEREAS, Municipal, county, state, and federal employed doctors of medicine are inadequately compensated, worked unfair hours, and are subjected to an excessive patient load; and

WHEREAS, These medical employees provide a baseline for the evaluation of medical compensation; therefore be it

Resolved, That a committee be appointed by the Speaker of the House of Delegates of the California Medical Association to investigate the injustice of these services and to recommend proper standards of hours and payments for these works.

* * *

Comment.—The Committee feels that this resolution calls attention to a situation that requires our careful investigation, inasmuch as doctors of medicine are frequently inadequately compensated, and worked unfair hours by various municipal, county, state, and federal agencies. A committee of this House, purely as an investigatory group, should consider what, if any, means could be undertaken by the California Medical Association to improve the hours and payment.

This Committee to report to the Council, who would have sole power to translate such recommendations into action; and the Committee's findings to be published in the Pre-Convention Bulletin.

We recommend that this resolution do pass. *Carried.*

* * *

(c) *Resolution No. 3, Capitation Systems of Socialized Medicine.* Presented by William Voorsanger for the San Francisco delegation.

WHEREAS, We of the organized medical profession recognize that all previous capitation plans have lowered the standard of medical care, reduced individual initiative and introduced political methods into the practice of medicine; be it

Resolved, That the membership of the California Medical Association, hereby goes on record as condemning all such proposals or legislation, and refuses to participate in the capitation system as a means of socializing medicine.

Comment.—The Committee feels that this resolution is a very timely restatement of our position in opposition of any form of capitation plan in the practice of medicine.

We recommend the adoption of this resolution with the deletion of the words "and refuses to participate in the capitation system as a means of socializing medicine."

The resolution will read:

WHEREAS, We of the organized medical profession recognize that all previous capitation plans have lowered the standard of medical care, reduced individual initiative and introduced political methods into the practice of medicine; be it

Resolved, That the membership of the California Medical Association, hereby goes on record as condemning all such proposals or legislation.

Your Committee recommends that this resolution, as amended, do pass. *Carried.*

* * *

(d) *Resolution No. 4,* CALIFORNIA AND WESTERN MEDICINE *Survey.* Presented by William Voorsanger for the San Francisco Delegation.

WHEREAS, California Medical Association is being subjected to increasing demands for the expenditure of money; and

WHEREAS, There must be a limit to the demand made upon the membership of the California Medical Association to furnish more money as dues and assessments; and

WHEREAS, Wise economy is good business policy; and

WHEREAS, The publication CALIFORNIA AND WESTERN MEDICINE costs the Association over $16,000 annually; therefore be it

Resolved, That a committee be appointed by the Speaker of this House of Delegates to study and report to the 1940 Session of the House of Delegates on the question of replacing the present journal, CALIFORNIA AND WESTERN MEDICINE by publishing a Monthly Bulletin for the members and publishing selected scientific papers from those read at the Annual Sessions in one volume to be known as "Proceedings of the California Medical Association for that year; and be it further

Resolved, That a committee be appointed by the Council to be known as the "Editorial Committee," whose duty will be the selection of scientific papers for publication.

Inasmuch as the import of this resolution has been covered by Resolution No. 1, and, having secured the proponent's consent, this resolution is withdrawn. *Withdrawn.*

* * *

(e) *Resolution No. 5, Business League Classification of Association.* Presented by William Voorsanger for the San Francisco delegation.

WHEREAS, Certain government employees have seen fit to arbitrarily rule that a medical organization is a "Business League" and not a Scientific Society, and advice has been given that the California Medical Association acquiesce to this change in status; and

WHEREAS, It is incumbent upon the medical profession to weigh most carefully each decision that has the possibility of lessening the standards of the profession because the highest courts have ruled that the judgment of the court must depend upon the standards set up by a profession; therefore be it

Resolved, That the California Medical Association does not acquiesce to the "Business League" ruling, but insists and stands by the purposes of this Association, according to Article II, Section 1, which can only be changed by a legal amendment, namely, that it is a Scientific and Educational Society; and be it further

Resolved, That the educational activities are not only for the members but particularly for the furthering of the public good and the Public Health and that this fact be widely publicized.

Comment.—The Resolutions Committee is in complete accord with the sentiment expressed in this resolution, and feels very emphatically that our organization is a scientific and educational society, and not a "Business League." However, we believe that we should take extreme care not to embarrass our Council and legal advisers by any uninformed action on this government ruling, and that we can safely leave this matter in their hands in the future.

We, therefore, recommend that this resolution do not pass. *Motion carried. (Resolution not adopted.)*

* * *

(f) *Resolution No. 6, Public Relations Counsel and Assessment Therefor.* Presented by William Bruck of San Francisco.

Inasmuch as four resolutions (No. 6, No. 8, No. 12, and No. 13) all pertain to the same common problem, a Substitute Resolution No. 6 is offered by the Committee, embodying the thoughts outlined in each of the four.

Doctor Bruck's resolution (No. 6) before amendment follows:

WHEREAS, The education of the public in those things which concern the standards of the scientific practice of medicine, and the concomittant facts which concern the economics of medicine, must be conducted on a wide basis by those who are most conversant with the facts at hand to carry on such an educational program through proper channels; therefore be it

Resolved, By the House of Delegates of the California Medical Association in annual session at Del Monte, California, May 1-4, 1939, that the Council of the California Medical Association is hereby instructed to set up a department of public education, which shall consist of a committee from the membership at large of the California Medical Association, and which shall have attached to it, on a full-time pay basis, a proper public relations counsel skilled in public relations work, to carry on a state-wide program of education of the public in matters of the public health and welfare, and in matters of the economics of medicine, through already existing channels, to include the news press, medical press, the agricultural press, the trade press, and other periodical press, as well as radio time, and public address, etc.; and be it further

Resolved, That committee from the membership of the California Medical Association herein created, attach to it a public relations counsel who is conversant with all the above methods of publicity, and who is already well-known to the public at large, in work of this character in order that public attention to the program be assured; and be it further

Resolved, That such pro rata assessment or assessments be made against the members of the California Medical Association to carry on the above widespread program be made by the Council of the California Medical Association, and that all funds obtained by such assessment or assessments be carried in a special fund for the above educational purposes, and for these purposes only.

Note: The resolution above is considered in the Committee's substitute resolution, which follows:

* * *

Substitute Resolution No. 6 (presented by the Committee as a substitute for Resolutions No. 6, No. 8, No. 12, and No. 13, and including amendments passed by the House), follows:

Whereas, The education of the public and public officials in those things which concern the public health and welfare, the standards of the scientific practice of medicine, must be conducted on a wide basis by those who are most qualified to carry on such as educational program; therefore be it

Resolved, By the House of Delegates of the California Medical Association in annual session at Del Monte, California, May 1-4, 1939, that the Council of the California Medical Association is hereby empowered and directed to create a committee of public education, under the supervision and direction of a committee of seven, to consist of the Chairman of the Council, the Speaker of the House of Delegates, and five members of the California Medical Association, appointed by the Chairman of the Council, with the approval of the Council. Said committee to employ a full-time public relations counsel skilled in public relations work and to carry on a state-wide program of education in matters of public health and welfare, on approval of the Council; and be it further

Resolved, That the Council of the California Medical Association is hereby empowered and directed to levy on and collect from each and every active member an assessment of $10, payable June 1, 1939. The Council is also empowered and directed to levy such assessment or assessments thereafter, payable monthly as may be necessary to accomplish the objectives of this Committee on Public Education, after due submission of plans, and budget approved by the Council; and be it further

Resolved, That failure to pay any of said assessments within sixty (60) days after the date on which each thereof is payable, shall forfeit the membership of a member, provided that the Council shall have the power to reinstate a member as provided by Chapter II, Section 2, Paragraph (b) of the By-Laws; and be it further

Resolved, That all moneys collected under and pursuant to this resolution shall be carried in a special fund and used only for the educational purposes contemplated in this resolution; and be it further

Resolved, That the only compensation received by members of this committee shall be their actual necessary expenses while on committee business; and be it further

Resolved, That any moneys remaining in this special fund at such time as the House of Delegates shall discharge this committee, and its work discontinued, shall be properly allocated and returned to those members from whom they have been collected.

Your Committee recommends the adoption of the substitute resolution as amended by the House. *Carried.*

* * *

(g) *Resolution No. 7, Code of Ethics.* Presented by John Hunt Shephard of San Jose for the Santa Clara delegation. The original resolution as presented by the Santa Clara delegation was somewhat cumbersome. It reads as follows:

Resolved, That the Santa Clara County Medical Society reaffirm its action taken March 18, 1935, pursuant to which the House of Delegates of the California Medical Association did at its Yosemite meeting in 1935 enact a resolution; and be it further

Resolved, That, in view of the trends toward rapid change in the economic, political and social relationships of the physician to his colleague, his patient and the public in general, we respectfully request the House of Delegates of the California Medical Association to instruct or create the proper committee or the Council to bring in at the earliest time consistent with well considered action a report for publication to the Association and subsequent adoption by the House of Delegates, setting up for the physician members of this State a restatement of the code of professional relations in the light of the code of ethics of the American Medical Association; and be it further

Resolved, That we request most respectfully that the House of Delegates of the California Medical Association instruct its delegates to the American Medical Association to sponsor a similar restatement of the code of ethics on a national scale, in view of the nation-wide influence of the appearance of physicians on the public platform, in the press, upon the radio and elsewhere; and be it further

Resolved, That delegates from the Santa Clara County Medical Society to the California Medical Association are hereby instructed to offer and actively to support this proposal at the meeting of the House of Delegates at Del Monte.

Above resolution was adopted by unanimous vote of the Santa Clara County Medical Society at its regular meeting held April 19, 1939.

Substitute resolution for that presented by Doctor Shephard of San Jose, and as amended by the Committee, follows:

Resolved, That this House of Delegates instruct its delegates to the House of Delegates of the American Medical Association to use their best efforts to secure the appointment of a committee for the recodification of the Principles of Medical Ethics; and be it further

Resolved, That the Council of the California Medical Association appoint a committee of three members of the California Medical Association to make a restatement of a code of professional relations in all its applications and local conditions in the State of California in conformance with the code of ethics of the American Medical Association.

Your Committee recommends the adoption of this substitute resolution. *Carried.*

* * *

(h) *Resolution No. 8, Public Relations Counsel and Assessment Therefor.* Presented by John Hunt Shephard of San Jose for the Santa Clara delegation.

Original Resolution No. 8 reads:

Preamble: At a regular meeting of the Santa Clara County Medical Society, held on the 19th day of April, 1939, its delegates to the California Medical Association meeting at Del Monte, California, May 1 to 4, 1939, were instructed to introduce the following resolution:

Whereas, Many misinformed individuals, sincere in their belief that society as a whole will be benefited by some form of politically controlled medical service; and

Whereas, Other individuals, envisioning personal preferment in such a system, are aiding in the spreading of such propaganda; and

Whereas, The promise of relief from the unpredictable indeterminate cost of sickness not only strikes a sympathetic cord in the human heart, but has a strong appeal to man's economic instincts; and

Whereas, Legislation, claimed by its sponsors to provide more adequate medical care than is now available to society at large, has been introduced in the last three sessions of the California Legislature, and also in the Congress of the United States; and

Whereas, The vast majority of the medical profession of America is united in the belief that any form of politically dominated medical service will result in the lowering of the standard of such service and greatly retard medical advancement, to the serious detriment of the people; and

Whereas, We believe that through proper enlightenment of the public, the high type of American medical service now available to all who seek it will be maintained, and all threatened attempts to place it under political control will be defeated; therefore be it

Resolved, By the House of Delegates of the California Medical Association, in regular session at Del Monte, California, this 3rd day of May, 1939, that the Council of the California Medical Association be, and is hereby directed and empowered, to inaugurate and establish in the Department of Public Relations, under the supervision of a man thoroughly trained and experienced in publicity salesmanship, a Department of Public Education; and be it further

Resolved, That the Council of the California Medical Association be, and is hereby empowered to levy a per capita installment assessment not to exceed $75 per member, on each and every active member of the California Medical Association for the purpose of defraying the cost of the department created under this resolution.

Action on Resolution No. 8, as presented by Doctor Shephard of San Jose, is covered in Substitute Resolution No. 6, previously noted.

* * *

(i) *Resolution No. 9, Nurses' Legislation.* Presented by Dewey Powell of Stockton.

WHEREAS, The registered nurses of the State of California are sponsoring a bill (A. B. 620) at the present session of the Legislature which aims to establish and maintain adequate standards of nursing training and practice to which all registered nurses must conform; and

WHEREAS, The principles and standards set forth in A. B. 620 are in keeping with professional standards advocated and supported by the California Medical Association and are a protection to the public of this State; and

WHEREAS, This Bill has already been voted "Do Pass" by the Assembly Committee on Medical and Dental Laws, and any further opposition on the part of the California Medical Association through its Legislative Committee would require appearance before the Senate Committee or opposition on the floor of the Assembly; and

WHEREAS, Many county units of the California Medical Association, after careful study of A. B. 620 as amended, have heartily endorsed it; and

WHEREAS, Other bills before the present Legislature are of much more importance to the membership of the California Medical Association, particularly, the compulsory health insurance bill, A. B. 2172, which has been voted out of Assembly Committee with a "Do Pass' recommendation, and which vitally affects the practice of medicine; and

WHEREAS, We need and should have the wholehearted support of all allied professions, and particularly our friends the registered nurses; and

WHEREAS, The public opposition of the California Medical Association expressed through its Legislative Committee is publicized as a lack of solidarity in professional ranks, and gives comfort and solace to all enemies of organized medicine; therefore, be it

Resolved, That this House of Delegates respectfully request the Council of the California Medical Association, through its Legislative Committee, to adjust any remaining differences to the end that the California Medical Association may support and coöperate with the registered nurses of this State in their desire to establish adequate professional standards, through the adoption of A. B. 620.

Comment.—After conference with the Legislative Committee Chairman, it has been ascertained that all points of difference between the viewpoint of our Committee and the Nurses' Association have been adjusted, excepting one important matter which is now under consideration.

Therefore, the proponents of the resolution have withdrawn it, and the Committee so reports.

* * *

(j) *Resolution No. 10, Redistricting Inyo and Mono Counties.* Introduced by J. B. Stevens of Los Angeles.

WHEREAS, We, the Southern Delegation from Riverside, San Diego, Orange, San Bernardino and Los Angeles counties, understand that the Doctors of Medicine of Inyo and Mono counties have made a request to the California Medical Association for a charter as a component county society; and

WHEREAS, The town of Bishop, because of its geographical location, is readily reached from Los Angeles by automobile over excellent highways which are open all winter, and also by motor bus facilities; and

WHEREAS, The City of Los Angeles owns land to a total of 296,286 acres in the two counties; therefore, be it

Resolved, That because of the above mentioned geographical and economic reasons, we, the Delegation of the above named counties, request the House of Delegates of the California Medical Association to include the Inyo-Mono County unit within Councilmanic District Number Two of the California Medical Association, if and when that unit is chartered.

Action on this is covered in the report of Reference Committee No. 2, L. A. Alesen, Chairman, approving Council report recommending redistricting.

(See page 435.)

* * *

(k) *Resolution No. 11, Needy Members of the Profession.* Introduced by N. J. Dau of Fresno.

PREAMBLE: Since sickness, misfortune and old age not infrequently are the causes of want and inability of worthy members of this Society to provide for themselves and dependents the necessities of life, and since such members of our profession would often rather suffer want and privation than humble their pride and ask assistance from government relief agencies, be it hereby

Resolved, FIRST, That each component county society be asked to appoint a committee to visit sick and needy members, and ascertain what assistance they may require and report their findings to the Secretary of the Society;

SECOND, That the Secretary of the County Society be authorized by the governing board of the Society to render such immediate assistance as may be possible from the funds of the Society;

THIRD, That additional funds for this purpose be secured from the membership by voluntary contributions or assessment as may be voted by the Society;

FOURTH, That the President of the California Medical Association appoint a committee of three, *to be known as "Big Brother Committee" (or other suitable name),** and that this committee ascertain as far as possible the number of physicians in need of assistance in the State of California, and devise ways and means to provide for the essential needs of such members, and report, with recommendations for action, to this House of Delegates at the next annual convention; and be it further

Resolved, That the Council of the California Medical Association may, in the interval, receive and distribute voluntary contributions and bequests for any urgent cases of needy members in the interim.

The Council is hereby instructed to establish a fund to be built up by voluntary contributions and bequests, the principal of which shall be held in trust unless otherwise stipulated by the respective donors, and the income from which shall be disbursed for the relief of deserving needy members of the profession under the direction of the Council or such committees as it may designate.

This resolution has a most worthy objective and attempts to solve the problem for relief for sick and needy members of the profession, both through the county medical society and a state-wide organization empowered to receive voluntary contributions and bequests for this purpose.

We recommend that the resolution, with deletion of the words, "to be known as Big Brother Committee (or other suitable name)," be deleted. *Carried as amended.*

* * *

(l) *Resolution No. 12, Publicity Bureau.* Presented by G. W. Walker of Fresno. Original Resolution No. 12 reads:

WHEREAS, Freedom and free institutions are preserved, not in laws, which may be changed, or in constitution which may be abrogated, but rather in public opinion; and

WHEREAS, Propaganda may mislead through misinformation and distort public opinion; and

WHEREAS, It is always the duty of the Medical Profession to endeavor to ward off the foe of the sick, whether the foe be pathogenic organism or otherwise; and

WHEREAS, Our patients' welfare is now threatened by something worse than an ordinary epidemic, that is, the politician being placed in charge of the patient and physician, in a considerable part of our practice thereby threatening a great increase in the cost of the public for medical care, in which only very inferior medical care can be rendered; and

WHEREAS, Propaganda has been employed very extensively by vicious interests; and

WHEREAS, Many well-meaning people may be misguided by this propaganda; now therefore be it

Resolved, By this House of Delegates that the Council of the California Medical Association and the Public Relations Committee thereof; establish a bureau, or special committee of physicians and others, to actively work in every effective manner, to make available speakers to address all lay groups, giving them facts as to what the Medical Profession is doing now, and as to the adequacy of medical care in the free practice of medicine in America, pointing out that now America has the best medical care in the world, and the proud progress of American medicine as compared with results in all political medical care plans, and the efforts of the California Medical Association through the California Physicians' Service, to demonstrate our anxiety to serve all classes of society in the best possible manner, in order that public opinion may be always well informed and able to discriminate between information and misinformation on the subject of medical care. And if the Council deems it practical to employ the use of radio and the press also, to convey this message, whatever expense the Council may sanction, be and is hereby voted by the House of Delegates of the California Medical Association.

---

* Italicized words deleted through amendment.

Action on Resolution No. 12 presented by G. W. Walker of Fresno, is covered in Substitute Resolution No. 6, previously noted.

* * *

(m) *Resolution No. 13, Field Secretary to Carry on Publicity.* Presented by Samuel Ayres, Jr., of Los Angeles. Original resolution reads:

WHEREAS, The medical profession from time to time is subjected to adverse publicity by the press, by the radio and by individuals addressing public audiences; and

WHEREAS, Much information is constantly available to be publicized by the press and by the radio and through the medium of individuals addressing public groups, which information would prove a distinct advantage to the public health and the public welfare in educating the people of this State to the value of medicine to them; and

WHEREAS, Today the importance of public opinion is recognized and public opinion is being used by various groups to attain their ends, often to the detriment of the public health and to the public welfare and to the profession of medicine; therefore be it

Resolved, That this House of Delegates request that the Council of the California Medical Association, acting under Section 8, Chapter IV, of the By-laws of the California Medical Association, take immediate steps to employ one or more executive or field secretaries or representatives to engage in such public relations activities as will tend to estop unfavorable publicity and to promote a better understanding of the value of the profession of medicine in the protection of the health of the people of California.

Action on Resolution No. 13, presented by Samuel Ayres of Los Angeles, is covered in the Substitute Resolution No. 6, previously noted.

* * *

(n) *Resolution No. 14, Life Membership.* Introduced by Conrad Briner of Placer.

WHEREAS, Membership in the California Medical Association is a very valuable asset; and

WHEREAS, Many physicians of advanced years, because of gradually decreasing incomes, find it difficult to continue to pay dues; and

WHEREAS, Because of this decreasing income many aged but satisfactory and respected members of the California Medical Association either give up their membership or continue it with increasing difficulty; and

WHEREAS, Some provision should be made so that these elderly members can continue their active affiliation without undue hardships; and

WHEREAS, The establishment of some procedure whereby members of a certain age can purchase life membership in the California Medical Association would solve this problem for many of our older members; therefore be it

Resolved, That this House of Delegates of the California Medical Association express its approval of such a plan for life membership; and be it further

Resolved, That a committee of three members of the California Medical Association, appointed by the Speaker of the House of Delegates, be appointed to study this problem and report back to the House of Delegates at its 1940 meeting, with such provisions and regulations as they, after consultation with legal counsel of the California Medical Association, may deem sufficient to safeguard the interests of the California Medical Association and of the individual members.

As this resolution is covered in a resolution presented by Doctor Alesen's Committee No. 2, the Committee recommends that Resolution No. 14 be withdrawn. *Motion carried, and the resolution was withdrawn.*

* * *

(o) *Resolution No. 15, Reservations for Guest Speakers, Delegates, Alternates, and Officers.* Introduced by Chalmers Myers of Los Angeles. The original resolution reads:

Resolved, That the delegates attending the Convention of the California Medical Association at Del Monte from May 1 to May 4, 1939, do hereby instruct the Secretary of the California Medical Association to make and confirm hotel reservations for all delegates and alternates hereinafter elected to attend future meetings of the California Medical Association; and that upon receipt by the Secretary, of a list of the delegates and alternates from the component counties, he shall immediately notify them in writing giving the location and cost of the hotel accommodations that have been reserved for them.

Also, that the delegates and alternates shall have ten days within which they may accept or reject such selection.

Finally, that no other reservations shall be issued excepting those for guest speakers and general officers until all delegates and alternates desiring to attend conventions shall have been provided with suitable accommodations.

The Committee on Resolutions submits the following amended resolution:

Resolved, That the delegates attending the Convention of the California Medical Association at Del Monte from May 1 to May 4, 1939, do hereby instruct the Secretary of the Medical Association to request the hotel management to give preferential rights in reservations to all delegates and alternates elected by the component county units to attend the Annual Meetings. Upon receipt by the Secretary of the list of delegates and alternates from the component county societies, he shall have the hotel management notify them in writing, giving the cost and location of the hotel accommodations that the delegates and alternates have ten days in which to accept or reject such hotel accommodations.

Also, that no other reservations shall be issued except those of guest speakers and general officers until after the ten-day period of notice given all alternates and delegates attending the Annual Session.

The Committee feels that it is to the interest of business efficiency of the Society and the House of Delegates to have, in so far as possible, the delegates and alternates located at the headquarters hotel and that, inasmuch as these men give of their time and service to the Society, often at a personal sacrifice in missing section meetings and some of the recreational opportunities incident to all convention gatherings, they should at least have the preferential right to avail themselves of securing their reservations at the headquarters hotel.

The Committee recommends that the resolution be adopted.

On motion of Robert Stone, seconded by C. B. Andrews, an amendment striking out all words after the words "on receipt of a list of delegates and alternates" in the first paragraph. *Amendment defeated.*

A vote was then taken on the motion of the Committee that the resolution be adopted. *Motion defeated.*

* * *

(p) *Resolution No. 16, Expenses of Officers and Councilors.* Introduced by A. A. Morrison of Santa Paula.

PREAMBLE: Inasmuch as the scope of work of the officers of the California Medical Association has greatly increased in the past few years, thereby creating a continuously increasing demand on the time and increasing personal expenditures on the part of Councilors, and Officers, and since Councilors and Officers have received no compensation for time lost from their practices and offices, but have donated their time and received no compensation for their personal expenses while on Association business, such as hotels, meals, taxis, etc.; therefore, be it

Resolved, That Chapter IV, Section 1, Paragraph (b) of the By-Laws, be amended to read as follows:

(b) Expenses of Councilors and Officers. Councilors and Officers shall be allowed railroad fare or mileage not exceeding 5 cents a mile, plus an allowance for maintenance expense of ten dollars a day, while absent from their places of residence; (a) in attending association, district, or county society meetings; (b) meetings of committees of the Association; (c) authorized councilor or officer visits to county societies; (d) and otherwise when on official business, authorized or approved by the Council.

Comment.—The Resolution Committee feels the officers of this Association, in giving their time and thought and energy which often entails absence from their offices, should not be expected or compelled to pay necessary expenses of traveling, either by railroad or automobile, or incidental maintenance expenses, with their own funds.

We, therefore, urge that this resolution be adopted to clarify the question of expenses as applying to officers of the California Medical Association engaged in Association business. *Carried.*

The Committee recommends the adoption of the report as a whole, as amended. *Carried.*

* * *

18. Tabled Reports.

It was moved by Henry Garland, duly seconded, that the sections of reports previously tabled be now removed from the table for consideration. *Carried.*

Budget.—L. A. Alesen, Chairman of Committee No. 2, moved for the adoption of the section of the report fixing the annual dues for the year 1940 at $10 per member. *Motion carried.*

* * *

It was moved by Henry Garland, seconded by Elbridge J. Best, that the report of the Secretary-Treasurer (see page 432) and the report of the Editor (see page 433) be removed from the table.

* * *

Report of Secretary-Treasurer.—R. Stanley Kneeshaw then read the section of his report on the report of the Secretary-Treasurer and moved its adoption. An amendment to strike the last paragraph was defeated. A vote on the original motion was taken. *Carried.*

(See page 432.)

* * *

Report of the Editor.—R. Stanley Kneeshaw then read the section of his report on the Editor, and moved its adoption. An amendment to secure an expression from the membership on California and Western Medicine. Amendment defeated. A vote was then taken on the original motion. *Carried.*

(See page 433.)

* * *

19. **Resolution of Appreciation.**—With the consent of the House, Eric Larson of Los Angeles introduced the following resolution:

> Whereas, The California Medical Association has again been privileged to meet at this delightful place; and
>
> Whereas, Such a meeting adds a great deal of work and confusion to the resident members of the Monterey County Medical Society; and
>
> Whereas, In spite of a large number of members of the California Medical Association, these resident members have provided many comforts and a most hearty welcome; therefore be it
>
> *Resolved*, That it is the profound wish of this House of Delegates that sincere thanks be extended to the members of the Monterey County Medical Society, and to the management of the Hotel Del Monte for their many courtesies.

Motion carried.

* * *

20. **Presentation of President.** — Speaker Goin presented the incoming president, Charles A. Dukes, to the House. Doctor Dukes expressed his appreciation of the honor conferred upon him in a fitting manner.

* * *

21. **Presentation of President-Elect.**—President-Elect Dr. Harry H. Wilson was escorted to the platform by Doctors Hayes and Young, and expressed his appreciation and deep sense of responsibility to the House.

* * *

22. **Presentation of Vice-Speaker.** — Vice-Speaker Dewey R. Powell was then presented to the House.

* * *

23. **President's Certificate.**—Ex-President Robert A. Peers of Colfax presented the President's certificate to William W. Roblee of Riverside on his retirement from office.

* * *

24. **Approval of Minutes.**—The President, the Speaker, and the Secretary were authorized to edit and approve the minutes of the House.

* * *

25. **Adjournment.**—There being no further business the House adjourned.

Lowell S. Goin, *Speaker.*
George H. Kress, *Secretary.*

COUNCIL OF THE CALIFORNIA MEDICAL ASSOCIATION

Minutes of the Two Hundred and Seventy-Third (273rd) Meeting of the Council of the California Medical Association

The meeting was held in the Directors' Room, Hotel Del monte, Del Monte, California, Sunday, April 30, 1939, at 8 p. m.

1. **Call to Order.**

The meeting was called to order by Chairman Schaupp, with the following members present: President W. W. Roblee, President-Elect Charles A. Dukes, Past President Howard Morrow, Speaker Lowell S. Goin, Chairman of Council Karl L. Schaupp; Councilors Calvert Emmons, A. E. Anderson, Louis Packard, A. L. Phillips, O. D. Hamlin, F. N. Scatena, H. S. Rogers, Harry H. Wilson, T. Henshaw Kelly, William H. Kiger, C. O. Tanner, P. K. Gilman; Chairman of Public Relations Committee George G. Reinle, Secretary-Editor George H. Kress; General Counsel Hartley F. Peart and his associate, Mr. Howard Hassard.

Absent: Doctors Harris and Howson.

2. **Resignation of Councilor Harris.**

Chairman Schaupp submitted to the Council the formal resignation of Dr. J. B. Harris, and a personal communication giving as his reasons the desire to devote more time to his practice and his family.

It was moved by William W. Roblee, seconded by C. A. Dukes, that the resignation of Junius B. Harris as councilor-at-large be accepted, and that the Council, in expressing its deep regret that the action is necessary, place on record its own and the Association's keen appreciation of Doctor Harris's invaluable service to organized and scientific medicine in California. Carried.

The Council agreed that the resignation of Doctor Harris should be submitted to the House of Delegates by Doctor Schaupp on Monday evening, with the Report of the Council.

3. **Minutes of the Council.**

The minutes of the 272nd meeting of the Council, held February 25, 1939, as published in the April issue of California and Western Medicine, were approved.

4. **Report of Council.**

The report of the Council, as prepared by Chairman Schaupp, was submitted to the Council for discussion.

The report was considered, section by section, and some minor changes in phraseology made.

5. **Charter Application from Inyo-Mono County.**

Consideration was given to the petition, with copies of by-laws, of a newly formed medical society in Inyo-Mono counties, in which request for a charter as a component county society of the California Medical Association was made.

It was pointed out that at the present time these counties were designated as part of the Fourth Councilor District, and that from the standpoint of accessibility they should be in the Second District.

It was moved by Charles Dukes, seconded by Louis Packard, that the counties of Mono and Inyo be removed from the Fourth District allocation and placed in the Second District. Carried.

It was voted to recommend to the House of Delegates that a charter be granted to the Inyo-Mono County Medical Society.

6. **Annual Dues.**

Consideration was given to the amount of the annual dues to be recommended by the Council to the House of Delegates for the year 1940.

It was moved by William Roblee, seconded by Louis Packard, that the annual dues for the calendar year 1940 be set at twenty dollars ($20) per year per member. A vote was taken, and the motion carried; Doctors Kelly and Phillips voting in the negative.

It was moved by P. K. Gilman, seconded by C. A. Dukes, that the motion fixing the dues at $20 be reconsidered. Motion to reconsider carried.

After further discussion, it was moved by Henry Rogers, seconded by A. L. Phillips, that a special committee be appointed to consider the amount of the annual dues, and submit a report to the Council at its meeting on Monday. Motion carried. The Chairman appointed Doctors William Roblee (Chairman), Harry Wilson, and Louis A. Packard.

Chairman Schaupp stated that the report of the Council would be revised to include the suggestions of the Council, and resubmitted at the Monday meeting.

7. Committees of House of Delegates.

Speaker Goin stated that the Credentials Committee and the three Reference Committees of the House of Delegates would be composed of the following members:

COMMITTEE ON CREDENTIALS

A. A. Morrison (Chairman)	Ventura
F. J. Gundry	Kern
G. W. Walker	Fresno

COMMITTEE ON REPORTS OF OFFICERS AND STANDING AND SPECIAL COMMITTEES

R. S. Kneeshaw (Chairman)	San Jose
S. J. McClendon	San Diego
Dorothy Allen	Oakland

COMMITTEE ON REPORT OF THE COUNCIL AND REPORT OF THE SECRETARY-TREASURER

L. A. Alesen (Chairman)	Los Angeles
Edwin L. Bruck	San Francisco
Lyle G. Craig	Los Angeles

COMMITTEE ON RESOLUTIONS, AMENDMENTS TO THE CONSTITUTION AND BY-LAWS AND NEW AND MISCELLANEOUS BUSINESS

Dewey Powell (Chairman)	Stockton
John W. Cline	San Francisco
William H. Daniels	Los Angeles

8. Review of Medical Service Policies.

Discussion was had of Resolution No. 5, presented at the special session of the House of Delegates on December 17, regarding the review of hospital and medical service plans of commercial companies. Attention was called to the fact that a special committee had been appointed by the Council for this purpose. The Committee reported that, because of the extensive task assigned to it by the resolution of the House of Delegates, it had not as yet progressed sufficiently to prepare or submit a report.

It was moved by Lowell S. Goin, seconded by C. A. Dukes, that the resolution be left on the table. Carried.

9. Membership of Standing and Special Committees.

The Chairman appointed Doctors Henry Rogers (Chairman), P. K. Gilman and C. O. Tanner to act as a special committee to review the membership of the Standing and Special Committees of the Association, and report to the Council with recommendations concerning the vacancies thereon; the Council then to act thereon, and submit its recommendations to the House of Delegates on Wednesday, May 3.

10. Policies of the Association.

Discussion was had of the resolution adopted at the 1938 meeting of the House of Delegates relating to a committee to outline general policies of the Association.

George G. Reinle, Chairman of a Special Council Committee to take up this work, stated that the Committee felt that the matters of policy contemplated in the resolution dealt largely with legislation, and that the consideration of such was largely a function of the Standing Committee on Public Policy and Legislation. On that account, it seemed undesirable to have pronouncements go out from different bodies representing the Association. The delicacy of certain legislative matters that were pending was stressed, and it was pointed out that confusion could easily arise if authority was divided in these matters. It was agreed that, for the present, it was desirable that this procedure should be followed.

11. Active Membership.

The question of interpretation of "Active Membership," in relation to quotas of members in the House of Delegates, was brought up by the Association Secretary.

On motion duly made, seconded and carried, it was

Resolved, That "active members" for the purpose of selecting delegates shall include those members whose membership dues have been paid to the California Medical Association for the current year.

12. Dues for Six Months' Period.

It was moved by Louis Packard, seconded by Henry Rogers, that new members joining the California Medical Association on or after July 1 of any calendar year be assessed only one-half of the yearly dues. Carried.

13. Transfer of Members Prior to April 1.

It was the sense of the Council that members transferring from one component county society to another within the state retained their membership until April 1 (date of delinquency provided in By-Laws, Chapter II, Section 2 (b)), but that final action on acceptance of the transfer rests with the component county society.

14. Retired Members.

The Secretary was instructed to write to the Judicial Council of the American Medical Association and request a decision on the status of retired members of the California Medical Association in the American Medical Association.

15. Section on Industrial Medicine and Surgery.

A request for a change of name of the Section on Industrial Medicine and Surgery to the Section on Traumatic Medicine and Surgery was presented.

It was moved by T. Henshaw Kelly, seconded by Louis Packard, that if the Section presented a resolution to that effect to the House of Delegates, that the Council approve the request for the change in name of the Section on Industrial Medicine and Surgery to the "Section on Traumatic Medicine and Surgery." Carried.

16. Amendment to the By-Laws of the Woman's Auxiliary.

A proposed amendment to Section 1 of the By-Laws re the Nominating Committee was presented for consideration and approval.

It was pointed out that, because the necessary time had not elapsed since publication of the by-law, it could not be considered by the Council or be adopted by the Woman's Auxiliary at the 1939 annual session without a violation of the By-Laws of the Auxiliary. The Association Secretary to so inform the representatives of the Woman's Auxiliary.

17. Financial Statements.

The Secretary presented members of the Council with financial statements covering the calendar year 1938, for the months of March, 1939 and April, 1939.

18. Budget.

The budget of receipts and disbursements for the year 1939–1940 was presented and discussed, and it was agreed that, after consideration by the Special Committee on Dues and report thereon to the Council, it should be submitted to the House of Delegates by the Chairman of the Council in connection with the Council report.

19. Fiscal Year.

It was moved by T. Henshaw Kelly, seconded by Louis Packard, that a committee of the Council be appointed to study the matter of reorganizing the financial set-up of the California Medical Association so that a definite fiscal year shall be established, and that the committee bring in its recommendations before the 1940 session of the Association, in ample time for consideration by the Council, in order that necessary amendments to the Constitution and By-Laws, to bring the recommendations of the Committee into effect, may be drafted. Carried.

20. Clerical Expense.

It was moved by Henry Rogers, seconded by Louis Packard, that an item of $900 for extra clerical expense in the legal department be included in the budget as item 23 (d).

It was moved by Louis Packard, seconded by C. A. Dukes, that consideration of the budget be postponed until after the receipt of the report of the Special Committee on Dues. Carried.

21. Invitations for Next Annual Session.

The Council fixed the hour of 2 p. m. on Wednesday as the time to hear representatives who wished to present invitations for the next annual session of the California Medical Association.

22. Time of Next Council Meeting.

The Council fixed the hour of 2 p. m. on Monday, May 1, 1939, as the time of the next meeting of the Council.

23. Adjournment.

On motion duly made, seconded and carried, the Council adjourned until 2 p. m. on Monday, May 1, 1939.

Karl L. Schaupp, *Chairman.*
George H. Kress, *Secretary.*

* * *

Minutes of the Two Hundred and Seventy-Fourth (274th) Meeting of the Council of the California Medical Association

The meeting was held in the Directors' Room, Hotel Del Monte, Del Monte, California, Monday, May 1, 1939, at 2 p. m.

1. Call to Order:

The meeting was called to order by Chairman Schaupp, with the following members present: President William W. Roblee, President-Elect C. A. Dukes, Past President Howard Morrow, Speaker Lowell S. Goin, Chairman of Council Karl L. Schaupp; Councilors Calvert Emmons, A. E. Anderson, Louis Packard, A. L. Phillips, O. D. Hamlin, F. N. Scatena, H. A. Rogers, Harry H. Wilson William H. Kiger, Carl R. Howson, T. H. Kelly, C. O. Tanner, P. K. Gilman; Chairman of Public Relations Committee George G. Reinle; Secretary-Editor George H. Kress, General Counsel Hartley F. Peart and his associate, Mr. Howard Hassard.

Absent: Doctor J. B. Harris.

2. Report of Special Committee on Dues and Finances.

Dr. Karl L. Schaupp read the section which was to be presented to the House of Delegates as an addendum to the Council report relating to finances. Doctor Roblee then explained the views of the Committee in arriving at the proposed changes in the budget.

The recommendation of the Committee was that the dues be set at $20 for the year 1940.

It was moved by C. A. Dukes, seconded by G. G. Reinle, that the budget as revised be submitted to the House of Delegates as an addendum to the report of the Council. Carried.

It was moved by George Reinle, seconded by C. A. Dukes, that the annual dues for 1940 be fixed at $20 per member for the calendar year 1940. Carried.

3. Standing Committees.

The report of the Special Committee (Doctors Rogers, Gilman, and Tanner) on Nominations for Membership on Standing Committees was presented, and on motion of F. N. Scatena, seconded by A. E. Anderson, was approved.

The Council's attention was then called to the resignation of John C. Ruddock, Chairman of the Committee on Postgraduate Activities, and Fred B. Clarke, Chairman of the Committee on Health and Public Instruction.

It was moved by Lowell S. Goin, seconded by Alfred L. Phillips, that the resignation of John C. Ruddock, as chairman of the Committee on Postgraduate Activities, be accepted with regret. Carried.

It was moved by Lowell S. Goin, seconded by Alfred Phillips, that the resignation of Fred B. Clarke, be accepted with regret. Carried.

Upon motion duly made and seconded, it was voted to recommend to the House of Delegates, for approval, the Standing Committees, as follows (new members thereon are those whose terms will expire in 1942, to take the places of members whose term expired in 1939. Also, nominations to fill vacancies through resignation):

COMMITTEE ON ASSOCIATED SOCIETIES AND TECHNICAL GROUPS

John V. Barrow (Chairman), Los Angeles	1940
Edwin L. Bruck, San Francisco	1941
Willard H. Newman, San Diego	1942

COMMITTEE ON HEALTH AND PUBLIC INSTRUCTION

Benjamin W. Black, Oakland	1940
Roy Thomas (Chairman), Los Angeles	1941
William Dock, San Francisco	1942

COMMITTEE ON HISTORY AND OBITUARIES

A. Elmer Belt, Los Angeles	1940
Frank R. Makinson (Chairman), Oakland	1941
J. Marion Read, San Francisco	1942

COMMITTEE ON HOSPITALS, DISPENSARIES AND CLINICS

Karl L. Schaupp, San Francisco	1940
George Dawson, Napa	1941
J. Norman O'Neill (Chairman), Los Angeles	1942

COMMITTEE ON INDUSTRIAL PRACTICE

Harry E. Zaiser, Orange	1940
Morton R. Gibbons, San Francisco	1941
Donald Cass (Chairman), Los Angeles	1942

COMMITTEE ON MEDICAL DEFENSE

John P. Nuttall, Santa Monica	1940
George G. Reinle (Chairman), Oakland	1941
William Van Den Berg, Sacramento	1942

COMMITTEE ON MEDICAL ECONOMICS

Edward M. Pallette, Sr., Los Angeles	1940
John H. Graves (Chairman), San Francisco	1941
L. W. Hines, Santa Rosa	1942

COMMITTEE ON MEDICAL EDUCATION AND MEDICAL INSTITUTIONS

John B. Doyle, Los Angeles	1940
B. O. Raulston, Los Angeles	1941
L. R. Chandler (Chairman), San Francisco	1942

COMMITTEE ON MEMBERSHIP AND ORGANIZATION

G. Dan Delprat, San Francisco	1940
George D. Maner (Chairman), Los Angeles	1941
Dewey R. Powell, Stockton	1942

COMMITTEE ON POSTGRADUATE ACTIVITIES

Dwight Wilbur (Chairman), San Francisco	1940
F. E. Clough, San Bernardino	1941
H. E. Henderson, Santa Barbara	1942

COMMITTEE ON PUBLICATIONS

Ralph Eusden (Chairman), Los Angeles	1940
Ruggles A. Cushman, Talmage	1941
Frank E. Toomey, San Diego	1942
Secretary ex officio	
Editor ex officio	

COMMITTEE ON PUBLIC POLICY AND LEGISLATION

E. T. Remmen, Glendale	1940
J. B. Harris (Chairman), Sacramento	1941
T. Henshaw Kelly, San Francisco	1942
President ex officio	
President-Elect ex officio.	

COMMITTEE ON SCIENTIFIC WORK

Lemuel P. Adams, Oakland	1940
J. Homer Woolsey, Woodland	1941
Howard West, Los Angeles	1942
Secretary of Section on General Medicine	
Secretary of Section on General Surgery	
Secretary of California Medical Association (Chairman)	

CANCER COMMISSION

Dr. Charles A. Dukes, as the incoming president, appointed the following members of the Cancer Commission: Clarence Berne to succeed Clarence Toland, who has resigned; Henry J. Ullmann and A. R. Kilgore.

4. Membership.

An application was presented by the San Francisco County Medical Society, requesting that associate membership be granted to Raymond O. Dart, San Francisco, and John B. M. Saunders, San Francisco.

It was moved by William Roblee, seconded by Alfred Phillips, that Raymond O. Dart and J. B. M. Saunders, San Francisco, be granted associate membership in the California Medical Association. Carried.

An application was presented by the San Francisco County Medical Society, requesting the Council to recommend to the House of Delegates of the American Medical Association that Adelaide Brown be granted affiliate membership in the American Medical Association.

It was moved by C. A. Dukes, seconded by Lowell S. Goin, that the Council recommend to the American Medical Association House of Delegates the granting of affiliate membership for Adelaide Brown in the American Medical Association. Carried.

An application was presented by the San Diego County Medical Society, requesting that Edgar Nelson Young be granted retired membership in the California Medical Association.

It was moved by C. O. Tanner, seconded by Henry Rogers, that Edgar Nelson Young, San Diego, be granted retired membership in the California Medical Association. Carried.

5. Consultation with Cultists.

The attention of the Council was called to a resolution of a component county society condemning consultations of members with others than doctors of medicine and providing disciplinary procedure. Doctor Goin again emphasized the necessity of component county societies abiding by the rules laid down in the disciplinary code, and the ineffectuality of resolutions of county societies in matters of suspension and expulsion.

No action taken.

6. Ethics.

The attention of the Council was directed to a matter of ethics of a member of the San Mateo County Society in the treatment of a patient.

It was the sense of the Council that the complaint should be referred to the component county society.

7. Life Members.

The Council considered the recommendation that life membership be granted at the age of sixty upon payment of a specific sum. The change in financial set-up of the Association that such action would entail was discussed, and the necessity of a comprehensive study of the proposed action, before taking action, was emphasized.

It was moved by C. A. Dukes, seconded by Howard Morrow, that the Council recommend to the House of Delegates that a committee be appointed to study the proposal whereby, under certain conditions, on and after the age of sixty, it might be possible for members to purchase life membership in the California Medical Association. Motion carried.

8. Woman's Auxiliary.

After discussion of the request of the Woman's Auxiliary that a supplement containing a roster of the Woman's Auxiliary be published, it was moved by Henry Rogers, seconded by George Reinle, that the 1940 roster of members of the California Medidal Association contain a section devoted to a roster of members of the Woman's Auxiliary. Carried.

9. Report of Legal Counsel.

(a) *Tator vs. Pacific Employers Insurance Company.*—The General Counsel reported that a favorable decision had been rendered by the Supreme Court of the United States in this case, and that further report would be included in his report to the House of Delegates.

(b) *Commercial Insurance Companies.*—The request of a commercial insurance company for approval as a malpractice insurance carrier was referred to the Committee on Medical Defense.

(c) *Standard Vaccines, Inc.*—General Counsel Peart reported that he had submitted to the San Bernardino County Medical Society, at its request, an opinion on Standard Vaccines, Incorporated, and that a copy of the letter had been placed in the files of the Association.

(d) *Engleking vs. Carlson.*—General Counsel Peart stated that the status of the case of *Engleking* vs. *Carlson* was included in his report for submission to the House of Delegates.

(e) *Jordt vs. State Board of Education.*—General Counsel Peart reported that a decision had been rendered by the Superior Court in Sacramento County. He further reported that the Superior Court had decided that an osteopathic physician and surgeon is eligible to qualify for a health and development certificate.

(f) *Social Security Taxes: Retroactive Ruling of Commissioner of Internal Revenue.*—The General Counsel reported that Social Security taxes, covering the year 1937 and the first six months of 1938, had been paid by the Association under protest. He further reported that the protest was based upon the fact that, during 1937 and 1938, a ruling of the Collector of Internal Revenue, First District of California, was in effect under the terms of which the Association was exempt from Social Security taxes. He also reported that the Commissioner of Internal Revenue has reversed the exemption ruling of the Collector of Internal Revenue, and has held that the Association is liable for Social Security taxes during the period that the Collector's ruling was in effect. The General Counsel reported that he believed the ruling of the Commissioner to be erroneous and that he recommended the filing of a refund claim, with respect to Social Security taxes for the period in question.

On motion duly made, seconded and unanimously carried, the Secretary was authorized and instructed to execute and cause to be verified and filed a claim for refund, prepared by Legal Counsel, covering Social Security taxes paid for the year 1937, and the first six months of the year 1938.

10. Appeal.

Association Secretary Kress reported that Dr. A. L. Bramkamp of Riverside would act as referee in the hearing of Dr. A. T. Martin before the Los Angeles County Medical Association.

11. Speakers' Committee.

The Secretary reported that Chairman of Public Relations Committee Reinle had appointed committees in the northern and southern parts of the state to speak before societies and other organizations on medical and hospital service and health problems. Doctor Kress stated the northern speakers were working under the chairmanship of Dr. John Cline, and the southern committeemen under Dr. Paul A. Quaintance.

It was moved by C. A. Dukes, seconded by Lowell S. Goin, that the action of the Chairman of the Committee on Public Relations in the appointment of a Speakers' Bureau, be approved. Carried.

It was stated that, when necessary, incidental travel expense could be budgeted from the allocation of the Department of Public Relations.

12. National Research Council.

Invitation from the National Research Council to participate in the Pacific Science Congress, was presented. No official action was considered necessary.

13. Public Health Defense League.

The attention of the Council was directed to an organization known as the "Public Health Defense League." This is a separate and distinct organization, and should not be confused with the Public Health League of California.

14. Well-Baby Clinics.

Correspondence regarding the improper procedures by representatives of the Bureau of Child Welfare of the State Board of Public Health, with particular relationship to the private practice of medicine, was discussed. Doctor Morrow stated that the State Board of Health had investigated the complaint and the matter had been taken care of to the satisfaction of those concerned. Doctor Packard suggested that the manner of operation in Kern County should also be called to the attention of the State Health Department workers. Doctor Morrow stated that any complaints submitted in writing would be given immediate consideration and an attempt made to clarify difficulties.

15. Health and Hospital Service Plans.

The request for approval of a lay manager of a health and hospitalization plan in Santa Clara was considered.

The Council felt that organizations offering medical and hospital service and operating on a profit basis were inimical to the development of the nonprofit plan of California Physicians' Service, and that approval of such commercial and profit-seeking plans was undesirable.

16. Medical Library Association.

It was moved by T. Henshaw Kelly, seconded by Lowell Goin, that the request of the National Medical Library Association concerning a proposed publication be filed. Carried.

17. House of Delegates.

It was moved by Carl Howson, seconded by George Reinle, that a committee, consisting of the Chairman of the Council. the Speaker of the House, the President, and the Secretary-Treasurer, consult with the sections on General Medicine and General Surgery and endeavor to make arrangements for use of one of the large auditoriums in time to start the second meeting of the House of Delegates at 4 p. m. Wednesday. Carried.

It was moved by Harry Wilson, seconded by O. D. Hamlin, that a Committee of Four, consisting of the President of the Association, the Chairman of the Council, the Speaker of the House of Delegates, and the Chairman of the Program Committee, who is the Secretary-Treasurer, work out arrangements and make recommendations to permit more time for the business of the second meeting of the House of Delegates. Carried.

18. Time of Next Council Meeting.

Because the docket of business had been covered, the Chairman stated that the next meeting of the Council would be held at 2 p. m. on Wednesday, instead of on Tuesday.

19. Adjournment.

There being no further business, the meeting adjourned.

Karl L. Schaupp, *Chairman.*
George H. Kress, *Secretary.*

Minutes of the Two Hundred and Seventy-Fifth (275th) Meeting of the Council of the California Medical Association

The meeting was held in the Directors' Room, Hotel Del Monte, Del Monte, California, Wednesday, May 3, 1939, at 2 p. m.

1. Call to Order:

The meeting was called to order by Chairman Schaupp, with the following members present: President William W. Roblee, President-Elect C. A. Dukes, Past President Howard Morrow, Speaker Lowell Goin, Chairman of Council Karl L. Schaupp; Councilors Calvert Emmons, A. E. Anderson, Louis Packard, A. L. Phillips, O. D. Hamlin, F. N. Scatena, H. A. Rogers, T. Henshaw Kelly, J. B. Harris, Harry H. Wilson, William H. Kiger, C. O. Tanner, P. K. Gilman, Carl Howson; Chairman of Public Relations Committee George G. Reinle, Secretary-Editor George H. Kress, General Counsel Hartley F. Peart and his associate, Mr. Howard Hassard.

2. Invitations for Next Annual Session.

The Chairman stated that the first order of business would be the presentation of invitations for the next annual session of the Association.

Representatives from Long Beach, Riverside, Del Monte, and Coronado addressed the Council, indicating the convention facilities offered by their respective communities.

The Secretary stated written invitations had also been received from San Francisco, Los Angeles, and Santa Barbara.

It was moved by William Kiger, seconded by Louis Packard, that the next annual session of the California Medical Association be held at Hotel del Coronado, Coronado, San Diego. Carried.

3. Health Insurance Legislation.

A letter was presented from the Orange County Medical Association voicing the opposition of that unit to any form of compulsory health insurance, and recommending that the plan of the California Physicians' Service be given ample time for trial before any other type of medical service is placed in operation. Carried.

4. Nurses Legislation.

It was reported that the proposed Nurses' Bill was passed out of Committee with the recommendation that it "do pass." The importance of incorporating a minimum standard for training schools was discussed.

5. State Board of Health.

In the absence of General Counsel Peart, who was attending a meeting of the Trustees of California Physicians' Service, his associate, Mr. Hassard, discussed the proposed legislation to abolish the State Board of Public Health, stating that the California constitution provides for the existence and maintenance of a State Board of Public Health, so that it cannot be abolished by legislative enactment.

6. Trichinosis.

The letter from the Alameda County Medical Association, regarding an "Act to Prevent Trichinosis," was referred to the Committee on Public Policy and Legislation.

7. Premarital and Prenatal Tests for Syphilis.

The request of the California units of the American Society for Social Hygiene for endorsement of the proposed premarital and prenatal tests for syphilis was presented. Doctor Morrow stated that the venereal disease campaign was being carried on by the State Department of Public Health, and that that body had recommended that the bills "do pass."

It was moved by A. E. Anderson, seconded by Louis Packard that the California Medical Association endorse the prenatal and premarital examination for syphilis. Carried.

8. Wagner Bill.

The present status of the Wagner Bill, now before the Federal Congress, was discussed and it was reported that indications were that the bill would not go on to passage at this time.

9. Association of California Hospitals.

The request of the Hospital Association, to be represented at the meetings at which legislation was discussed, was referred to the Committee on Public Policy and Legislation, as occasion may arise.

10. Narcotic Legislation.

After consideration of the request of the Division of Narcotic Enforcement, it was moved by Howard Morrow seconded by O. D. Hamlin, that the California Medical Association endorse the proposed narcotic legislation. Carried.

11. Optometry Bill.

It was moved by Louis Packard, seconded by F. N. Scatena, that the Council approve the action of the Legislative Committee in working for the passage of Assembly Bill 516. Carried.

12. Dangerous Fireworks.

It was moved by Howard Morrow, seconded by F. N. Scatena, that the Council endorse Senate Bill No. 6 for the control of dangerous fireworks, as sponsored by the United States Junior Chamber of Commerce. Carried.

13. Letter of Protest.

Letter from the Medical-Dental Democratic Club, protesting an article in the Los Angeles County Medical Association Bulletin, was presented. The letter was ordered filed.

14. Palo Alto Hospitalization Insurance Association.

Correspondence relative to the Palo Alto Hospitalization Group, Pacific Employers Insurance Company, and related matters were presented.

Doctor Reinle, chairman of the committee appointed to review medical and hospital service policies of commercial insurance companies, reported that the correspondence from the Palo Alto Hospitalization Group had been referred to his committee, and that the Committee desired the Council's suggestions in the matter. It was the sense of the Council that no positive action should be taken by the Committee or the Council unless requests were received directly from insurance companies involved.

15. Time of Next Council Meeting.

The time of the annual organization meeting of the Council was fixed for 9 a. m. Thursday.

Karl L. Schaupp, *Chairman.*
George H. Kress, *Secretary.*

* * *

Minutes of the Two Hundred and Seventy-Sixth (276th) Meeting of the Council of the California Medical Association

The meeting was held in the Directors' Room, Hotel Del Monte, Del Monte, California, Thursday, May 4, 1939, at 9 a. m.

1. Call to Order.

The meeting was called to order by President Dukes, who introduced the new members of the Council: Councilor for Second District, George D. Maner of Los Angeles; Councilor for the Fifth District, D. Kelly Canelo of San Jose; Councilors-at-large, Elbridge J. Best of San Francisco. Frank MacDonald of Sacramento, newly elected Councilor for the Eighth District, was unavoidably absent.

The following members were present: President Charles A. Dukes, President-Elect Harry H. Wilson, Past President William W. Roblee, Speaker Lowell Goin; Councilors Karl L. Schaupp, Calvert L. Emmons, A. E. Anderson, Louis Packard, C. Kelly Canelo, O. D. Hamlin, F. N. Scatena, H. A. Rogers, William H. Kiger, C. O. Tanner, P. K. Gilman, Elbridge Best, George Maner; Chairman of Public Relations Committee George G. Reinle, Secretary-Editor George H. Kress. Mr. Peart and Mr. Hassard arrived following the executive session. Dr. J. B. Harris was present during the discussion of certain legislative matters.

2. Chairman of Committee on Public Relations.

President Dukes stated that, on account of the inability to secure a quorum for a meeting of the Committee on Public Relations, George G. Reinle would hold office as Chairman of the Committee as provided in the Constitution until an election took place.

3. Election of Chairman of Council.

Doctor Dukes stated that the first order of business would be the election of a chairman of the Council.

William Roblee nominated Karl Schaupp as Chairman of the Council for the ensuing year; such nomination was seconded by Louis Packard. There being no other nominations, the President declared the nominations closed, and it was voted that the Secretary cast the unanimous ballot of the Council for Doctor Schaupp. Doctor Schaupp then took the chair.

4. Election of Vice-Chairman of Council.

William H. Kiger nominated Charles A. Dukes as Vice-Chairman of the Council for the ensuing year. The nomination was seconded by F. N. Scatena. There being no further nominations, the Chairman declared the nominations closed, and it was voted that the Secretary cast the unanimous ballot of the Council for Dr. Charles A. Dukes as Vice-Chairman.

5. Executive Session.

Upon motion duly made and seconded, the Council went into executive session.

Chairman Schaupp appointed George G. Reinle to act as secretary for the executive session.

Chairman Schaupp brought up the matter of the proposed survey of the Central Office, as indicated in the resolutions submitted to the House of Delegates.

Discussion was then had of the election of a secretary and the term of office thereof. The election of a secretary was discussed by Doctors Roblee, Dukes, Anderson, Kiger, and Wilson.

It was moved by Doctor Dukes, and seconded by Doctor Anderson, that Doctor Kress be retained as Secretary-Treasurer and Director of Public Relations and Editor until the 1940 annual session, at his present salary. Carried.

It was moved by Dr. Lowell S. Goin, and seconded by Dr. Louis Packard, that the Council rise from executive session. Carried.

6. Appointment of Legal Counsel.

On motion duly made, seconded and carried, Mr. Hartley F. Peart was appointed General Counsel of the Association for the ensuing year at the same retainer.

On motion duly made, seconded and carried, Hr. Hubert Morrow was appointed associate general counsel for the ensuing year, without retainer.

7. Clerical Expense.

It was moved by Charles Dukes, seconded by P. K. Gilman, that the item of extra clerical expense for the legal department, as included in the budget, be approved. Carried.

8. Councilor Vacancy.

It was pointed out that the election of Harry Wilson as president-elect caused a vacancy as councilor-at-large.

William H. Kiger nominated William Daniels of Los Angeles as councilor-at-large to fill the vacancy of Dr. Harry Wilson; such nomination was seconded by F. N. Scatena.

Calvert Emmons nominated Earl Moody of Los Angeles as councilor-at-large to fill the vacancy of Dr. Harry Wilson; such nomination was seconded by George Maner.

A vote was taken on the nominations: Doctor Moody having received the majority of the votes cast, the Chairman declared him elected councilor-at-large to fill the unexpired term of Harry Wilson; term expiring in 1941.

9. Committee on Public Policy and Legislation.

Dr. Junius B. Harris of Sacramento stated that it was necessary to formulate a plan for the handling of legislative matters in the future, and outlined the ideas he had in mind. A tentative plan would be to have two men from each assembly district and one from each senatorial district, these to serve as a local legislative committee. In addition, perhaps, an employed full-time coördinator, who would be on service both during and between the biennial legislative sessions. Doctor Harris was of the opinion that the good will that the profession engenders in the community rests largely upon the extent to which physicians practice good medicine and maintain kindly contacts with patients and fellow citizens, so that these may then be counted upon for support of legitimate public health standards. Doctor Harris stated that the plan he had in mind was not to be confused with the proposed set-up, as outlined in the House of Delegates resolutions, concerning publicity and allied endeavors.

In the general discussion that followed, the sentiment that the services of Doctor Harris, as a member of the Legislative Committee, should be retained met with unanimous approval.

Action taken: It was moved by Lowell S. Goin, seconded by P. K. Gilman, that the Chairman of the Council appoint a Committee of Three to study the subject that had been discussed, with instructions to submit a plan of a proposed organization, with recommendations, and report thereon at the next meeting of the Council.

The Chairman appointed as members of the committee: the President of the Association, Doctor Dukes; the Speaker of the House, Doctor Goin; and Dr. J. B. Harris, the Chairman of the Committee on Public Policy and Legislation.

10. Principles of Ethics.

The Council instructed Dr. Elbridge Best, as a member of the House of Delegates of the American Medical Association, to act as a special committee to carry out the instructions contained in Resolution No. 7 of the California Medical Association House of Delegates relating to a recodification of the Principles of Ethics.

It was emphasized that the resolution did not contemplate a change in the basic ethics of the profession which remain unchangeable, but that it was advocated therein that the Code of Ethics be formulated in line with canons of law; and where indicated, the phraseology be clarified, with supplementary notes on past decisions of the American Medical Association Judicial Council that might be of the nature of precedent, and therefore of value in current and future procedures.

It was the sense of the Council, if the American Medical Association committee reported favorably thereon, it would then be in order that similar action be taken in California for guidance of the State Association and its component county societies.

At the request of the Council the Chairman appointed a Committee of Three, consisting of Doctors Best, Goin, and Dukes to draft a code for possible use in California.

11. Special Assessment of $10: Due and Payable June 1, 1939.

The assessment of $10 per member levied in accordance with Substitute Resolution No. 6 (combining Resolutions Nos. 6, 8, 12, 13) was discussed.

It was moved by William W. Roblee, seconded by Louis A. Packard, that an assessment of $10 per member be levied upon all active members of this Association, California Medical Association, in accordance with the instructions of the House of Delegates as embodied in amended resolution No. 6, adopted by the House on May 3, 1939, and that notice of this special assessment be given in writing to each active member of the Association by the Secretary as soon as possible. As provided in the resolution of the House of Delegates, the said assessment is due and payable June 1, 1939, and, if not paid within sixty days thereafter, loss of membership shall occur. Motion carried.

It was pointed out that, in accordance with provisions in the California Medical Association Constitution and By-Laws, this assessment must be paid through the component county societies, in the same manner as the annual dues, that is, checks to be drawn by members in favor of respective component county societies, and county societies to then forward reports and checks to cover to the Central Office of the Association.

It was agreed that Doctor Alson Kilgore and General Counsel Peart should prepare a letter of explanation for the Council to accompany the notice of assessment.†

12. Auditing Committee.

The Chairman of the Council appointed as the Auditing Committee for the ensuing year, P. K. Gilman (Chairman), O. D. Hamlin, and Elbridge Best. The appointments were approved by the Council.

13. Date of Next Council Meeting.

It was moved by Lowell S. Goin, seconded by A. E. Anderson, that the next meeting of the Council be held at San Francisco on Saturday, June 3, 1939. Motion carried. Meeting to convene at 9 o'clock in the Sir Francis Drake Hotel, San Francisco.

14. Adjournment.

There being no further business, the Council adjourned.

Karl L. Schaupp, *Chairman.*
George H. Kress, *Secretary.*

A. M. A. ANNUAL SESSION—ST. LOUIS*

San Francisco, California,
May 22, 1939.

At the 1939 session of the American Medical Association House of Delegates there were present from California its full delegation, consisting of Drs. William R. Molony, Sr., Robert A. Peers, George G. Reinle, Edward M. Pallette, J. P. Nuttall, Lyell C. Kinney, and Elbridge J. Best. This was a complete delegation from California.

California was favored with three delegates on Reference Committees: Dr. William R. Molony, Sr., on Reference Committee on Sections and Section Work; Dr. Edward M. Pallette, Reference Committee for Hygiene and Public Health; and Dr. Elbridge Best on Reference Committee on Reports of Officers.

At this session Dr. Nathan B. Van Etten of New York received the honor of president-elect; Dr. Alphonse McMann of St. Louis, vice-president. Dr. Ray Lyman Wilbur was reëlected to the Council on Medical Education and Hospitals. Dr. E. L. Henderson was elected as the new member of the Board of Trustees. Atlantic City was chosen for the 1942 meeting. (Editor's Note: The American Medical Association meets in New York in 1940, and in Cleveland in 1941.)

---

† For Official Notice, see page 426.

* Report submitted by Elbridge J. Best, M. D., San Francisco.

The California delegation presented the resolution on rearranging the Principles of Ethics. There was considerable objection from the Chairman of the Judicial Council, and the final outcome was that the Chairman of the Reference Committee on the amendments to the constitution and by-laws, after speaking on the question of "changes" of our ethics, moved that this resolution be referred to the Judicial Council. Resolution follows:

Resolution Concerning the Principles of Ethics*

WHEREAS, In these and other troublous times, in order to maintain the high quality and ideals of our medical profession, it is most essential to uphold the standards of the Principles of Medical Ethics without compromise; and

WHEREAS, Since the Principles of Medical Ethics were rewritten in 1912, there have arisen many problems not known to the leaders of our profession twenty-seven years ago; and

WHEREAS, Because of the nationwide influence of members of component societies appearing on public platforms, in the press, over the radio, etc., and because of the arrangement and wording of the Principles of Medical Ethics, component county medical societies have recently found it next to impossible to draw up sound charges to discipline members who have violated our Medical Ethics; therefore be it

Resolved, That the Speaker of this House of Delegates appoint a Committee of five Fellows of the American Medical Association to study the Principles of Medical Ethics and the form of the code of ethics of the legal profession, having in mind the rearrangement of our principles of ethics for continuity, rewording for clarity, adding a commentary following each principle to illustrate the intent, and to quote relating decisions of the Judicial Council; and be it further

Resolved, This Committee be directed to report its recommendations to the 1940 Session of the American Medical Association House of Delegates.

A resolution on the patenting of medicine and instruments caused some discussion, and the Judicial Council was asked to study the question of amending Article 1, Section 5, of the Principles of Ethics.

The question of special representation in the American Medical Association House of Delegates for women physicians and problems relating to negro physicians were introduced. These resolutions, after producing considerable discussion, were left in *status quo,* but with clarified wording.

The by-laws were amended to put nine members on the Council on Medical Education and Hospitals, each to serve a nine-year term and ineligible for reëlection.

Doctor Braash reported on the American Medical Association Survey on Medical Care. His report was on the results up to date, which are incomplete, but reveal vacant hospital beds in private institutions; and that the figure 40,000 for those needing medical care is more nearly the truth than the figure 40,000,000 reported by certain political bodies.

The Board of Trustees, the Iowa delegation and the Texas delegation submitted a resolution regarding the Wagner Act. The committee appointed in the September, 1938, special meeting, for similar study, was reappointed to report on the Wagner Act. After three days and nights of work with medical and lay opinions, a report was rendered the House of Delegates in executive session containing a summary of twenty-two items, showing American Medicine's opinion in no uncertain terms, and bringing out the lack of safeguards to private practice and revealing this Act as contrary to the best interests of the American people.

REPORT OF REFERENCE COMMITTEE ON THE WAGNER HEALTH BILL*

Summary

1. The Wagner Health Bill does not recognize either the spirit or the text of the resolutions adopted by the House of Delegates of the American Medical Association in September, 1938.
2. The House of Delegates cannot approve the methods by which the objectives of the National Health Program are to be obtained.
3. The Wagner Health Bill does not safeguard in any way the continued existence of the private practitioners who have always brought to the people the benefits of scientific research and treatment.
4. The Wagner Health Bill does not provide for the use of the thousands of vacant beds now available in hundreds of church and community general hospitals.
5. This Bill proposes to make federal aid for medical care the rule rather than the exception.
6. The Wagner Health Bill does not recognize the need for suitable food, sanitary housing and the improvement of other environmental conditions necessary to the continuous prevention of disease.
7. The Wagner Health Bill insidiously promotes the development of a complete system of tax supported governmental medical care.
8. While the Wagner Health Bill provides compensation for loss of wages during illness, it also proposes to provide complete medical service in addition to such compensation.
9. The Wagner Health Bill provides for supreme federal control: federal agents are given authority to disapprove plans proposed by the individual states.
10. The Wagner Health Bill prescribes no method for determining the nature and extent of the needs for preventive and other medical services for which it proposes allotments of funds.
11. The Wagner Health Bill is inconsistent with the fundamental principles of medical care established by scientific medical experience and is therefore contrary to the best interests of the American people.
12. The fortunate health conditions which prevail in the United States cannot be disassociated from the prevailing standards and methods of medical practice.
13. No other profession and no other group have done more for the improvement of public health, the prevention of disease and the care of the sick than have the medical profession and the American Medical Association.
14. The American Medical Association would fail in its public trust if it neglected to express itself unmistakably and emphatically regarding any threat to the national health and well-being. It must, therefore, speaking with professional competence, oppose the Wagner Health Bill.
15. The House of Delegates would urge the development of a mechanism for meeting the needs for expansion of preventive medical services, extension of medical care for the indigent and the medically indigent, with local determination of needs and local control of administration, within the philosophy of the American form of government and without damage to the quality of medical service.
16. The fundamental question is how and when a state should be given financial aid by the Federal Government out of the resources of the states as a whole, pooled in the Federal Treasury.
17. The bizarre thinking which evolved the system of federal subsidies—sometimes called "grants-in-aid"—is used to induce states to carry on activities suggested frequently in the first instance by officers and employees of the Federal Government.
18. The use of federal subsidies to accomplish such federally determined activities has invariably involved federal control.
19. Any state in actual need for the prevention of disease, the promotion of health and the care of the sick should be able to obtain such aid in a medical emergency without stimulating every other state to seek and to accept similar aid, and thus to have imposed on it the burden of federal control.
20. The mechanism by which this end is to be accomplished, whether through a federal agency to which any state in need of federal financial assistance can apply, or through a new agency created for this purpose or through responsible officers of existing federal agencies, must be developed by the Executive and the Congress, who are charged with these duties.
21. Such a method would afford to every state an agency to which it might apply for federal assistance without involving every other state in the Union or the entire government in the transaction.
22. Such a method would not disturb permanently the American concept of democratic government.

---

* Presented by the California Delegation, as instructed by the House of Delegates of the California Medical Association.

* Submitted to the American Medical Association House of Delegates on May 17, 1939, at St. Louis, Missouri.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS[†]

HOW ASSEMBLYMEN VOTED ON THE PROPOSED COMPULSORY HEALTH LAW (ASSEMBLY BILL 2172)

On Tuesday afternoon, May 16, the proposed compulsory health insurance law was given place on the Assembly calendar, as a special order. In the Assembly chamber on that afternoon, the tenseness of the situation was quite evident, for there was to be witnessed a test vote on one of the Administration's "must" measures. Elsewhere in this issue other items in relation thereto are given.[*]

For the information of members, the roll call vote is printed below. The test vote was on a certain amendment, the "Aye" votes being cast by Assemblymen who, presumably, are in favor of the compulsory health measure known as Assembly Bill 2172, the "No" votes indicating the Assemblymen who are opposed to a compulsory health insurance law.

Component county societies and members of the California Medical Association who are interested in the proposed legislation may wish to carefully look over the lists.

Vote as recorded follows:

"Aye" Votes (Assemblymen Supposedly in Favor of a Compulsory System)

PRIZES FOR SCIENTIFIC EXHIBITS

The California Medical Association Committee on Scientific Program this year awarded three diplomas of merit as prizes for outstanding presentations in the scientific exhibit division.

The prize winners were selected by three members of the Association, each unknown to the other, who gave ratings on the five exhibits which in their respective opinions were best.

The sealed reports submitted by the three judges were then canvassed and the final decision made. The three judges were Doctors John Sampson, San Francisco; Herbert Johnstone, Anaheim, and Orris Myers, Eureka.

First prize went to the exhibit on "Gastroscopic Studies," presented by Allan L. Cohn, Rubin Gold, Alfred White, all of San Francisco. Much of the work in this exhibit was done at Mount Zion Hospital.

The second prize, that of first honorary mention, was awarded to the exhibit on "Gastro-Enterostomy and Jejunoplasty Transparencies" by Carl L. Hoag, John B. DeC. M. Saunders, Harold H. Lindner, and John M. Moore, all of San Francisco.

The third prize, that of second honorary mention, went to the exhibit on "Reconstructive Plastic and Oral Surgery," presented by Arthur E. Smith and James B. Johnson, both of Los Angeles.

The diploma certificates, ornamented with the seal of the Association and suitably engrossed and framed, have been presented to the three prize winners.

CALIFORNIA PHYSICIANS' SERVICE*

Informative Bulletins

Bulletin I

California's statewide voluntary prepayment plan for medical, surgical and hospital care is ready for launching at rates of $2.50 a month, or less, to employed groups of five or more people, or to other groups organized originally for purposes other than those of medical care.

Trustees of California Physicians' Service, which includes in its professional membership a great majority of the licensed doctors of medicine in active general practice in the state, included in this announcement the following provisions of the plan:

Complete medical, surgical and hospital care for all illness or accidents, with a few specific exemptions such as mental cases, drug or alcoholic addiction, preëxisting ailments or results of lawless acts, at $2.50 a month, prepaid.

The same care will be offered with the patient paying the cost of the first two doctor's visits in any one illness or accident, at $2 a month.

The Service at the start will be offered only to groups of employed or other persons, but the group can be as limited in number as five persons, provided satisfactory guarantees of financial stability are given. Groups must collect monthly prepayments from their members and remit as a group to California Physicians' Service, or employers can make deductions for the employees' groups and remit for the groups.

Answering numerous inquiries, the Service trustees state that the rates within a group can be regulated by the group itself, so long as the rate of $2.50 or $2 a month, as the case may be, is maintained in the group payment to California Physicians' Service. With the service based on an average group income not to exceed $3,000 a year, this would permit higher-paid employees to pay more than $2.50 a month in order to permit the office boy or janitor to join at a lower monthly prepayment.

Families of group members, and later individuals, will be admitted to beneficiary membership when the many groups now seeking membership are assimilated and sufficient experience through actual operation of the plan has been gained, the trustees stated.

COUNTY SOCIETIES

SACRAMENTO COUNTY

The regular meeting of the Sacramento Society for Medical Improvement was called to order by President Manuel Azevedo in the Auditorium at Twenty-Ninth and L streets on April 18. There were fifty-two members and guests present.

Dr. Paul Gliebe of San Francisco presented the paper of the evening, his subject being *Emotions in Physical Disease*. Doctor Gliebe especially stressed the recent work being done on the anxiety states, fatigue neurosis and psychoses, and their treatment with sodium chlorid. In many of the depressed states they have found the absence of free hydrochloric acid in the stomach, associated with low blood chlorids and an alkaline urine, due to hyperventilation or overingestion of alkalies. The paper was very well presented and elicited much discussion.

Drs. A. A. Atkinson, Eric Blunden, Pearson Kellogg, and L. Specker were unanimously elected to membership in the Society.

Under new business it was moved, seconded, and so passed, that the name of Dr. Frank MacDonald be presented at the Del Monte annual session to fill the vacancy created by the resignation of Dr. J. B. Harris as councilor-at-large.

Dr. Norris Jones reported for the Public Relations Committee. G. E. Millar, *Secretary.*

⁂

SAN BERNARDINO COUNTY

The meeting of the San Bernardino County Medical Society was held in the San Bernardino County Charity Hospital on Tuesday, May 9.

The meeting was opened by the president, Dr. Delbert B. Williams, at 8 p. m. About sixty members and guests were present.

The Secretary gave a few highlights of the proposed fee schedule for California Physicians' Service.

Mr. Dobson, new manager of the Mount Vernon Sanitarium, spoke briefly on the new policies of the institution.

---

* Address: 220 Montgomery Street, San Francisco. Telephone: EXbrook 3212.

The application for membership of Dr. William L. Cover of San Bernardino was approved.

Dr. Walter Cherry reported on the House of Delegates meeting in Del Monte. The most important item is a $10 assessment to be levied shortly.

The program of the evening was as follows: *Common Skin Diseases and Their Treatment,* by Dr. Paul D. Foster of Los Angeles.

The meeting adjourned at 9:40 p. m., following which refreshments were served.

Arthur E. Varden, *Secretary.*

* * *

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society was held on Thursday, May 4, in the Medico-Dental clubrooms. The meeting was preceded by the customary supper meeting at the Hotel Wolf, at which Doctor Ross read a paper on some *Urogical Problems.*

The regular meeting was called to order at 8:30 p. m. by President Neill P. Johnson. The application of Dr. W. T. Auld was read and referred to the Admissions Committee. The Secretary of the Society briefly reported on the recent secretaries' meeting at Del Monte, April 30. Dr. Dewey Powell reported for the delegates to the California Medical Association Convention, telling us the progress of the California Physicians' Service and the creation of the Public Relations Council. The paper of the evening was presented by Dr. John A. Bacher of Stanford, who spoke on *Otorhinolaryngology.* The paper was illustrated with blackboard drawings and slides. This caused considerable and favorable discussion from the floor.

There being no further business to come before the Society the meeting was declared adjourned, and refreshments were served at 10:30 p. m.

G. H. Rohrbacher, *Secretary.*

In Memoriam

Day, Robert Verne. Died at Los Angeles, April 30, 1939, age 63. Graduate of the University of Southern California School of Medicine, Los Angeles, 1897, and licensed in California the same year. Doctor Day was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

* * *

McKee, William Clifford. Died at Los Angeles, April 23, 1939, age 54. Graduate of Johns Hopkins University School of Medicine, Baltimore, 1913. Licensed in California in 1914. Doctor McKee was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

* * *

Poage, Charles Allen. Died at Colusa, May 3, 1939, age 66. Graduate of Cooper Medical College, San Francisco, 1901, and licensed in California the same year. Doctor Poage was a member of the Yolo-Colusa-Glenn County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

* * *

Sellew, Paul Kibbe. Died at Los Angeles, May 5, 1939, age 53. Graduate of Yale University School of Medicine, New Haven, 1911. Licensed in California in 1916. Doctor Sellew was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

* * *

Zantiny, William George. Died at Long Beach, April 12, 1939, age 62. Graduate of Cleveland College of Physicians and Surgeons, 1908. Licensed in California in 1925. Doctor Zantiny was a member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

MRS. FREDERICK N. SCATENA..........................President
MRS. FRED H. ZUMWALT..............Chairman on Publicity
MRS. FRANK H. RODIN..Assistant Chairman on Publicity

News Letter

Dear Auxiliary Members:

The convention of the California Medical Association and its Auxiliary, held at Del Monte, has taken place. We are greatly indebted to Mrs. Lawrence M. Knox, Chairman of Convention, and her very able committee for the generous hospitality and splendid arrangements for the comfort and entertainment of the members and guests who attended the convention.

As this goes to press, the names of the newly elected officers and the reports of the convention had not reached me, therefore I regret very much that this information is not included in this issue. I hope it will be included in the July issue of CALIFORNIA AND WESTERN MEDICINE.*

Sincerely yours,
MRS. FRANK H. RODIN.

Component County Auxiliaries

Alameda County

The Doctor's Mother was the theme used for the program of the May meeting of the Woman's Auxiliary to the Alameda County Medical Association held at the Claremont Country Club. The wives and members of doctors' families met for luncheon at 12:30.

Mrs. I. O. Church, Program Chairman, arranged a delightful program which included songs by Julia Phillips Page, accompanied by Mary Barnard Jacobus; instrumental numbers by Misses Helen Shutes, Lawring Palmer, and Edgell Stoltz; a string trio, and readings by Miss Barbara Ann Ashley.

As this was the last meeting of Mrs. Frank Baxter's term of office as president, she was credited with a very successful year of increased interest and attendance.

The hostess of the day was Mrs. Louis Henry Dyke, Sr.

MRS. GRANT ELLIS, *Publicity Chairman.*

* * *

Los Angeles County

The April meeting of the Woman's Auxiliary was held at the Los Angeles County Medical Building at noon. The president, Mrs. William H. Leake, presided. Seventy-seven members and guests were present.

Mrs. Paul D. Foster reported on *Hygeia,* the health magazine, subscriptions.

Mrs. Harold E. Crow, Philanthropy Chairman, reported that she, assisted by Mrs. Otto Bames, delivered eighteen Easter baskets to indigent families.

Dr. Claud Buss, Associate Professor of International Relations of the University of Southern California, spoke on *The Present International Crisis.*

MRS. KARL VON HAGEN, *Publicity Chairman.*

Marin County

The Woman's Auxiliary to the Marin County Medical Society met for dinner on April 27 at the Sleepy Hollow Golf and Country Club.

Mrs. C. W. Clark reported on a meeting held by the League of Women Voters, at which plans for socialized medicine were discussed.

The Chairman of Philanthropy reported that braces were bought for a needy crippled child. An allowance of $1.50 a month to purchase art materials was given to a young girl patient in the tuberculosis ward of the county hospital. She also was provided with a bathrobe, slippers, housecoat, and other physical comforts.

Dr. C. A. DeLancey showed some very interesting colored slides and gave a talk on *Glandular Disturbances and Abnormalities.*

MRS. C. A. DELANCEY, *Publicity Chairman.*

* * *

San Diego County

The Woman's Auxiliary to the San Diego County Medical Society met for luncheon on April 11 at the University Club.

Dr. Floyd Bond gave an interesting talk and explained the *Intricacies of Ophthalmology.* Mrs. R. H. Pressman gave an inspiring talk on *The March of Medicine.*

The report of the Nominating Committee was read.

MRS. H. K. ALBERTSON, *Publicity Chairman.*

* * *

San Joaquin County

The March meeting of the San Joaquin Auxiliary was held at the home of Mrs. H. A. Chapman. The president, Mrs. G. K. Weaver, presided. Twenty-one members and two guests were present.

Dr. Dewey Powell discussed the *Health Plan of the California Medical Association* and gave a very clear picture of the details.

The legislation affecting the nursing profession was also discussed with much interest.

Delicious refreshments and a social hour were enjoyed at the conclusion of the meeting.

MRS. G. K. WEAVER, *President.*

* * *

Santa Barbara County

The attractive parish hall of Trinity Episcopal Church was the setting for the annual bridge tea given by the Woman's Auxiliary to the Santa Barbara County Medical Society on April 21. A profusion of spring flowers adorned the tea tables and other parts of the large room. One hundred and seventy members and guests attended.

Presiding at the tea tables were Mesdames Horace Pierce, Franklin Nuzum, Charles Stevens, and William Remfry Hunt. The young daughters of the members assisted in serving.

MRS. C. W. HENDERSON, *Publicity Chairman.*

* * *

Santa Cruz County

The Woman's Auxiliary to the Santa Cruz County Medical Society met for luncheon at the Pasatiempo Country Club on April 27.

At the conclusion of the meeting the members adjourned to the Woman's Club to hear Drs. A. R. Kilgore, R. S. Stone, and Otto Pflueger speak on the *Cure and Prevention of Cancer.*

The newly elected officers are as follows: Mrs. F. P. Shenk, president; Mrs. Henry Watters, first vice-president; Mrs. N. R. Sullivan, second vice-president; Mrs. Mahlon McPherson, corresponding secretary; Mrs. R. C. Alsberg, recording secretary; Mrs. O. C. Marshall, treasurer; Mesdames A. L. Phillips and A. J. Sambuck, directors.

MRS. R. C. ALSBERG, *Recording Secretary.*

---

† As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Frank H. Rodin, Assistant Chairman of the Publicity and Publications Committee, 2457 Bay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Rodin and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

* Editor's Note.—Names of newly elected officers appear in the roster, on advertising page 6.

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association. (Date of next annual session to be decided.) Olin West, M. D., Secretary, 535 North Dearborn Street, Chicago, Illinois.

California Medical Association, Hotel Del Coronado, Coronado, 1940. (Date of next annual session to be decided.) George H. Kress, M. D., Secretary, 450 Sutter Street, San Francisco.

Nevada Medical Association, Reno, September 22 and 23, 1939. Horace J. Brown, M. D., Secretary, P. O. Box 689, Reno, Nevada.

Medical Broadcasts*

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of June is as follows:

Thursday, June 1—KECA, 10:45 a. m., The Road of Health.

Saturday, June 3—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.

Thursday, June 8—KECA, 10:45 a. m., The Road of Health.

Saturday, June 10—KFI, 8:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.

Thursday, June 15—KECA, 10:45 a. m., The Road of Health.

Saturday, June 17—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.

Thursday, June 22—KECA, 10:45 a. m., The Road of Health.

Saturday, June 24—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.

Thursday, June 29—KECA, 10:45 a. m., The Road of Health.

American Congress of Physical Therapy.—The eighteenth annual scientific and clinical session of the American Congress of Physical Therapy will be held on September 5–8, 1939, at the Hotel Pennsylvania, New York City. Preceding these sessions the Congress will conduct an intensive instruction seminar in physical therapy for physicians and technicians on August 30 and 31, September 1 and 2.

Physicians are urged to plan their vacation for these periods and bring their families to New York for the World's Fair. Ample time has been provided for during the convention to visit the Fair and to enjoy the various activities of America's metropolis.

While the convention proper will have numerous special program features of scientific interest, the added attraction of the World's Fair should make it extremely worth while for every physician to come to New York and spend a most profitable vacation.

The instruction seminar should prove of unusual interest to physicians and technicians. The clinics which comprise half the schedule make this course outstanding for its practical value. As in the past, outstanding clinicians and teachers will participate. Registration is limited to one hundred, and is by application only. For information concerning seminar and preliminary program of convention proper, address American Congress of Physical Therapy, 30 North Michigan Avenue, Chicago.

Medical Discovery May Be Greater Than Microscope.—The discovery of methods for producing radioactive substances which can be widely used clinically "probably will be of greater importance than the discovery of the microscope." This statement was made by Dr. William J. Kerr, retiring president of the American College of Physicians, following the presentation of new evidence on the usefulness of the radio-active substances at the annual meeting of the College in New Orleans recently. Doctor Kerr is head of the division of medicine of the University of California Medical School.

"These substances will have a tremendous influence on the study of human metabolism," Doctor Kerr said. "It is possible now to use radio-active elements which have been shown to combine themselves in chemical molecules, and to study their course in the human body. Practically all of the chemical substances found in or taken into the body can now be traced in their progress throughout the body by methods which have been developed in the physics laboratories of the world."

Doctor Kerr called special attention to the University of California cyclotron, which is used to make all of the known elements radio-active, and to Dr. E. O. Lawrence, its director and inventor. Doctor Lawrence delivered the convocation address at the New Orleans meeting and likewise made a demonstration there, showing how the work of producing radio-active substances can have a direct bearing on the advancement of medicine.

University of California Medical School Revives Old English Custom.—Because three young men in the University of California Medical School did such outstanding work in their classes, certain of the faculty members were prompted to revive the fine old English custom of "handing down the gold-headed cane" in special recognition of their efforts.

Under the old custom, which held for 136 years, the physician who was deemed the most worthy member of his profession in the British Isles, was given the cane, to keep until his successor had been named. Doctor Radcliffe was the subject of the first cane presentation ceremony in 1689. Four successors received the same cane—Doctors Mead, Askew, Pitcairn, and Baillie. Upon the death of the last named in 1825, the cane went to the Royal College of Surgeons, where it may still be seen in the College Hall, London.

In the University of California ceremony, Warren L. Bostick, a senior student, was given a cane somewhat similar to that which figured in the English ceremony. Seniors Edward Jones and William R. Rosanoff were each given copies of the earliest edition of a book by Macmichael, describing the cane ceremony and giving the history of its recipients. A new cane is to be presented to next year's honor graduate in the same manner.

As a special feature, Dr. Herbert C. Moffitt, clinical professor, emeritus, who made the presentation speeches, was also given a gold-headed cane in recognition of fifty years of service with the University. Doctor Moffitt was the "gold medal" graduate of the University with the class of 1889.

The old custom symbolizes the habit of English physicians of long ago carrying gold-headed canes, in the hollow heads of which they carried herbs to protect themselves from disease.

---

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour and subject) to California and Western Medicine, 450 Sutter Street, San Francisco, for inclusion in this column.

Technical Exhibitors at Del Monte Annual Session Present Three Prizes.—In order to create interest in the technical or commercial exhibits, the firms who had booths at the Del Monte session created a pool of $100, to be divided into three cash prizes: the first for $50, the second for $30, and the third for $20.

The contest was open only to physicians, it being stipulated that each physician who entered the contest should receive a card on which was printed the names of various exhibits. All cards showing that the physician had visited every one of the technical booths were then placed in a sealed box. On Wednesday evening, May 3, President-Elect Dukes took therefrom three cards. The first prize of $50 was awarded to Dr. William Booth, Coronado; the second prize of $30 went to Dr. C. E. Schultz, Castroville; and the third prize of $20 was won by Dr. Hiram M. Currey, Santa Ana. This action by the exhibitors excited much interest.

New York Polyclinic Medical School and Hospital. Dr. Walter C. Alvarez, Mayo Clinic, Rochester, Minnesota, read a paper on "The Patient Who Doesn't Get Well in Spite of Treatment," on Thursday, May 4.

The New York Polyclinic Medical School and Hospital, 341 West Fiftieth Street, New York, is inaugurating a combined full-time course in urology, covering an academic year (eight months), on October 1, 1939. It will comprise instruction in pharmacology; physiology; embryology; biochemistry; bacteriology and pathology; practical work in surgical anatomy and urological operative procedures on the cadaver; regional and general anesthesia (cadaver); office gynecology; proctological diagnosis; the use of the ophthalmoscope; physical diagnosis; roentgenological interpretation; electrocardiographic interpretation; dermatology and syphilology; neurology; physical therapy; continuous instruction in cysto-endoscopic diagnosis and operative instrumental manipulation; operative surgical clinics; demonstrations in the operative instrumental management of bladder tumors and other vesical lesions as well as endoscopic prostatic resection.

Graphic Medical Murals Presented to University.—A history of California medicine from the time that Sir Francis Drake witnessed the crude autopsy on his brother's body, to the present day of super-voltage x-rays, painted in heroic proportions on the walls of a medical amphitheater, were formally presented to the University of California at a special ceremony recently in the University hospital here. The presentation was made in Toland Hall, where the realistic murals occupy all of the free portion of the circular wall above the demonstration pit. The display is said to be unique in hospital history.

One-half of the room shows the development of medicine in Northern California and the other in Southern California. The earliest Indians are seen emerging from their sweat houses, or being worked over by the shaman, or medicine man. Gold Rush medicine, which often substituted pliers for forceps, and which used whisky as one of its chief anesthesias, is made the subject of a mural in the central background. Dr. Don Pablo Soler, Spanish surgeon of the late eighteenth century, is seen attending an Indian who had been gored by a bull. The transition from these early crude forms of medical attention to the highly specialized and scientific procedures of the present is skillfully made by the artist.

Another central panel shows the first hospital in California, a crude shelter put up at San Diego in 1789 to succor members of the Portola expedition. The incident of James Ohio Pattie, old California trapper, vaccinating a number of early Californians against smallpox, is also shown.

Pacific Coast Society of Obstetrics and Gynecology. The next meeting of the Pacific Coast Society of Obstetrics and Gynecology will be held in Portland, Oregon, on October 4 to 7, 1939.

For further information, write to T. Floyd Bell, M. D., Secretary, 400 Twenty-ninth Street, Oakland.

Plan School Health Program for University of California Summer Study.—Public health and public health nursing will have an important place in the curricula of the 1939 Summer Session at the University of California at Los Angeles, according to Dr. J. Harold Williams, Dean of the Session.

Dr. Richard Arthur Bolt, director of the Cleveland Child Health Association, will come to Los Angeles to instruct two courses in public health for the State University. Other members of the Public Health teaching staff will include Helen D. Halvorsen, Birdie M. Adair, and Ruth Endicott Lewis, a member of the Department of Social Work at Washington University in St. Louis, Missouri.

Information concerning the summer courses is available on request to the University's Summer Session Office, 405 Hilgard Avenue, Los Angeles.

Quarterly Dinner of the "Society of the Medical Friends of Wine."[*]—On Wednesday evening, May 24, at the St. Francis Yacht Club, San Francisco, the members of the medical profession, to the number of almost one hundred, gathered to hold their quarterly dinner. The speakers for the evening included Carl E. Bundschu, a renowned wine grower of Napa County, who spoke on the "Romance of California Wine," and Doctor Maynard A. Amerine, Assistant Enologist, Department of Viticulture, University of California, who addressed the members present on "Wine Growing in California: Its Present-Day Status and Future Objectives." Following this, members participated in an informal discussion on wine in medical practice.

A guest of honor was M. le Marquis Bertrand de lur-Saluces, owner of a celebrated French vineyard. His informal address was much appreciated.[†]

The object of the Society of Medical Friends of Wine is to stimulate scientific research on wine, develop an understanding of its beneficial effects, and encourage an appreciation of the conviviality and good-fellowship that are a part of the relaxed and deliberate manner of living that follows its proper use.

The pioneers or founders of the Society are: Doctors H. E. Alderson, R. E. Ashley, Lloyd Crow, M. A. Francoz, C. D. Leake, S. P. Lucia, C. P. Mathé, H. C. Moffitt, T. F. Mullen, Langley Porter, R. A. Yoell, and G. E. Ebright.

Dr. Charles P. Mathé is president; Dr. T. F. Mullen, vice-president; Dr. R. G. Flood, secretary; and Dr. M. A. Francoz, treasurer.

---

[*] See CALIFORNIA AND WESTERN MEDICINE, April, 1939, on page 300.

[†] Mr. Chairman, Gentlemen, Friends of Wine!

My English is much too poor to allow me to make a speech. But I have only to look in my heart to tell you how glad I am to meet American friends of wine and, as a French wine grower, to let you know the great pleasure I'll have during my journey to get in touch with Californian wine growers. It is my first trip to the United States, and I feel delighted to at last have the opportunity to visit the great country and friend of my country.

The whole world, especially France, looks to California as the best known and most famous paradise, and I am now able to see how much this wonderful country deserves its universal reputation.

Bordeaux wines and my own wine are appreciated and drunk over here; I am extremely proud of it. But this can give me some right to say that California wines are excellent. They ought to be served on every table twice a day, and we should not be able to find any left on the market.

Louis Pasteur has written somewhere that "Wine is the most healthful and most hygienic beverage."

Drink California wine! I really believe those three words ought to be written and read everywhere.

Long live California, and California wines forever!

Press Clippings.—Some news items from the daily press on matters related to medical practice, follow:

Patterson Promises to Help Chiropractors

Stockton, May 27 (Special to the Chronicle).—Lieutenant-Governor Ellis Patterson today told the convention of National Affiliated Chiropractors of California that the present Administration would "do everything in its power to further an amendment giving the chiropractic profession the same rights and privileges extended to other members of the healing professions."

The amendment is soon to be presented by the chiropractors to the voters for their approval.—San Francisco *Chronicle.*

Initiative May Give Harsher Health Insurance*

By Chester Rowell

The vote of the California Legislature on the health insurance bill merely means that the vote of the people on it will be by initiative instead of by referendum. It was certain from the beginning that the matter would be referred to the people one way or the other, and the motion, by friends of the bill, to make the referendum provision a part of the bill itself, was no "last minute concession" or "subterfuge," as stated by epithet-seeking opponents, but had been the intention of supporters of health insurance, including Governor Olson, from the outset. If the bill had passed the Legislature, opponents would have invoked the referendum by petition, and supporters were entirely willing, instead, to provide it by legislative action.

* * *

The only practical issue, therefore, was which way the vote of the people should be taken, and the Legislature has determined that it shall be by initiative. Whether from the standpoint of supporters or of opponents of health insurance, this is decidedly the less desirable of the two choices, but the Legislature, under the impact of pressure groups, has made it, and those who regret this choice have nothing to do but accept it and meet it on that basis. This will be done.

* * *

From the standpoint of opponents, the disadvantage is that the initiative, since it will originate from the labor groups, may be more objectionable to them than the much more conservative compromise measure which alone could have passed the Legislature. If what they want is no health insurance at all, they would have the opportunity to defeat it by popular vote, under either method of submission. If their hope is that the initiative method will submit a more radical measure, which they would have a better chance of defeating, they must remember that conservative supporters of health insurance will do their best to urge that the initiative measure submitted be as conservative as possible, and that radical supporters may be as open to the argument, in presenting the measure to the people, as they were in presenting it to the Legislature, that a measure less radical than they desire would be more likely to secure the votes necessary to pass it. Or, in the alternative that the more radical supporters do present a measure putting more of the cost on employers and the State and less or none on labor, that might pass, too, and then the opponents would have to live with it. They would then wish that the vote had been on the more conservative legislative measure.

* * *

From the standpoint of supporters of health insurance, the initiative is the less desirable of the alternative methods, though they accept it if denied the other. In the first place, all but the extreme Left wing of them would themselves prefer the test on a moderate measure, such as, except for the pressure groups, could have passed the Legislature. And, in the second place, a measure passed by initiative is cumbersome to amend, as experience and changing conditions will require even in technical details. It would be better if the initiative could provide that future Legislatures could amend it by a two-thirds vote, subject of course to referendum, but it may prove impossible to induce those who will sponsor the initiative petition to include this provision.

* * *

Nevertheless, since the vote can now be taken only this way, it will be done. There will inevitably be a hot campaign, of education and miseducation, before the people, the Medical Association the central political group on the one side and the labor unions on the other. Neither of these groups has votes enough to pass or defeat a bill, so the result will depend on the votes of the rest of us. If there were any hope that the campaign would be conducted by sober argument, on the facts, this would be a welcome example of the democratic process. Experience when the matter was last before the people, and with the pressure campaign to influence this Legislature, indicates that, instead, there will be wholesale resort to slogans, epithets, and appeals to prejudice.

* * *

Hitler says this is the only way to appeal to the people, and there are Americans who share this view. Even if they were correct, they would at least not be democratic. This was not Abraham Lincoln's estimate of the intelligence of the people of his time, who had far less advantages of education and means of information. It would be an inestimable service to democracy if this coming debate in California could be conducted as Lincoln and Douglas conducted theirs in Illinois. Unfortunately, there seems little prospect of it.

Anyhow, this question will not down, and the first test comes in California. Once it may have been "academic"; now it is practical, with the State and National administrations and large groups of organized voters determinedly behind it. Even the medical profession, in California, now concedes the principle of insurance, though it ignores the lessons of experience in applying it. In a few years, health insurance will be taken as much for granted as it now is in the rest of the world, and as workmen's compensation is in America.—Editorial, San Francisco *Chronicle,* May 20.

* * *

Ten Democratic "Noes" on Olson Health Bill

Sacramento, May 17.—Administration forces huddled today to decide what could be done to revive the compulsory health insurance bill promised to the voters when the Democrats were elected last November.

Apparently on the road to certain defeat in the Assembly, the bill, amended yesterday, was back on file today awaiting decision of administration leaders.

The one clause, by which the administration hoped to woo the votes of both branches, provided the bill would not go into effect until approved by a referendum vote in 1940, was defeated, 41 to 33.

Ten Democrat "Noes"

The vote was along non-partisan lines despite administration backing for the measure. Five Republicans voted for the amendment and ten Democrats voted against it, one of them being Democratic Leader Hugh P. Donnelly of Turlock.

Heated words were tossed back and forth as Assemblyman Ben Rosenthal, Los Angeles Democrat and author of the bill, charged the "medical trust" was attempting to put sponsors of the measure on the spot.

He charged dictaphones had been planted in the chamber to record every speech and that owners of the machines should be made to register with the clerk of the lower house.

3 Per Cent Pay Roll Tax

He won his point, but Republicans revealed the administration also had a stenographic recording of all proceedings. She, too, registered.

After the dictaphone controversy died down, the bill as amended was sent out for reprint, to be considered later.

As amended, the compulsory health insurance bill, to be financed by a 3 per cent pay roll tax at an annual cost to industry of $63,000,000, provides these things:

Exemption for agricultural workers, domestics, public, religious and charitable organization employees.

Defeat Predicted

All income classes are included, with those making more than $3,000 a year given cash reimbursement for hospitalization in private institutions.

In its present form, Democrats and Republicans alike predict the bill is dead.

Assemblyman Melvyn I. Cronin, San Francisco Republican, in urging the referendum provision be killed, said:

"The administration knows full well this bill will not pass both houses. The amendment is offered in hope they can convince some of us it will take us off the spot by giving the people the final say. It is rank subterfuge."

Selling Economic Security

Adding his opposition to the measure, Assemblyman Lee T. Bashore, Glendora Republican, said that to approve it would be to "sell our economic security for social security."

Upon the referendum amendment, the roll call was as follows:

Ayes—Atkinson, Bennett, Michael Burns, Cassidy, Collins, Del Mutolo, Desmond, Dills, Doyle, Gallagher, Gannon, Gilmore, Hawkins, Heisinger, Kilpatrick, King, Lore, Maloney, Massion, Meehman, George P. Miller, Pelletier, Reaves, Richie, Rosenthal, Salsman, Tenney, Turner, Voight, Weber, Williamson, Yorty, Peek.

Noes—Allen, Bashore, Hugh M. Burns, Burson, Carlson, Clarke, Corwin, Cronin, Crowley, Daley, Dilworth, Donnelly, Evans, Field, Fulcher, Garland, Green, Houser, Johnson, Kellems, Kepple, Knight, Kuchel, Leonard, Lyon, Eleanor Miller, Millington, O'Donnell, Phillips, Poulson, Redwine, Scudder, Sheridan, Stream, Thorp, Thurman, Walker, Waters, Watson, Weybret, Wollenberg.

State Health Plan Faces Defeat

Final Voting on Measure Is Postponed

Assembly Accepts Many Exemptions, Limits Benefits of Program

Sacramento, May 17.—Facing almost certain defeat, Administration forces in the Assembly today postponed indefinitely a showdown over Governor Olson's proposed compulsory health insurance program after the House late yesterday rejected an amendment to permit the people to vote on the measure.

Assemblyman Ben Rosenthal, Los Angeles, Administration spokesman, said he would not seek a final vote on the bill until some time next week and that he was under no illusions about the issue.

"The medical trust seems too strong for us," said Mr. Rosenthal.

Prior to rejection of the amendment to submit the bill to the people the lower house accepted half a dozen other changes modifying the scope of the proposal. The amendments limited health insurance benefits to those eligible to unemployment insurance, exempting agricultural labor, public employees, domestics and workers of community chest agencies and religious organizations.

Many Exemptions

Another change exempted Christian Scientists and similar healing groups; a third sought to guarantee health insurance benefits to those earning more than $3,000 a year; a fourth removed a possibility of use of state funds for administrative purposes.

Assemblymen Melvyn I. Cronin, San Francisco; Charles W. Lyon, Los Angeles, led the fight against the amendment.

The 41-33 vote against the amendment was not considered a proper measure of the voting strength of the opposition to the bill.—San Francisco *News*, May 17.

* * *

Legislature to Push Work as Payless Days in Offing

Issues of Unemployment Relief and Budget Expected to Come Up This Week

Sacramento, May 14 (AP).—Prospects of payless service after next Saturday heightened probability of action next week on the two major issues of the fifty-third session—unemployment relief and the 1939-41 budget—as the Legislature prepared to resume its work tomorrow.

Under Constitutional provisions Legislators are paid only for one hundred Legislative days, at $12 for each day of such service, the total being the $1,200 annual salary paid to members of the California Legislature. A resolution setting May 27 as date of adjournment is before the Assembly.—Los Angeles *Times*, May 15.

* * *

Warning Given on Olson Health Plan

Del Monte (AP).—The California Medical Association received warning yesterday from its legislative representative Governor Olson's pending compulsory health insurance bill appeared to be gaining strength, but organized medicine had a "fighting chance" to defeat it in the Assembly.

Speaking of that and other measures affecting medical practice, Dr. Junius B. Harris, spokesman for the association in legislative matters, said the doctors were facing their "greatest fight" in the next few months.

Dr. Harry H. Wilson of Los Angeles was unanimously chosen president-elect, to take office in 1940. Dr. Lowell S. Goin of Los Angeles, was reëlected speaker of the house of delegates. Dr. Dewey R. Powell of Stockton was elected vice-speaker.

Dr. George D. Maner of Los Angeles, Dr. C. Kelly Canelo of San Jose and Dr. Frank MacDonald of Sacramento, were named district councilors. Elected councilors-at-large were Dr. C. O. Tanner of San Diego, Dr. Elbridge Best of San Francisco, and Dr. Frederick N. Scatena of Sacramento.—Riverside *Press*, May 4.

* * *

New Group Health Insurance Plan Outlined to Doctors

Del Monte (UP).—Proposed costs and membership regulations of the new group health insurance plan advanced by the California State Medical Association in the first statewide move of its kind in the United States were announced at the State Medical convention.

The Board of Trustees of the California Physicians' Service, the incorporated association group under which the plan is to be operated, said final plans and actual operation of the plan "is a matter of weeks."

Membership at the outset will be limited to employed groups earning not more than $3,000 a year. WPA workers will be eligible. A 50 per cent signup will be required for groups of 1,000 or more; a 100 per cent for groups of less than 10; and a corresponding ratio for groups between these limits.

$2.50-$2.00 Monthly

Voluntary memberships will cost $2.50 or $2.00 a month. The $2.00 fee will apply when the individual assumes costs of the first two visits for any illness.

Patients may select any physician of the 4,300 who have already joined the service.

Beneficiaries will be entitled to not more than one year's medical treatment for any one illness or injury; and not more than twenty-one days' hospitalization with complete nursing, x-ray and laboratory service.

The Physicians' Service will not accept responsibility for injuries covered by workmen's compensation insurance, mental disease, alcoholism, attempts to commit suicide, or incurred as the result of lawlessness. The service will not pay for drugs.

Provision for Childbirth

Medical and hospital care for childbirth will be provided only after the mother has been a member of the service for more than two years.

The plan will go into operation after completing arrangements with hospital insurance groups already in existence and the setting up of physicians' fees.

Payment for physicians will be based on a unit fee, ranging from one unit for a "second office visit" to eighty units for a major operation. The value of the unit in dollars and cents was yet to be determined.

Operation Schedule

Tentative schedules provided such unit valuation as:

Appendicitis operation—50 to 60 units; cesarian operation—60 units; fractures—8 to 60 units.

Although limited at first to those in employed groups, California Physicians' Service officials said it was hoped eventually to accept membership from dependents of group employees and from individuals.

The plan is to be operated and run by the physicians themselves. Another plan, compulsory, however, advanced by the State Administration, is up for consideration by the Legislature.—Watsonville *Register-Pajaronia*, May 4.

* * *

Doctors Study Health Bill

A. M. A. Leaders Fear Opening of Door to Major Social Revolution

St. Louis, May 14 (AP).—Prospects that 40 to 60 million Americans may become eligible to tax-paid, or tax-aided, medical service was the main issue discussed informally today by physicians gathering here for the annual meeting of the American Medical Association. Upwards of ten thousand doctors are expected.

In the Wagner Bill, now before Congress, some leaders professed to see the opening of the door to a major social revolution.

Provides Vast Sum

The bill would appropriate $92,000,000 for 1940 in six classes of federal aid to states for medical care. In 1941 the money would be $103,000,000 plus "sufficient" to care for indigent and unemployed sick at that time coming under state networks yet to be set up and if they are approved. In 1942, $199,000,000 plus the same kind of "sufficient" funds states would contribute.

The principle on which the bill is based has been accepted by the American Medical Association itself, by other groups of physicians and by President Roosevelt's health counselors. The principle is tax money to help indigent sick.

Method Criticized

But how to do it is drawing criticism from doctors. They forecast dangers, from the Wagner Bill, running even to control of election of Senators in thinly populated states by federal health officials, to benefits, if the principle is wisely used, such as standards of universal health the like of which the world has never seen.

Main criticism of the bill: Three federal officials would control not only the money but directly and indirectly the kind of medical service in each state. Anything, up to a state paying for the sickness of everyone, is possible.

Favor Local Control

Only local control can be medically efficient and that is not provided for specifically. Care of the sick is for doctors and should not be controlled by public health officials. Administrative personnel is provided for without specification of its medical qualifications.

The house of delegates of the American Medical Association, governing body of American medicine, said Dr.

Morris Fishbein, editor of the American Medical Association *Journal,* will this week consider the issues of localized control.

The Wagner Bill would provide new hospitals. Critics declare existing hospitals are not fully used. The nation has five thousand x-ray machines in hospitals, and these are not yet used to capacity for those who could benefit.—Los Angeles *Times,* May 15.

* * *

Reported Medical Lack Challenged

Association Group Denies 40,000,000 Need Care

St. Louis, May 16 (AP).—The idea that 40,000,000 economically submerged Americans are without medical care was challenged before the American Medical Association today.

The committee study of 43,000,000 Americans was presented with the written opinion the number actually in medical need is nearer 40,000 than 40,000,000.

This statement referred only to persons not at present cared for in some manner. The report estimated that perhaps 10,000,000 persons among the 43,000,000 are receiving, as needed, free medical care direct from doctors.

The report was read by Dr. W. F. Brasch of the Mayo Clinic. It summarized the results of a survey of 747 counties in thirty-seven states made by local physicians.

Free Aid Told

Twenty thousand physicians replied to questionnaires. Of these, 17,000 reported free medical service to 2,611,451 persons. In addition, these same physicians reported giving 1,909,713 hours a year free service in hospitals.

The report considered this showing a good cross-section of the average and said that if it is then the estimates of $1,000,000 a day free service by American doctors is far too low.

The 17,000 physicians were only 25 per cent of the doctors in the territories canvassed. The report assumed the probability that the other doctors contribute free service in about the same degree and said that if this is true, then the number of persons served without cost, among the 43,000,000, is about 10,000,000 in a year.

Action Postponed

Action on the Wagner Bill in the United States Senate proposing federal subsidies for the indigent sick, was postponed until Wednesday. It was announced that representatives of organized medicine will go to Washington, May 25, to give the Senate Committee the views of the present meeting of the house of delegates of the American Medical Association on the act.—San Francisco *Examiner,* May 17.

* * *

Medical Association Attacks Health Act

St. Louis, May 18 (AP).—The American Medical Association, through its house of delegates, was lined up solidly today in opposition to the Wagner health bill as "contrary to the best interests of the American people."

A resolution, adopted by the 174 delegates in twenty minutes without a dissenting vote, held the Wagner Bill fails to make use of existing facilities for the sick poor and would impose federal control of spending for the sick.

As an alternative, the doctors proposed starting with existing facilities, expanding them and permitting states to ask for and get federal aid as needed.

The resolution adopted yesterday was in general terms, so couched to serve as a statement of principles to guide the thinking of doctors. The American Medical Association and federal authorities are in agreement on the basic principle, that tax moneys be used to help care for the indigent sick.

The bill, commonly called the "national health act of 1939," is an amendment to the social security of 1935 and is intended to make effective a national health program recommended by the inter-departmental committee to coordinate health and welfare activities.—San Francisco *Call-Bulletin,* May 18.

* * *

Medical Association Lists Bars to Socialized Medicine

New York, April 15.—Six reasons why the American Medical Association opposes socialized medicine were placed before the American Association for Social Security by Dr. Morris Fishbein, editor of the *Journal* of the American Medical Association, here today.

His first point was that American medicine opposes compulsory sickness insurance "because it is compulsory and represents another step toward the breakdown of American democracy."

Doctor Fishbein predicated his second point on the stand that compulsory health insurance so called was not "health" insurance, but "sickness" insurance, and declared that the tendency of such proposals was to do "little or nothing for preventive medicine."

Other speakers at the morning session were Miss Helen Hall, head worker of the Henry Street Settlement and President of the National Federation of Settlements, and Dr. Hugh Cabot, of the Mayo Clinic, Rochester, Minnesota.

Thirdly, Doctor Fishbein held that compulsory sickness insurance encouraged excessive attention to minor illnesses and complaints and "deficiencies in the care of more serious conditions."

"Compulsory sickness insurance exalts administration at the expense of patient and doctor alike," he said as his fourth objection. "The German system has for years employed more administrators than physicians. The reported costs of administration in various countries vary from 10 to 20 per cent. Costly buildings for administration multiply and hospitals deteriorate. Sickness insurance interferes with professional control of standards and introduces incompetent political control.

"Fifth, compulsory sickness insurance offers no contribution to the care of indigent. The majority of the expense in such systems is paid by the low income workers. The deductions of these costs from a wage already too small to do more than meet the necessities of life creates more sickness than the medical care provided can prevent or cure.

"Sixth, in the United States today our sickness and death rates are as low or lower than those of any other great country in the world. . . . Thousands of experiments are being conducted with the aid of the medical profession leading to new methods of distribution of any payment for medical service. The American Medical Association has opposed only these experiments which involved deterioration of the quality of service, inhibition of medical advancement, uncontrolled solicitation and seduction of patients, promises that were certain never to be fulfilled."—Boston *Christian Science Monitor,* April 18.

* * *

Bill Limiting Use of "Doctor" O.K.'d

(By International News Service)

Sacramento, May 16.—Before the Governor for signature today were two bills passed by the Legislature, regulating the practice of medicine, including one which would permit only physicians and surgeons to use the title "doctor" alone. Holders of other medical certificates would be required to explain after their title what field they were licensed to practice.

A bill by Assemblyman Melvyn Cronin of San Francisco would permit graduate medical students and internes to treat the sick and afflicted for only two years in hospitals and schools. After that time a certificate would be required for further practice.—Los Angeles *Times,* May 16.

* * *

Prenatal Health Test Bill Signed

Sacramento, May 10 (AP).—Governor Olson today signed a bill requiring prenatal examination of women for syphilis. A second measure which would require premarital examinations of a similar nature has been passed by the Senate and is now pending before the Assembly. Olson announced he would sign this bill also.—San Francisco *Chronicle,* May 11.

* * *

Traveling Clinics to Visit Migrants

Three "Samaritan wagons," each staffed with a doctor, a nurse and a sanitarian, left San Francisco yesterday to carry preventive medicine to migratory workers in the agricultural valleys of California.

These traveling health centers of the State Department of Health will start work in Kern, Tulare and Yuba counties. First aid and treatment for simple ailments will be given. The truck clinics are equipped to act as ambulances in emergencies. They will move from locality to locality with the workers.

Each worker will be immediately immunized against smallpox (430 cases of it so far this year) and typhoid. Blood tests will be taken and a survey of malaria conditions made. In any case of serious illness the patient will be referred to the Federal Farm Security Administration's medical service.—San Francisco *Chronicle,* May 16.

* * *

Medical Loans Rank Second

Hartford, Conn., May 14 (UP).—A survey of the State Banking Department reveals that most persons secured small loans—maximum $300—during 1938: first, to pay off old debts; second, to meet medical bills, and third, to refinance old debts.

Other reasons, in their order, were to cover immediate business needs, and for clothing.

Small loan companies in Connecticut catered to 72,013 borrowers during the year and lent $9,976,381. Interest was charged at the rate of 3 per cent on the unpaid balance up to $100 and 2 per cent on the unpaid balance up to the maximum borrowable amount of $300.

Skilled workers represented 36.89 per cent of the borrowers; unskilled workers, 18.38 per cent; office and clerical workers, 12.41 per cent; federal, state, county and city employees, 7.37 per cent; proprietors, 6.35 per cent, and commercial and sales workers, 6.25 per cent.

The average loan in 1938 was $104.34, while in 1937 it was $98.83.

Small loan companies collected 88.67 per cent of collectible charges.—Los Angeles *Times,* May 14.

* * *

Senate Hears Cure Defense

Committee Tables Bill Declared Aimed at Practitioner After Hearing San Bernardino Man

Examiner Bureau, Sacramento, May 16.—A Senate committee today heard of a "cure" for advanced hopeless cases of tuberculosis, and how it was concocted of secret compounds from "Nature's laboratories."

The story was narrated by C. E. Grier, chairman of the San Bernardino County Board of Supervisors, appearing before a public health committee to protest a bill aimed, he said, at E. C. Hurlburt, "the unlicensed practitioner to whom I owe my life." He told how Hurlburt's remedy had aided him.

So effective was his story that the committee tabled the bill. However, Hal Randal, special investigator for the State Board of Medical Examiners, testified that examination showed that Hurlburt's "cure" compounds consisted among other things of kerosene, oil of sassafras and yellow dye, applied externally.—San Francisco *Examiner,* May 17.

* * *

Dr. Van Etten Next President of A.M.A.

Opposes Public Control of Medical Practice

St. Louis, May 18 (AP).—From the ranks of its general practitioners, the American Medical Association today chose 72-year-old Dr. Nathan B. Van Etten of New York as its president-elect to take office when the Association meets in New York in June, 1940.

Summoned before the Association's House of Delegates, which selected him unanimously, Doctor Van Etten responded with a call for education of physicians and patients to the "dangers of centralized control of medical practice" he said were found in the Wagner public health bill.

The delegates adopted a resolution yesterday opposing the bill, which would set up a system of federal subsidies for indigent sick.

The bill, Doctor Van Etten charged, would "destroy" the practice of medicine as it now is known and would turn over "the functions of the most highly educated group of professionals in the world to bureaus operated by adventurous amateurs."

Others Elected

Doctor Van Etten, born in Waverly, N. Y., received his medical degree at Bellevue Hospital College in 1890, and has been medical director of the Morrisania Hospital since 1929.

Dr. Rock Sleyster of Wauwatosa, Wisconsin, took over presidency of the Association for 1939-40 at the convention here, succeeding Dr. Irvin Abell of Louisville.

Dr. Alphone McMahon, president of the St. Louis Medical Society, was elected vice-president of the Association to serve during the current year. He won by a vote of 93 to 42 over Dr. Louis J. Hirschman of Detroit.

Other officers were reëlected including Dr. Olin West, Chicago, secretary and general manager; Dr. Herman L. Kretschmer, Chicago, treasurer; Dr. H. H. Shoulders, Nashville, Tenn., speaker of the House of Delegates, and Dr. R. W. Fouts, Omaha, Nebraska, vice-speaker.

Atlantic City Wins

Atlantic City, New Jersey, was chosen over Philadelphia for the 1942 convention. The 1941 meeting will be held in Cleveland. . . .—San Francisco *Examiner,* May 19.

* * *

Three Agencies of Four Put Okeh on Health Unit Plan

The long-talked-of public health service for Sutter and Yuba counties seemed to be assured this week when three of the four governing bodies voted to enter into agreement to include the plan in their budgets for the coming year. The Yuba County Board of Supervisors and the Yuba City Council voted it unanimously and the Sutter County voted it four-to-one. . . .—Yuba City *Independent Farmer,* May 5.

Coronado Gets Medical Parley

Two San Diegans were elected by the California Medical Association at Del Monte yesterday, Coronado was selected for the 1940 meeting place and delegates heard a San Diego Assemblyman's hospital bill termed a "screwbox" measure.

Dr. C. O. Tanner, San Diego, was elected a councilor-at-large. Dr. Lyell C. Kinney, San Diego, was chosen a delegate to the American Medical Association convention, The Associated Press reported.

In an address to the medical men, Dr. Junius B. Harris, legislative spokesman, said Assemblyman Paul Richie's bill requiring hospitals to supply "full service," without discrimination, to all patients and those who treat them, was a "screwbox" measure. The bill would compel the hospital to provide the patient and doctor with an advance price list of all service and supplies ordered by the patient or attending physician.

Dr. Harry H. Wilson, Los Angeles, unanimously was named president-elect. Dr. Lowell S. Goin, Los Angeles, was reëlected speaker, House of Delegates, and Dr. Dewey R. Powell, Stockton, vice-speaker.

Dr. George D. Maner, Los Angeles; Dr. C. Kelly Canelo, San Jose, and Dr. Frank MacDonald, Sacramento, were elected district councilors. Dr. Elbridge Best, San Francisco, and Dr. Frederick Scatena, Sacramento, also were named councilors-at-large.

With Doctor Kinney, Doctors Goin and Best were elected delegates to the American Medical Association convention.—San Diego *Union,* May 4.

* * *

A.F.L. and C.I.O. Back Wagner Health Plan

Washington, May 11 (AP).—American Federation of Labor and Committee of Industrial Organization officials testified today in support of a proposal by Senator Wagner, Democrat of New York, for an expanded federal health program, while a representative of the Pennsylvania Medical Society opposed it as creating "a danger of breaking down Democracy in this country."

The witnesses testified at a Senate Labor Committee hearing on legislation which would provide federal grants to states for various health activities.

"In Germany in 1850 they started these things, and what is it now—a dictatorship," Dr. C. L. Palmer of Harrisburg, chairman of the Pennsylvania society's committee on public health legislation, asserted.

Lee Pressman, counsel for the C.I.O., attributed opposition to the bill to a "reactionary group of officials of the American Medical Association."

Matthew Woll, representing the A. F. of L., urged enactment of the measure, contending that "the cost of medical care should be lowered so that it is within the reach of that large part of the population which has less than $1,500 income."

Woll asked that administration of old age insurance, the national employment service, unemployment compensation and health insurance be placed under the Department of Labor.—Sacramento *Bee,* May 11.

* * *

State's Compensation Plan Founder Opposes Olson Bill

Will J. French Warns Against Proposal to Create Industrial Insurance Monopoly

Sacramento, May 21 (Exclusive).—Will J. French, who served on the State Industrial Commission for approximately twenty years under five Governors and who was one of the founders of California's workmen's compensation system, has issued a warning against the proposal to create by law a monopolistic state compensation fund.

Governor Olson is supporting a bill pending before the Assembly Insurance Committee to give a monopoly to the state compensation fund and to eliminate the private carriers in the writing of workmen's compensation insurance.

In a letter to Assemblyman Gardiner Johnson, Berkeley, French declared that but "for the heavy hand of politics," the state compensation fund would have returned to policyholders a greater sum than the $30,800,000 returned since January 1, 1914.

He said that "there is a certain stability given by the prevailing system because of competition between the private insurance companies and the state fund."

French pointed out that when the state fund was planned in 1913, the three commissioners were divided as to recommending a monopoly and that his vote decided the controversy.

"Later on," he said, "the commissioners agreed that the wisest course had been followed."—Los Angeles *Times,* May 22, 1939.

100 Million Tax Seen If Insurance Bill Passes

North Coast Council Opposes Compulsory Insurance Bill

State levies of one hundred million dollars a year would be required to finance the compulsory health insurance plan now awaiting action by the California Legislature, members of the North Coast Council Taxation Committee—one of the major State Chamber of Commerce committees meeting here today—pointed out following their meeting.

Discussion of the health insurance plan featured the Taxation Committee's session during the morning. H. H. Sawyer, chairman, presided at the meeting, at which a bulletin recently compiled by the State Chamber on the plan, was read and discussed at length.

Of the $100,000,000 annual tax levy, $80,000,000 would be raised by new pay roll taxes and new state or federal taxes, the committee pointed out. This amount would go into a medical benefit fund, and $20,000,000 would be shifted from the employee pay roll taxes now going into the unemployment reserve fund would be shifted to a new disability benefit fund, according to the State Chamber's bulletin, which analyzes Assembly Bill 2172.

From the fund of $80,000,000 to be so created, the state would undertake to provide all medical care and medicines, and specified dental, hospital and nursing care, to all employed workers receiving less than $3,000 per year and their dependents.

The State Chamber bulletin says:

"The most important provisions of the measure would provide for a system of compulsory health insurance for about 1,800,000 employed workers and dependents. Under this act, the state would collect by new taxation about $80,000,000 annually, to go into a state medical benefit fund.

Employees Provide One-Third

"Employees would provide one-third of this fund by means of a 1 per cent pay roll tax on earnings. The remaining two-thirds would be provided by the general public, one-third to be raised by a 1 per cent employer pay roll tax, and one-third by other new taxes which are not specified in this measure.

"For about 70 per cent of the state's population the existing relationship between doctors and patients would be entirely changed. All licensed physicians and surgeons would be permitted to register and contract with the state to furnish medical and surgical care for this group of workers and their dependents.

"A doctor's payment would not be on the present basis of fees for various services actually rendered to individual patients, but each doctor would be paid a uniform flat rate of so many dollars per year for each person on his medical list, regardless of the amount or quality of services rendered."

The State Chamber of Commerce, at a recent meeting of its Board of Directors, voted to oppose this health insurance measure, raising particular objection to the method of finance proposed, and the addition of new pay roll taxes on industrial and business employers.—Santa Rosa *Republican*, May 5.

Health Insurance Bill Loses First Test in Assembly

Administration Forces Beaten on Referendum Amendment; Final Defeat Is Predicted

Sacramento, May 16.—By a vote of 41 to 33 the Assembly late today gave positive indication it will defeat the compulsory health insurance bill sponsored by Governor Olson when the measure is up for final action.

The decisive vote came on an amendment by administration forces to provide that the bill would not become effective until it had been approved by the people. Plans were to submit it to the voters at the 1940 general election.

The amendment proposing a referendum was offered in an effort to stave off defeat for the administration forces. Assemblyman Ben Rosenthal, Los Angeles, author of the bill and an Olson leader, presented the amendment.

Termed "Evasive"

Characterizing the amendment as "a subterfuge and an evidence of insincerity," Assemblyman Melvin I. Cronin, San Francisco, one of the opponents of the bill, declared the sponsors of the health insurance program should submit it as an initiative measure if they wished to put it before the people.

Assemblyman Charles W. Lyon, Los Angeles, joined in urging defeat for the amendment, declaring the "orderly way for the Legislature to submit such a program is by a constitutional amendment which would require the votes of fifty-four members of this body." He also branded the amendment as "evasion and a subterfuge."

Prior to the vote on the amendment a series of other changes were made in the bill. The most important exempted members of the Christian Scientist faith from the provisions of the bill. Another provided for cash reimbursement and hospitalization for those who earn more than $3,000 annually, giving them the same credit as those in the brackets between $300 and $3,000. Other amendments excluded all persons not included under provisions of the unemployment reserves act.

Assemblyman Rosenthal admitted that his bill faced defeat. He declared the "medical lobby" had been too strong for his forces.

The bill provides for the establishment of a compulsory health insurance system for persons earning between $300 and $3,000 per annum, financed by a 1 per cent contribution from employer, employee and state. Physicians would register under a panel system. The plan would be placed within the present unemployment reserves for administrative purposes.—San Francisco *Chronicle*, May 17.

LETTERS

Subject: Statute of limitations.*

(COPY)

May 9, 1939.

Dear Doctor:

Yours of May 1 addressed to the California Medical Association has been referred to me for reply. Ordinarily, a claim for medical services would be barred by the statute of limitations if pleaded, unless suit is brought within two years from the date of rendition of services. Therefore, it is well to either commence a suit within two years from date of rendition of services or secure a promissory note or a written acknowledgment of the debt before the two-year period passes.

Under certain circumstances the statute of limitations on a suit to recover professional fees is four years, but it is not advisable to wait more than two years and risk the interposition of the two-year statute as a defense.

Normally a claim for negligence (malpractice) against a physician can be barred by pleading the statute of limitations if the action is commenced more than one year after the alleged negligent action or omission occurred.

I am stating the general rules. There are exceptions to both, particularly in malpractice cases where the alleged negligent act may be a continuing one, *e. g.*, failure to remove a sponge.

Very truly yours,

HARTLEY F. PEART.

JOINT COMMITTEE ON PROFESSIONAL RELATIONS
OF THE
MEDICAL SOCIETY OF NEW JERSEY
AND THE
NEW JERSEY PHARMACEUTICAL ASSOCIATION
Trenton, New Jersey,

May 5, 1939.

To the Editor:—The Joint Committee on Professional Relations of the Medical Society of New Jersey and the New Jersey Pharmaceutical Association at a recent meeting passed the following resolution, which has been endorsed by the Medical Society of New Jersey and the New Jersey Pharmaceutical Association:

Resolved, That the Joint Committee on Professional Relations request the Medical Society of New Jersey and the New Jersey Pharmaceutical Association to enter a formal protest against the prescribing of medicines and the giving of medical advice on the radio, with the exception of such broadcasts on health matters as are given under the auspices of recognized associations of licensed physicians or Federal, State and local health departments; and be it further

---

* Copy of a letter from General Counsel Hartley F. Peart to a member of the California Medical Association.

Resolved, That such protest be sent to the broadcasting companies and the Federal Communications Commission.

The members of your organization have doubtless been moved to protest against the type of medical advice that is furnished over the radio in connection with patent medicine broadcasts. This type of promotion in behalf of self-medication is becoming more subtle and radio announcers are endeavoring to tie up their advertising message with some complimentary reference to the medical and pharmaceutical professions.

We believe the time has come for concerted action to curtail this type of activity, in behalf of the lay public which is unable to recognize the difference between correct medical advice and commercial propaganda, and we trust, therefore, that your organization may pass a resolution similar to the one noted above and send it to broadcasting companies and the Federal Communications Commission at Washington, D. C. . . .

319 Trenton Trust Building.

Very truly yours,

JOINT COMMITTEE ON PROFESSIONAL RELATIONS.
Prescott R. Loveland, *Secretary.*

Subject: Certain reports—To be had on application.

THE AMERICAN PUBLIC HEALTH ASSOCIATION

New York, N. Y., May 11, 1939.

To the Editor:—The American Public Health Association has recently adopted five reports dealing with educational qualifications of public health statisticians, school health educators, public health engineers, sanitarians, and subprofessional field personnel in sanitation. A copy of each report is sent you in the hope that you will find it possible to carry an item in your Journal announcing their availability. These reports are distributed free of charge in the hope that they will serve a useful purpose in raising the educational standards of professional public health personnel. Copies may be secured from the Book Service, American Public Health Association, 50 West Fiftieth Street, New York, N. Y.

Your coöperation will be greatly appreciated.

50 West Fiftieth Street.

REGINALD M. ATWATER, M. D.,
Executive Secretary.

Subject: Benzyl benzoate, not Benzoyl benzoate: A correction.

(COPY)

May 11, 1939.

To the Editor:—My article in the April issue, page 265, of CALIFORNIA AND WESTERN MEDICINE, "A Comparative Study of Sodium Thiosulphate Treatment of Scabies as Compared with Benzyl Benzoate," has an error which is of great importance (and which was not noted at the time I corrected the proofs).

Instead of benzoyl benzoate, as stated in the article, it should be benzyl benzoate. These two drugs are entirely different, benzyl benzoate only being active in the treatment of scabies.

I would appreciate it very much if you have any means of making a correction in your next issue of CALIFORNIA AND WESTERN MEDICINE.

Very truly yours,

ARNE ELY INGELS, M. D.

MEDICAL JURISPRUDENCE†

By HARTLEY F. PEART, ESQ.
San Francisco

EXTENSION TO NURSE OF OBLIGATION TO KEEP COMMUNICATIONS CONFIDENTIAL

In the April issue of CALIFORNIA AND WESTERN MEDICINE, the author treated under the title, "Legal and Ethical Protection Given to Facts Made Known to a Physician in Confidence," various phases of the obligation resting upon a physician to keep inviolate, facts learned from or about a patient during the existence of the physician-patient relationship. The following is a brief summary of an opinion of a California District Court of Appeal upon the issue: How far, if at all, does the obligation of confidence bind a physician's assistants? The facts of the case in which the opinion was rendered (*Kramer* vs. *Policy Holders' Life Ins. Assn.,* 5 Cal. App. (2nd) 380) are interesting though recurrent.

Plaintiff brought suit, as beneficiary, upon an insurance policy in which his diseased wife was the insured. On February 2, 1930, in her application for the policy, deceased stated that she had consulted a doctor within three years for a minor operation of the breast, but had fully recovered from such operation and that her present state of health was good.

On July 2, 1930, the insured visited the Coffey-Humber Clinic in Los Angeles. At that time and place, a staff physician, in the presence of his stenographer, took the patient's history and made a physical examination. From the patient he learned, among other things, that between the 11th and 12th of December, 1929, less than two months before the acceptance of her application for insurance her right breast had been removed because of cancer. Also that, at the time of the removal of the right breast, she was informed by the doctor that there was already a tumor of the left breast, and many other facts as to her previous state of health. The physical examination revealed to the doctor that the insured had an extensive spread of cancer, originating in the right breast, which, in his opinion, had been in existence in her system for in excess of two years.

To show that the representations made by the insured in her application for insurance were false and untrue, and known by her to be so, the company attempted to introduce the testimony of the physician as to what he learned in taking the patient's history and making his examination. The appellate court in sustaining the act of the trial court in ruling out the testimony of the physician on the ground that the physician had gained such information in professional confidence, extended its opinion to include a discussion of the position of the physician's stenographer in relation to the confidential communications, which discussion is the latest expression of a California appellate court on this phase of law.

Due to the fact that the stenographer in this instance kept the registry of all appointments, got the patient ready, took off her waist so as to get at her chest, and remained during the examination to take down in shorthand all that the physician discovered, it can be said that her duties resembled those of an office nurse.

The Court said:

> As already suggested, the mere presence of a third person does not mean that the privilege has been waived as to the doctor. The capacity in which the third person is present makes a real difference. There are three lines of cases in this respect. One in which a third party is present, whose

---

† Editor's Note.—This department of CALIFORNIA AND WESTERN MEDICINE, presenting copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

presence is in no respect necessary, and this is obviously apparent to the patient. In this type of case some decisions hold that both the physician and the third party may testify, and some that the third party only may testify. The second line of authorities applies to that type of case in which a third party is present and the patient has a right to believe that said party is present as one of the agents or assistants of the physician in charge. In this class the authorities agree that the attending physician cannot testify, but as to the third persons they divide themselves into three groups. The first group for convenience may be referred to as the co-professional class, in which it is held that when said third party being a licensed doctor is a consulting doctor; or an assistant doctor; or the partner of a doctor; neither the attending doctor nor his co-professional may testify.

The second group for convenience may be called professional agents, in which it is held that when a nurse or other third person is actually working as agent and assistant under the supervision of the doctor in charge, such agent is covered by the privilege as well as the doctor. A study of the cases in this group, however, shows that the statute had been extended to include nurses. (*Culver* vs. *Union Pac. R. Co.*, 112 Neb. 441 (199 N. W. 794)). Such not being the fact here, we will not discuss this group, although the Culver case, *supra*, speaking without regard to the amendment of the statute to include nurses, does suggest that the statute should as a matter of law be extended to the professional assistant. We express no opinion on the suggestion, since none is necessary to a decision of this case.

The third group holds that in situations where the presence of a third person is apparently necessary, the doctor is covered by the privilege, but the necessary third person is not.

This third general line of authority applies to those cases in which a nurse or other third person, as separate individuals in independent positions and not as incidents to a conference with the doctor in charge, receive medical confidence. All of these cases are to the effect that such confidence is not within the privilege.

An analysis of the facts in the cases coming within this group and the rules therein enunciated demonstrates the extreme jealousy on the part of practically every court which has been asked to construe a statute similar to our own, to guard the privilege and to save it from being frittered and nibbled away because of factual situations which do not come within the letter of the statute, but are plainly embraced within its intent and spirit.

Further on the Court stated:

The only California case to which our attention has been called which is at all related on the facts is the case of *Horowitz* vs. *Sacks*, 89 Cal. App. 336 (265 Pac. 281). In that case the Court says at page 344: ". . . All of the information the witness obtained from his patient was obtained in the presence and hearing of third parties, the husband, mother, and brother of the patient. Such communications of the patient were not confidential and therefore were not privileged." It will be discerned, however, that the Sacks case is easily distinguished in at least one vital element, even if there were no other elements in that case which do distinguish it. In the instant case the communications were made in the presence of a necessary third party who was acting as the agent of the doctor, under his direction and supervision and under such circumstances that the patient had every right to conclude that the presence of such third party was necessary. In the Sacks case the information was given in the presence of nonprofessional and unnecessary third persons, in so far as the attendance of the doctor was concerned. It is apparent that although called a stenographer, the third party in the instant case was in reality and did perform all the duties of an office nurse. This distinction calls for the application of a principle different from that applicable when a third party has, strictly speaking, no business being present. (See cases *supra.*) The statement in the Sacks case must, however, be construed in relation to the facts to which it was applied. As a general statement purporting to be the law in all cases, it cannot be accepted, and the cases cited to support the general statement made in the Sacks case do not so hold. It is quite clear that the Court in the Sacks case did not so intend it, when the statement is read in the light of the authorities cited to support it, and the facts to which it was applied. The cases referred to in the Sacks case and others called to our attention by appellant with practical unanimity are decided on the doctrine that the communications made and testified to were not in fact confidential, and were not intended to be so by the person making them, and this conclusion is reached by the Court in those cases not merely because the nonprofessional unnecessary third party was present, but on additional facts such as the voluntary nature of the statements, their irrelevancy to the confidential relationship, the fact as to whether the relationship existed at all, and other important circumstances.

In *Southwest Metals Co.* vs. *Gomez, supra,* the Federal Circuit Court of Appeals of this district had before it a parallel situation—the construction of an Arizona statute similar to our own. It was there held that the nurse could testify, but that the doctor could not. We are satisfied that the presence of the stenographer did not operate to waive the privilege, in so far as the doctor was concerned, and that the motion to strike was correctly granted. Since the stenographer was not called and did not testify, we are not called upon to determine whether she could testify.

The opinion above referred to clearly shows that the law is still unsettled in California in regard to whether or not a patient can rely upon protection being afforded to his or her statements when a third party is present. If the presence of a third party or parties is unnecessary, that party is not bound by the rules governing confidential communications. Should the third party be a professional agent, such as a nurse, such agent would probably be bound as is the doctor, but the point is still unsettled.

3. *Lowest Infant Mortality Rate Recorded for California.*
4. *Activities of American Foundations.*

PROPOSED NATIONAL HEALTH PROGRAM*

The assumptions upon which the structure of the proposed national health program is based are essentially fallacious.

1. It is assumed that the health of the people of the United States is neglected and of low order. The record is consistent to the contrary effect. The national health was better in 1938 than in any past year and has been improving steadily for the past ten years. No other 130,000,000 people in man's history have enjoyed so favorable an experience of life as the people of the United States do today.

2. It is assumed that 40,000,000 people in the United States are unable, and in fact do not get the medical care they need. The evidence of physicians, medical institutions and widespread human experience convinces us that those who need medical care and want it are receiving it, except where poverty and sparsity of population groups have failed to attract physicians to settle among them.

3. It is assumed that large expenditures of federal money will make great improvements in health and care of the sick at the same time that economic and social inequalities of serious degree remain uncorrected.

Experience suggests that in the United States expenditures for health and care of the sick have been increasing at as rapid a rate as the several states, cities, and counties can afford, and as fast as trained personnel can be had to carry out the technological procedures.

Whatever money is granted from Washington to states has been taken first out of the states and to that degree has deprived states and local health jurisdictions of resources which they know better how to spend than do officers of federal departments.

4. It is assumed that there is a spontaneous, informed, widespread demand by the laity, particularly the unemployed, unemployable, relief, and subsistence level wage-earners for an amount and quality of medical care and health protection not now available to them.

---

* Summary of a statement by Haven Emerson, M. D., given at a dinner meeting, March 15, 1939, New York City.

The record would point to ingenious, persistent, organized propaganda, and costly federal publicity and promotion, to create a sense of dissatisfaction with the present medical services on the part of the indigent and low-income groups, who have, almost without exception, shown grateful appreciation for and confidence in the care provided now through existing voluntary and tax-supported institutions and agencies for the sick, and by the individual physician.

5. It is assumed that the health officers and organizations of states and subordinate jurisdictions of civil government, authorized, appointed, trained and qualified for expert services for health protection. can by virtue of federal grants, and under federal regulations and restrictive standards, deal expertly with the elaborate services required for the sick in hospitals, dispensaries, and individual homes, in spite of the lack of clinical qualifications or familiarity with diagnosis and treatment of disease possessed by these same state and local health officers.

Familiarity with this professional group convinces me that the health services of cities, counties, and states will deteriorate if the major responsibility and expenditures of health departments are for care of general sickness.

6. It is assumed that the education of physicians, sanitarians, nurses and other associated professional personnel can be extended and hastened better by federal subsidy of individuals and favored institutions than by the independent development of professional educational institutions under their present auspices and with their present resources.

There is no experience, accomplishment or leadership in the field of professional education among the officers or employees of the Federal Government of a quality equal to what is to be found in the nonpolitical state and endowed institutions in the United States today.

Every draft of tax funds from the states to be distributed according to some federal formula or departmental criterion starves and hampers the states which have means to carry their own loads and share with their neighbors, and replaces self-dependence and local initiative and resourcefulness in the backward and impoverished states by encouraging their dependence upon federal doles for purely local and state functions for care of the sick and for public health.

The device of federally abetted state compulsion of sickness insurance schemes upon certain classes of the population, who are especially dependent because of low earning power and lack of facilities for effective voluntary association to carry the cost of sickness, represents a mere duplication of the unsatisfactory systems of medical services developed in the era of social deception and central governmental dominance by Bismarck and Lloyd George, neither of which has brought adequacy, superiority or professional or lay satisfaction to Germany or Great Britain.

7. The United States is now at the head of modern nations in the performance of medical function for social ends. The structure created by local and state government and society is effective, delicately adjusted, well understood by the communities concerned and improving as fast as human resources and funds permit. . . .

The undertakings provided for in the Wagner Bill will set back rather than advance public health, will destroy the strongest motives of self-reliance and local responsibility by dependence upon remote federal officers unfamiliar with the respective needs, ambitions, and capacities of the widely varied state populations and governments. . . .

Nothing but a threatened calamity of catastrophic proportions could justify such a revolution of control over functions reserved by the Constitution to the police powers of the states.

Calamity of an enduring kind to the applications of the medical sciences for social ends is likely to follow any general acceptance of the policies and programs provided for in the Wagner Bill.

REPORT ON 1938 MORBIDITY AND MORTALITY*

Measles.—The measles epidemic of 1938 in the United States was the greatest in recent times, according to complete reports just received from state departments of health, the number of cases being more than two and a half times that of 1937 and twice the median for the preceding five years. The number of deaths from measles was thrice the figure for 1936 and 1937.

The epidemic was unusually widespread, with only the New England and Pacific Coast areas fairly free. Thirty-one states reported increased death rates from this cause.

Smallpox.—Only this disease and smallpox were more than usually prevalent during 1938, according to a statement from the United States Public Health Service (*Public Health Reports,* May 5, 1939). The latter disease showed twice the number of cases of the preceding five-year median.

"With the possible exception of Mexico," said the statistical analysis, "the United States has one of the highest case rates of smallpox reported in North America and Europe. The incidence of the disease is unknown in most parts of South America, Africa and Asia in view of the success of other nations in practically stamping it out. The situation prevailing in this country reveals a curious indifference to the existence of a disease which can be readily controlled by well-known methods.

"The disease is relatively rare in all parts of the country except the Great Plains and Pacific Northwestern States. Starting there in 1938, the outbreak spread slowly until many states outside this area reported a higher case rate than usual. The incidence began to decrease during the last half of 1938, but it is still well above the average."

Diphtheria.—Below the five-year median are the number of cases of diphtheria, influenza, meningococcus meningitis, poliomyelitis, scarlet fever, and paratyphoid fever. Diphtheria, while slightly higher than in 1937, was still about one-fifth less prevalent than the preceding five-year median.

Mortality Rates.—The mortality rates reported are based on preliminary data covering about 90 per cent of the country's estimated population. They indicate that the general death rate will be the lowest on record, resulting in large part from the unusually low death rates for the principal respiratory diseases, influenza, and pneumonia.

The rates reported for these diseases during 1938 were the lowest on record: typhoid and paratyphoid; scarlet fever; diphtheria; poliomyelitis; tuberculosis; malaria; pellagra; diseases of the digestive system; pregnancy and childbirth; nephritis; and epidemic cerebrospinal meningitis. In addition, mortality rates from influenza, pneumonia, and accidental causes were the lowest in recent years.

For the ninth consecutive year a decline in the maternal mortality rate was noted.

For the first time since mortality statistics have been available for any appreciable number of states, the death rate from tuberculosis is now shown to be less than fifty per 100,000 population.

"Judging from the decline in the mortality rate," said the Reports, "the widespread safety campaign aimed especially at preventing fatal automobile accidents has achieved appreciable success. The mortality rates were decreased 20 per cent during 1938, and the rate 23.9 per 100,000 population was the lowest since 1932. The death rate from all accidents decreased 12 per cent as compared with the rate for 1937."

Two important diseases of childhood, also, diphtheria and scarlet fever, continued to decline in importance. The infant mortality rate continued to decline, reaching a new low of forty-eight deaths per one thousand live births.

---

* From the United States Public Health Service.

Twenty states reported a higher death rate from whooping cough and cerebral hemorrhage than in 1937; twenty-four states, a higher death rate from diabetes.

Cancer and heart disease were the only major causes of death for which a higher rate was recorded in 1938. As this increase has been reported annually for several years, it is probably one which results, in part at least, from a general aging of the population.

LOWEST INFANT MORTALITY RATE RECORDED FOR CALIFORNIA

There were 4,450 infant deaths registered in California in 1938 as compared with 5,066 such deaths in 1937. The rate dropped from 53.7 in 1937 to 43.8 in 1938. Since 1920, California's infant mortality rate has been almost cut in half, and in some communities of the state infant mortality rates have been achieved that compare favorably with those of any communities anywhere in the world. If it were not for the large numbers of Mexican infant deaths, California's record in saving the lives of babies would be particularly outstanding. As a matter of fact, the infant mortality rate for the white race in California last year was but a little more than thirty-six per thousand live births. The reduction in the death rate for Mexican babies was conspicuous last year, however, as in 1937 there were 1,479 such deaths registered as compared with 1,131 in 1938, the rate falling from 121.5 to 87.6. Deaths in white babies dropped from 3,276 in 1937 to 3,056 in 1938, the rate falling from 42.2 to 36.4.

Among the counties with infant mortality rates lower than that for the state as a whole are the following: Alameda. Butte, Colusa, Contra Costa, Eldorado, Glenn, Humboldt, Inyo, Lake, Los Angeles, Marin, Napa, San Bernardino, San Francisco, San Mateo, Santa Cruz, Sierra, Siskiyou, Solano, Sonoma, Stanislaus, Tehama, and Yolo. Among the cities having infant mortality rates lower than that for the state as a whole are Alameda, Berkeley, Richmond, Martinez, Bakersfield, Los Angeles, Long Beach, Pasadena, Pomona, Santa Monica, Glendale, Redondo Beach, Whittier, San Rafael, Merced, Pacific Grove, Santa Ana, San Diego, San Francisco, Stockton, San Mateo, Santa Barbara, San Jose, Palo Alto, Santa Cruz, Watsonville, Vallejo, Petaluma, Santa Rosa, Modesto, Visalia, and Porterville.

Among the cities having the lowest infant mortality rates in 1938 are Berkeley, 17.2; Hayward, 16.7; Pasadena, 19.1; Pomona, 19.9; and San Mateo, 18.1. Infant mortality for the larger cities of the state in 1938 and 1937 are as follows:

	1938	*1937*
Oakland	45.6	45.1
Berkeley	17.2	19.4
Fresno	45.4	46.9
Bakersfield	38.0	69.0
Los Angeles	43.3	52.3
Long Beach	26.2	28.7
Pasadena	19.1	34.5
Glendale	20.8	29.5
Sacramento	44.6	47.1
San Diego	40.1	34.4
San Francisco	29.6	32.2
Stockton	42.9	40.2
Santa Barbara	43.6	59.6
San Jose	29.8	24.8

In consideration of the fact that, for biological reasons, a certain proportion of infant deaths cannot be prevented, it would seem that California's infant mortality rate is fast approaching a point of stabilization. Activities in local communities directed toward the health protection of mothers and children have increased greatly during the past year because of the provision of Social Security funds. Infant mortality, to a large extent, however, is affected by conditions that are not under human control, and the annual general trend of the rate is similar throughout most of the country. There is every indication, however, that present activities directed toward the saving of infant lives are productive of results. The infant mortality rate must be regarded as a sensitive index of the health, social and economic conditions that prevail among the communities of the state.

ACTIVITIES OF AMERICAN FOUNDATIONS

Medicine and public health outrank education among the objects toward which American foundations now grant an annual total of $38,500,000, according to a survey of foundation-giving just completed by Raymond Rich Associates, consultants to foundations, learned societies and other nonprofit institutions. The survey, embracing reports from the 243 leading foundations, is an extensive revision of an investigation formerly published periodically by the Twentieth Century Fund.

In suggesting that the Rich Associates undertake this task, the Twentieth Century Fund placed at their disposal all records and materials used in previous reports, and assisted in preparation of the current issue, which considerably enlarges the scope of previous studies. The Associates, however, bear all responsibility for the new report.

The survey indicates that for medical research, medical education, the erection and support of hospitals, and other purposes related to medicine and public health, foundations granted individuals and institutions more than one-third of their total disbursements, or $13,495,898 during 1937 (the latest year for which complete figures are available).

Education, for many years the foremost concern of foundations, dropped to second place and received but one-fourth, or $9,170,318, of the total gifts. The other leading fields in which foundations subsidize projects are, in the order of their importance from the standpoint of grants: social welfare, $4,695,880; physical and biological sciences, $2,253,298; government and public administration, $1,710,598; economics, $1,353,386.

In bringing together these and other figures covering foundation activities and structures, the Rich organization restricted its report to foundations that paid out at least $1,500 during 1937 for projects not directly controlled by foundation staff members. The Twentieth Century Fund's former surveys provide comparable figures for 1934 and 1931.

Several large foundations gave the bulk of foundation subsidies for medical and public health projects. The General Education Board, a Rockefeller fund, allotted $5,120,446 to this field in 1937, The Rockefeller Foundation $4,222,472, and The Commonwealth Fund $1,367,644. During the past five years, the report states, The Commonwealth Fund—a Harkness benefaction—has devoted an increasingly larger share of its annual payments of $1,750,000 to $2,000,000, to medical research.

Gifts of the Carnegie Corporation of New York for medicine and public health amounted to $525,250 in 1937. The John and Mary R. Markle Foundation since 1935 has limited its new activities to research in the medical sciences and spent $224,550 on such projects in 1937. Public health and medicine are also the chief interests of the Milbank Memorial Fund and the Josiah Macy, Jr., Foundation, to the extent of $165,328 and $183,314 a year, respectively.

An intensified interest in medicine and public health is further evidenced by the establishment of new foundations created specifically to lend assistance in this field. The Rich report lists the following large medical foundations set up in the last five years: The Jane Coffin Childs Memorial Fund for Medical Research, which subsidizes cancer investigations, established in 1937; Dazian Foundation for Medical Research, 1938; The Samuel S. Fels Fund, 1936, interested primarily in discovering ways to maintain health; Finney-Howell Research Foundation, Inc., 1937, established to promote the study of cancer; The National Foundation for Infantile Paralysis, 1938; The Nemours Foundation, 1936, whose current project is the erection of a hospital for crippled children in Delaware; and Zachary Smith Reynolds Foundation, Inc., 1936, which is financing a campaign to control venereal diseases in North Carolina. In addition, the control and elimination of disease is one of the purposes for which the Rosenberg Foundation was set up in 1937 in California, and it gave a large share of its $56,500 disbursements during its first year of operation for medical research.

Projects in the educational field received about one-fourth—$9,170,318—of the grants paid in 1937, while social welfare accounted for approximately one-eighth—$4,695,880—of the total. In the education field, the General Education Board once again led with grants of $3,794,192 in 1937, and the Carnegie Corporation of New York contributed $1,850,285. The third largest source for foundation funds in support of educational projects was the Horace H. Rackham and Mary A. Rackham Fund, which granted $1,101,000 in 1937.

The three largest donors to social welfare projects in the year under survey were: The Carnegie Foundation for the Advancement of Teaching, $1,922,835; the Rackham Fund, $496,850; and the New York Foundation, $407,841. Grants in the field of social welfare, including direct relief to individuals, have been decreasing since 1931.

The physical and biological sciences received the fourth largest share of the grants, a total of $2,253,298. The leading donors of these funds were: The Rockefeller Foundation, with gifts of $1,094,052 in 1937; General Education Board, $791,638; and the Carnegie Institution of Washington, $76,564.

Grants for projects in the field of government and public administration totaled $1,710,598 in 1937 and were given chiefly by two Rockefeller foundations. The Spelman Fund of New York contributed $1,076,420, and The Rockefeller Foundation distributed $588,450.

An increasing proportion of foundation income is being allotted to individuals and organizations working on economic problems. Such grants, however, still rank sixth in the list of totals, aggregating $1,353,386. The Rockefeller Foundation gave $1,136,475 of this, chiefly for research in social security problems. Two other large foundations are now concentrating their funds upon economic projects; these are The Maurice and Laura Falk Foundation of Pittsburgh, formed in 1929, and Alfred P. Sloan Foundation, Inc., of New York, organized in 1936.

The social sciences other than economics did not share the increased interest in economic problems, the Rich organization discovered. Sixty foundations, whose grants for 1937, 1934, and 1931 may be compared, expended $882,920 on social science in 1937, 71 per cent less than 1934 and 84 per cent under 1931.

Thirty-nine of the 243 foundations each made total grants of $100,000 and more in 1937. Of these, the General Education Board led the list with disbursements of $9,716,277, a figure due in part to the policy of liquidation adopted by the organization's directors. The Rockefeller Foundation ranked second with $8,996,016, and the Carnegie Corporation of New York third with $3,695,534.

Thirty-one of the foundations making the largest grants had also reported their grants in 1934 and 1931. Of these, twenty-two made more sizeable disbursements in 1937 than in 1934. The Wieboldt Foundation increased its payments by 265 per cent, rising from $30,300 to $110,650. Grants of the Lucius N. Littauer Foundation increased 225 per cent, from $32,557 to $105,901. The Horace H. Rackham and Mary A. Rackham Fund, established in 1934, made disbursements of $2,164,950 in 1937, four times as much as its payments of $527,110 in 1934.

Other large increases in total gifts were those of the W. K. Kellogg Foundation, whose 1937 grants of $572,685 were 127 per cent greater than its 1934 total, and the Josiah Macy, Jr., Foundation whose increase was 95 per cent to $211,239 in 1937. The grants paid by the General Education Board, the Chicago Community Trust, and the John Simon Guggenheim Memorial Foundation, all were more than 74 per cent greater in 1937 than in 1934.

TWENTY-FIVE YEARS AGO[†]

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XII, No. 6, June, 1914

From Some Editorial Notes:

Proceedings of the Council.—During the time of the annual meeting at Santa Barbara, the Council held four meetings, the 72nd, 73rd, 74th, and 75th. . . .

Modoc and Lassen-Plumas County Medical Societies, which had been organized in March, were officially accepted in affiliation with the State Society. . . .

* * *

County Societies: Important.—A number of matters directly affecting county societies and membership in them and in the State Society, the privileges of medical defense, etc., were acted upon by the House of Delegates and referred to the county units for action. Each county unit should take these up as soon as possible and act upon them. The only legislation by the House of Delegates which was not unanimous was the endorsement of the proposed agreement in regard to the work under the industrial accident law; there were about ten opposing votes on this measure, but it was adopted and referred to the county units for their ratification. Four county societies have already, at the time of writing, met and rescinded resolutions previously passed, and have endorsed the action of the House of Delegates. All county units should act upon these various matters (they will be found in the Minutes of the House of Delegates, published in this issue of the Journal) as soon as possible, that there may be no delay in knowing just where we stand on all of these points. More than ever is it clear that the House of Delegates' plan is a good one; a body of from 90 to 100 men, representing the whole state, can transact the business of the Society more satisfactorily than could the whole mass of the Society. A surprisingly large amount of work was done in a short time and without hitch or friction of any sort.

* * *

Surgeon-General's Library.—At the Santa Barbara meeting a protest was read, calling attention to an amendment to the Army appropriation bill, which amendment would take the library of the Surgeon-General away from its present quarters and combine it with the Congressional Library and would have almost put a stop to the wonderfully good work that is being done by the machinery provided in the Surgeon-General's Library. The Secretary was instructed to take up this matter by telegram with our representatives in Washington, and it is with pleasure that the information contained in the following telegram is now placed before our readers:

"Washington, D. C., May 5, 1914.

"Army bill now law. Senate amendment defeated. Medical library continues its former status.

"(Signed) Julius Kahn."

* * *

Scientific Work.—It is gratifying to note the steady improvement in the quality of the papers presented at the annual meetings of the Society. At the Santa Barbara meeting of this year, the general average of the papers was very high and the range of subjects presented made an exceedingly attractive and interesting program. The tuberculosis society is to be congratulated upon the activity

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA[†]

By Charles B. Pinkham, M. D.
Secretary-Treasurer

News

"Preliminary hearing into the case involving Dr. John M. Robinson, 37-year-old physician-socialite, charged with criminal abortion, will be heard today (Thursday) in Division 4 of the Municipal Court. Doctor Robinson was arrested last week in connection with the death of Mrs. Gladys Smith, 19-year-old former acrobatic dancer. Mrs. Smith died on April 19 at the General Hospital, allegedly from an illegal operation performed on her by Doctor Robinson." (Los Angeles *Eagle,* May 4, 1939.)

"Dr. Charles H. Wilson, chiropractor of 217 North Vermont Avenue, accused of causing the death of Mrs. Ursula Warner, 33-year-old Hermosa Beach housewife, by an illegal operation, was up before Municipal Judge C. A. Ballreich today on charges of murder and performing an illegal operation. The woman's husband, William F. Warner, testified that he took his wife to Doctor Wilson's office on April 21 and that she was closeted with the doctor for nearly an hour. When they returned home, he said, she became violently ill and was later removed to the Torrance Hospital. She died there three days later, he testified, despite the effort of five doctors called into consultation. . . ." (Los Angeles *Herald and Express,* May 9, 1939.

"Convicted late last night of a charge of performing an unlawful operation, Dr. O. A. Welsh, 50-year-old Ventura surgeon, today is at liberty under $2,500 bond, pending pronouncement of sentence on Tuesday. The jury returned its verdict at approximately 11:25 p. m., finding the doctor guilty of the operation charge, but acquitting him of a morals count. Doctor Welsh was indicted by the Ventura County Grand Jury on January 23. . . . The case closed with a flourish yesterday morning when the District Attorney called to the stand two young Santa Barbara mothers, both of whom testified their husbands had paid Doctor Welsh $50 to perform operations to prevent them from having additional children. . . . Doctor Welsh, former World War army surgeon, has practiced in Ventura for the past nine years." (Ventura *Star-Free Press,* May 5, 1939.)

"The Municipal Retirement Board yesterday rejected a plan for drugless practitioners to participate in the city workers health service system. Members of the profession had objected to details of the plan and its adoption by directors of the health service system and taken their case to court. . . ." (San Francisco *Examiner,* May 10, 1939.)

"Doctor Frederick Waitzfield (Waitzfelder) physician and surgeon, 3950 West Sixth Street, yesterday was granted one year probation on two counts of violation of the state narcotics act by Municipal Judge Harold B. Landreth, who suspended a sentence of 180 days on each count. Judge Landreth made a provision of the probation that the physician refrain from administering or prescribing narcotics during his probation. The court pointed out Doctor Waitzfield (Waitzfelder) had technically violated the act

Depend upon Baxter's tested laboratory purity

Baxter's Intravenous Dextrose and Saline Solutions in Vacoliters are tested and retested for purity and sterility.

Then they are packed in *Vacoliters* .. in high vacuum to guard their sterility .. and closed with a tamper-proof metal seal that shuts out contamination.

Months of storage, of waiting to be used, cannot change the tested laboratory purity of Baxter's.

To you that is important. It means your hospital can keep enough Baxter's always on hand to meet unexpected needs, even emergencies. It means that you will never have to delay while fresh solutions are prepared in the pharmacy. It means that you need not worry over the purity or the sterility of the dextrose and saline solutions used in your hospital.

Baxter's are pure and safe; they are in convenient Vacoliters. The Vacoliter prevents any change; keeps the solutions sterile always.

Refugee Physician Immigration Figures Since 1930 Compiled.—Government figures on the refugee physician problem in the United States are given by *The Journal of the American Medical Association* for February 25. The report says:

"According to material obtained through Government agencies, alien immigrants describing themselves as physicians have entered the United States during each fiscal year since June 30, 1930, as shown in Table 1.

Table 1.—*Annual Immigration of Alien Physicians*

Fiscal Year Ended June 30	From All Countries	From Germany-Austria	Physicians Listed as Jewish
1931	329	16	38
1932	259	23	34
1933	187	8	41
1934	353	166	163
1935	304	104	137
1936	462	253	273
1937	533	286	310
1938	738	365	475

During the four months July, August, September and October, 1938, 482 alien immigrants who described themselves as physicians entered the United States. Of these 390 were Jewish physicians.

"Neither the foregoing figures nor those that follow include alien physicians who entered the United States as tourists and whose stay is accordingly limited. No evidence has been found to show that any order has been issued undertaking to extend the time during which such alien tourist physicians may remain in this country. No evidence has been found to show that alien physicians find their way into the United States for permanent residence by entering through countries other than those in which they respectively are nationals; as, for instance, German physicians entering the United States by way of, say, some country in South America.

"As between the fiscal year ended June 30, 1937, and the fiscal year ended June 30, 1938, the outstanding changes in the numbers of immigrant physicians entering the United States are shown in Table 2.

Table 2.—*Increase in Immigration Within Two Years*

From	Fiscal Year Ended June 30, 1937	Fiscal Year Ended June 30, 1938
Germany-Austria	286	365
Italy	14	26
Switzerland	11	25
Canada	79	107

Table 3.—*Racial Stocks Represented*

	Fiscal Year Ended June 30, 1937	Fiscal Year Ended June 30, 1938	Four Months July-October 1938
English	31	36	11
German	98	86	43
Jewish	310	475	390
Irish	11	18	1
Magyar	7	12	6
Scotch	10	26	10

"Immigrant physicians from Asia increased from thirteen in 1937 to thirty-three in 1938, the number arriving in the latter year coming from China, ten; India, one; Palestine, twenty; and Syria, two. It does not necessarily follow, however, that physicians arriving from those countries were not Caucasians."

(Continued from Page 34)

After reëmphasizing such limiting factors of the problem as immigration quota restrictions, *The Journal*, editorially, says:

"Unfortunately, there are publications, political groups, and subsidized agencies in this country which are endeavoring to make prestige and favor for themselves by stirring the motives of selfishness, prejudice, and hatred among American doctors. In *The Journal*, February 11, six distinguished leaders of America medicine urged the medical profession to coöperate with the special committees that have been set up in New York and Boston for helping in this situation. The committees specifically concerned with the problem of the refugee who is a physician are:

"Emergency Committee in Aid of Displaced Foreign Physicians, 59 East Fifty-Seventh Street, New York, Dr. Emanuel Libman, chairman, Dr. Laurence Farmer, executive secretary. This nonsectarian committee deals with a select and small number of prominent scientists, for whom positions are found in the field of medicine for research and study.

"National Coördinating Committee for Aid to Refugees and Emigrants Coming from Germany, 165 West Forty-Sixth Street, New York, Joseph P. Chamberlain, chairman, Miss Cecilia Razovsky, executive director. This committee coördinates the activities of the major organizations working in this field.

"Boston Committee on Medical Emigrés, 114 Riverway, Boston, Dr. David L. Edsall, chairman (The Problem of the Refugee Physician, *The Journal*, February 11, p. 570).

"Various suggestions have come to the American Medical Association urging the establishment of a special committee to handle this problem. Thus far the only action taken by the House of Delegates has been a recommendation to the state boards of medical registration that citizenship be requirement for license to practice. As every physician knows, the right to regulate the practice of medicine rests with the individual states. As the letter recently published points out in the field of general practice and in the specialties also numerous openings exist for which it is difficult to find qualified American physicians; for example, poorly paid full-time positions and practices in rural communities.' If any of the committees concerned can undertake to make a survey to locate such openings, a certain number of the refugees can be absorbed with a minimum amount of disturbance of the rights of American physicians.

"The chief difficulties that have arisen in this situation arise from the fact that some of the refugees are poorly trained or of low ethical standing, that some find it difficult to adapt themselves to American ways in the practice of medicine, and that many tend to settle in large cities already overcrowded with physicians. Certainly, a physician who is poorly trained or of low ethical standing should not be permitted to practice anywhere. Perhaps the difficulties of adaptation can be overcome by well-planned instruction. Only the coördinating committees already mentioned, or groups of a similar character, can aid in solving properly the problem of suitable distribution of the refugees to places where they may be useful rather than a foreign body setting up irritation and forcing extrusion."

Only 6 Per Cent.—Of 8,654 veterans of the World War hospitalized for tuberculosis in six months, 71 per cent were far advanced, 23 per cent moderately advanced and only 6 per cent were minimal.—Matson, R. C., U. S. Vet. Ad. Phys. Conf., 1938.

Man has subjected animals to his use; but he has also subjected himself to many of their diseases.—*Hygeia.*

A MESSAGE TO HOME CANNERS FROM THE CANNING INDUSTRY

● Every year, in various regions of the country, a considerable amount of the produce from thousands of small orchards and gardens is preserved for future use by canning in the home. Despite much that has been written on the subject (1), outbreaks of botulism from improperly heat processed home-canned foods continue to be reported.

To eliminate the possibility of botulism from their products—specifically those foods of the "non-acid" type—home canners should take a page from the experience of commercial canners. Through considerable research, the American canning industry has scientifically established the necessary processing requirements for products of this character. For non-acid foods, modern canners employ only recommended process time and temperature schedules(2) known to be adequate to destroy the heat-resistant spores of clostridium botulinum whose growth produces the toxin which causes the deadly type of food intoxication known as botulism.

Brief comment on the heat-processing requirements of common foods might be in order. In general, foods or food products may be classed into two groups according to their acidity, i.e., the "acid" and "non-acid" classes with pH values below and above 4.5, respectively. The acid foods include tomatoes and the common fruits. These foods are not favorable to the growth of clostridium botulinum and consequently they may be safely processed at 212°F., or the temperature of boiling water.

The non-acid products, however, present a special processing problem. Such products—meat, fish, fowl, milk and most common vegetables—can be adequately processed only at temperatures above 212°F. As the records indicate (1) botulism in home canned foods may result from processing non-acid foods in boiling water. Safe canning of these foods in the home, therefore, requires the use of properly operated "pressure cookers"—identical in principle with the "retorts" used by commercial canners—which will permit the use of a process under steam pressure. Usually 10 lbs. steam pressure is used in these cookers which corresponds to a processing temperature of 240°F.

Home canners desiring to pack non-acid products should obtain a copy of United States Department of Agriculture Farmers Bulletin No. 1762. In this bulletin are described the necessary equipment, precautions, and time and temperature processing schedules required for the safe canning of non-acid foods in the home. If the necessary equipment cannot be obtained and the recommendations contained in the above bulletin cannot be faithfully followed, some means of preservation of non-acid products other than canning should be sought.

In the interests of public health, it is our sincere hope that home canners may soon become educated to the necessity of steam pressure processes for non-acid foods. Experience dictates that only by processes of this type, with a time and temperature schedule suitable for each particular product, can botulism from non-acid home canned foods be effectively controlled and ultimately eradicated.

T-157

Blindness.—There are at least 117,000 totally blind persons in the United States, according to estimates of the National Health Survey by the United States Public Health Service.

In presenting this figure, George St. John Perrott, director of the Survey, stated that blindness, which already constitutes a major problem in society, will be likely to increase because older persons, among whom blindness is more prevalent, are constituting a larger and larger proportion of the population. One-fourth of the blind are over 75 years of age and three-fifths are over 55.

Cataract, glaucome, trachoma, optic nerve atrophy and other eye diseases coupled with more general diseases such as high blood pressure, hardening of the arteries and diabetes are responsible for nearly three-fourths of all blindness. The rest is attributed to accidents (about 21 per cent) and congenital or early infancy causes (approximately 7 per cent).

Among the accidents causing blindness—which account for about one-fifth of the entire amount—the largest single cause is falls (16 per cent); next in order come automobile accidents and burns (each 10 per cent); and poisonings and firearms (each 7 per cent); the remaining 50 per cent is distributed over a large number of known and unknown types of accidents. Forty-three per cent of these accidents are classified as occupational injuries, those occurring at work; 27 per cent occurred in the home and 30 per cent in public places, including automobile accidents.

The report pointed out that blind persons are concentrated in the low income groups. Seventy per cent were found to be in families with annual incomes of less than $1,000.

The prevalence of blindness among men is greater than among women, according to Survey findings. For every 100 blind women there are 111 men afflicted with blindness. Among youths (15-24 years), the prevalence rate for males is 20 per 100,000, while the female rate is only 9 per 100,000. Figures for the younger working ages (25-44) show a prevalence of 144 blind per 100,000 men, while the rate for women is only 28. In the oldest age grouping (65 and over), however, the rate is 706 per 100,000 women to 660 per 100,000 men.

The Survey found nearly twice as much blindness among colored people as among whites in proportion to their numbers. The rate of blindness for colored persons is 146 per 100,000 as contrasted with 75 for the white population.

Only 11 per cent of the blind were reported as being employed in gainful occupations, leaving the greater number dependent upon private or public support.

This study of the National Health Survey was primarily concerned with total blindness, which included "all persons reported by the family as being blind in both eyes." In connection with the study, however, figures for blindness in only one eye were compiled and it was estimated that "in the general population there were about 425,000 persons blind in one eye only," as against 117,000 persons blind in both eyes.

Three Hundred X-Ray Examinations per Hour.—A new method of x-raying the chests of large groups cheaply and quickly has been developed in Germany. It consists of photographing the fluoroscopic image on motion picture film. When developed, the strip of film is projected on a screen for interpretation. By this method two physicians, assisted by a crew of ten men, examined at the rate of three hundred per hour, more than 10,000 men during a Nazi party celebration at Nüremberg. The device is not a substitute for the standard x-ray technique but is a means of "screening" and it promises the possibility of examining the whole nation.—Holfelder, H., and Berner, F., Muenchen, Med. Wchnschr., 1938, 47.

For Acidity and Allied Conditions, we suggest ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

A Natural Mineral Water
SHOWING MAIN CONSTITUENTS
By Prof. Sydney A. Tibbetts, *Berkeley*

MANGANESE	1.3 parts per million
IRON	12.5 parts per million
CALCIUM	173.3 parts per million

Steam heated hotel, open all year around.

3000 feet up in the Lake County Pines.

(Since 1870)

Lederle at the New York World's Fair.—In the Medicine and Public Health Building, New York World's Fair, Lederle Laboratories are sponsoring the scientific exhibits on Allergy and on Pneumonia, each exhibit being controlled by a committee of eminent specialists on these diseases. All exhibits in the building are scientific in character, merely carrying on a small plaque the names of the sponsors.

The Pneumonia exhibit, surfaced entirely of white laminated "Beetle," occupies a booth 20 x 30 feet in a commanding position. It presents, pictorially, the best composite opinion of the medical profession on how a pneumonia case should be treated. The narrative is unfolded by means of a sequence of dioramas, pictures, and charts. The story begins with an "animation" of a man walking in the rain, and takes him through typing and serum therapy and all the various progressive stages of a typical case of pneumonia to a final picture at the serum farm where his little daughter is pictured, saying, "Thanks, old horse, you saved my Daddy's life!" A "postscript" deals with sulfapyridine.

The second exhibit, on Allergy, tells, in changing dramatic sequences, three two-minute dramas of Allergy: "Tommy Todd's Autumn 'Colds,'" "Mrs. Tucker's Wheezes," and "Baby Bing's Eczema."

By means of an animated question box and dioramas showing typical scenes in the doctor's office, a search for the offending allergic excitant in each of the three stories is conducted through information obtained by questions, scratch tests, and an examination of the patient's family tree. An interesting part of the allergy exhibit is an illuminated transparency chart showing in full color, forty-eight of the most common allergic excitants. A separate series

of little pictures invites the visitor to examine commonplace scenes for causes of allergy and then, by pressing buttons, to illuminate the concealed answers.

Both exhibits are addressed to intelligent laity, and are attracting close attention.

Physicians visiting the New York World's Fair are entitled to exclusive privileges in the Professional Club in the same building. Admission is obtained by simple identification as a doctor, without charge, and is only available to physicians and their guests. Provision is made here for consultation with exhibit sponsors on technical questions.

Flexibility Needed in Legislation on Syphilis Control. Extreme care must be exercised in the enactment of venereal disease control legislation, especially that involving syphilis, if much harm to future health regulation measures is to be avoided, John H. Stokes, M. D., and Norman R. Ingraham, Jr., M. D., Philadelphia, warn in *The Journal of the American Medical Association* for March 25.

The two authors, in their paper, "Syphilis and the Law," point out that much of the existing health legislation on syphilis is not based on sound legal or medical principles. They state that, fundamentally, health regulations involving questions of infectious stages of syphilis must be broad and flexible in their scope. They take a stand in opposition to any attempt by law to define infectiousness or noninfectiousness too rigidly, and recommend that special legislation for the control of venereal disease should not depend solely on laboratory tests but should provide for expert medical judgment to insure necessary latitude in interpretation.

"All law, and public health law in particular, should be an expression of educated public demand and should arise not from waves of fear, sentiment, hysteria or propagandist activity, but from the broad base of intelligent comprehension of the problem involved," the two physicians declare.

"In the case of syphilis there exists a sufficient body of expert knowledge as to what constitutes public health protection and a sufficient unanimity of opinion on treatment control to make the framing of sound legislation a practicality.

"It would seem, first of all, that laws regulating the control of syphilis should take account of the enormous variability in individual cases and the positive necessity for expert medical interpretation whenever a serious question arises.

"Laws governing syphilis will tend to be too specific and drawn in too great detail. So far as they preserve the right of the state to allow its public health officers to decide by individual local or official regulation in a flexible manner the processes of enforcement and judgment, subject to cooperative interpretation by the court, they are likely to be good.

"So far as the enactments tend to define in days and weeks and to specify in degrees of positiveness and negativeness of specific tests, they will tend to run into difficulties both in the infliction of injustice on individuals and in unenforceability in the light of expert testimony in the courts.

"The medical principles with respect to syphilis which all law enforcement must recognize are essentially these:

"First, no single test or single procedure uncontrolled or unchecked should be conclusively diagnostic of syphilis. Serologic syphilis and clinical syphilis from the standpoint of public health are by no means identically significant. There exists a serologic syphilis which has virtually no public health significance, and there exists a clinical syphilis without serologic confirmation which is of the highest

against the misery and inconvenience of

IVY POISONING

Two small injections (1 cc. each) of "Poison Ivy Extract *Lederle*" administered within a two-week interval have shown, in controlled clinical studies and experiences, that ivy dermatitis can be prevented in a large proportion of susceptible persons.

It must be emphasized, however, that the protection afforded by these prophylactic injections is effective only against ordinary, casual contacts, and is not effective against vigorous *handling* of the plant. The protection should suffice to immunize the individual for the entire season.

In the *treatment* of ivy poisoning, one or two injections of "Poison Ivy Extract *Lederle*" often give marked relief within a short time.

importance from the standpoint of the transmission of the disease.

"Law and regulatory practice in the control of syphilis which makes the result of the blood test the arbiter of decisions involving the civil rights and individual freedom of persons cannot stand critical review in the courts of a liberty-loving and intelligently guided people.

"The congenital syphilitic man or woman, particularly, who has reached adult life with an irreversibly positive blood reaction for syphilis can suffer all the penalties of the law with little or no justification. The patient with a primary lesion still in the seronegative stage or an infection reduced to temporary invisibility and serologic negativity by inadequate treatment can be a public danger of the first magnitude and yet remain entirely outside the control of a law so drafted.

"A second principle based on the characteristics of syphilis as a disease and one which when confronted in its full meaning is extremely embarrassing to venereal disease control officers is the definition of infectiousness and noninfectiousness. No absolute definition of noninfectiousness and no means of infallibly attaining it exists at the present day.

"There will always be in practice patients who have had sufficient treatment to exceed a reasonable standard of control of infectiousness, who are still periodically relapsing and periodically infectious.

"It is, therefore, one of the first duties in research on syphilis to attempt to define broad categories of infectiousness and noninfectiousness. Special legislation for the control of venereal disease should not be written to depend purely and simply on laboratory tests. The factor of expert medical judgment must be drawn into the phraseology in a way to provide for a necessary latitude in interpretation, yet without permitting escape of the individual through a loophole of professional ignorance or connivance.

"Until legal enactment becomes general throughout the country, evasion must inevitably be expected. Since it is extremely difficult to define the amount of treatment which cures syphilis, and impossible at this writing to define exactly what cure is, marriage legislation should limit itself to the use of the term 'noninfectiousness' if it proposes to withhold license to marry as long as a person can be regarded as capable of transmitting the disease.

"The ultimate question as to whether the state can on any serologic grounds at least, and perhaps even on any combination of clinical and serologic grounds, definitely and finally or even indefinitely withhold permission to marry must ultimately be decided by the courts. As syphilologists we must take a definite stand against the validity of purely serologic criteria in decisions of this sort. If the law is pushed to this extreme at any point, public health policy with reference to the control of infectious disease will have a critical review such as it has never sustained in all its past.

"In matters involving the job, current practice quite largely fails to discriminate between infectious or disabling syphilis and harmless syphilis. There is evidence of grapevine telegraphy, action without authority, disregard of medical knowledge and supervision, misapplication of medical treatment principles by laymen in supervisory capacities and use of results of blood tests as pretexts for personal and unfair discriminations."

Motility of Spermatozoa Does Not Always Indicate Fertility.—Motility of spermatozoa, contrary to prevalent belief, does not necessarily indicate fertility, Frances I. Seymour, M. D., New York, reports in *The Journal of the American Medical Association* for May 6.

In her report on the case of a problem of sterility of an Eastern college professor and his wife, Doctor Seymour points out that although the sperms of the professor were motile, artificial insemination tests with sixteen volunteer women and his wife proved them to be sterile.

Additional confirmation of the sterility was obtained by artificial insemination of the seventeen women with the sperm of another man, an eminent figure in his profession, whose fertility index was known. Pregnancy resulted in all of the women.

In the same issue, *The Journal* discusses the legal phases of artificial insemination. The editorial says:

"Whether a child begotten from artificial insemination is legitimate or illegitimate according to the law is an important question. If the child is illegitimate and if the

husband of its mother fails to adopt it legally, the child does not acquire rights to inherit from the husband. A child is legitimate if its parents are intermarried when it is begotten or born. Statutes generally legitimatize also the issue of illicit intercourse if the parents intermarry, even though the intermarriage occurs after birth. The fact that conception is effected not by adultery or fornication but by a method not involving sexual intercourse does not in principle seem to alter the concept of legitimacy. This concept seems to demand that the child be the actual offspring of the husband of the mother of the child.

"The presumption of law that a child born during wedlock is legitimate is not absolute and conclusive under all circumstances. Even at early common law the presumption was overcome by proof of the husband's sterility. Today the presumption as to legitimacy is more easily controverted than it was in earlier times. Now it is generally recognized by the courts that a child is illegitimate, though born or begotten during marriage, when it is impossible that its mother's husband could have been its father. Every species of legal evidence tending to this conclusion is admissible on the trial of the issue as to its legitimacy.

"Artificial insemination can be effected from only two sources: from the semen of the husband of the prospective mother and from the semen of some other male. If the semen of the husband is used, the child obviously is as legitimate as if it were the result of normal and usual intercourse between husband and wife. If the semen of some other male is utilized, the resulting child would seem to be illegitimate. The fact that the husband has freely consented to the artificial insemination does not have a bearing on the question of the child's legitimacy. If it did, by similar reasoning it might be urged that the fact that a husband had consented to the commission of adultery by his wife would legitimatize the issue resulting from the adulterous connection.

"Some advise that all question as to the legitimacy of a child produced from the semen of a male other than the husband of the mother be ignored, apparently relying on the secrecy attendant on artificial insemination and on the presumption of law that a child born during wedlock is legitimate. Such reliance, however, disregards the apparent intent of the husband to confer on the child the rights incident to legitimacy. Those rights, if illegitimacy or even doubt as to legitimacy is frankly recognized, can be assured by adoption proceedings, which ordinarily are comparatively simple.

"In many instances of artificial insemination, perhaps in a great majority, the facts may never be known to any one other than husband and wife and the physician involved. There is the possibility, however, that interested relatives may learn of the circumstances and may procure the evidence necessary to overcome the presumption of legitimacy and may thus deprive the child of a share of intestate property. It is the just due of the child that false pride or considerations of delicacy be put aside and that it be given, through adoption proceedings, the protection intended by the husband of the mother when he consents to the artificial insemination of his wife."

Deaths From Appendicitis Increased During Depression Years.—Delayed operation, attributed largely to economic factors and use of home remedies, including laxatives, was responsible for an increased death rate (9 to 23 per cent) in the acute suppurative (pus-discharging) type of appendicitis among 1,000 adult cases of all types between 1931 and 1936 in Cleveland, as compared with the same number during the previous five years, F. R. Kelly, M. D., and R. M. Watkins, M. D., Cleve-

land, report in *The Journal of the American Medical Association* for May 6.

The significance of the depression years in the increased mortality rate, they point out, is emphasized by the findings of other investigators who have reported a similar increase. Their report, as was the first one in 1931, is a review of consecutive cases. With the exception of the sharp increase in mortality, they found no great variations between the two series of reviews.

In a few cases of suppurative appendicitis the operation should be deferred. In the greater number, however, surgical measures should be taken at once.

"The increase in mortality," they say, "can be explained in three words: delay in operation. We have in mind three causes for this delay:

"(*a*) Changed economic conditions. The first thousand cases occurred from about 1925 to 1930, when the nation was in a prosperous state economically. The second series of 1,000 occurred from 1931 to 1936, when conditions were entirely different. The records show that in the early series the patients were ill for 3.8 days before operation and in the later series for 4.9 days. This means that during these depression years patients delayed operation 29 per cent longer than in better times. This surely increased the mortality rate.

"(*b*) Home treatment, especially with laxatives. This subject may be a corollary of the previous one, because the increase of the use of home measures probably is a mirror of the economic state. During the delay in reaching surgical aid the patient is using various medicines suggested by those about him, and among them, unfortunately,

(Continued on Next Page)

IT HAS STOOD THE TEST

THE one urge that transcends all others in the physician's mind when he prescribes a feeding formula for a baby is to obtain the best physical development of which the child is capable.

We are continually receiving very gratifying reports from physicians who prescribe Lactogen in their infant feeding cases. Furthermore, extensive tests of Lactogen feeding on large groups of infants under supervision of competent pediatricians have proved to their satisfaction that Lactogen is very successful as a routine infant food as well as for the supplemental feeding of the newborn.

If you have not as yet tried Lactogen, we urge you to do so.

No laity advertising. No feeding directions given except to physicians.

For free samples of Lactogen and literature, mail your professional blank to Lactogen Dept.

are laxatives. We have gleaned from the records the facts that in the 1925-1930 series, 42 per cent reported having done so. We feel that the increase of laxative taking has been partly responsible for the increase in mortality. Of the patients who died of what we term immediate causes, twenty-one, or 67 per cent, reported taking laxatives. Complicating factors in diagnosis were also found to cause delay in operation."

Doctors Kelly and Watkins pay credit to J. O. Bower, M. D., Philadelphia, for actively campaigning for education of the public regarding the dangers of laxatives in such cases. He found that of 306 patients who died of acute suppurative appendicitis, 147, nearly half, had taken laxatives. In another series he reported that 91.6 per cent of 214 patients who died of acute diffuse peritonitis following appendicitis had taken them.

The importance of early operations in cases of acute suppurative appendicitis is stressed by the authors in their report that 28 of their 190 patients in the second series were operated on less than twenty-four hours after rupture, with a death rate of only 3.5 per cent, whereas of 86 who were operated on forty-eight or more hours after rupture, 32 per cent died.

Education of the public to the importance of seeking early medical attention for abdominal pain will decrease this mortality rate, the authors say, pointing out that "if economic conditions improve, this delay on the patient's part will be lessened, but in the meantime persons should be told to pocket their pride and seek medical aid, regardless of their circumstances, if they have pain in the abdomen. For this educational measure the great publicity mediums of newspapers, magazines, radios, public speeches and placards can well be used, as they are being employed now in the campaigns against cancer and syphilis. Especial attention must be placed on the danger of taking purgatives in the presence of abdominal pain."

Describes New Wrist Fracture Splint.—A splint for Colles fracture (of the wrist) which permits normal use of the hand in such operations as writing and eating is recommended by Frederick H. Amendola, M. D., New York, in *The Journal of the American Medical Association* for May 6.

While union of the wrist bone requires uninterrupted fixation of the fragments, a better recovery will be obtained if the splint allows complete function of every muscle and joint which does not have to be kept motionless, Doctor Amendola declares.

Describing his procedure, the author says, "If x-rays show a satisfactory reduction, plaster splints (front and back) are applied. Both splints are lined with a thin layer

of cotton padding and they are securely fixed with gauze bandage.

"The patient is instructed to start immediate active motion of the fingers. He is permitted to discard the sling at home for several hours at a time to permit elevation of the arm and flexion and extension of the elbow.

"These splints are not disturbed for about five days. By that time most of the swelling will have disappeared and the splints will be ready for final adjustment. Without disturbing the splints, some of the outer gauze bandage is removed. A very light circular bandage of plaster is then applied over the splints and gauze. This circular bandage must be snug enough to prevent any movement at the wrist and it must be applied so that it does not interfere with complete motion of the fingers and thumb.

"The patient should be able to clench the fist completely and to pick up and use a pencil or a fork without difficulty. The splint should be light enough so that the sling may be discarded completely after a few days.

"There is seldom any need for further adjustment of the splints, and they are worn until the fracture is solidly healed and all danger of displacement has passed (that is, for from three to six weeks). When the splints are discarded the patient is instructed to begin active motion at the wrist."

Editorial Explains Status and Cost of Sulfapyridine.—"In *The Journal,* February 11, appeared five communications on sulfapyridine," says an editorial in *The Journal of the American Medical Association* for May 6.

"One was a report of the Association's Council on Pharmacy and Chemistry in which the Council recommended that the preparation be not licensed for sale in interstate commerce at that time. Under the new food and drugs act we have advanced greatly in the commercial introduction of new products. For the first time a preliminary survey of the potentiality for good and for harm preceded the exploitation of a drug. The medical profession had opportunity of being informed and its representatives consulted about the drug before any preparation was placed on the open market.

"After the Council had published its preliminary report, much evidence was assembled. March 2 *The Journal* sent inquiries to all investigators who had clinical experience with the product during the period between its availability for experimental use and its introduction on the market. Replies were received from about one hundred investigators.

"The results of these investigations yield two significant observations: first, sulfapyridine is a drug of exceedingly great value in certain cases of pneumonia; second, like sulfanilamide, it is a drug that needs careful supervision. Its use may probably give rise to as many side reactions as sulfanilamide, if not more—for instance, hematuria.

"Sulfapyridine was licensed for sale in interstate commerce on or about March 10. The Council and *The Journal* approve the action taken by the government in releasing the drug at that time. The final survey by the Food and Drugs Administration was carefully conducted and warranted the release. At present *The Journal* is overwhelmed with papers that have been sent in by various investigators. *The Journal* is grateful for these contributions. Since, however, most of the original articles are merely confirmatory of work already published, it has been necessary for *The Journal* to accept only a few articles. Manuscripts dealing with unusual side reactions or unusual toxic effects or papers reporting extended studies will of course be given special consideration.

"Several physicians and organizations have sent inquiries to the headquarters of the American Medical

Colfax School for the Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

Association asking for an explanation of the relatively high cost of sulfapyridine—approximately 10 cents for a 5 grain tablet in lots of 1,000. A number of factors probably enter into the situation. The drug is patented and therefore not available to free competition. May & Baker, the English concern, assigned its patent rights to Merck & Company of New York. The Calco Chemical Company, it is also understood, claims that it is entitled to a patent and has filed interference claims. One of the ingredients for making the drug, pyridine, has skyrocketed in price from about 35 cents a gallon to approximately $1.75 a gallon. Of course, the introduction of any new drug entails tremendous expense, because of the high cost of investigation; in addition, much of the drug must be given free to investigators. For this outlay the firms must be repaid.

"That the drug might be available and not withheld because of legal complications due to the patent situation, the Calco Chemical Company—a member of the American Cyanamid Corporation—and Merck & Company apparently entered into an agreement whereby the Lederle Laboratories of New York—also a member of the American Cyanamid Corporation—would be the outlet for the pharmaceutic and medical distribution of the drug. The Lederle Laboratories, it will be recalled, have contributed greatly to the development of serums for the treatment of pneumonia, thus being concerned simultaneously with biologic and chemotherapeutic agents.

"Even with the high price of sulfapyridine, the cost of treatment is considerably less than with the use of antipneumococcus serum. No doubt the commercial investments will soon be equalized, and there is reason to hope that the price of sulfapyridine may be materially reduced in the near future."

VEGEX

BREWERS YEAST EXTRACT

B VITAMIN COMPLEX

EXTRINSIC FACTOR

SPECIAL PURPOSE FOOD for the VITAMIN B COMPLEX (including antineuritic B_1; riboflavin B_2; antipellagric G; complete vitamin B complex growth factor); the EXTRINSIC FACTOR and available FOOD IRON.

●

INGREDIENTS

A brewers' yeast extract from a salt-enzyme autolyzing process—see analysis—with added pure vegetable flavor and added available iron salt—ferrous malate.

As used, a teaspoonful to a cup of liquid, the salt concentration is less than in toast. The vegetable flavor is of possibly no physiological significance. Meat-like flavor, but entirely meat free. Starch and sugar free for restricted diets; casily borne by infants and patients on liquid diets.

VEGEX ANALYSIS

	Per Cent
Protein (N × 6.25)	32.6
Fat	0.8
Calories per ounce	40
Sodium Chloride	11.1
Phosphorus as P	2.62
Potassium as K	2.18
Calcium as Ca	0.098
Iron as Fe	0.048
Magnesium as Mg	0.13
Copper	0.00275
Manganese	Distinct Traces

B VITAMIN TEST

Average per Gram

Sherman-Chase B_1	45 units
International B_1	25 units
Sherman-Bourquin riboflavin	35 plus units
B complex full growth	2 to 3 units

Mass clinical use indicates one man unit each anti-beriberi, anti-pellagric and extrinsic factor (anemias) per ounce.

●

Adequate nutrition requires the whole of the vitamin B complex. Vegex supplies it.

★ VITAMINS *minus*

"In thousands of laboratories all over the world scientists are busy 'unwinding' vitamins much as a person would unwind rope," says an exhibit circular.

Out of all vitamin research, this is sure: the *strength* of the *entire* rope *must be had.*

What limited use these separated and concentrated parts of the A, B, C, D and E groups—the thiamin, riboflavin, nicotinic acid fractions from the whole B complex—may have, is in and only in medicine; misleading when held forth for general nutrition.

In the real World of Tomorrow the unwound vitamin strands, now so much entangled in error, will be disentangled and rewound into strong hawsers for every port in human nutrition.

Vitamins are food factors. The whole of the B complex has not yet been concentrated into a capsule.

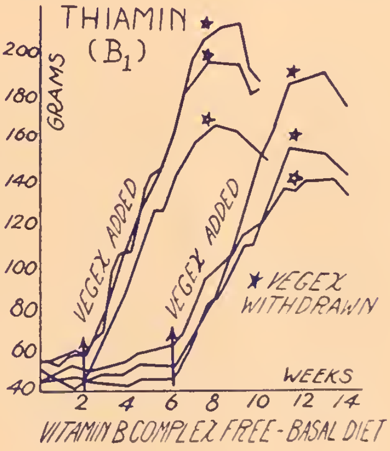
★FOR THE VITAMIN B COMPLEX

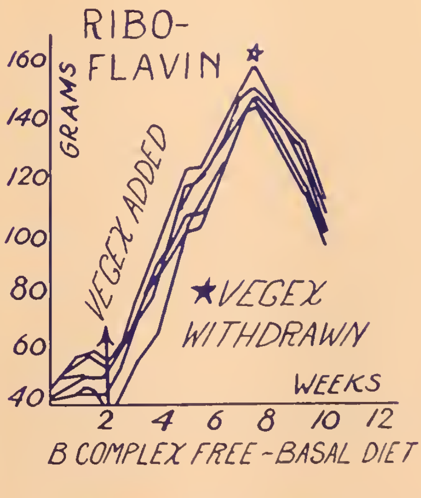
Vegex, separated and condensed from the cells of grain grown brewers' yeast, is and has been from pioneer use, a dependable, natural source of the whole vitamin B complex.

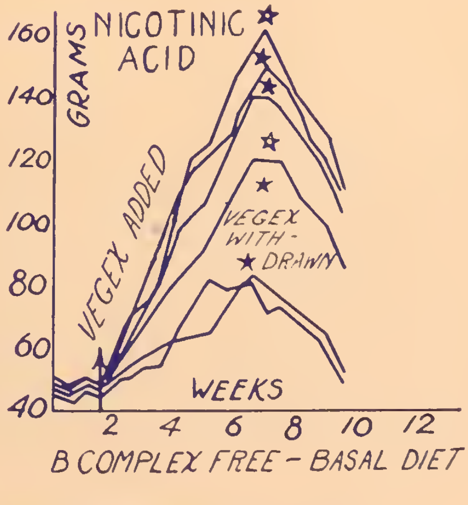
Deficiencies in Some Vitamin B Strands

The limitations in a B complex free diet of the several unwound strands, thiamin (B_1), riboflavin (B_2)—erroneously called G—and nicotinic acid are shown in the charts. Vegex, added and withdrawn, as shown, is used for the whole of the vitamin B complex rope.

Feedings per rat per day; thiamin (B_1), 20 gamma; riboflavin, 20 gamma; nicotinic acid, 1.5 milligrams; Vegex, where used, 500 milligrams.







Samples for clinical or professional use sent on request

VITAMIN FOOD CO., INC.

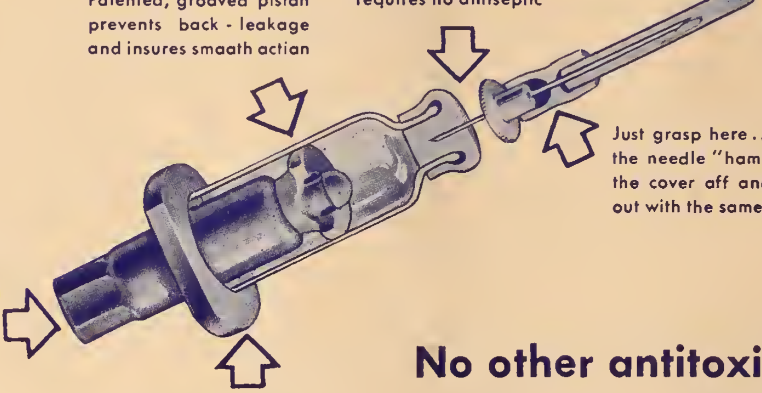
NEW YORK, N. Y.

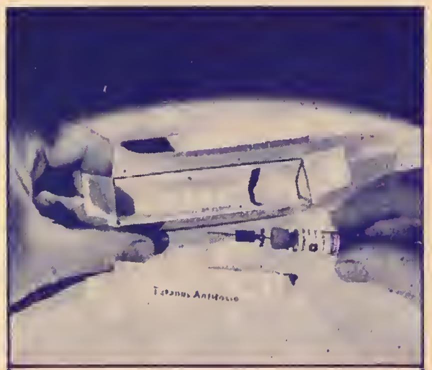
VEGEX, INC.

Say "CUTTER" *when you order Tetanus Antitoxin*



Patented, grooved piston prevents back-leakage and insures smooth action
Needle in place . . . requires no antiseptic
Just grasp here . . . shove the needle "home," pull the cover off and stylet out with the same action.
Bakelite plunger fits barrel . . . doesn't wobble
Large, soft-rubber comfortable grip

No other antitoxin brings you this ready-to-use, smooth-working syringe



No assembling . . . ready to use in 5 seconds after you lift the Cutter syringe from its cradle.

For the smoothest possible action, rotate the plunger a quarter-turn; one more simple action prepares the needle.

The tiny "Cutter" dose can be given comfortably into the deltoid muscle.

Tetanus Gas-Gangrene Antitoxin Syringe 4.00	Tetanus Antitoxin 1500 Unit Syringe 1.25
Tetanus Gas-Gangrene Antitoxin Vial 3.75	Tetanus Antitoxin Vial 1.00

No other antitoxin is more concentrated nor lower in total solids

Cutter Laboratories hyper-immunize and eliminate many horses, selecting only those few which yield the highest titre antitoxin. This antitoxin is fractionated by a method which ruthlessly discards millions of units but yields a fraction low in solids and low in proteins that might cause reactions.

Officers of the California Medical Association

General Officers

President—William W. Roblee, 202 Mission Inn Rotunda, Riverside.

President-Elect—Charles A. Dukes, 601 Wakefield Building, 426 Seventeenth Street, Oakland.

Speaker of House of Delegates—Lowell S. Goin, 414 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.

Vice-Speaker of House of Delegates—John H. Graves, 977 Valencia Street, San Francisco.

Chairman of Council—Karl L. Schaupp, 490 Post Street, San Francisco.

Vice-Chairman—Junius B. Harris, Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Chairman of Executive Committee—T. Henshaw Kelly, 830 Medico-Dental Building, 490 Post Street, San Francisco.

Chairman of the Committee on Public Relations—George G. Reinle, 532 Fifteenth Street, Oakland.

Past President—Howard Morrow, 384 Post Street, San Francisco.

Secretary-Treasurer—George H. Kress, 450 Sutter Street, Room 2004, San Francisco. Telephone DOuglas 0062.

Editor—George H. Kress, 450 Sutter Street, Room 2004, San Francisco.

General Counsel—Hartley F. Peart, Room 1800, 111 Sutter Street, San Francisco.

Associate General Counsel—Hubert T. Morrow, Van Nuys Building, 210 West Seventh Street, Los Angeles.

Councilors

(In addition to the elected district and at-large Councilors, the Council has as ex officio members, the general officers and the Chairman of the Committee on Public Relations. Chairman of Council, Karl L. Schaupp; Secretary, George H. Kress.)

District Councilors

First District—Imperial, Orange, Riverside, San Bernardino and San Diego Counties, Calvert L. Emmons (1941), 206 Emmons Building, Ontario.

Second District—Los Angeles County, Carl R. Howson (1939), 1114 Wilshire Medical Bldg., 1930 Wilshire Boulevard, Los Angeles.

Third District—Kern, San Luis Obispo, Santa Barbara and Ventura Counties, Louis A. Packard (1940), 563 Haberfelde Building, Bakersfield.

Fourth District—Calaveras, Fresno, Inyo, Kings, Madera, Mariposa, Merced, Mono, San Joaquin, Stanislaus, Tulare and Tuolumne Counties, Axcel E. Anderson (1941), Medical Group Building, 1759 Fulton Street, Fresno.

Fifth District—Monterey, San Benito, San Mateo, Santa Clara and Santa Cruz Counties, Alfred L. Phillips (1939), 84 Walnut Avenue, Santa Cruz.

Sixth District—San Francisco County, Karl L. Schaupp (1940), 530 Medico-Dental Building, 490 Post Street, San Francisco.

Seventh District—Alameda and Contra Costa Counties, Oliver D. Hamlin (1941), 389 Thirtieth Street, Oakland.

Eighth District—Alpine, Amador, Butte, Colusa, El Dorado, Glenn, Lassen, Modoc, Nevada, Placer, Plumas, Sacramento, Shasta, Sierra, Sutter, Tehama, Yolo, and Yuba Counties, Frederick N. Scatena (1939), Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Ninth District—Del Norte, Humboldt, Lake, Marin, Mendocino, Napa, Siskiyou, Solano, Sonoma and Trinity Counties, Henry S. Rogers (1940), Petaluma.

Councilors-at-Large

Harry H. Wilson (1941), 1919 Wilshire Boulevard, Los Angeles.

C. O. Tanner (1939), 3255 Fourth Street, San Diego.

William H. Kiger (1940), 911 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.

Philip K. Gilman (1941), 2000 Van Ness Avenue, San Francisco.

T. Henshaw Kelly (1939), 830 Medico-Dental Building, 490 Post Street, San Francisco.

Junius B. Harris (1940), Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Standing Committees

Executive Committee

The President, the President-elect, the Speaker of the House of Delegates, the Chairman of the Council, the Chairman of the Auditing Committee, the Chairman of the Committee on Public Relations, the Past President, the Secretary-Treasurer, and the Editor. (T. Henshaw Kelly, chairman; George H. Kress, secretary.)

Auditing Committee

O. D. Hamlin	Oakland	1939
T. Henshaw Kelly (Chairman)	San Francisco	1939
Philip K. Gilman	San Francisco	1939

Members of the Auditing Committee are appointed each year by the Chairman of the Council.

Committee on Associated Societies and Technical Groups

William H. Geistweit	San Diego	1939
John V. Barrow (Chairman)	Los Angeles	1940
Edwin L. Bruck	San Francisco	1941

Committee on Health and Public Instruction

W. R. P. Clark	San Francisco	1939
Benjamin W. Black	Oakland	1940
Fred B. Clarke (Chairman)	Long Beach	1941

Committee on History and Obituaries

J. Marion Read	San Francisco	1939
A. Elmer Belt	Los Angeles	1940
Frank R. Makinson (Chairman)	Oakland	1941

Secretary ex officio
Editor ex officio

Committee on Hospitals, Dispensaries and Clinics

W. Earl Mitchell (Chairman)	Oakland	1939
Karl L. Schaupp	San Francisco	1940
George Dawson	Napa	1941

Committee on Industrial Practice

Philip Stephens (Chairman)	Los Angeles	1939
Harry E. Zaiser	Orange	1940
Morton R. Gibbons	San Francisco	1941

Committee on Medical Defense

Fred R. De Lappe	Modesto	1939
John P. Nuttall	Santa Monica	1940
George G. Reinle (Chairman)	Oakland	1941

Committee on Medical Economics

William R. Molony, Sr.	Los Angeles	1939
Edward M. Pallette	Los Angeles	1940
John H. Graves (Chairman)	San Francisco	1941

Committee on Medical Education and Medical Institutions

Loren R. Chandler (Chairman)	San Francisco	1939
John B. Doyle	Los Angeles	1940
B. O. Raulston	Los Angeles	1941

Committee on Membership and Organization

Dewey R. Powell	Stockton	1939
G. Dan Delprat	San Francisco	1940
George D. Maner (Chairman)	Los Angeles	1941

Committee on Postgraduate Activities

F. F. Gundrum	Sacramento	1939
John C. Ruddock (Chairman)	Los Angeles	1940
F. E. Clough	San Bernardino	1941

Secretary ex officio

Committee on Publications

Oscar Reiss	Los Angeles	1939
Ralph Eusden (Chairman)	Los Angeles	1940
Ruggles A. Cushman	Talmage	1941

Secretary ex officio
Editor ex officio

Committee on Public Policy and Legislation

T. Henshaw Kelly	San Francisco	1939
E. T. Remmen	Glendale	1940
Junius B. Harris (Chairman)	Sacramento	1941

President ex officio
President-elect ex officio

Committee on Scientific Work

F. M. Pottenger	Monrovia	1939
Lemuel P. Adams	Oakland	1940
J. Homer Woolsey	Woodland	1941

William H. Barrow, Secretary of Section on General Medicine, ex officio

Ray B. McCarty, Secretary of Section on General Surgery, ex officio

George H. Kress (Chairman), ex officio.

Committee on Public Relations

The Committee on Public Relations consists of the chairmen of the following standing committees and of certain general officers of the Association, all serving ex officio. The chairman of the committee is George G. Reinle, the secretary is George H. Kress. The director of the Department of Public Relations is George H. Kress. The chairman of the Committee on Public Relations is ex officio a member of the Council.

Fred B. Clarke	Chair., Com. on Health and Public Instruction
W. Earl Mitchell	Chair., Com. on Hospitals, Dispensaries, Clinics
Philip Stephens	Chair., Com. on Industrial Practice
George G. Reinle	Chair., Com. on Medical Defense
George D. Maner	Chair., Com. on Membership and Organization
John H. Graves	Chair., Com. on Medical Economics
Junius B. Harris	Chair., Com. on Public Policy and Legislation
Alson R. Kilgore	Chair., Cancer Commission
John C. Ruddock	Chair., Com. on Postgraduate Activities
William W. Roblee	President of California Medical Association
Charles A. Dukes	President-elect
George H. Kress	Secretary-Treasurer

Communications for the Public Relations Department should be addressed to the Director, George H. Kress, M. D., Room 2004, 450 Sutter Street, San Francisco.

Cancer Commission

Alson R. Kilgore (Chairman)	San Francisco	1939
Henry J. Ullmann	Santa Barbara	1939
Clarence G. Toland	Los Angeles	1939
Charles A. Dukes	Oakland	1940
Lyell C. Kinney (Vice-Chairman)	San Diego	1940
Otto H. Pflueger (Secretary)	San Francisco	1940
Orville Meland (Sec'y for Southern Section)	Los Angeles	1941
A. Herman Zeiler	Los Angeles	1941
Gertrude Moore	Oakland	1941

Communications for the Cancer Commission should be addressed to the Secretary, Otto H. Pflueger, M. D., Room 2004, 450 Sutter Street, San Francisco.

FOREWORD

Editor's Note.—*For many years, the California Medical Association has printed annually a Membership Directory, some issues having more than two hundred pages. In recent years, the Board of Medical Examiners of the State of California, with headquarters at 420 State Office Building, Sacramento, has also printed a directory, containing the name, date of birth, years of licensures in different states, and the office address of every physician and surgeon licensed under its jurisdiction. The State Board Directory has also contained much other information concerning the Medical Practice Act, and narcotic and other laws related to healing-art practice in California. A copy of each year's directory is sent to every physician and surgeon who has a license to practice in California.*

Directories of the California Medical Association brought off the press in the past have also presented historical and other information of similar nature.

In order to avoid duplication of printing and other costs, the California Medical Association in the last few years has printed a membership roster giving the names of members and the city or location in which they practice, with key numbers to indicate county medical society membership. This information, when used in connection with that given in the directory of the State Board of Medical Examiners, should answer all ordinary needs.

For additional information, inquiry should be made of the secretaries of the California Medical Association or the Board of Medical Examiners of the State of California.

For reference convenience, California and Western Medicine *is printing this Membership Roster, containing the names of all members through date of March 1, 1939, as a supplement to its March issue. For possible future use, members are advised to place this Membership Roster Supplement in their library files.*

ROSTER OF COUNTY MEDICAL SOCIETIES. CALIFORNIA MEDICAL ASSOCIATION

(County society secretaries are requested to promptly notify "California and Western Medicine" when changes are indicated in their roster information.)

Alameda County Medical Association

2404 Broadway, Oakland

President, Frank H. Bowles, 426 Seventeenth Street, Oakland.

Secretary, Gertrude Moore, 2404 Broadway, Oakland.

Meeting, *Third Monday, 8:15 p. m., Hunter Hall, Oakland.*

Butte County Medical Society

President, E. L. Meyers, Fourth Street and Broadway, Chico.

Secretary, J. O. Chiapella, 131 Broadway, Chico.

Meeting, *Second Thursday.*

Contra Costa County Medical Society

President, Kaho Daily, 314 Tenth Street, Richmond.

Secretary, Clifford E. Dieterich, 1306 Pomona Avenue, Crockett.

Meeting, *Second Tuesday, 8 p. m.*

Fresno County Medical Society

President, Roland W. Dahlgren, 1006 Mattei Building, Fresno.

Secretary, Lester R. Nielson, 1006 Mattei Bldg., Fresno.

Meeting, *First Tuesday, University-Sequoia Club, Fresno.*

Humboldt County Medical Society

President, Samuel P. Burre, 507 F Street, Eureka.

Secretary, Joseph S. Woolford, 350 E Street, Eureka.

Meeting, *First Thursday.*

Imperial County Medical Society

President, Henry B. Graeser, 115 E. Fifth Street, Holtville.

Secretary, William A. Clarke, Holtville.

Meeting, *Third Tuesday, 7 p. m., Barbara Worth Hotel, El Centro.*

Kern County Medical Society

President, C. I. Mead, Haberfelde Building, Bakersfield.

Secretary, C. S. Compton, 428 C Street, Bakersfield.

Meeting, *Third Thursday, 8:00 p. m.*

Kings County Medical Society

President, P. K. Edmunds, Corcoran.

Secretary, William A. Johnstone, Hanford.

Meeting, *Second Monday, 8 p. m., Legion Hall, Hanford.*

Lassen-Plumas-Modoc County Medical Society

President, C. I. Burnett, Susanville.

Secretary, Fred J. Davis, Jr., Westwood.

Meeting, *On Call.*

Los Angeles County Medical Association

1925 Wilshire Boulevard, Los Angeles

President, William H. Daniel, 1930 Wilshire Boulevard, Los Angeles.

Secretary, George D. Maner, 1925 Wilshire Boulevard, Los Angeles.

Meetings, *First and Third Thursdays, 1925 Wilshire Boulevard, Los Angeles.*

Marin County Medical Society

President, Harry N. Hensler, Home Market Building, San Anselmo.

Secretary, Carl W. Clark, 510 B Street, San Rafael.

Meeting, *Fourth Thursday, 7:00 p. m., Marin Golf and Country Club.*

Mendocino-Lake County Medical Society

President, Robert B. Smalley, Willits.

Secretary, Dallas Wagner, Fort Bragg.

Meeting, *On Call.*

Merced County Medical Society

President, E. M. Soderstrom, Merced.

Secretary, Fred O. Lien, Shaffer Building, Merced.

Meeting, *Third Thursday, Hotel Tioga, Merced.*

Monterey County Medical Society

President, Walter P. Farr, 308 Main Street, Salinas.

Secretary, Herbert Archibald, Salinas National Bank Building, Salinas.

Meeting, *First Thursday.*

Napa County Medical Society

President, Alexander H. McLeish, Veterans Home Hospital, Yountville.

Secretary, M. M. Booth, Bruck Building, St. Helena.

Meeting, *First Wednesday.*

Orange County Medical Society

President, M. W. Hollingsworth, 1806 No. Main Street, Santa Ana.

Secretary, Glenn Curtis, 323 So. Pomona Street, Brea.

Meeting, *First Tuesday, 8 p. m., Chapel of the Orange County Hospital, Orange.*

Placer County Medical Society

President, William M. Miller, Auburn.

Secretary, Robert A. Peers, Colfax.

Meeting, *At Call of President.*

Riverside County Medical Society

President, N. K. Bear, 3655 Fourteenth Street, Riverside.

Secretary, Thomas A. Card, 3616 Main Street, Riverside.

Meeting, *Second Monday, 8 p. m., Library, Riverside Community Hospital.*

Sacramento Society for Medical Improvement

President, Manuel Azevedo, 1027 Tenth Street, Sacramento.

Secretary, Glenn E. Millar, 321 Physicians Building, Sacramento.

Meeting, *Third Tuesday, 8:30 p. m., Auditorium, Sacramento.*

San Benito County Medical Society

President, J. M. O'Donnell, Hollister.

Secretary, L. E. Smith, Hollister.

Meeting, *At Call of President.*

San Bernardino County Medical Society

President, Delbert B. Williams, 1151 D Street, San Bernardino.

Secretary, A. E. Varden, Medico-Dental Building, San Bernardino.

Meeting, *First Tuesday, 8 p. m., San Bernardino County Charity Hospital.*

San Diego County Medical Society

Fourteenth Floor, Medico-Dental Building, 233 A Street, San Diego

President, Hall G. Holder, 1109 Medico-Dental Building, San Diego.

Secretary, C. V. Bernardini, Medico-Dental Building, 233 A Street, San Diego.

Meeting, *Second Tuesday, El Cortez Hotel.*

San Francisco County Medical Society

2180 Washington Street, San Francisco

President, Edwin L. Bruck, 384 Post Street, San Francisco.

Secretary, Stanley H. Mentzer, 2180 Washington Street, San Francisco.

Meetings, *Every Tuesday, 8:15 p. m., 2180 Washington Street, San Francisco.*

San Joaquin County Medical Society

President, N. P. Johnson, Medico-Dental Building, Stockton.

Secretary, George H. Rohrbacher, Medico-Dental Building, Stockton.

Meeting, *First Thursday, 8:15 p. m., Medico-Dental Club Rooms, Stockton.*

San Luis Obispo County Medical Society

President, J. B. V. Butler, 722 Marsh Street, San Luis Obispo.

Secretary, E. M. Bingham, County Health Department, San Luis Obispo.

Meeting, *Third Saturday, 6:30 p. m., Gold Dragon Cafe, San Luis Obispo.*

San Mateo County Medical Society

President, N. D. Morrison, 205 Third Avenue, San Mateo.

Secretary, J. Garwood Bridgman, 205 Third Avenue, San Mateo.

Meeting, *Fourth Wednesday, Benjamin Franklin Hotel, San Mateo.*

Santa Barbara County Medical Society

President, W. H. Johnston, 1515 State Street, Santa Barbara.

Secretary, D. H. McNamara, 317 W. Pueblo Street, Santa Barbara.

Meeting, *Second Monday, Cottage Hospital.*

Santa Clara County Medical Society

President, Cletus S. Sullivan, Bank of America Building, San Jose.

Secretary, Leslie B. Magoon, 652 East Santa Clara Street, San Jose.

Meeting, *Third Wednesday, 8 p. m., Medico-Dental Building, San Jose.*

Santa Cruz County Medical Society

President, John T. Harrington, 10 Cooper Street, Santa Cruz.

Secretary, Samuel B. Randall, 84 Walnut Avenue, Santa Cruz.

Meeting, *First Monday, 7:30 p. m., Club Rio del Mar, Aptos.*

Shasta County Medical Society

President, B. F. Saylor, Redding.

Secretary, Morton J. Murphy, 1542 Market Street, Redding.

Meeting, *Second Monday.*

Siskiyou County Medical Society

President, J. B. McGuire, Mt. Shasta.

Secretary, Victor W. Hart, 113 No. Oregon Street, Yreka.

Meeting, *Sunday on call.*

Solano County Medical Society

President, Ream S. Leachman, 727 Sonoma Street, Vallejo.

Secretary, John W. Green, Box 539, Vallejo.

Meeting, *Second Tuesday, 8 p. m., Casa de Vallejo Hotel, Vallejo.*

Sonoma County Medical Society

President, D. C. Oakleaf, 301A West Street, Healdsburg.

Secretary, T. E. Albers, 600 B Street, Santa Rosa.

Meeting, *Second Thursday.*

Stanislaus County Medical Society

President, John A. Cooper, 1024 J Street, Modesto.

Secretary, Hoyt R. Gant, 403 Beaty Building, Modesto.

Meeting, *Second Friday, 7:30 p. m., Hotel Hughson.*

Tehama County Medical Society

President, O. T. Wood, Red Bluff.

Secretary, R. G. Frey, Red Bluff.

Meeting, *At Call of President.*

Tulare County Medical Society

President, Newton Miller, 231 No. Main Street, Porterville.

Secretary, Ray Cronemiller, Exeter.

Meeting, *Sunday Evening once a month.*

Ventura County Medical Society

President, W. F. Mosher, 34 No. Ash Street, Ventura.

Secretary, A. A. Morrison, 625 Main Street, Santa Paula.

Meeting, *Second Tuesday, Ventura County Country Club.*

Yolo-Colusa-Glenn County Medical Society

President, H. G. Potter, Winters.

Secretary, W. J. Blevins, Jr., Woodland.

Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society

President, P. E. Thunen, I. O. O. F. Building, Marysville.

Secretary, Leon M. Swift, I. O. O. F. Building, Marysville.

Meeting, *First Tuesday.*

OFFICERS OF SCIENTIFIC SECTIONS, CALIFORNIA MEDICAL ASSOCIATION

Anesthesiology

Chairman, John G. Dunlop, 168 So. Kingsley Drive, Los Angeles.
Secretary, Adena C. Dutton, 1955 Broadway, San Francisco.

Dermatology and Syphilology

Chairman, Norman N. Epstein, 450 Sutter Street, San Francisco.
Vice-Chairman, Franklin I. Ball, 6253 Hollywood Boulevard, Hollywood.
Secretary, Arne E. Ingels, 490 Post Street, San Francisco.

Eye, Ear, Nose and Throat

Chairman, Clifford B. Walker, 427 West Fifth Street, Los Angeles.
Vice-Chairman, Harry J. Wiley, 2701 Florence Street, Huntington Park.
Secretary, Dewey R. Powell, 242 No. Sutter Street, Stockton.

General Medicine

Chairman, Howard F. West, 602 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.
Secretary, William H. Barrow, 1400 Medico-Dental Building, San Diego.

General Surgery

Chairman, Loren R. Chandler, Stanford University Medical School, San Francisco.
Secretary, Ray B. McCarty, 3616 Main Street, Riverside.
Assistant Secretary, Frederick S. Foote, 490 Post Street, San Francisco.

Industrial Medicine and Surgery

Chairman, Harvey G. McNeil, 523 West Sixth Street, Los Angeles.
Vice-Chairman, George H. Sanderson, 242 North Sutter Street, Stockton.
Secretary, John S. Stephens, 1136 W. Sixth Street, Los Angeles.

Neuropsychiatry

Chairman, John B. Doyle, 1930 Wilshire Boulevard, Los Angeles.
Secretary, George S. Johnson, Stanford University Hospital, San Francisco.

Obstetrics and Gynecology

Chairman, George W. Coon, 3770 Twelfth Street, Riverside.
Vice-Chairman, John N. Ewer, 411 Thirtieth Street, Oakland.
Secretary, William Benbow Thompson, 1930 Wilshire Boulevard. Los Angeles.

Pathology and Bacteriology

Chairman, Alvin G. Foord, Huntington Memorial Hospital, Pasadena.
Secretary, Roy W. Hammack, 657 South Westlake Boulevard, Los Angeles.
Assistant Secretary, Paul H. Guttman, 1127 Eleventh Street, Sacramento.

Pediatrics

Chairman, Harold K. Faber, Stanford Hospital, San Francisco.
Secretary, Hartzell H. Ray, 23 Second Avenue, San Mateo.
Assistant Secretary, W. W. Belford, 601 Medico-Dental Building, San Diego.

Radiology

Chairman, Karl M. Bonoff, 1930 Wilshire Boulevard, Los Angeles.
Secretary, Carl D. Benninghoven, Mills Memorial Hospital, San Mateo.

Urology

Chairman, Carl F. Rusche, 905 Taft Building, 1680 North Vine Street, Hollywood.
Secretary, John A. Dougherty, 3115 Webster Street, Oakland.

Delegates and Alternates to the American Medical Association

DELEGATES		ALTERNATES

Yuba-Sutter Counties	16
Active members	6021
Associate members	4
Retired members	75
Honorary members	1
Total all members	6101

Seventy-three members died during the year 1938.

Note.—The California Medical Association by-laws provide for an annual directory. Because every member receives the annual directory of the Board of Medical Examiners of the State of California, and in order to avoid the great cost of duplication of such a directory, the California Medical Association Council has decided to print in the official journal a simple roster of members, giving for each member the city or place of residence, with a key number to indicate the county medical society in which membership is held.

For additional information concerning school of graduation, etc., the State Medical Board directory or the central office of the California Medical Association should be consulted.

Errors in the list here printed should be promptly reported to the central office of the California Medical Association, Four Fifty Sutter, San Francisco.

SALUTATION
FROM PRESIDENT ROBLEE

William W. Roblee, M.D.
President, California Medical Association
1939

To Members of the California Medical Association—

Greetings:

It is my happy privilege to extend to you a cordial invitation to attend another annual meeting of your California Medical Association, which will be held May 1 to 4.

This year we return to Del Monte, which choice we know from past experience will be a happy one. The hospitality extended by the hotel heretofore has been most cordial; the opportunities for out-of-door sports during the recreation periods are ample, and the provision made for the section meetings is satisfactory. Old friendships will be renewed, new ones acquired, and the social functions are always happy occasions.

Medicine is not static, both its science and art being constantly improved. The doctor of medicine and surgery who fails to take cognizance of new developments soon fails to render the type of service to which his patients are entitled. The papers and discussions arranged by the committee in charge are designed to bring to us, in an authentic and thorough manner, the latest developments of medical science. I urge your attendance at as many sessions as possible.

Consideration will also be given, at the first general session and at the meetings of the House of Delegates, to the present status of our medical economic problems.

There never has been a time in the history of the Association when loyalty to our national, state and county organizations was more necessary. I ask your continued interest and support, in order that those to whom you have intrusted leadership may feel that they are backed by a united profession. A good attendance at the Del Monte meeting will give them that assurance.

Cordially,

W. W. Roblee,
President.

GUEST SPEAKERS AT THE SIXTY-EIGHTH ANNUAL SESSION CALIFORNIA MEDICAL ASSOCIATION

Speakers at General Meetings

URSUS VICTOR PORTMANN, M.D.
Cleveland Clinic, Cleveland, Ohio

CHESTER SCOTT KEEFER, M.D.
Associate Professor of Medicine
Harvard University Medical School
Boston, Massachusetts

REGISTRATION INFORMATION

Registration and Information. The registration and information desk is located in the west lobby, adjacent to the entrance of the dining room, Del Monte Hotel. All persons attending the convention, whether members or not, are requested to register immediately on arrival. Beginning on Monday, May 1, registration secretaries will be on duty daily from 9 a. m. until 5 p. m.

Programs and Pre-Convention Bulletin. The registration clerks will give to every member a copy of the program. The Pre-Convention Bulletin will appear as a supplement to the April issue of CALIFORNIA AND WESTERN MEDICINE. Delegates and alternates are especially requested to read the reports of officers and committees.

Guests and Visitors. All guests and visitors are requested to register. All general meetings and scientific meetings are open to visitors and guests.

Badges. Four kinds of badges will be issued by the registration bureau:

1. *Members.* Only active, associate, retired, or honorary members of the California Medical Association will be issued the usual membership badge.

2. *Guests.* A guest badge will be issued to all fraternal delegates and visiting physicians who are attending this year's session.

3. *Delegates and Alternates.* The usual official badge for each delegate and alternate is provided for this purpose, and will be issued only to one authorized to wear it.

4. *Officers.* An official badge is provided for all officers and members of the Council.

Announcements. Please register on arrival and secure program and special announcements. Registration Bureau, Del Monte Hotel.

The program as given in this Pre-Convention Bulletin indicates the tentative arrangements. These are subject to change. The final or reprint program, a copy of which will be given to each member as he registers, will contain additional and detailed information on matters not appearing in the Pre-Convention Bulletin.

Delegates will please file *credentials* with the House of Delegates committee at 7:30 to 8 p. m., at each meeting of the House.

Consult bulletin board daily for schedule of *Scientific Exhibit Demonstrations.*

Consult diagram for *meeting places of Scientific Sections.* Diagram will be printed in the final program.

President's Dinner Tickets. Tickets for the dinner to the President must be gotten at the hotel desk. Members who are registered as guests at the Hotel Del Monte must also secure special tickets at the hotel desk.

Golf. Please register for tournaments at the California Medical Association registration desk. Also consult bulletin boards.

Riding Horses. Please register at the California Medical Association registration desk for services of groom.

Swimming Pool. For information, apply at hotel desk.

Woman's Auxiliary members register at Hotel Del Monte, main lobby, immediately opposite hotel's registration desk.

Consult program for *entertainment events.*

Visit the *commercial exhibits.*

Suggestions and Constructive Criticism. The officers and committees have tried to do everything possible to make the session a success. Suggestions and constructive criticism calculated to make future sessions more useful will be welcomed by any of the officers. Complaints of whatever character should be promptly made at the registration desk, where they will receive attention.

PROGRAM: BY DAYS

Sunday, April 30

9:00 a. m. to 4:30 p. m.—Pathologic Conference (under auspices of the Cancer Commission).

10:00 a. m. to 4:00 p. m.—Radiologic Conference (under auspices of the Cancer Commission).

12:00 noon to 5:00 p. m.—Scientific and commercial exhibits.

12:00 noon—North and South Golf Tournament.

2:00 p. m.—Conference of County Society Secretaries.

7:30 p. m.—Council meeting.

Monday, May 1

10:00 a. m.—Opening General Meeting.

1:30 p. m.—Section meetings.

8:00 p. m.—House of Delegates.*

Tuesday, May 2

7:45 a. m.—Past Presidents' breakfast.

8:30 a. m.—Section meetings.

11:15 a. m.—General Meeting (Clinical-Pathological Conference).

1:00–6:00 p. m.—Recreation. (Golf, skeet shoot, seventeen-mile drive). Tuesday afternoon is set aside for entertainment features. No section meetings on Tuesday afternoon. (See items under Registration Information, and under "X—Del Monte.")

7:30 p. m.—President's dinner, reception, and dance.

Wednesday, May 3

8:30 a. m.—Section meetings.

11:15 a. m.—General Meeting (Social Security, legislation, and economics).

1:30 p. m.—Section meetings.

4:15 p. m.—Meeting of "Medical Society of the State of California."

8:00 p. m.—House of Delegates.*

Thursday, May 4

8:30 a. m.—Section meetings.

* * *

Note.—Council meets daily during the annual session.

Watch bulletin board for hours during which film and other demonstrations will be given in the Scientific Exhibits Section.

Utilize every opportunity to visit the commercial and technical exhibits.

---

* In order to permit the House of Delegates to be called to order at 8 p. m., all delegates are requested to register with the Credentials Committee between 7:30 p. m. and 8 p. m. at each meeting.

* * *

I—GENERAL MEETINGS

All General Meetings will be held in the Auditorium, on the ground floor, Hotel Del Monte

First General Meeting

Monday, May 1, 10 a.m.

Address of Welcome—Walter P. Farr, M.D., President of the Monterey County Medical Society.

Address of President—William W. Roblee, M.D., Riverside, President, California Medical Association.

California Physicians' Service—T. Henshaw Kelly, M.D., San Francisco, Chairman of the Executive Committee, California Physicians' Service.

Medicine and Surgery Under the California Physicians' Service—Morton R. Gibbons, Sr., M.D., San Francisco, Medical Director of the California Physicians' Service.

Diaphragmatic Hernia—Stuart W. Harrington, M. D., Rochester, Minnesota, Professor of Surgery, University of Minnesota Graduate School, Rochester, Minnesota.

Second General Meeting

Tuesday, May 2, 11:15 a.m.

President William W. Roblee, Presiding

William H. Barrow, Director

Clinical-Pathological Conference—Conducted by Chester S. Keefer, M.D., Associate Professor of Medicine, Harvard Medical School, Boston; William Dock, M. D., Professor of Pathology, Stanford Medical School, San Francisco; and Jesse Carr, M.D., University of California Hospital, San Francisco.

Note.—Protocols of the cases under discussion, with complete clinical histories and laboratory findings, will be distributed. These case histories will be discussed by the guest speaker and differential diagnoses presented, following which the pathological findings will be presented and discussed.

The three cases may be summarized briefly as follows:

1. Febrile illness of two years' duration; appendectomy and nephropexy without relief of abdominal pain.
2. Severe hypertension noted after pneumonia in a man whose pressure was normal a few months before. Postoperative complications following splanchnic nerve resection.
3. Twenty-five years of "peptic ulcer" history followed by appearance of abdominal masses, cough, and hemoptysis.

Third General Meeting †

Wednesday, May 3, 11:15 a.m.

Pending State Legislation—Junius B. Harris, M.D., Sacramento, Chairman of the Committee on Public Policy and Legislation.

On Periodic Payment Medical Service Plans—Lowell S. Goin, M.D., Los Angeles, Vice-President of the Board of Trustees, California Physicians' Service.

---

† The third general session will immediately follow the paper given in the Section on Medicine, on "The Practical Interpretation of Laboratory Tests in the Diagnosis of Infectious Disease," by Chester S. Keefer, M. D., Associate Professor of Medicine, Harvard Medical School, Boston.

II—SECTION MEETINGS

SCIENTIFIC SECTION PROGRAMS

(Numbers in parenthesis after each section indicate sequence reference numbers of papers read in each section.)

I.—General Medicine (1-22) 11
II.—General Surgery (23-42) 14
III.—Obstetrics and Gynecology (43-53) 16
IV.—Eye, Ear, Nose and Throat (54-66) 17
V.—Anesthesiology (67-75) 19
VI.—Dermatology and Syphilology (76-87) 19
VII.—Industrial Medicine and Surgery (88-95) 21
VIII.—Neuropsychiatry (96-99) 22
IX.—Pathology and Bacteriology (100-109) 23
X.—Pediatrics (110-113) 24
XI.—Radiology (114-123) 25
XII.—Urology (124-133) 27

Rules Regarding Papers and Discussions at the State Meetings

Upon the recommendation of the Executive Committee the following rules regarding papers have been adopted by the Council:

1. The maximum time that may be consumed by any paper is fifteen minutes, provided that not to exceed ten minutes' latitude may be allowed invited guests at the discretion of the presiding chairman.

2. Motions from the floor to extend the time of an author may be entertained by the presiding officer.

3. The maximum time permitted any individual to discuss a paper is four minutes. This also applies to the author in closing his discussion. No speaker may discuss more than once any one subject.

4. A copy of each and every paper presented at the state meeting must be in the hands of the chairman or secretary of the section or in the hands of the general secretary before the paper is presented.

5. All papers read at the annual meeting may be published in full in CALIFORNIA AND WESTERN MEDICINE as soon after the meeting as space will permit; or at the option of the author, an abstract of the paper of about one column in length shall be published as soon as possible after the meeting, with reprints in full of the entire paper (the cost of setting up type for the reprint to be borne by the Association, and all other costs to be borne by the author).

6. Articles are accepted for publication on condition that they are contributed solely to CALIFORNIA AND WESTERN MEDICINE. Authors desiring to publish their papers elsewhere than in the JOURNAL may have their manuscripts returned to them upon written request to the editor.

7. No paper will be accepted by the General Program Committee nor by Section program committees unless accompanied by a synopsis of not to exceed fifty words.

8. Papers shall not be "read by title."

9. No member may present more than one paper at any one state meeting, provided that a member may be a collaborator on more than one paper, if these papers are presented by different authors.

10. Failure on the part of an author to present a paper precludes acceptance of future papers from such author for a period of two years, unless the author explains to the satisfaction of the Executive Committee his inability to fulfill his obligation.

Section Papers: How Numbered

For convenience in reference, papers are numbered in serial sequence for the entire session, instead of a separate sequence for each section.

Business Meetings of Sections

Time of business meetings and elections of officers of sections will be scheduled on section blackboards by section secretaries, and through preliminary announcements by section chairmen.

Unless otherwise announced, the business meetings of each section and the election of officers will be held immediately after the reading of the second paper on the second day's section program.

I

GENERAL MEDICINE SECTION

HOWARD F. WEST, M.D., *Chairman*
1930 Wilshire Boulevard, Los Angeles

WILLIAM H. BARROW, M.D., *Secretary*
1400 Medico-Dental Building, San Diego

First Meeting

Monday, May 1, 1:30 p. m.

SYMPOSIUM ON SULFANILAMID

This will be a joint meeting with the General Surgery Section.

Paper No. 1:

Pharmacology of Sulfanilamid and Related Compounds—Windsor C. Cutting, M.D., Department of Pharmacology, Stanford Medical School, and William L. Cover, M.D., San Bernardino.

Sulfanilamid, neoprontosil, and sulfapyridin will be compared briefly chemically and in their general effects on bacteria. The controversy concerning the mode of action, and the differences in absorption, distribution, excretion, toxicity, and therapeutic use will be discussed in some detail.

Paper No. 2:

Sulfanilamid and Sulfapyridin in the Treatment of Various Infections—Chester S. Keefer, M. D., Associate Professor of Medicine, Harvard Medical School, Boston, Massachusetts. (By invitation.)

The results of the use of sulfanilamid in the treatment of hemolytic streptococcal, gonococcal, meningococcal, and urinary-tract infections will be summarized, and its mode of action and toxic effects will be discussed. A new derivative of sulfanilamid, sulfapyridin, has been used for the treatment of pneumococcus pneumonia. The present status of this drug will be reviewed. Its indications, mode of action, and side effects will be stressed.

Paper No. 3:

Urological Uses of Sulfanilamid—Bernard Silver, M.D., 1712 North Highland, Hollywood.

In the three years since the introduction of sulfanilamid in urologic practice its efficacy in gonorrhea has been established in many large series of cases, but despite this, its effect on the total incidence of gonorrhea has been apparently small.

In nonspecific infections of the upper urinary tract, sulfanilamid is more effective than all previous antiseptics, but it is an adjunct to mechanical urologic procedures, because without removal of obstructive factors the infection has either failed to respond or the infection has promptly recurred after its discontinuance.

Paper No. 4:

Sulfanilamid in Surgical Practice—Arthur Haim, M.D., 450 Sutter Street, San Francisco.

Discussion of the use of sulfanilamid compounds in conditions met with in surgical practice, with special emphasis on indications and contra-indications. Lantern slides will illustrate the immunobiologic management of a series of severe hemolytic streptococcus infections in which chemotherapy was used.

Discussion by William Mitchell, M.D., Los Angeles; Edgar Wayburn, M.D., San Francisco; Clayton Lyon, M.D., San Francisco; Shuler F. Fagan, M.D., Los Angeles.

Section Aides: Clarence H. Nelson, M.D., Los Angeles; Raymond D. Kay, M.D., Los Angeles; Mast Wolfsohn, M.D. Monterey; Garnett Cheney, M.D., San Francisco.

Second Meeting

Tuesday, May 2, 8:30 a. m.

SYMPOSIUM ON ALCOHOLISM

This will be a joint meeting with the Neuropsychiatry Section.

Paper No. 5:

The Importance of Individual Tolerance to Alcohol in the Evaluation of Chemical Tests of Drunkenness—Henry W. Newham, M.D., Stanford University School of Medicine, San Francisco.

The metabolism of alcohol proceeds at a constant rate, and is peculiarly resistant to change. It is thus possible to estimate, from one blood alcohol determination, the blood alcohol concentration at some previous time. The determination of alcohol in body fluids or in breath is simple and accurate. The weak point in the chemical diagnosis of drunkenness is due, however, to the fact that different individuals do not show the same degree of intoxication with the same blood alcohol concentration, due to inherent and acquired tolerance to alcohol. This tolerance has been shown to be a true tissue tolerance, and is not due to decreased absorption or increased elimination of alcohol.

Paper No. 6:

Psychiatric Treatment of Alcoholism—J. L. Henderson, M.D., Compton Sanitarium, Compton.

Alcoholism is widespread, has serious economic, social and medical aspects, and its treatment is probably second in human importance only to that of schizophrenia. Recently, literature points toward the family background of the alcoholic as being of major etiologic significance. This, it appears, has a profound influence upon the development of the individual's personality, and it is in this setting that alcoholism develops. Thus it is that we speak of an "alcoholic personality." Certain classifications can be applied to alcoholics, and this is of help principally in the matter of prognosis. The present commitment laws, discussed and compared with commitment laws of other states. Treatment of alcoholism in the state hospitals is reviewed. Approach to the problem through intensive psychotherapy is outlined and problems involved in individual treatment discussed. This approach has certain advantages and certain limitations. Its contributions to the solution of the problem of alcoholism are evaluated.

Paper No. 7:

Subacute Alcoholic Cirrhosis of the Liver: A Clinical and Pathological Study of Eighty Cases—Ernest M. Hall, M.D., University of Southern California School of Medicine, Los Angeles; W. A. Morgan, M. D., Los Angeles County Hospital, Los Angeles.

A study of some eighty cases of cirrhosis in the early phase in which the liver is enlarged and often fatty, showing a subacute proliferative inflammation. Such livers selected on anatomic grounds were associated with chronic alcoholism in 80 per cent of the patients.

Paper No. 8:

The Use of Vitamins in the Treatment of Alcoholic Disorders—John M. Askey, M.D., 902 Wilshire Medical Building, Los Angeles.

A review of the recent developments in the recognition of the rôle of vitamin deficiencies in the etiology of alcoholic disorders; with a discussion of the present trend in therapy.

Discussion by Emil Bogen, M.D., Los Angeles; Percy Poliak, M.D., San Francisco; John M. Nagle, M.D., Agnew; P. J. Hanzlik, M.D., San Francisco; Newton Evans, M.D., Los Angeles; Charles L. Connor, M.D., San Francisco; George H. Houck, M.D., Los Angeles.

Paper No. 9*:

Clinical-Pathological Conference—Conducted by Chester S. Keefer, M.D., Associate Professor of Medicine, Harvard Medical School, Boston; William Dock, M. D., Professor of Pathology, Stanford Medical School, San Francisco; and Jesse Carr, M.D., University of California Hospital, San Francisco.

Note.—Protocols of the cases under discussion, with complete clinical histories and laboratory findings, will be distributed. These case histories will be discussed by the guest speaker and differential diagnoses presented, following which the pathological findings will be presented and discussed.

The three cases may be summarized briefly as follows:

1. Febrile illness of two years' duration; appendectomy and nephropexy without relief of abdominal pain.
2. Severe hypertension noted after pneumonia in a man whose pressure was normal a few months before. Postoperative complications following splanchnic nerve resection.
3. Twenty-five years of "peptic ulcer" history followed by appearance of abdominal masses, cough, and hemoptysis.

⁂

Third Meeting

Wednesday, May 3, 8:30 a. m.

Paper No. 10:

The Treatment of Syphilis in the Tuberculous Patient—Walter Beckh, M.D., 490 Post Street, San Francisco.

The problems incident to the coexistence of syphilis and tuberculosis are considered, and a discussion of the correlation of the treatment of syphilis and tuberculosis is presented.

Discussion by George V. Kulchar, M.D., San Francisco; Philip Pierson, M.D., San Francisco.

Paper No. 11:

Anemia as a Cause of Angina Pectoris—Francis M. Smith, M.D., Scripps Metabolic Clinic, La Jolla.

Case reports and review of literature to show that cardiac pain indistinguishable from angina pectoris may be a symptom of anemia. Anemia, particularly pernicious anemia, may be masked by severe angina pectoris. Considerations of angina pectoris in relation to various factors, as hemoglobin levels, presence or absence of coronary arterial disease, and reactions to therapy of the underlying anemia.

Discussion by Franklin Nuzum, M.D., Santa Barbara; E. Manning Clarke, Los Angeles.

Paper No. 12:

Chairman's Address—Causes of Death in Diabetes: An Autopsy Review—Howard F. West, M.D., 1930 Wilshire Boulevard, Los Angeles.

The active literature on diabetes deals chiefly with problems relating to diabetes as a disease entity. With better measures of control the diabetic's life is being increasingly prolonged. An autopsy study has been made to illustrate primarily the clinical problems involved in the care of these patients aside from specific treatment.

Paper No. 13:

The Practical Interpretation of Laboratory Tests in the Diagnosis of Infectious Diseases—Chester S. Keefer,

---

* This Clinical-Pathologic Conference will be a General Meeting, commencing at 11:15 a.m. Presiding, President William W. Roblee, M. D.; Director, William H. Barrow, M. D. See special notice under General Meetings.

M. D., Associate Professor of Medicine, Harvard Medical School, Boston, Massachusetts (By invitation.)

There is no group of diseases in which the physician relies more on laboratory examinations than in the diagnosis of infectious diseases. The various bacteriologic and serologic examinations which are in common use will be discussed and assessed in the light of present-day knowledge, and illustrative cases will be cited to stress both the value and the limitations of laboratory methods in diagnosis.

Business Recess

Business meeting and election of officers.

⁂

Fourth Meeting

Wednesday, May 3, 1:30 p. m.

SYMPOSIUM ON POLIOMYELITIS

This is a joint session of Medicine and Pediatrics Sections.

Paper No. 14:

The Basic Nature of Poliomyelitic Infection—Harold K. Faber, M.D., Stanford University School of Medicine, San Francisco.

In this paper will be discussed the virus of poliomyelitis, its tissue affinities, its mode of entrance into the body, the lesions it causes and the bearing which these features have on symptomatology, diagnosis, prevention, and treatment.

Paper No. 15:

Some Basic Contributions of Experimental Poliomyelitis to Our Knowledge of the Human Problem—E. W. Schultz, M.D., Stanford University School of Medicine, San Francisco.

A summary of the fundamental aspects of poliomyelitis as gathered from studies of the experimental disease, with special reference to its pathogenesis and the problems it presents from the standpoint of the treatment and the prevention of the acute disease.

Paper No. 16:

Symptomatology and Differential Diagnosis in Poliomyelitis—Albert G. Bower, M.D., Clinical Professor of Medicine, University of Southern California Medical School, Los Angeles.

The criteria for the recognition of the preparalytic (abortive) case of poliomyelitis and the evaluation of the spinal-fluid findings. Consideration of the carrier problem. A discussion of the relationship of the pathology and spinal-fluid findings.

Paper No. 17:

The Treatment of Poliomyelitis—Edward B. Shaw, M.D., 384 Post Street, San Francisco.

Our practical knowledge of the treatment of this disease is mostly concerned with the support of damaged muscles, the prevention of contractures, the maintenance of respiration and other vital functions, the maintenance of complete bodily rest, and measures to facilitate the restoration of function.

Serum treatment is a matter of great theoretical interest; it is our only approach, whether effective or not, to specific therapy.

Note.—At the conclusion of the symposium a motion picture film on poliomyelitis will be shown. This film has been prepared by Albert G. Bower, M.D., of Los Angeles, and shows methods of diagnosing in the admitting room; hospital treatment after the diagnosis is completed, including the respirator and respirator room; postquarantine orthopedic hospital warm pool, and physical therapy treatments.

Fifth Meeting

Thursday, May 4, 8:30 a. m.

SYMPOSIUM ON DISEASES OF THE GASTRO-INTESTINAL TRACT

Paper No. 18:

The Viscerospinal Syndrome and Its Relation to the Alimentary Tract—Neville T. Ussher, M.D., The Santa Barbara Clinic, Santa Barbara.

Some new observations of the "viscerospinal syndrome" in relation to particular sections of the alimentary tract. Studies and treatment of two hundred patients included in this group are summarized. A description is given of the nervous mechanism of the syndrome and its application to the observed cardiospasm, pylorospasm, colic, and spastic constipation.

Discussion by Gordon E. Hein, M.D., San Francisco; F. M. Pottenger, M.D., Monrovia.

Paper No. 19:

Diagnostic Value of Gastroscopy—Allan L. Cohn, M.D., 450 Sutter Street, San Francisco.

Gastroscopy with the flexible gastroscope is a simple, safe procedure facilitating the study of the stomach interior. Its value is demonstrated by colored lantern slides in the following conditions: (1) chronic superficial, hypertrophic and atrophic gastritis; (2) early diagnosis of carcinoma; (3) ulcer, (*a*) localization, (*b*) aid in therapeutic management, (*c*) differential diagnosis between benign and malignant ulcer; (4) postoperative stomach.

Discussion by L. R. Chandler, M.D., San Francisco; Fred Kruse, M.D., San Francisco.

Paper No. 20:

Recent Advances in Treatment of Hematemesis and Melena—Grant H. Lanphere, M. D., 1908 Wilshire Boulevard, Los Angeles. (Lantern demonstration.)

Pathologic anatomy of morbid changes at site of hemorrhage. Immediate diagnosis of cause of bleeding not necessary, since initial treatment is the same, no matter the source. Classification of bleeding according to severity. Intrinsic gastro-intestinal lesions caused hematemesis in majority of patients. Results of Meulengracht regimen as a means to reduce mortality from acute hemorrhage.

Discussion by William C. Boeck, M.D., Los Angeles; Clarence J. Berne, M.D., Los Angeles.

Paper No. 21:

The Efficacy of Liver Extract in the Treatment of Ulcerative Colitis—Garnett Cheney, M. D., 210 Post Street, San Francisco.

Consideration of causative factors in idiopathic ulcerative colitis; susceptibility of colon to ulceration; allergy; infection; and nervous system influences. Clinical types of ulcerative colitis. Failure of usual modes of therapy. Results obtained with parenteral liver extract in treating twenty-five cases followed from six to eighteen months.

Discussion by Eugene L. Armstrong, M.D., Los Angeles; Edwin L. Bruck, M.D., San Francisco.

Paper No. 22:

The Gall-Bladder in Relation to Chronic Arthritis of Unknown Etiology—Robert S. Peers, M.D., 2939 Summit Street, Oakland.

A study of gall-bladder pathology as determined by x-ray visualization in relation to the onset, progress, prognosis and response to treatment in chronic arthritis of unknown etiology.

Discussion by A. A. Alexander, M.D., Oakland; Edward W. Boland, M.D., Los Angeles.

II

GENERAL SURGERY

Loren R. Chandler, M.D., *Chairman*
Stanford University Medical School, San Francisco
Ray B. McCarty, M.D., *Secretary*
Mission Inn Rotunda, Riverside
Frederick S. Foote, M.D., *Assistant Secretary*
Dante Hospital, San Francisco

First Meeting

Monday, May 1, 1:30 p. m.

Symposium on Sulfanilamid

This will be a joint meeting with the General Medicine Section.

Already Listed as Paper No. 1.

Pharmacology of Sulfanilamid and Related Compounds—Windsor C. Cutting, M.D., Department of Pharmacology, Stanford Medical School, and William L. Cover, M.D., San Bernardino.

Sulfanilamid, neoprontosil, and sulfapyridin will be compared briefly chemically and in their general effects on bacteria. The controversy concerning the mode of action, and the differences in absorption, distribution, excretion, toxicity, and therapeutic use will be discussed in some detail.

Already Listed as Paper No. 2.

Sulfanilamid and Sulfapyridin in the Treatment of Various Infections—Chester S. Keefer, M. D., Associate Professor of Medicine, Harvard Medical School, Boston, Mass. (By invitation.)

The results of the use of sulfanilamid in the treatment of hemolytic streptococcal, gonococcal, meningococcal, and urinary-tract infections will be summarized, and its mode of action and toxic effects will be discussed. A new derivative of sulfanilamid, sulfapyridin, has been used for the treatment of pneumococcus pneumonia. The present status of this drug will be reviewed. Its indications, mode of action, and side effects will be stressed.

Already Listed as Paper No. 3.

Urological Uses of Sulfanilamid—Bernard Silver, M.D., 1712 North Highland, Hollywood.

In the three years since the introduction of sulfanilamid in urologic practice its efficacy in gonorrhea has been established in many large series of cases, but despite this, its effect on the total incidence of gonorrhea has been apparently small.

In nonspecific infections of the upper urinary tract, sulfanilamid is more effective than all previous antiseptics, but it is an adjunct to mechanical urologic procedures, because without removal of obstructive factors the infection has either failed to respond or the infection has promptly recurred after its discontinuance.

Already Listed as Paper No. 4.

Sulfanilamid in Surgical Practice—Arthur Haim, M.D., 450 Sutter Street, San Francisco.

Discussion of the use of sulfanilamid compounds in conditions met with in surgical practice, with special emphasis on indications and contra-indications. Lantern slides will illustrate the immunobiologic mangement of a series of severe hemolytic streptococcus infections in which chemotherapy was used.

Discussion by William Mitchell, M.D., Los Angeles; Edgar Wayburn, M.D., San Francisco; Clayton Lyon, M.D., San Francisco; Shuler F. Fagan, M.D., Los Angeles.

Second Meeting

Tuesday, May 2, 8:30 a. m.

Paper No. 23:

Chairman's Address: Imperforate Anus and Its Surgical Treatment—Loren R. Chandler, M.D., Stanford University Medical School, San Francisco.

The embryology concerned in the formation of the imperforate anus and congenital fistulae from the bowel to the genito-urinary tract is presented. The clinical features of the conditions, aids to diagnosis, and the surgical treatment are discussed. It is pointed out that control of the intestine can be obtained without preservation of the external anal sphincter, provided the function of the levätor ani muscles is preserved. Five cases are reported.

Paper No. 24:

Duodenal Obstruction of Congenital Origin—Harold H. Lindner, M.D., 490 Post Street, San Francisco; and John B. DeC. M. Saunders, F.R.C.S. (Ed.), University of California Hospital, San Francisco. (By invitation.)

As a result of a recent study of cases illustrating congenital duodenal valve formation, stenosis and malposition, the authors, following a preliminary discussion of existing views, offer new embryologic evidence of etiologic correlation with congenital obstructive lesions occurring elsewhere in the intestines. Clinical diagnosis and treatment of these conditions are discussed.

Discussion by Jacob Smith, M.D., San Francisco; Philip M. Savage, Sr., M.D., San Bernardino.

Business Recess

Business meeting and election of officers.

Paper No. 25:

The Surgical Treatment of Diseases of the Extra Hepatic Biliary Tract—Philip J. Cunnane, M.D., 1052 West Sixth Street, Los Angeles.

An analysis of two hundred consecutive cases. An evaluation of diagnostic procedures and preoperative preparatory measures. Pathology encountered and its operative treatment. Comparative results of conservative and emergent treatment of acute cholecystic disease. Postoperative care, mortality, and morbidity.

Discussion by Walter A. Bayley, M.D., Los Angeles; Stanley H. Mentzer, M.D., San Francisco.

Paper No. 26:

Diverticulitis of the Colon—Clarence J. Berne, M.D., 1136 West Sixth Street, Los Angeles, and A. C. Pattison. M.D.. 595 East Colorado Street, Pasadena.

This is a study of the surgically important complications of diverticulosis of the colon seen at the Los Angeles General Hospital since 1930. The complications particularly considered are acute infection, stricture, and fistula. Particular consideration will be given to the relative value of conservative and operative treatment of the acute cases, with an evaluation of the various operative procedures.

Discussion by Dudley V. Saeltzer, M.D., Sacramento; Meredith G. Beaver, M.D., Redlands.

Paper No. 27:

The Use of Antiseptics in Colon Surgery—Clarence E. Rees, M.D., Rees-Stealy Clinic, San Diego.

Various antiseptics were injected into the loops of the colons of animals and their efficacy determined by means of cultures. The work may form a basis for a technique to be used in colon surgery, whereby the infectiousness of the colon contents will be reduced and

---

Section Aides: Carleton Mathewson, Jr., M.D., San Francisco; Robert Scarborough, M.D., San Francisco; Newman K. Bear, M.D., Riverside; Martin W. Debenham, M.D., San Francisco.

the incidence of peritonitis resulting therefrom correspondingly lessened.

Discussion by Carleton Mathewson, Jr., M.D., San Francisco; Caleb S. Stone, Jr., M.D., Santa Barbara.

Paper No. 28:

Intestinal Obstruction Incident to Acute Appendicitis—Calvin A. Lauer, M.D., 117 East Eighth Street, Long Beach; and Harold Totten, M.D., 8224 South Broadway, Los Angeles.

Ten years of consecutive intestinal obstruction cases incident to appendicitis treated at Los Angeles General Hospital.

A study is made of the effect on the incidence of obstruction by the following factors: Type of appendiceal pathology, and the treatment used, including type of incision and drainage methods, and accessory procedures.

Discussion by George D. Brown, M.D., Pomona.

⁂

Third Meeting

Wednesday, May 3, 8:30 a. m.

SYMPOSIUM ON CARCINOMA OF THE BREAST

This will be a joint meeting with the Radiology Section.

Paper No. 29:

The Spread of Breast Cancer—Eric Liljencrantz, M.D., Stanford University Hospital, San Francisco.

Distribution of metastases, in a thousand patients dying with carcinoma has been studied. Breast carcinoma has been found to spread more widely than any other epithelial tumor. Its paths of metastases have been traced, representative material collected. This is presented to illustrate problems which must be faced in clinical management.

Paper No. 30:

Borderline Intraductal Hyperplasias of the Breast—Alson R. Kilgore, M.D., 490 Post Street, San Francisco.

Overgrowths within ducts cause rise to persistent disagreement among pathologists. Probably most examples are benign and remain so, but some are certainly precancerous. Diagnostic significance of nipple erosion and discharges. (Illustrative cases.)

Paper No. 31:

Surgical Treatment of Carcinoma of the Breast—Stuart W. Harrington, M.D., Mayo Clinic, Rochester, Minn. (By invitation.)

Recognition of malignant disease of the breast by clinical signs and symptoms depends on the duration of the lesion at the time of examination; these signs and symptoms are hopelessly inadequate in determining early malignant disease.

There are many factors which influence prognosis, the most important of which are the type of malignant disease which is present, the degree of malignancy as shown by the microscopic examination of the tissue, the age of the patient, the presence of other conditions such as diabetes, exophthalmic goiter, etc., the extent of the disease at the time of operation, and the thoroughness with which the radical operation is done. The following studies and results of operation are based on a series of 5,105 cases in which the patients were operated on in the period of 1910–1935, inclusive.

Discussion by H. Glenn Bell, M.D., San Francisco; Verne C. Hunt, M.D., Los Angeles; Robert E. Stone, M.D., San Francisco; Lyell C. Kinney, M.D., San Diego.

Paper No. 32:

Treatment of Carcinoma of the Breast from the Standpoint of the Radiologist—U. V. Portmann, M. D., Cleveland Clinic, Cleveland, Ohio. (By invitation.)

Discussion by Robert E. Stone, M.D., San Francisco; Lyell C. Kinney, M.D., San Diego.

⁂

Fourth Meeting

Wednesday, May 3, 1:30 p. m.

Paper No. 33:

Experimental Production of Breast Lesions by Injection of Gonadotropic and Estrogenic Hormones—Nelson J. Howard M.D., 350 Post Street, San Francisco.

Normal growth and development of the breast in rats. Pathologic states of the rat breast produced by chronic hormone injections. The relation of hormones to pathologic changes encountered in human breast tissue; infantile, adolescent and adult. Chronic mastitis, benign, fibro-adenoma, and cancer.

Discussion by Henry J. Ullmann, M.D., Santa Barbara; Alson R. Kilgore, M.D., San Francisco.

Paper No. 34:

Beyond the Thyroid—Conrad J. Baumgartner, M.D., 523 West Sixth Street, Los Angeles.

Technical hazards of thyroidectomy are: (1) Hemorrhage. (2) Recurrent laryngeal nerve injury. (3) Parathyroid injury. These hazards are greatly obviated by full knowledge of the anatomy of the region of the thyroid. This presentation demonstrates a telescopic view, motion picture in color of an anatomical dissection of the region about the thyroid.

Discussion by George Thomason, M.D., Los Angeles; Wallace Terry, M.D., San Francisco.

Paper No. 35:

Modern Methods of Aiding Wound Healing—Hall G. Holder, M.D., 233 A Street, San Diego; and Eaton M. McKay, M.D., 476 Prospect Street, La Jolla.

Removal of necrosis and débris from wounds. Effect of urea experimentally and clinically. Blood supply. Experimental demonstration of deleterious effects of germicidal agents on granulation tissue and epithelialization. Consideration of epithelializing agents. Experimental and clinical use of thio-urea.

Discussion by Leighton Ray, M.D., Santa Rosa; John M. Schmoele, M.D., Los Angeles.

Paper No. 36:

Uses of Staphylococcus Toxin and Antitoxin in General Surgery—Charles Weiss, Ph.D., M.D., Mount Zion Hospital, San Francisco.

A review of newly developed knowledge concerning the immunology of staphylococcus toxin and its rôle in surgical infections. Methods measuring immunity in patients. Experiences with staphylococcus toxin and antitoxin in the treatment of staphylococcus septicemia, boils, osteomyelitis, etc. The absorption and elimination of antistaphylococcus antibody. The combined use of antitoxin and sulfanilamid.

Discussion by Robert P. Sutherland, M.D., Oakland; Albert G. Bower, M.D., Glendale.

Paper No. 37:

Skin Grafting: With Report of New Procedure—Arthur E. Smith, M.D., D.D.S., 1930 Wilshire Boulevard, Los Angeles, and James B. Johnson, M.D., 1930 Wilshire Boulevard, Los Angeles.

The presentation will consist of a brief consideration of the various methods of skin grafting and their relative merits. Special attention will be paid to the subdermal implant method, which we believe to be original, and to a method of removing split skin of desired calibration. Most of the allotted time will be consumed in illustrating various methods by colored motion pictures, depicting the surgical procedure of several cases.

Discussion by E. Eric Larson, M.D., Los Angeles; George Warren Pierce, M.D., San Francisco.

⁂

Fifth Meeting

Thursday, May 4, 8:30 a. m.

Paper No. 38:

Cancer of the Nasopharynx and Maxillary Sinus with Treatment—James F. Percy, M.D., 1030 South Alvarado Street, Los Angeles.

This paper is based on fifty cautery operated patients with advanced and otherwise hopeless cancer and sarcoma of the nasopharynx and maxillary antrum. All had previously been treated by various methods and abandoned. What constituted advanced cancer of this region of the body is related; pathology and treatment are described. Cautery will be demonstrated.

Discussion by Thomas F. Mullen, M.D., San Francisco; Franklyn D. Hankins, M.D., Riverside.

Paper No. 39:

Polypoid Bronchial Tumors—Alfred Goldman, M.D., University of California Hospital, San Francisco.

Polypoid bronchial tumors are of three types—carcinomatous, adenomatous, and a large group of several histologic types which are often confused with adenomata. The differentiation of adenomtata, comprising approximately 10 per cent of all bronchial tumors from carcinomata has given to medicine a curable bronchial tumor previously thought to be fatal.

Discussion by Leo Eloesser, M.D., San Francisco; John G. Jones, M.D., Los Angeles.

Paper No. 40:

Papaverin Hydrochlorid in the Treatment of Mesenteric Thrombosis—Leo J. Madson, M. D., 710 Wilshire Boulevard, Los Angeles.

A case report is cited of mesenteric thrombosis proved by surgery and treated by intravenous papaverin hydrochlorid, with recovery.

The paper presents a proved case of mesenteric thrombosis which has been successfully treated medically; urges the use of papaverin hydrochlorid in the field of obstructive mesenteric thrombosis.

Discussion by Donald C. Collins, M.D., Los Angeles; William Whitfield Crane, M.D., Oakland.

Paper No. 41:

Pharyngo-esophageal Diverticula—John Hunt Shephard, M.D., 609 Medico-Dental Building, San Jose.

A short review of the symptoms and diagnosis; comments on the present-day accepted operative procedures; and a description of a modified, one-stage technique.

Discussion by Charles Roller, M. D., Woodland; Francis B. Settle, M. D., Long Beach.

Paper No. 42:

Treatment of Varicose Veins—S. H. Babington, M.D., 2301 Ward Street, Berkeley.

Causes of varicose veins; methods of therapy from earliest to the present time; injection method—pros. and cons; contra-indications for injection; tests for suitability prior to injection; untoward reactions and how to avoid them; review of results of about five thousand injections at Oakland Health Center and in private practice.

Discussion by John Louis Lohse, M.D., Oakland; Stanton Sherman, M.D., San Francisco.

III

OBSTETRICS AND GYNECOLOGY SECTION

George W. Coon, M.D., *Chairman*
3770 Twelfth Street, Riverside

John N. Ewer, M.D., *Vice-Chairman*
411 Thirtieth Street, Oakland

William Benbow Thompson, *Secretary*
1930 Wilshire Boulevard, Los Angeles

First Meeting

Monday, May 1, 1:30 p. m.

Paper No. 43:

Hyperemesis Gravidarum: A Clinical Study of One Hundred and Twenty Cases Treated by Suprarenal Cortex and Vitamin B_1 Preparations—Abraham Bernstein, M.D., 390 Post Street, San Francisco.

Of one hundred and twenty cases of nausea and vomiting of pregnancy, 10.8 per cent were severe, 6.6 per cent were reflex, and the rest were moderate in character. The entire group was treated with suprarenal cortex and vitamin B_1 after other methods had failed. The results and rationale of treatment are carefully discussed.

Discussion opened by Alice F. Maxwell, M.D., San Francisco.

Paper No. 44:

Menstrual Disturbances of the Climacteric with Endometrial Findings—Gertrude Flint Jones, M. D., 490 Post Street, San Francisco.

A study of the four types of endometrium from which bleeding at the climacteric and before the menopause may take place, *i. e.*, secretory, proliferative, hyperplastic, and atrophic. An attempt has been made to discover a relationship between the type of endometrium, the character of the bleeding and the symptom of hot flushes, and/or the appearance of APH in the blood. The histology of endometrium found in bleeding cases at this period should logically influence the choice of therapy.

Discussion by Charles Frederick Fluhmann, M.D., San Francisco; Samuel J. Glass, M.D., Los Angeles.

Paper No. 45:

The Use of Equine Gonadotropic Serum in Gynecology—George Joyce Hall, M.D., 626 Medico-Dental Building, Sacramento.

Derivation and "what is it?" Effects on laboratory animals (very short notation). Clinical application in such conditions as: amenorrhea, primary and secondary; hypomenorrhea; dysmenorrhea; menorrhagia; hypogonad conditions; sterility (functional); menopause—no effect. Case histories. Summarization of statistics of results. Comments. Conclusions. (Lantern demonstrations.)

Discussion by L. F. Hawkinson, M.D., Oakland; Sheldon Payne, M.D., Los Angeles.

Paper No. 46:

Pediatric Gynecology—Goodrich C. Schauffler, M.D., 548 Medical Arts Building, Portland. (By invitation.)

This discussion will include: (1) Psychologic factors; (2) special methods of examination; (3) differential factors between the immaturity and maturity in relation to anatomy and physiology; (4) detailed consideration of management—of affections of: (*a*) vulva; (*b*) clitoris; (*c*) hymen; (*d*) rectum (*e*) va-

---

Section Aides: R. Glenn Craig, M.D., San Francisco; Erle M. Henriksen, M.D., Los Angeles.

gina; (*f*) cervix; (*g*) tubes, ovaries, and pelvic peritoneum.

Discussion by Frank W. Lynch, M.D., San Francisco.

Paper No. 47:

Hysterectomy for Chronic Salpingitis—John C. McDermott, M.D., 1930 Wilshire Boulevard, Los Angeles.

Salpingectomy alone is frequently performed for chronic salpingitis. In a large number of cases following this procedure, irregular, prolonged, and profuse uterine bleeding develops, and a hysterectomy becomes necessary. It is, therefore, suggested that subtotal hysterectomy should accompany the salpingectomy.

Discussion by Philip H. Arnot, M.D., San Francisco; William Buster McGee, M.D., San Diego.

Paper No. 48:

Rupture of Membranes Prior to Onset of Labor: Results of Stimulation of Contractions—Raymond D. McBurney, M. D., 825 South Alvarado Street, Los Angeles.

Rupture of the membranes prior to the onset of labor. A comparison of the management and results obtained in two series representing clinic and private cases. Data and discussion concerning the difficulties met with in those cases where the onset of labor is prolonged more than six hours following rupture of the membranes.

Discussion by Margaret Schulze, M.D., San Francisco.

⁂

Second Meeting

Wednesday, May 3, 8:30 p. m.

Paper No. 49:

Major Complications Encountered in a Study of Nine Thousand Three Hundred Ninety-Four Obstetrical Cases at the University of California Hospital—P. L. Martin, M.D., University of California Hospital, San Francisco.

This study is based on twenty-two years of obstetrical experience in the University of California Hospital. The relative rôles of the pelvis, the pains and the position, are studied in difficult labors. The sequelae of cesarean section are compared with those from operative delivery by the vaginal route. Toxemia, heart disease and diabetes with pregnancy are studied. The results of a general plan of conservative obstetrical management are evaluated in terms of fetal and maternal mortality.

Discussion by Charles Harold Lewis, M.D., Santa Monica.

Paper No. 50:

Aspiration Pneumonitis: A Factor in Maternal Morbidity—Charles C. Hall, M.D., 411 Thirtieth Street, Oakland.

The author reports a case in which a patient vomited during the course of a gas anesthetic for low forceps delivery, and died thirteen days later. Autopsy showed a very extensive pneumonitis probably of a chemical nature. The possibility of such an occurrence is referred to in the standard books on anesthesia, but a careful search of the medical literature failed to reveal a single case, reported in any detail. Without much difficulty, however, the author has collected several cases by inquiring among his associates, so that he is convinced that the condition is not rare, though rarely fatal. This paper tries to study these collected cases and ascertain why the incident occurs; what the nature of the pathologic lesion is, whether this accident can be prevented, and how the condition can be treated.

Discussion by Philip H. Pierson, M.D., San Francisco; Karl Schaupp, M.D., San Francisco.

Business Recess

Business meeting and election of officers.

Paper No. 51:

Chairman's Address: The Patient's Concept of Maternity Care and Obstetrical Anesthesia as Obtained from Popular Sources—George W. Coon, M. D., 3770 Twelfth Street, Riverside.

A critical review of recent popular magazine articles on prenatal care and anesthesia, and of available free literature on these subjects, along with a résumé of questionnaires sent to past maternity patients, in an endeavor to obtain their reactions to various obstetrical procedures and preferences of anesthesia.

Paper No. 52:

Studies in Sterility: The Results in Five Hundred Cases—Erle Henriksen, M.D., 523 West Sixth Street, Los Angeles.

Brief summarization of the innumerable etiologic items accounting for sterility in five hundred couples. No routine for treatment of sterility; emphasis on appraising male fertility before advising possible unwarranted treatment in the female. Complicated routines requiring elaborate equipment replaceable by competent clinical study and intelligent recognition of possible causative factors.

Discussion by R. Glenn Craig, M.D., San Francisco; W. K. Lamb, M.D., Berkeley.

Paper No. 53:

Comparative Results of the Various Contraceptive Techniques—Nadina R. Kavinoky, M.D., 1930 Wilshire Boulevard, Los Angeles.

The comparative results of various contraceptive techniques will be discussed. Comment on the studies made from records in the contraceptive clinics. An analysis is also made of the factors which contribute to increasing the efficiency of the standard methods, together with factors involved where the methods failed. The newer contraceptives will be discussed. (Lantern demonstration.)

Discussion by Henry A. Stephenson, M. D., San Francisco.

◆

IV

EYE, EAR, NOSE, AND THROAT SECTION

Clifford Walker, M.D., *Chairman*
427 West Fifth Street, Los Angeles
Harry Wiley, M.D., *Vice-Chairman*
2701 Florence Avenue, Huntington Park
Dewey R. Powell, M.D., *Secretary*
501 Medico-Dental Building, Stockton

First Meeting

Monday, May 1, 1:30 p. m.

Paper No. 54:

The Effect of Orthoptic Training on the Reading Ability—C. A. Broaddus, M.D., 905 Medico-Dental Building, Stockton.

The object of all orthoptic training is to give the patient more comfort in reading and at the same time to increase his speed and comprehension. Heretofore, we have not had accurate means of determining the patient's reading ability before treatment nor any way of measuring his improvement from such treatment or exercise. In this paper such methods are described and their results demonstrated.

Discussion by Avery Hicks, M.D., San Francisco.

Section Aide: Harry Wiley, M.D., Huntington Park.

Paper No. 55:

Optical Keratoplasty: An Evaluation—Max Fine, M.D., 490 Post Street, San Francisco.

The reported results of corneal transplantation by various authors display a great discrepancy due largely to lack of standardization of terms, but due also to differences in technique and in the selection of cases. The indications for the operation are now well defined and a statistical basis for prognosis is now available. The author gives reasons for believing that the most efficient technique is a modification of the operation of Castroviejo, using two corneal sutures for fixation of the graft. Two cases of permanently successful transplantation by this method are described.

Discussion by David Harrington, M.D., San Francisco.

Paper No. 56:

Vitamin A Deficiency in Asthenopia—Frederick C. Cordes, M.D., and David O. Harrington, M.D., 384 Post Street, San Francisco.

The paper presents a brief review of vitamin A and its relation to the eye. In addition, it reports a series of approximately eighty cases with asthenopia and low biophotometer readings. In a very high percentage of these cases symptoms were relieved by the administration of carotene.

Discussion by Hans Barkan, M.D., San Francisco.

Paper No. 57:

Cornea Plana: Complicated by Glaucoma—Harold F. Whalman, M.D., 1147 Roosevelt Building, Los Angeles.

A description of this condition is given, with references to the literature on the subject. The frequent occurrence of glaucoma as a complication to this anatomical anomaly is supported by a case report of a young woman who came under the observation of the essayist three years ago. Pilocarpin has adequately controlled tension and fields since that time.

Discussion by Hans Barkan, M.D., San Francisco.

Paper No. 58:

Interesting Ocular Muscle Conditions—Roderic O'Connor, M.D., 1904 Franklin Street, Oakland.

A series of reports of interesting muscle conditions is presented with comments thereon.

Discussion by George Hosford, M.D., San Francisco.

⁂

Second Meeting

Tuesday, May 2, 8:30 a. m.

Paper No. 59:

Chronic Nonhealing Lesions of the Nose—Russell Fletcher, M.D., Medico-Dental Building, San Francisco.

Occasionally one encounters lesions in the nose which do not respond to the usual methods of treatment. The differential diagnosis may be difficult, necessitating biopsy. The treatment depends upon the diagnosis. Report of cases diagnosed by biopsy as tuberculosis and/or sarcoid.

Discussion by Matthew Hosmer, M.D., San Francisco.

Paper No. 60:

Problems of the Hard of Hearing: Committee Report—Francis L. Rogers, M.D., 360 Junipero Avenue, Long Beach.

Review of objectives and accomplishments of the Committee on Problems of the Hard of Hearing for 1934–1939, and consideration of the future plans. Approximately 720,000 handicapped citizens of California who are deafened present economic problems. Deafness as a factor in juvenile delinquency. Standardization of audiometric tests. Part that otologists should play in the problem of the hard of hearing.

Discussion by Roy Jones, M.D., Sacramento.

Business Recess

Business meeting and election of officers.

Paper No. 61:

Osteomyelitis of the Frontal Bone—Lewis F. Morrison, M.D., 490 Post Street, San Francisco.

Report of two cases, lantern slides, and discussion of the methods of treatment.

Discussion by R. C. Martin, M.D., San Francisco.

Paper No. 62:

Relief of Neuritis of the Eighth Cranial Nerve with Vitamin B_1—K. C. Brandenburg, M.D., 110 Pine Avenue, Long Beach.

A short review of the important facts concerning methods of administration, dosage, excretion, storage, toxicity, and sources of vitamin B_1 will be accompanied by the report of a case of severe tinnitus, following extensive irradiation for carcinoma of the cervix uteri, relieved by treatment with thiamin chlorid. Other possible applications of this form of therapy in neuritis of the cranial nerves will be suggested.

Discussion by Dewey R. Powell, M.D., Stockton.

⁂

Third Meeting

Wednesday, May 3, 1:30 p. m.

SYMPOSIUM ON HEADACHES

Paper No. 63:

Headaches, from the Standpoint of the Internist—Dwight L. Wilbur, M.D., and Lindol R. French, M.D., 490 Post Street, San Francisco.

In this paper will be considered the etiology, mechanism of production, the clinical and diagnostic features of common chronic headaches, such as those of the rheumatic, toxic, reflex, vascular, psychoneurotic and migrainous type.

Paper No. 64:

Headaches, from the Standpoint of the Neurologist—O. W. Jones, Jr., M.D., 384 Post Street, San Francisco.

"Headache of Intracranial Origin." A discussion of various intracranial disorders of which headache is a common symptom.

Paper No. 65:

Headaches, from the Standpoint of the Ophthalmologist—W. D. Horner, M.D., 490 Post Street, San Francisco.

Headaches in ophthalmic practice are common, being only exceeded by defective vision as a major complaint. The characteristics of these headaches are discussed. Their mechanism is reviewed as referred pain through the fifth and sympathetic nerves and from local disorders of the extra-ocular muscles, accommodation, retinal function, and congestive states.

Paper No. 66:

Headaches, from the Ear, Nose, and Throat Standpoint—Herbert J. Cohn, M.D., 450 Sutter Street, San Francisco.

History of complaint, causes, location, symptomatic determination. Coexistence of other diseases. Specific localization. (1) Frontal; (2) Lateral; (3) Occipital; (4) Vertex.

Suppurative and nonsuppurative type. Intracranial and extracranial causes. General remarks.

Discussion of the above papers by Edmund J. Morrissey, M.D., San Francisco; C. B. Courville, M.D., Los Angeles; Russell Fletcher, M.D., San Francisco; S. P. Lucia, M.D., San Francisco.

V

ANESTHESIOLCGY SECTION

John G. Dunlop, M.D., *Chairman*
168 South Kingsley Drive, Los Angeles
Adena C. Dutton, M.D., *Secretary*
2400 Pacific Avenue, San Francisco

First Meeting

Monday, May 1, 1:30 p. m.

Paper No. 67:

Chairman's Address: Anesthetic Practices in Thoracic Surgery—John G. Dunlop, M.D., 168 South Kingsley Drive, Los Angeles.

This report is based upon personal communications with thoracic surgeons and anesthetists at the larger medical centers in this and other English-speaking countries.

Preoperative preparation and medication, the anesthetic agents and techniques preferred, and the methods employed to minimize the danger of spread of infection throughout the lungs, are discussed.

Paper No. 68:

Anesthetic Technique in Plastic Surgery of the Head and Neck—A. J. Wineland, M.D., 338 South Saint Andrews Place, Los Angeles.

A presentation of the author's experience with closed endotracheal anesthesia in reconstructive and general surgery of the head and neck during the past ten years. The advantages of this technique to the operating team and patient will be discussed.

Discussion by Albert Davis, M.D., San Francisco; John A. Stiles, M.D., San Francisco. (By invitation.)

Paper No. 69:

Nitrous Oxid Anesthesia—Philip K. Gilman, M.D., 2000 Van Ness Avenue, San Francisco.

Preliminary considerations, secret of satisfactory anesthesia, teamwork among members of the operating group, preparation of the patient, handling and position of the patient before, during and after operation, relaxation, shock, fluids, opiates, advantages and difficulties of nitrous oxid anesthesia, statistical data—fifteen years' experience, and conclusions.

Discussion by Ehler H. Eiskamp, M.D., Santa Cruz; Emelie Anderson, M.D., San Francisco.

Paper No. 70:

Trichlorethanol: Animal Experimentation—Evelyn Hart Case, M.D., Department of Anesthesia, Stanford University School of Medicine, San Francisco.

Preliminary report on the use of trichlorethanol in animals. A comparative study was made of the effective and toxic dosage of trichlorethanol and tribromethanol, given intraperitoneally to rats. Results of pathologic examinations, of those dying from large doses after repeated increasing doses of the drugs are included.

Discussion by Maurice L. Tainter, M.D., San Francisco.

Paper No. 71:

A Plea for the Accurate Rating of Anesthetics—Paul Campiche, M.D., 450 Sutter Street, San Francisco.

To appraise accurately the value of various anesthetics, the author proposes a method of "rating" based on the combined opinions of competent anesthetists and expressed by a single figure, making rapid comparison possible. The ideal general anesthetic is described and a possible method of achieving it is discussed.

Discussion by Dorothy Wood, M.D., San Francisco.

Second Meeting

Tuesday, May 2, 8:30 a. m.

Paper No. 72:

Spinal Anesthesia—Leo L. Stanley, M.D., San Quentin.

In twenty-five years at San Quentin, 220 operations were performed with inhalants, and 4,674 with spinal anesthesia. Dosage of procain ranged from one and one-half to four grains, according to the operation. Ephedrin was the only preoperative medication. There were three deaths, only one of which was attributed directly to spinal anesthesia. Administration, complications, duration of anesthesia, are discussed.

Discussion by Lloyd R. Reynolds, M.D., San Francisco; Reginald F. Grant, M.D., San Francisco.

Paper No. 73:

Subarachnoid Block: "Saddle Area" Distribution—Edward H. Bolze, M.D., 516 Sutter Street, San Francisco.

Introduction, definitions, anatomy; technique of administration and drugs used. Report of 150 minor rectal operations where this type of anesthesia was used and conclusions are given.

Discussion by David Susnow, M.D., San Francisco; Robert Scarborough, M.D., San Francisco; M. J. Groper, M.D., San Francisco; Jacob Smith, M.D., San Francisco.

Business Recess

Business meeting and election of officers.

Paper No. 74:

Pentabarbital Sodium—Nembutal—in Obstetric Analgesia—Gwendolyn Campion, M.D., 909 Hyde Street, San Francisco.

Pharmacology, physiologic action and toxicity; requirements of an obstetrical analgesic; effects noted on analgesia, excitement or restlessness, condition of child, type of delivery, length of labor; short review of the literature and comparison of findings.

Discussion by Donald A. Dallas, M.D., San Francisco; Ethel Righetti, M.D., San Francisco.

Paper No. 75:

Management of Senile Patients for Anesthesia and Operation—Walter Lawrence, M. D., 54 Brentwood Avenue, San Francisco.

A regimen is suggested for the preoperative care, premedication, anesthesia, and postoperative management of senile surgical patients, which should aid in reducing the mortality rate in such cases. A review of a series of surgical prostate and fracture cases is presented to illustrate the regimen described.

Discussion by George McChesney, M.D., San Francisco; Lionel Player, M.D., San Francisco.

◆

VI

DERMATOLOGY AND SYPHILOLOGY SECTION

Norman N. Epstein, *Chairman*
450 Sutter Street, San Francisco
Franklin I. Ball, *Vice-Chairman*
6253 Hollywood Boulevard, Hollywood
Arne E. Ingels, *Secretary*
490 Post Street, San Francisco

First Meeting

Monday, May 1, 1:30 p. m.

Paper No. 76:

Chairman's Address: The Present Status of Artificial Fever in the Treatment of Syphilis—Norman N. Epstein, M.D., 450 Sutter Street, San Francisco.

Section Aides: Edwin H. Keeley, M.D., San Diego; David N. Treweek, M.D., West Hollywood; Harry J. Smith, M.D., Oakland; Karolina B. Jump, M.D., San Mateo.

Section Aides: Charles Albert Shumate, M.D., San Francisco; Herman V. Allington, M.D., Oakland.

Paper No. 77:

Treatment of Dermatophytosis—Harry E. Alderson, M.D., 490 Post Street, San Francisco.

General considerations; general care of patient; local care of lesions; after-care and prophylaxis.

Discussion by Hiram E. Miller, M.D., San Francisco; Merlin Maynard, M.D., San Jose.

Paper No. 78:

Public Health Measures in Combating Syphilis—Malcolm H. Merrill, M.D., State Department of Public Health, Civic Center, San Francisco.

The present official syphilis control program in California will be summarized. The administrative machinery will be described, the main objectives of the program discussed. Statistics on reporting, clinic activities, assistance to private physicians, laboratory services and educational activities will be given. The relationship between the health departments and private physicians will be discussed.

Discussion by Howard Morrow, M.D., San Francisco; Walter Dickie, M.D., San Francisco (by invitation); Harry J. Templeton, M.D., Oakland.

Paper No. 79:

Pigmented Eruptions Occurring in Patients Receiving Arsenicals and Bismuth in the Treatment of Syphilis—Irving R. Bancroft, M.D., and Chris R. Halloran, M.D., 1052 West Sixth Street, Los Angeles.

Observations taken from the study of twenty patients who developed skin eruptions while receiving arsenicals or bismuth in the treatment of syphilis. Several different types of pigmentary eruptions were observed, one type so closely simulating lichen planus as to be indistinguishable either clinically or histologically. (Lantern-slide demonstration of the various types of eruptions, together with histologic and chemical findings.)

Discussion by Frederick G. Novy, Jr., M.D., Oakland; Julius Scholtz, M.D., Los Angeles.

Paper No. 80:

Recurrent Herpetiform Dermatitis Repens — Samuel Ayres, Jr., M.D., and Nelson P. Anderson, M.D., 2007 Wilshire Boulevard, Los Angeles.

A report of a series of six cases of a hitherto undescribed clinical entity, consisting of a chronic, recurrent, superficial, spreading vesicular and undermining eruption affecting chiefly the neck, axillae, and crotch. The lesions appear spontaneously without any history of trauma or drug ingestion, and are rebellious to therapy.

Discussion by George Kulchar, M.D., San Francisco; P. K. Allen, M.D., San Diego.

Paper No. 81:

Differential Diagnosis of Keratoderma Blennorrhagicum and Psoriasis Arthropathica—Ervin Epstein, M.D., 1624 Franklin Street, Oakland.

There is a dispute in the literature as to whether these conditions are identical or not. The differential diagnosis of the two conditions may be very difficult in individual cases. However, a statistical review of a large series of recorded cases indicates certain differential points that make it seem most likely that gonorrheal keratoses and the arthropathic form of psoriasis are separate entities that can be distinguished from the standpoint of etiology, clinical and laboratory findings, prognosis, and response to different forms of therapy.

Discussion by C. Russell Anderson, M.D., Los Angeles; H. V. Allington, M.D., Oakland.

Second Meeting

Tuesday, May 2, 8:30 a. m.

Paper No. 82:

Poison Oak and Poison Ivy: "Dermatitant Units," as a Standard Measure of Potency for Extracts from these Plants—Ernest K. Stratton, M.D., 490 Post Street, San Francisco.

The dermatitant strength rather than the solids content of extracts of poison oak and poison ivy is suggested as a unit of measure, owing to the presence of varying quantities of the former in the different extracts.

Preliminary testing of the extracts is done on the skins of animals incapable of being sensitized, such as the rabbit, rat, and mouse. Ten thousand "dermatitant units," the minimum reactive dose for these animals, is determined in this manner. For use on sensitized skins, such as those of the guinea pig and human, dilutions or concentrations can then be made so that 0.1 cubic centimeter represents 10 units, 100,000 units, or any number of units between these two extremes.

Discussion by Albert H. Rowe, M.D., San Francisco; Thomas W. Nisbet, M.D., Pasadena.

Paper No. 83:

Occupational Dermatoses in the Aircraft Industry—C. Ray Lounsberry, M.D., 233 A Street, San Diego.

A three years' study of occupational dermatoses found in one of America's largest aviation manufacturing plants, the Consolidated Aircraft Corporation of San Diego, as dermatological consultant. In this study Doctor Lounsberry takes up certain allergic industrial dermatoses associated with new metals which are used in the manufacturing of airplanes.

Discussion by Kendal Frost, M.D., Los Angeles; Eric Liljencrantz, M.D., San Francisco.

Business Recess

Business meeting and election of officers.

Paper No. 84:

Fungus Infection of Eyelashes—C. J. Lunsford, M.D., 3115 Webster Street, Oakland.

R. J., boy, age seven years, came to the office because of tinea capitis. Subsequently he developed a tinea corporis and blepharitis. The loosened eyelashes were microscopically positive for fungi, and cultures of them showed microsporon lanosum. This was true of all areas affected. Discussion of treatment and review of literature.

Discussion by Frank Ball, M.D., Los Angeles; Charles Shumate, M.D., San Francisco.

Paper No. 85:

A Statistical and Pathologic Review of Thirty Cases of Melanoma Studied in the Past Twenty Years—Laurence R. Taussig, M.D., and Frances Torrey, M.D., 384 Post Street, San Francisco.

The course and eventual outcome of the group of patients with malignant melanoma seen at the University of California Dermatologic Service and in private practice. The palliative or curative effects of various types of treatment will be discussed. The relationship of the microscopic appearance to the clinical course will be noted.

Discussion by Clement E. Counter, M.D., Long Beach; Robert Stone, M.D., San Francisco.

Paper No. 86:

Tinea Capitis on the Pacific Coast—Edward A. Levin, M.D., 450 Sutter Street, San Francisco.

A study of fifty cases with microscopic and cultural findings. A description of the type of organism found predominantly on the Pacific Coast, and the relationship of this type of organism to treatment and prognosis. Based on these findings the various forms of therapeutic agents usually employed are discussed, and a simplified form outline of treatment is presented.

The exhibit will consist of photographs showing the various clinical forms of tinea capitis, photomicrographs of the appearance of the infected hairs under the microscope and gross cultures of the two chief types of ringworm, causing tinea capitis.

Discussion by Robert Stewart, M.D., San Francisco (by invitation); Otto P. Diederich, M.D., Fresno.

Paper No. 87:

Pruritus Ani and Its Relationship to Seborrheic Dermatitis and Dermatophytosis—Paul D. Foster, M.D., 2007 Wilshire Boulevard, Los Angeles, and Malcolm R. Hill, M.D., 927 West Seventh Street, Los Angeles.

It has been noted by both authors independently that a definite relationship exists between attacks of pruritus ani and an exacerbation of either seborrheic dermatitis or dermatophytosis of the feet.

It appears to us that in many cases pruritus ani is an allergic reaction from the above condition. Many cases of pruritus ani, when cultures are negative for fungi, will respond to treatment of the toxic focus without local medication. It is granted that there are many causes of pruritus ani, both of local and constitutional etiology. However, at least a majority of these cases are toxic in the same way as the dermatophytid of the hands; this latter condition is a well-recognized entity. We also know that in some severe cases the toxemia produced will cause a generalized body eruption.

This paper is for the purpose of calling to the attention of the profession that many of their persistent and exasperating cases of pruritus ani will respond only when the basic focus has been removed specifically, seborrheic dermatitis and dermatophytosis.

Discussion by Ernest D. Chipman, M.D., San Francisco; Charles Caskey, M.D., Los Angeles.

VII

INDUSTRIAL MEDICINE AND SURGERY SECTION

Harvey G. McNeil, M.D., *Chairman*
523 West Seventh Street, Los Angeles

George H. Sanderson, M.D., *Vice-Chairman*
242 North Sutter Street, Stockton

John S. Stephens, M.D., *Secretary*
1136 West Sixth Street, Los Angeles

First Meeting

Tuesday, May 2, 9:30 a. m.

Paper No. 88:

Fractured Necks of the Femur: The Simplest Method of Direct Fixation—James M. Marshall, M.D., 1215 Chorro Street, San Luis Obispo.

A description of the technique of using multiple Kirschner wire pins, without incision, in obtaining positive fixation of the fragments with minimum risk. Report on end-results.

Discussion by Keene O. Haldeman, M.D., San Francisco.

Paper No. 89:

The Industrial Back from the Internist's Viewpoint: An Analytical and Statistical Study—Rutherford T. Johnstone, M.D., 423 Towne Avenue, Los Angeles.

No single entity in industrial medicine remains so ill-defined as the "disabling back." The orthopedist offers a diagnostic tableau which finds no unanimity of opinion. The general practitioner and industrial physician consistently stereotype all these cases with a diagnosis of "back strain or sacro-iliac strain." This proffered paper proposes to analyze three thousand cases examined from a standpoint of history, physical examination, x-ray studies, laboratory findings, reaction to treatment, length of treatment and temporary disability. The incidence of infection, disease of the adjacent organs, congenital anomalies, structural defects, neurologic aspects and trauma, is cited. Certain conclusions are suggested from the statistics.

Discussion by Frederic C. Bost, M.D., San Francisco.

Paper No. 90:

The Z Nail—Vernon P. Thompson, M.D., 2007 Wilshire Boulevard, Los Angeles.

The Z nail is specially adapted for the internal fixation of intracapsular femoral neck fractures. There is one universal length of such strength and shape as to control shear and rotation. Centimeter-spaced holes provide visual and x-ray calibration and self-retention by bone growth through them. Modified Z nails are adapted to the fixation of epicondylar, capitellar, malleolar and other fractures.

Discussion by Steele F. Stewart, M.D., Los Angeles.

Paper No. 91:

Depressed Skull Fractures—Mark Albert Glaser, M.D., and Frederick P. Shafer, M.D., 1118 Roosevelt Building, Los Angeles.

This will consist of a follow-up study of one hundred cases for a period of one to eight years with some original remarks as to the value of encephalography, case reports, dural repair based upon experimental studies, and post-traumatic epilepsy, as well as the handling of bony defects.

In addition, a follow-up study of the x-rays showing the status of the bone following grafts and fractures will be presented.

Discussion by E. J. Morrissey, M.D., San Francisco.

Second Meeting

Wednesday, May 3, 2:00 p. m.

Paper No. 92:

Errors in the Treatment of Fractured Carpal Scaphoid—Francis M. Findlay, M.D., Suite 1220 First National Bank Building, San Diego.

Fracture of the carpal scaphoid is a very common injury, frequently overlooked. Neglect in prompt recognition of this injury usually results in permanent disability because of secondary changes that occur in the bone. Immediate, adequate, and prolonged immobilization of the wrist usually results in complete recovery. The importance of repeated x-ray examinations and adequate immobilization are clearly stressed with lantern slides of illustrative cases.

Discussion by Richard McGoveny, M. D., Santa Barbara.

Paper No. 93:

Treatment of Interfascial Hematoma—Harold E. Crowe, M.D., 2417 South Hope Street, Los Angeles.

These lesions occur as the result of trauma. They are large collections of blood extravasated between the superficial fascia and deep fascia. It is a common practice in Europe and America to treat such hematomata by the application of heat. This treatment results commonly in gangrene, sloughing, and the formation of large secondarily infected ulcers which heal very slowly. The cause of this is explained. Treatment by pressure bandage is described. (With lantern slides.)

Discussion by Charles L. Lowman, M. D., Los Angeles.

Business Recess

Business meeting and election of officers.

Paper No. 94:

Factors to Be Considered in Bone Metabolism, with Suggestions as to Control—Charles F. Nelson, M.D., Suite 332, Beverly Professional Building, Beverly Hills.

The blood chemistry of several thousand patients reveals that 68 per cent show deficiencies in calcium, 35 per cent in phosphorus. Fresh fracture cases show 85 per cent low in calcium, 25 per cent low in phosphorus. Most patients with bone diseases, delayed union of fractures, have mineral imbalance. Observations of this study suggest: Mineral imbalance produces lowered resistance; demineralization probably precedes all bone diseases, including arthritis; predisposes to fractures and causes delayed union; soft callus can be mineralized in many instances without surgery; with optimal mineral balance, fractures will heal in syphilitic or diabetic patients; mineral imbalance should be established immediately in all fractures. A detailed management of several thousand cases of mineral imbalance has demonstrated that a ratio of three to one should be maintained with an optimal blood calcium of from 10 to 12 milligrams and an optimal blood phosphorus of from 3.5 to 4 milligrams. Other factors which influence bone metabolism will be discussed.

Discussion by Ward Rolland, M.D., Los Angeles.

Paper No. 95:

A Review of the End-Results in Fractures of the Os Calcis—Russell F. Jaekle, M.D., and Albert G. Clark, M.D., 450 Sutter Street, San Francisco.

Forty-four cases of acute fractures of the os calcis admitted to the Boulder City Hospital are presented. A simple classification of these fractures is offered from which a fairly accurate estimate of the end-results, in percentage of total permanent disability, can be made at the time of the first examination.

Discussion by Samuel S. Mathews, M. D., Los Angeles.

VIII

NEUROPSYCHIATRY SECTION

John B. Doyle, M.D., *Chairman*
1930 Wilshire Boulevard, Los Angeles

George S. Johnson, M.D., *Secretary*
Stanford University Hospital, San Francisco

First Meeting

Tuesday, May 2, 8:30 a. m.

Symposium on Alcoholism

This is a joint meeting with the General Medicine Section.

Already Listed as Paper No. 5.

The Importance of Individual Tolerance to Alcohol in the Evaluation of Chemical Tests of Drunkenness—Henry W. Newman, M.D., Stanford University School of Medicine, San Francisco.

The metabolism of alcohol proceeds at a constant rate, and is peculiarly resistant to change. It is thus possible to estimate, from one blood alcohol determination, the blood alcohol concentration at some previous time. The determination of alcohol in body fluids or in breath is simple and accurate. The weak point in the chemical diagnosis of drunkenness is due, however, to the fact that different individuals do not show the same degree of intoxication with the same blood alcohol concentration, due to inherent and acquired tolerance to alcohol. This tolerance has been shown to be a true tissue tolerance, and is not due to decreased absorption or increased elimination of alcohol.

Already Listed as Paper No. 6.

Psychiatric Treatment of Alcoholism—J. L. Henderson, M.D., Compton Sanitarium, Compton.

Alcoholism is widespread, has serious economic, social and medical aspects, and its treatment is probably second in human importance only to that of schizophrenia. Recently, literature points toward the family background of the alcoholic as being of major etiologic significance. This, it appears, has a profound influence upon the development of the individual's personality, and it is in this setting that alcoholism develops. Thus it is that we speak of an "alcoholic personality." Certain classifications can be applied to alcoholics, and this is of help principally in the matter of prognosis. The present commitment laws, discussed and compared with commitment laws of other states. Treatment of alcoholism in the state hospitals is reviewed. Approach to the problem through intensive psychotherapy is outlined and problems involved in individual treatment discussed. This approach has certain advantages and certain limitations. Its contributions to the solution of the problem of alcoholism are evaluated.

Already Listed as Paper No. 7.

Subacute Alcoholic Cirrhosis of the Liver: A Clinical and Pathologic Study of Eighty Cases—Ernest M. Hall, M.D., University of Southern California School of Medicine, Los Angeles; W. A. Morgan, M. D., Los Angeles County Hospital, Los Angeles.

A study of some eighty cases of cirrhosis in the early phase in which the liver is enlarged and often fatty, showing a subacute proliferative inflammation. Such livers selected on anatomic grounds were associated with chronic alcoholism in 80 per cent of the patients.

Already Listed as Paper No. 8.

The Use of Vitamins in the Treatment of Alcoholic Disorders—John M. Askey, M.D., 902 Wilshire Medical Building, Los Angeles.

A review of the recent developments in the recognition of the rôle of vitamin deficiencies in the etiology of alcoholic disorders; with a discussion of the present trend in therapy.

Discussion by Paul J. Hanzlik, M.D., San Francisco; Percy Poliak, M.D., San Francisco; John M. Nagle, M.D., Agnew; Newton Evans, M.D., Los Angeles; Charles L. Connor, M.D., San Francisco; George H. Houck, M.D., Los Angeles.

Already Listed as Paper No. 9.*

Clinical-Pathological Conference—Conducted by Chester S. Keefer, M.D., Associate Professor of Medicine, Harvard Medical School, Boston; William Dock, M. D., Professor of Pathology, Stanford Medical School, San Francisco; and Jesse Carr, M.D., University of California Hospital, San Francisco.

Note.—Protocols of the cases under discussion, with complete clinical histories and laboratory findings, will

---

Section Aides: R. B. Raney, M.D., Los Angeles; William T. Grant, M.D., Los Angeles.

* This Clinical-Pathologic Conference will be a General Meeting, commencing at 11:15 a.m. Presiding, President William W. Roblee, M. D.; Director, William H. Barrow, M. D. See special notice under General Meetings.

be distributed. These case histories will be discussed by the guest speaker and differential diagnoses presented, following which the pathological findings will be presented and discussed.

The three cases may be summarized briefly as follows:

1. Febrile illness of two years' duration; appendectomy and nephropexy without relief of abdominal pain.
2. Severe hypertension noted after pneumonia in a man whose pressure was normal a few months before. Postoperative complications following splanchnic nerve resection.
3. Twenty-five years of "peptic ulcer" history followed by appearance of abdominal masses, cough, and hemoptysis.

⁂

Second Meeting

Wednesday, May 3, 1:30 p. m.

Paper No. 96:

Chairman's Address: Santiago Ramón y Cajal—John B. Doyle, M.D., 1930 Wilshire Boulevard, Los Angeles.

The life of Cajal is reviewed briefly. Emphasis is laid upon the characteristics of the man as well as his contributions to the field of neurology.

Paper No. 97:

Quantitative Methods in the Diagnosis of Brain Tumors—William T. Grant, M.D., 1136 West Sixth Street, Los Angeles.

The measuring and graphic recording of neurological responses constitute a great advance in the earlier recognition and localization of brain tumors. Instead of reporting that the sense of smell is diminished on one side we may now employ the technique of Elsberg and say that the minimum identifiable odor is so many cubic centimeters by blast injection. Such quantitative methods have been devised for many parts of the neurological examination, allowing absolute values to be determined. They enable comparisons to be made among different patients, and also in the same patient from time to time. It is proposed to review briefly the various methods and to comment on their application.

Discussion by Frederick L. Reichert, M. D., San Francisco.

Business Recess

Business meeting and election of officers.

Paper No. 98:

Anancastic Depressions: Obsessive-Compulsive Symptoms Occurring During Depressions—Ernest G. Lion, M.D., 490 Post Street, San Francisco.

Clinical observations made on patients at Stanford University Hospitals and the Psychiatric Clinic of Yale University School of Medicine, who exhibited obsessive-compulsive symptoms occurring predominantly during the course of a depression, form the basis of this paper. Illustrative cases are presented. The characteristics of the mental status and the physiologic concomitants are discussed. The rigid, anancastic prepsychotic personality which was found, and its influence on the course of the illness, are considered. The diagnostic problems involved are mentioned. The way of experiencing is differentiated from the experiential content. Emphasis is placed upon the need of judicious therapeutic management of these patients.

Discussion by Sydney K. Smith, M.D., Oakland.

Paper No. 99:

Mongolism: A Study of Two Hundred and Sixty Institutional Cases, with Special Emphasis on Congenital Heart Conditions—Robert E. Wyers, M.D., Pacific Colony, Spadra; Kate Brousseau, Ph.D., Los Angeles, and Robert W. Langley, M.D., 1930 Wilshire Boulevard, Los Angeles.

Various theories on Mongolism were reviewed and a study made of all such cases in Sonoma State Home and Pacific Colony to compare our findings with those reported previously. This study deals with etiology, incidence, and anomalies—under anomalies special emphasis being put upon congenital heart lesion.

Discussion by F. O. Butler, M.D., Sonoma.

⁂

IX

PATHOLOGY AND BACTERIOLOGY SECTION

Alvin G. Foord, M.D., *Chairman*
Huntington Memorial Hospital, Pasadena
Roy W. Hammack, M.D., *Secretary*
657 South Westlake Avenue, Los Angeles
Paul H. Guttman, M.D., *Assistant Secretary*
1127 Eleventh Street, Sacramento

First Meeting

Monday, May 1, 1:30 p. m.

Paper No. 100:

Chairman's Address: Thrombosis of Mesenteric Vein—Alvin G. Foord, M.D., Huntington Memorial Hospital, Pasadena.

So-called spontaneous thrombosis of the superior mesenteric vein is a rare acute abdominal lesion. A review of recent literature as to its frequency, clinical symptoms, and discussion of etiology, pathogenesis, and pathologic results will be given. A report of an autopsied case without clinically demonstrable antecedent abdominal disease, is reported.

Paper No. 101:

Traumatic Hemorrhages of the Brain Stem—A. M. Moody, M.D., St. Francis Hospital, San Francisco, and Jesse Carr, M.D., University of California Hospital, San Francisco.

Over a period of ten years, a series of cases has been collected at the San Francisco Coroner's office and elsewhere, in which trauma, delivered externally to the face and head, had caused hemorrhages in the medulla and pons Varolii. The mechanism of production of this type of brain lesion, the clinical and pathological sequences, and the histopathology at autopsy will be discussed.

Paper No. 102:

Causes of the Occasional Failure of the Subcutaneous Inoculation of Guinea Pigs for the Demonstration of Tubercle Bacilli when Present in Very Small Numbers—J. E. Pottenger, M.D., Pottenger Sanatorium and Clinic, Monrovia.

Resistance to infection of individual animals; the expulsion of the inoculum due to early nontuberculous abscess formation and ulceration; excess of inert matter in inoculum preventing the bacilli from coming in contact with the tissues of the animal.

Paper No. 103:

Mushroom Poisoning — Frederick Proescher, M.D., Santa Clara County Hospital, San Jose.

Report of six cases of mushroom poisoning caused by Amanita virosa. Clinical course and autopsy find-

---

Section Aides: Paul Guttman, M.D., Sacramento; Paul Michael, M.D., Oakland; Albert F. Brown, M.D., Los Angeles; Elmer W. Smith, M.D., San Francisco.

ings in two fatal cases will be discussed. Review of present knowledge of chemical nature of the Amanita poisons. Brief outline for treatment of mushroom poisoning.

Paper No. 104:

Arteriosclerotic Aneurysms of the Aorta and Major Arteries: A Clinico-Pathological Study—Clark E. Brown, M.D., 2411 Anacapa Street, Santa Barbara.

Nine arteriosclerotic aneurysms, eight of which are from postmortem and one from surgical material are reported. Aneurysms of the thoracic and abdominal aorta, hypogastric, renal, gluteal, popliteal and basilar arteries are considered. These are discussed from the standpoint of age, duration, symptoms, roentgenologic findings and gross pathological and microscopical appearance.

⁂

Second Meeting

Tuesday, May 2, 8:30 a. m.

Paper No. 105:

Latent Choriocarcinoma—Albert F. Brown, M.D.; Wilfred Snodgrass, M.D., and Orlyn B. Pratt, M.D., 312 North Boyle Avenue, Los Angeles.

Occurrence of pulmonary choriocarcinoma eight years after a molar pregnancy, demonstrates the ability of deported chorion to undergo delayed malignant development.

Complete hysterectomy, six years before the appearance of the choriocarcinoma, provides unusual proof of a genuine period of latency in this type of tumor.

Paper No. 106:

Bone Marrow Studies as a Diagnostic Aid in Early Leukemia—Ernest H. Falconer, M.D., 384 Post Street, San Francisco.

Paper presents clinical data of patients with actual or suspected blood dyscrasias. Aspirated sternal marrow studies are correlated with these clinical findings and laboratory studies in an attempt to rule in or out the diagnosis of leukemia. To evaluate sternal marrow biopsy as an aid to the early diagnosis of leukemia, is in particular, sought.

Business Recess

Business meeting and election of officers.

Paper No. 107:

On the Value of the Complement Fixation Test in the Diagnosis of Psittacosis—K. F. Meyer, M.D. (by invitation), George Williams Hooper Foundation for Medical Research, University of California, San Francisco.

Using boiled Maitland cultures of the particulate psittacosis virus or spleens of infected mice, as antigens is a very scientific complement-fixation system. Typical and abortive human infections have been diagnosed early in the course of the illness. The progressive rise of antibodies in the serum of a very severe laboratory infection in the light of these observations and the mechanism of immunity, will be discussed.

Paper No. 108:

Experimental Pathology Related to the Female Sex Hormones: a Review—Isabella H. Perry, M.D., Division of Pathology, University of California, San Francisco.

Since the isolation of the female sex hormone a decade ago a large and diverse literature has accumulated on lesions produced experimentally with it. These range from congenital sexual malformations to involutional hyperplasias, and include the endocrine, sex, skeletal, hematopoetic vascular, and nerve systems.

Paper No. 109:

Metastasis of Carcinoma to the Spleen—Paul H. Guttman, M.D., 605 Medico-Dental Building, Sacramento.

A review is given of the literature on the frequency of metastasis of carcinoma to the spleen. The anatomic factors controlling metastasis are also considered. A case is reported of carcinoma of the lung with extensive metastasis to the spleen.

⁂

X

PEDIATRICS SECTION

Harold K. Faber, M.D., *Chairman*
Stanford Hospital, San Francisco
Hartzell H. Ray, M.D., *Secretary*
23 Second Avenue, San Mateo
W. W. Belford, M.D., *Assistant Secretary*
Medico-Dental Building, San Diego

First Meeting

Monday, May 1, 1:30 p. m.

Paper No. 110:

Tubercle Bacilli in the Gastric Contents of Tuberculous Children—Samuel Hurwitz, M.D., 490 Post Street, San Francisco; E. Rosencrantz, M.D., University of California School of Medicine, San Francisco.

The gastric contents of 164 tuberculous children were inoculated into guinea pigs and the results were analyzed in relation to contact history, clinical findings, x-ray and pathological findings of the tonsils. Positive gastric washings were obtained in approximately 50 per cent of the group as a whole, in all cases under one year of age, and in 100 per cent of those with pathological tuberculous tonsils.

Discussion by Ernest Wolff, M.D., San Francisco; Lloyd Dickey, M.D., San Francisco.

Paper No. 111:

The Present Status of Pertussis Immunization—John J. Miller, M.D., 2000 Van Ness Avenue, San Francisco.

The evidence for and against different Phase I H. pertussis vaccines will be summarized. The literature as it pertains to immunization will be reviewed and summarized. An attempt will be made to analyze critically the material and make recommendations for the use of certain products.

Discussion by William C. Deamer, M.D., San Francisco.

⁂

Second Meeting

Wednesday, May 3, 8:30 a. m.

Business Recess

Business meeting and election of officers.

Paper No. 112:

Effective Sulfanilamid Dosage: The Value of Quantitative Blood Studies—William J. Mitchell, M.D., 1200 State Street, Los Angeles; Paul M. Hamilton, M.D., 284 East Main Street, Alhambra; and Albert G. Bower, M.D., 136 North Central, Glendale.

Most of the work done on sulfanilamid has dealt with its therapeutic properties from the qualitative

---

Section Aides: Ralph Netzley, M.D., Pasadena; John Rector, M.D., San Francisco; A. Lawrence Gleason, M.D., Oakland; Harry R. Lusignan, M. D., Monterey.

standpoint. Dosage has been accepted on an arbitrary ratio to body weight. Such an arbitrary dosage may produce an entirely inadequate blood concentration due to individual variations in absorption and excretion. Further, different diseases respond to different blood concentrations.

Discussion by Andrew B. Stockton, M.D., San Francisco.

Paper No. 113:

Erythema Infectiosum: With a Report of an Epidemic in San Francisco—Sidney N. Zuckerman, M.D., 490 Post Street, San Francisco.

This paper will include an introduction, the synonyms of erythema infectiosum, and a complete historical background of the disease. Following this will be a description of the disease picture based on a comparison of previously reported signs and symptoms with those observed in the San Francisco epidemic.* A report of 128 cases of erythema infectiosum occurring in San Francisco in the summer of 1938 will be given.

Discussion by K. F. Meyer, M.D., San Francisco; E. B. Shaw, M.D., San Francisco; E. A. Wayburn, M.D., San Francisco; Garnet Cheney, M.D., San Francisco.

⁂

Third Meeting

Wednesday, May 3, 1:30 p. m.

Symposium on Poliomyelitis

This is a joint meeting with the General Medicine Section.

Already Listed as Paper No. 14.

The Basic Nature of Poliomyelitic Infection—Harold K. Faber, M.D., Stanford University School of Medicine, San Francisco.

In this paper will be discussed the virus of poliomyelitis, its tissue affinities, its mode of entrance into the body, the lesions it causes and the bearing which these features have on symptomatology, diagnosis, prevention, and treatment.

Already Listed as Paper No. 15.

Some Basic Contributions of Experimental Poliomyelitis to Our Knowledge of the Human Problem—E. W. Schultz, M.D., Stanford University School of Medicine, San Francisco.

A summary of the fundamental aspects of poliomyelitis as gathered from studies of the experimental disease, with special reference to its pathogenesis and the problems it presents from the standpoint of the treatment and the prevention of the acute disease.

Already Listed as Paper No. 16.

Symptomatology and Differential Diagnosis in Poliomyelitis—Albert G. Bower, M.D., Clinical Professor of Medicine, University of Southern California Medical School, Los Angeles.

The criteria for the recognition of the preparalytic (abortive) case of poliomyelitis and the evaluation of the spinal fluid findings. Consideration of the carrier problem. A discussion of the relationship of the pathology and spinal fluid findings.

Already Listed as Paper No. 17.

The Treatment of Poliomyelitis—Edward B. Shaw, M.D., 384 Post Street, San Francisco.

Our practical knowledge of the treatment of this disease is mostly concerned with the support of damaged muscles, the prevention of contractures, the maintenance of respiration and other vital functions, the maintenance of complete bodily rest, and measures to facilitate the restoration of function.

Serum treatment is a matter of great theoretical interest; it is our only approach, whether effective or not, to specific therapy.

Note.—At the conclusion of the symposium a motion picture film on poliomyelitis will be shown. This film has been prepared by Albert G. Bower, M.D., of Los Angeles, and shows methods of diagnosing in the admitting room; hospital treatment after the diagnosis is completed, including the respirator and respirator room; postquarantine orthopedic hospital warm pool, and physical therapy treatments.

⁂

XI

RADIOLOGY SECTION

Karl M. Bonoff, M.D., *Chairman*
1930 Wilshire Boulevard, Los Angeles
Carl D. Benninghoven, M.D., *Secretary*
Mills Memorial Hospital, San Mateo

First Meeting

Monday, May 1, 1:30 p. m.

Paper No. 114:

The Clinical Aspect of Electrically Produced Gamma Rays—Albert Soiland, M.D., 1407 South Hope Street, Los Angeles.

Outside of radium, radioactive elements or salts, rays of ultra short wave length are obtained from any vacuum tube energized by high voltage. When this voltage reaches 500 kv., ultra short wave length radiation is in the ascendency, and after 2,000 kv. the emission is practically of the pure gamma type. Clinical experience with the higher voltages is commented upon in this report.

Discussion by John Lawrence, M.D., San Francisco; Frederick Rodenbaugh, M.D., San Francisco.

Paper No. 115:

The Treatment of Carcinoma of the Pharynx and Larynx—L. Henry Garland, M.D., 450 Sutter Street, San Francisco.

The majority of malignant tumors of the pharynx and larynx are already inoperable when presented for treatment. For those that are operable, it is to be emphasized that complete and total excision is the most certain method of cure. However, for the great majority of cases, which are unfortunately inoperable, the most efficient weapon which we have at our disposal today is roentgen irradiation. The present paper is a discussion of our method of roentgen therapy of these neoplasms, and of the results obtained, including a report of five years' survivals in cases both of laryngeal and pharyngeal cancer treated exclusively by roentgen irradiation.

Discussion by Robert E. Stone, M.D., San Francisco; Otto H. Pfleuger, M.D., San Francisco.

Paper No. 116:

Symmetrical Parietal Dysplasia—Robert A. Powers, M.D., 261 Hamilton Avenue, Palo Alto.

Symmetrical thinness of the skull has been described as senile atrophy, an atrophy not necessarily senile, as a congenital defect, as a result of muscular action, and even as of traumatic origin. Few reports in the roentgen literature have dealt with this unusual and striking condition. Report of a case discovered during routine examination.

---

* Permission to use the case reports was obtained through the courtesy of the San Francisco Department of Public Health.

Section Aides: Charles A. Galligan, Jr., M.D., Monterey; Arthur J. Williams, M.D., San Francisco; Wilbur Bailey, M.D., Los Angeles; Elmer N. Liljedahl, M.D., Los Angeles.

Discussion by C. S. Capp, M.D., San Francisco; E. E. Leef, M.D., San Francisco.

Paper No. 117:

Internal Cranial Hyperostosis: Its Clinical Significance—B. N. Tager, M.D., E. Kost Shelton, M.D., 921 Westwood Boulevard, Los Angeles; W. C. Matzen, M.D., 921 Westwood Boulevard, Los Angeles.

The general incidence, sex, and age distribution of internal cranial hyperostosis is established, and correlated with clinical and biochemical findings. Theories of etiology of this condition are briefly discussed.

Paper No. 118:

An Unusual Case of Dwarfism: Resulting from Roentgen Radiation of Pregnant Mother?—S. J. Glass, M.D., 1930 Wilshire Boulevard, Los Angeles.

A microcephalic dwarf, age eleven years, with failure of somatopsychic development. Was born after mother was subjected to weekly destructive roentgen radiation over pelvis during last six months of pregnancy in attempt to induce abortion.

Discussion by Benjamin Tager, M.D., Los Angeles; Clyde Emery, M.D., Los Angeles.

⁂

Second Meeting

Tuesday, May 2, 11:15 a. m.

GENERAL ASSEMBLY

Paper No. 119:

Some Indications for the Use of Roentgen-Ray Treatment—U. V. Portmann, M.D., Cleveland Clinic, Cleveland, Ohio. (By invitation.)

The newer developments in the treatment of inflammatory and endocrine disturbances will be discussed, as well as the treatment of carcinoma and the results to be expected from radiation.

Recess

PACIFIC ROENTGEN CLUB CONFERENCE

⁂

Third Meeting

Wednesday, May 3, 8:30 a. m.

SYMPOSIUM ON CARCINOMA OF THE BREAST

This is a joint meeting with the Surgical Section.

Already Listed as Paper No. 29.

The Spread of Breast Cancer—Eric Liljencrantz, M.D., Stanford University Hospital, San Francisco.

Distribution of metastases in a thousand patients dying with carcinoma has been studied. Breast carcinoma has been found to spread more widely than any other epithelial tumor. Its paths of metastases have been traced, representative material collected. This is presented to illustrate problems which must be faced in clinical management.

Already Listed as Paper No. 30.

Borderline Intraductal Hyperplasias of the Breast—Alson R. Kilgore, M.D., 490 Post Street, San Francisco.

Overgrowths within ducts cause rise to persistent disagreement among pathologists. Probably most examples are benign and remain so, but some are certainly precancerous. Diagnostic significance of nipple erosion and discharges. Illustrative cases.

Discussion by Robert E. Stone, M.D., San Francisco; Lyell C. Kinney, M.D., San Diego.

Already Listed as Paper No. 31.

Surgical Treatment of Carcinoma of the Breast—Stuart W. Harrington, M.D., Mayo Clinic, Rochester, Minn.

Recognition of malignant disease of the breast by clinical signs and symptoms depends on the duration of the lesion at the time of examination; these signs and symptoms are hopelessly inadequate in determining early malignant disease.

There are many factors which influence prognosis, the most important of which are the type of malignant disease which is present, the degree of malignancy as shown by the microscopic examination of the tissue, the age of the patient, the presence of other conditions such as diabetes, exophthalmic goiter, etc., the extent of the disease at the time of operation, and the thoroughness with which the radical operation is done. The following studies and results of operation are based on a series of 5,105 cases in which the patients were operated on in the period of 1910–1935, inclusive.

Surgical discussion for this program by H. Glenn Bell, M.D., San Francisco; Verne C. Hunt, M.D., Los Angeles.

Already Listed as Paper No. 32.

Treatment of Carcinoma of the Breast from the Standpoint of the Radiologist.—U. V. Portmann, M.D., Cleveland Clinic, Cleveland, Ohio. (By invitation.)

Discussion by Robert E. Stone, M.D., San Francisco; Lyell C. Kinney, M.D., San Diego.

⁂

Fourth Meeting

Wednesday, May 3, 1:30 to 4:00 p. m.

Paper No. 120:

Roentgenological Study of the Fractured Clavicle—R. S. Graham, M.D., 1830 L Street, Sacramento.

For more than two years the author has used an oblique view in addition to the usual postero-anterior projection to demonstrate the relationship of fragments in clavicle fractures. The advantages of biplane examination are discussed and demonstrated by slides, and the technical problem considered.

Paper No. 121:

Differential Diagnosis of Intestinal Obstruction by Means of X-ray Examination—Joseph Levitin, M.D., 516 Sutter Street, San Francisco.

Properly performed x-ray examination can often differentiate a mechanical obstruction, paralytic ileus, and peritonitis. A study is made of the abdomen by films, in two or more planes, and attention paid to the character of the loops of distended bowel, size and mobility.

Discussion by Clayton Lyons, M.D., San Francisco.

Paper No. 122:

Liver or Gall-Bladder Disease? A Simultaneous Functional Test for Each, with a Critical Evaluation—Charles S. Capp, M.D., University of California Hospital, San Francisco.

A group of hospitalized patients presenting major symptoms or signs of liver or gall-bladder dysfunction has been studied intensively. Every case had a simultaneous testing of liver excretory function coupled with cholecystographic functional tests. The completed hospital records have been critically reviewed, and a correlation attempted from the accumulated clinical findings, from the roentgen examinations, the clinical laboratory data, from the surgical and pathologic findings, and from a limited number of postmortem examinations.

Discussion by F. S. Foote, M.D., San Francisco; S. P. Lucia, M.D., San Francisco.

Paper No. 123:

Chairman's Address: Water Absorption from the Colon and Its Relation to Motility—Karl M. Bonoff, M.D., 1930 Wilshire Boulevard, Los Angeles.

Business Recess

Business meeting and election of officers.

PACIFIC ROENTGEN CLUB CONFERENCE

◆

XII

UROLOGY SECTION

CARL RUSCHE, M.D., *Chairman*
905 Taft Building, 1680 North Vine Street, Hollywood
JOHN A. DOUGHERTY, M.D., *Secretary*
3115 Webster Street, Oakland

First Meeting

Monday, May 1, 8:30 a. m.

Paper No. 124:

The Survey of a Series of Urologic Patients—Leon I. Oppenheimer, M.D., Dalziel Building, Oakland.

The survey of one thousand patients referred to the Urologic Department, Oakland Health Center, over a five-year period. A discussion of these conditions as they occurred in the men and women is undertaken with comparison as to relative frequency and character. The importance of maintaining an anatomic index is emphasized.

Discussion by James R. Dillon, M.D., San Francisco; A. J. Scholl, M.D., Los Angeles.

Paper No. 125:

Four Years' Experience with an Operation for the Relief of Impotence—Oswald S. Lowsley, M.D., 899 Park Avenue, New York City; Robert W. Hunt, M.D., 899 Park Avenue, New York City; and James L. Bray, M.D., 727 West Seventh Street, Los Angeles.

Technique of operation and results on selected cases over a period of four years. The type of impotence applicable to this procedure and also the contraindications are discussed. Chart of the operative cases and lantern slides of the operation will be presented.

Discussion by Nathan G. Hale, M.D., Sacramento; Lloyd Reynolds, M.D., San Francisco.

Paper No. 126:

Papilloma of the Kidney Pelvis—William W. Cross, M.D., 1624 Franklin Street, Oakland.

Case report: Nephrectomy four years ago for papilloma of renal pelvis. Recently the patient returned with a recurrence in the ureter of the same side. Lantern slide demonstration, some of which are colored.

Discussion by William E. Stevens, M.D., San Francisco; Paul Michael, M.D., Oakland. (By invitation.)

Paper No. 127:

Preoperative Estimation of the Risk in Urologic Surgery—James C. Negley, M.D., 229 North Central Avenue, Glendale.

Considers blood chemistry, kidney function, phthalein, electrocardiograms, type of operation, pathology present, number of patients on urology wards (10,522), number of blood chemistry examinations (8,341), number of patients (547) with abnormal blood chemistry, surgery done in this group of patients, and mortality rate.

Discussion by Albert M. Meads, M.D., Oakland; Dudley P. Fagerstrom, M.D., San Jose.

Paper No. 128:

Chairman's Address: Vesico-Intestinal Fistula (with report of four cases, namely, operative trauma complicated by carcinoma of the ovary, carcinoma of the sigmoid, gun-shot wound, and diverticulitis).—Carl Rusche, M.D., 906 Taft Building, Hollywood.

The paper consists of a discussion of the etiology, diagnosis, and treatment of vesico-intestinal fistula. Included are the reports of four interesting cases which demonstrate the common causes of the condition.

⁂

Second Meeting

Tuesday, May 2, 2:30 to 5:00 p. m.

Paper No. 129:

Is Cystoscopy Necessary in the Larger Prostatic Hypertrophies?—B. M. Palmer, M.D., Franklin Building, Oakland.

Section Aides: Thomas I. Buckley, M.D., Oakland; B. M. Palmer, M.D., Oakland.

Most picturesque of Del Monte's golf courses is the exclusive Cypress Point links.

The beautiful seventh hole on the Pebble Beach golf course.

Using lantern slides, we will present information obtained from a study of one hundred air cystograms and sodium iodid cystograms taken on patients having prostatic hypertrophy. We believe cystoscopy unnecessary in the larger prostatic hypertrophies.

Discussion by Nathaniel G. Alcock, M.D., Iowa City, Iowa. (by invitation); George W. Hartman, M.D., San Francisco; Curtis H. McDonnell, Sacramento.

Business Recess

Business meeting and election of officers.

Paper No. 130:

Treatment of Gonorrhea by Artificial Fever and by Fever Therapy in Combination with Sulfanilamid—Elmer Belt, M.D., 1893 Wilshire Boulevard, Los Angeles, and Alvin W. Folkenberg, M.D., 1893 Wilshire Boulevard, Los Angeles.

A résumé of cases treated: (1) with a single ten-hour fever at 106.7 degrees rectal temperature, (2) with sulfanilamid combined with multiple short fevers of 103 to 106 degrees, and (3) with a single fever equal to the thermal death time of the patient's own strain of gonococcus.

Discussion by F. B. Moor, M.D., Los Angeles; Rodney F. Atsatt, M.D., Santa Barbara; Gerald O'Hara, M.D., San Francisco. (By invitation.)

Paper No. 131:

Ureterostomy for Carcinoma of the Cervix—Lional P. Player, M.D., 384 Post Street, San Francisco.

Curettement without histological study several weeks previously. Patient referred because of hematuria. Cystoscopy revealed a submucosal neoplasm and bleeding from the left ureteral orifice. Rectovesical palpation gave one the impression that the tumor involved the rectal wall, uterus and bladder.

Discussion by Charles P. Mathe, M.D., San Francisco; Robert V. Day, M.D., Los Angeles.

Paper No. 132:

Ureteral Kinks and Strictures—H. C. Bumpus, Jr., M.D., 112 North Madison Avenue, Pasadena.

Paper consists of a discussion of ureterograms, with special reference to the interpretation of changes resulting from both intra and extra ureteral pathology. Included is the report of a case of ureteral intussusception and the demonstration of apparent strictures in fully dilated ureters.

Discussion by Thomas E. Gibson, M.D., San Francisco; James A. May, M.D., San Diego.

Paper No. 133:

Lymphogranuloma Venereum — The Fourth Venereal Disease—Pathology and New Treatment—Report of Twenty-five Cases—Abstract of Sixty Cases Treated at Panama, Canal Zone—Francis H. Redewill, M.D., Flood Building, San Francisco, and Captain C. F. Lyter, Medical Corps, U.S.A., Presidio of San Francisco. (By invitation.)

Pathology: (*a*) Inguinal type; (*b*) cases with anorectal syndrome. Treatment: Medical, surgical. Discussion of various preparations: Tartar emetic, stibyal, faudin, anthiomalin, sulfanilamid.

Anthiomalin (lithium antimoniothiomalate) effective in 50 per cent of cases. Dosage and method of administration. Signs and symptoms of saturation. Treatment with sulfanilamid more promising. Report of cases and comparison of treatment using various antimony drugs and sulfanilamid. Conclusions. (Lantern slides.)

Discussion by Miley B. Wesson, M.D., San Francisco.

The main lounge, Hotel Del Monte.

The dining room, Hotel Del Monte.

III—HOUSE OF DELEGATES MEETINGS

36th ANNUAL SESSION—AUDITORIUM, HOTEL DEL MONTE

Speaker, LOWELL S. GOIN, Los Angeles *Vice-Speaker*, JOHN H. GRAVES, San Francisco
Secretary, GEORGE H. KRESS, San Francisco

FIRST MEETING

Monday, May 1, 8 p. m.

Order of Business

1. Call to order.
2. Report of Committee on Credentials.
3. Roll call.
4. Announcement and approval of Reference Committees.*
   - (*a*) Committee on Credentials.
   - (*b*) Reference Committee on the Reports of Officers and Standing Committees.
   - (*c*) Reference Committee on the Report of the Council and the Report of the Secretary-Treasurer.
   - (*d*) Reference Committee on Resolutions, Amendments to the Constitution and By-Laws, and New and Miscellaneous Business.
5. President's address—William W. Roblee.

   Reports: †
6. Annual report of the Council—Karl L. Schaupp, Chairman.
7. Report of the Trustees Of The California Medical Association—Karl L. Schaupp, President.
8. Report of Auditing Committee—T. Henshaw Kelly, Chairman.
9. Report of Secretary-Treasurer—George H. Kress.
10. Report of Editor—George H. Kress.
11. Report of General Counsel—Hartley F. Peart.
12. Report of Committee on Public Relations—George G. Reinle.
13. Reports of Standing and Special Committees:
    - A. Standing Committees.
      - Executive Committee—T. Henshaw Kelly.
      - Committee on Associated Societies and Technical Groups—John V. Barrow.
      - Committee on Health and Public Instruction—Fred B. Clarke.
      - Committee on History and Obituaries—Frank R. Makinson.
      - Committee on Hospitals, Dispensaries and Clinics—W. Earl Mitchell.
      - Committee on Industrial Practice—Philip Stephens.
      - Committee on Medical Defense—George G. Reinle.
      - Committee on Medical Economics—John H. Graves.
      - Committee on Medical Education and Medical Institutions—Loren R. Chandler.
      - Committee on Membership and Organization—George D. Maner.
      - Committee on Postgraduate Activities—John C. Ruddock.
      - Committee on Publications—Ralph Eusden.
      - Committee on Public Policy and Legislation—Junius B. Harris.
      - Committee on Scientific Work—George H. Kress.
      - Committee on Public Relations—George G. Reinle.
      - Cancer Commission—Alson R. Kilgore.
    - B. Special Committees.
      - Committee on Medical Research—Philip K. Gilman.
      - Committee on Syphilis—Howard Morrow.
      - Committee on Cancer Exhibit, Golden Gate International Exposition—T. Henshaw Kelly.
      - Committee on County Hospitals—Louis A. Packard.
      - Committee on a Basic Science Law—George H. Kress.
14. Unfinished Business.

    No unfinished business.
15. Resolutions and New Business.

    (NOTE: *All resolutions must be presented in writing and be in triplicate.*)
16. Approval of Minutes.
17. Recess to Wednesday, 8 p. m.

SECOND MEETING

Wednesday, May 3, 8:00 p. m.

Order of Business

1. Call to order.
2. Supplemental Report of Credentials Committee.
3. Roll call.
4. Secretary's announcement of Council's selection of place for the 1940 annual session.
5. Elections:
   - (*a*) President-Elect.
   - (*b*) Speaker.
   - (*c*) Vice-Speaker.
   - (*d*) Councilors:
     - Second District—Carl R. Howson, Los Angeles (term expiring).
     - Fifth District—Alfred L. Phillips, Santa Cruz (term expiring).
     - Eighth District—Frederick N. Scatena, Sacramento (term expiring).
   - (*e*) Councilors-at-Large:
     - C. O. Tanner, San Diego (term expiring).
     - T. Henshaw Kelly, San Francisco (term expiring).
   - (*f*) Delegates to the American Medical Association—Incumbents:
     - Elbridge Best, San Francisco (term expiring).
     - Lyell C. Kinney, San Diego (term expiring).
     - J. P. Nuttall, Santa Monica (term expiring).
   - (*g*) Alternates to the American Medical Association—Incumbents:
     - Robert S. Stone, San Francisco (term expiring).
     - Bon O. Adams, Riverside (term expiring).
     - F. M. Pottenger, Los Angeles (term expiring).
6. Announcement and Approval of Members of Standing Committees Elected by the Council.
7. Report of Reference Committees:
   - (*a*) Reports of Council and Secretary-Treasurer.
   - (*b*) Reports of Officers, Standing and Special Committees.
   - (*c*) Resolutions, Amendments, New and Miscellaneous Business.
8. Unfinished Business.
9. Presentation of Officers:
   - President.
   - President-Elect.
   - Speaker.
   - Vice-Speaker.
10. Presentation of President's Certificate to William W. Roblee.
11. Approval of Minutes.
12. Adjournment.

---

* Excerpt from the California Medical Association By-Laws: Chapter III, Section 6, Paragraphs (a) and (b).

Section 6 (a). Appointment of Committee on Credentials and three Reference Committees.

Prior to or at the beginning of an annual session, the Speaker of the House shall appoint from the members thereof the following committees:

1. Committee on Credentials.
2. Reference Committee on the Reports of Officers and Standing Committees.
3. Reference Committee on the Report of the Council and the Report of the Secretary-Treasurer.
4. Reference Committee on Resolutions, Amendments to the Constitution and By-Laws, and New and Miscellaneous Business.

(b) Membership of Credentials and Reference Committees.

Each of the aforesaid committees shall consist of three members, the chairman of each to be designated by the Speaker.

The Speaker, the House concurring, shall refer said reports, resolutions, and business to the respective Reference Committees, but may allocate among them any of said reports, resolutions or portions thereof, and other business, to avoid duplication and to expedite the business of the House of Delegates.

The Reference Committees shall present written reports dealing with and making recommendations on all matters submitted to them. The report of each committee shall be read by its chairman first as a whole, and the House of Delegates shall then act and vote upon the report as a whole or section by section, as it may deem best.

† Reports of officers, standing and special committees appear in full text in the Pre-Convention Bulletin, printed as an appendix to this annual session program.

IV—OTHER MEETINGS

I

CANCER COMMISSION PATHOLOGY CONFERENCE

Sunday, April 30, 9:30 a. m. to 12 noon, and 1:30 to 4:30 p. m.

Hotel Del Monte, Del Monte

The usual semi-annual Microscopic Conference of the Cancer Commission of the California Medical Association will be held at the Hotel Del Monte on Sunday, April 30, 1939, at 9: 30 a. m. This meeting will be conducted in the same manner as in the past; case histories being presented and slides passed out for diagnosis by each attendant. A very interesting group of cases has been assembled, and it will be necessary for each attendant to bring his own microscope.

The meeting will consist of morning and afternoon sessions, and will be conducted by the following committee: Dr. Paul Michael (chairman), Dr. Jesse Carr, and Dr. Alvin Cox.

Please make reservations with the chairman of the committee at 434 Thirtieth Avenue, Oakland; or with Dr. Otto H. Pflueger, Secretary of the Cancer Commission, 384 Post Street, San Francisco.

* * *

II

PROGRAM FOR GENERAL MEETING

Sunday, April 30, 10 a. m. to 12 noon, and 2 to 4 p. m.

10 : 00 a. m.—*Skin Cancers.*
  Clinical Aspects—Otto Pflueger.
  Pathological Aspects—Jesse Carr.
  Radiological Treatment—Henry Ullmann.
11 : 00. a. m.—*Pigmented Lesions of the Skin.*
  Clinical Aspects—Nelson Howard.
  Pathological Aspects—David Wood.
2–4 p. m.—*Breast Tumors.*
  Benign Tumors—Newton Evans.
  Malignant Tumors—Ernest Hall.
    Clinical Aspects—Clarence Berne.
    Radiological Aspects—William Costolow.

Reservations should be made with the secretary of the Cancer Commission, Otto H. Pflueger, M.D., 384 Post Street, San Francisco.

Each attendant should bring his own microscope for the study of prepared slides of the cases presented.

III

CANCER COMMISSION RADIOLOGY CONFERENCE

Sunday, April 30, 10 a. m. to 3:30 p. m.

Hotel Del Monte, Del Monte

The Cancer Commission is again sponsoring a Radiological Conference on Sunday, April 30, at Del Monte. The meetings will be held in one of the rooms of the Hotel Del Monte, between 10 and 12 in the morning and 1 :30 to 3 :30 in the afternoon. In previous years a large number of doctors have drifted into these meetings without registering. This year only those who register, up to the number of thirty, will be admitted. This is because any greater number than this makes the meetings less profitable for everyone concerned. Please send your registration at once to the offices of the California Medical Association if you intend to be present. Do not register and hold someone else from a position if you do not intend to come.

The following is the formal program:

10 : 00–12 : 00 a. m.—*Diagnostic Problems.*
  Brain Tumor Problem—R. S. Stone, San Francisco.
  Pulmonary Malignancy Problem—R. A. Carter, Los Angeles.
  Intestinal Malignancy Problem—H. D. Snure, Los Angeles.
  Bone Malignancy Problem—C. B. Bowen, Oakland.
1 : 30–3 : 30 p. m.—*Therapeutic Problems.*
  Lip Cancer Treatment Problem—O. S. Cook, Sacramento.
  Bladder Cancer Treatment Problem—O. N. Meland, Los Angeles.
  Uterine Cancer Treatment Problem—Lyle C. Kinney, San Diego.
  Breast Cancer Treatment Problem—E. Liljencrantz, San Francisco.

We believe this to be a very worth-while program and hope that you will be able to attend.

Please make reservation with the chairman of the committee arranging the meeting, Dr. L. H. Garland, 450 Sutter Street, San Francisco.

V—ENTERTAINMENT[*]

(For places and hours of luncheons, and other entertainment features, such as golf, horses, swimming, skeet shooting, consult the bulletin boards in the lobby near the hotel desk. See also under "X—Del Monte and Monterey Peninsula," for additional information concerning outing attractions.)

Sunday:

Golf.[†]
Swimming.
Horses.

Tuesday Evening:

Dinner to President William W. Roblee, Hotel Del Monte, 7 : 30 p. m., main dining room. Reservations for plates should be made at the hotel desk by noon on Tuesday. Guests of Hotel Del Monte will sign regulation cards at the tables. Reservations for tables should be made with the dining-room captain, Mr. Carter. Plate tickets are $2.50 each.

---

[*] For entertainment features sponsored by the Woman's Auxiliary, see program of Woman's Auxiliary.

[†] California Medical Association Golf Tournament.—The annual Golf Tournament of the California Medical Association will be held at Del Monte on Tuesday afternoon, May 2. At the last tournament at Del Monte, in 1937, over one hundred and fifty doctors played. It is hoped that this number will be exceeded this year. The hotel course is in splendid shape, and Peter Hay and Dr. H. R. Lusignan of Del Monte, are working hard on the local arrangements. All members of the California Medical Association are welcome and it is only necessary to appear on the first tee on Tuesday afternoon when foursomes will be arranged by the professional. Play will be 18 holes, medal play at handicap. Incidentally, Peter Hay knows your handicap. Doctor Lusignan is collecting the prizes.

We hope to have a North-South tournament on Sunday afternoon, April 30, to play for the California Medical Association trophy. Details will be sent out to you.

The Committee on Arrangements is:

James W. Morgan, chairman, 384 Post Street, San Francisco.
H. R. Lusignan, Monterey, representing the local Committee on Arrangements.
John W. Crossan, 1930 Wilshire Boulevard, Los Angeles.
Robert W. Langley, 1930 Wilshire Boulevard, Los Angeles.
John P. Lordan, 2007 Wilshire Boulevard, Los Angeles.
George W. Pierce, 490 Post Street, San Francisco.
Robert Kile, 490 Post Street, San Francisco.
George A. Gray, St. Claire Building, San Jose.

VI—SCIENTIFIC EXHIBITS

Garden Terrace Tent—South Front, Hotel Del Monte

A. Scientific Exhibits*

Allergy Exhibit—Edward Matzger, M.D., 909 Hyde Street, San Francisco.

Cardiac and Vascular Diseases—California Heart Association, 45 Second Street, San Francisco.

Device for Bed-Confining Fracture Patients—Stuart C. Knox, M.D., 2007 Wilshire Boulevard, Los Angeles.

Gastric Lesions—Harold Lincoln Thompson, M.D., 1930 Wilshire Boulevard, Los Angeles.

Gastroscopic Studies—Allan L. Cohn, M.D., 450 Sutter Street, San Francisco; Rubin Gold, M.D., 450 Sutter Street, San Francisco; Alfred White, M.D., 516 Sutter Street, San Francisco.

Human Rabies—Hyman I. Vener, M.D., 116 Temple Street, Los Angeles.

Hypoglycemia Associated with an Adenoma of the Pancreas—H. I. Burtness, M.D., 317 West Pueblo Street, Santa Barbara.

Medical Books: Classics in Anesthesia—Chauncey Leake, M.D., University of California, Medical School, the Medical Center, San Francisco.

Medical Building Construction—John Homer Woolsey, M.D., Woodland Clinic, Woodland.

Monroe Tidal Irrigator: Thermal Death Time of the Gonococcus—Alvin W. Folkenberg, M.D., 1893 Wilshire Boulevard, Los Angeles.

Pneumonia Control in California—W. P. Shepard, M.D., 600 Stockton Street, San Francisco.

Poison Oak and Poison Ivy—Ernest K. Stratton, M.D., 490 Post Street, San Francisco.

Postgraduate Study Activities of the San Joaquin County Medical Society—C. A. Broaddus, M.D., 905 Medico-Dental Building, Stockton.

Reconstructive Plastic and Oral Surgery—Arthur E. Smith, M.D., and James B. Johnson, M.D., 1930 Wilshire Boulevard, Los Angeles.

Renal Neoplasms—Dudley P. Fagerstrom, M.D., 710 Medico-Dental Building, San Jose.

Simplified Technique of Hysterectomy—W. H. Brownfield, M.D., 2007 Wilshire Boulevard, Los Angeles.

Surgical Treatment of Vesical Diverticula—Roger W. Barnes, M.D., 947 West Eighth Street, Los Angeles.

Synovial Membrane and the Synovial Fluid—David H. Kling, M.D., 1052 West Sixth Street, Los Angeles.

B. Films*

Elschnig Technique in Cataract, Trephine, and Cyclodialisis—William A. Boyce, M.D., 727 West Seventh Street, Los Angeles.

Medical and Surgical Films—Frank A. Lowe, M.D., 870 Market Street, San Francisco.

Metrazol Shock Therapy of the Psychoses—J. Elliott Royer, M.D., 2976 Summit Street, Oakland.

Poliomyelitis—Albert G. Bower, M.D., 1238 Dorothy Drive, Glendale.

C. Conferences on Cardiac and Vascular Disease

Sixteen half-hour clinical demonstrations and lectures in heart and circulatory disease will be presented in connection with the scientific exhibit of the California Heart Association at the annual meeting of the California Medical Association at Del Monte.

Dr. William H. Leake of Los Angeles is chairman of the committee preparing the demonstrations. Sixteen clinicians from all parts of the state will review the results of recent progress in the diagnosis and treatment of various types and manifestations of cardiac and vascular disease.

The program will begin late Monday, May 1, and continue through Tuesday and Wednesday. They are arranged so there will be no conflict with the medical sessions.

Detailed programs, giving places and hours of the conferences, will be available at the California Medical Association registration desk, and will appear in the programs to be distributed at Del Monte.

MRS. CLIFFORD A. WRIGHT
President, Woman's Auxiliary to the
California Medical Association
1938-1939

MRS. G. WENDELL OLSEN
Recording Secretary, Woman's Auxiliary
to the California Medical Association
1938-1939

VIII—WOMAN'S AUXILIARY

Tenth Annual Session

WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION

Headquarters at Hotel Del Monte, Del Monte

Mrs. Clifford A. Wright, *President*

Mrs. Lawrence M. Knox, *Convention Chairman*

Sunday, April 30

Arrival of delegates, members and guests, greeted by delegation hostesses.

3:00–5:00 p.m.—Registration at registration desk.

4:00 p.m.—Informal tea in Hotel Del Monte Lounge.

7:30–9:30 p.m.—Registration.

Monday, May 1

8:45 a.m.—Pre-Convention State Board meeting in the Tower Room, Hotel Del Monte.

9:30 a.m. to 4:00 p.m.—Registration.

10:00 a.m.—First general meeting of the California Medical Association. All Auxiliary members and wives of doctors are invited to attend.

12:30 p.m.—Informal luncheon at Hotel Del Monte, with local hostesses presiding.

2:00 p.m.—Motor trips to interesting points on the Monterey Peninsula. Historic and Garden tours.

9:00 p.m.—Reception and musicale in honor of Mrs. William W. Roblee, wife of the president of the California Medical Association, to be held in the Copper Cup Room of the Hotel Del Monte. Members of the State Board will serve on the Reception Committee.

Tuesday, May 2

9:00 a.m. to 1:00 p.m.—Registration.

9:30 a.m.—First general session of the tenth annual convention at Del Monte Lodge, Mrs. Clifford A. Wright, presiding.

1:00 p.m.—Luncheon at Del Monte Lodge in honor of Mrs. Clifford A. Wright, with Mrs. Thomas J. Clark presiding. Speaker, Dr. George H. Kress. Members of the State Advisory Board will be guests of honor.

7:30 p.m.—President's dinner and dance of the California Medical Association at Hotel Del Monte.

Wednesday, May 3

9:00–11:00 a.m.—Registration.

9:30 a.m.—Second general session of the tenth annual convention at Del Monte Lodge, Mrs. Clifford A. Wright presiding. Election of officers.

1:00 p.m.—Luncheon at Del Monte Lodge in honor of Mrs. Frederick N. Scatena, with Mrs. Hobart Rogers presiding. Speaker, Dr. J. B. Harris.

2:30 p.m.—Women's Golf Tournament.

3:00 p.m.—Post-Convention State Board meeting.

President's Report

To the Members of the Auxiliary:

The annual convention of the California State Medical Association in Pasadena last May, and the American Medical Association meeting in San Francisco later, demonstrated to the women of the Auxiliary the real importance of our organization. Many of the women realized as never before just how far-reaching our influence had become. The opening meeting of the American Medical Association convention in the beautiful San Francisco Auditorium made an impression on those who were fortunate enough to attend that will never be forgotten. The splendid men at the head of the American Medical Association inspired the confidence and admiration of all those present. We can justly take pride in belonging to an Auxiliary to this great body of men.

Our endeavors this year embrance friendship, public relations, public speaking, the *Courier,* a state library, *Hygeia,* and membership.

This year we have been continuing the health education program similar to that given us last year. Our women are very active in every club—civic and educational—in each community. The Parent-Teacher Association is one of our best fields for spreading health education and preventive medicine. We are proud that our women are well represented in this organization.

Last fall the counties were asked to form public-speaking classes. In some cases this work has been especially noteworthy. The classes were resolved into study groups, paying special attention to subject matter of which they need to be well informed.

We think a well-informed woman who is never belligerent but always gracious and well poised is a splendid representative for the noble profession we serve. This idea has been carried out with good results.

Several plays have been written and presented by the members. The San Diego Auxiliary made such success of the Christmas play that they were asked to repeat it on two occasions. The play has been placed on file in the State Library, and is available for any who may want to use it.

The *Courier* has attained quite an important place in this state. It is published at great effort on the part of the editor and her committee, and at considerable expense, but if it does help in promoting interest in the organization throughout the state it is well worth the effort and expense. Mrs. Charles C. Tomlinson, the National president, and several National officers, to whom copies were sent, have been very complimentary in expressing their appreciation of our journal.

The State Library is giving us considerable worry. We have some very desirable books, but get very few requests for them. If the Library is to have any value it must be used. A list of books in the Library was sent to every state officer last fall, with the urgent request that they be read. Of course, these same books are in the home libraries of many of our members, and are easily obtained in public libraries nearer at hand, so it is not difficult to understand why our State Library has not been more popular. County presidents have been asked to have at least one of our books reviewed by a member at an Auxiliary meeting during the year. Many counties have complied with this request. We hope all will have done so by the end of the year.

Hygeia continues to become more popular. The Rogers plan for increasing circulation was approved by the Auxiliary State Board, and we hope to have some marked results from this plan before long.

Terrace: Overlooking one of the Sunken Gardens

We are anticipating the organization of a new county auxiliary in Modesto, in Stanislaus County.

The doctors have given us much credit for the defeat of the "Humane Pound Act."

The State Council has approved the cancer control campaign, and has asked that the women of the Auxiliary take an active part. Plans are now being made for the drive which is to be put on in April.

We hope to continue to be good-will ambassadors in the cause of scientific medicine as we go about our Auxiliary work.

Respectfully submitted,

Mrs. Clifford A. Wright, *President.*

WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION

CONVENTION COMMITTEES

Mrs. Lawrence M. Knox, *General Chairman*

Credentials and Registration

Mrs. Eric Larson, Chairman
Mrs. A. A. Arehart, Local Chairman

Auxiliary members of the five counties comprising the Fifth District will act in this capacity.

IX—RAILROAD INFORMATION

Ticket Agents of principal rail lines in California, on presentation and surrender of identification certificates, will sell round-trip tickets to Del Monte or Monterey, Calif., costing approximately 1¼c per mile, which is the first-class one-way fare. Tickets will be sold from April 26 to May 4, 1939, inclusive. Return limit date being May 14, 1939. Stopovers allowed. If longer return limit is desired, consult railroad ticket agent at Del Monte or Monterey prior to May 14, 1939.

Following are examples of fares to Del Monte and illustrate the extent of reduction:

From	One Way 1st Class	One Way Coach	Convention Round Trip	30-Day Round Trip Coach	21-Day Round Trip 1st Class
San Francisco	$ 3.70	$ 2.47	$ 3.70	$ 4.45	$ 4.90
San Jose	2.25	1.50	2.25	2.70	3.00
Los Angeles	11.45	7.64	11.45	13.76	15.15

If you cannot obtain a copy of the certificate from your County Society Secretary, send a stamped, self-addressed envelope to the California Medical Association, 450 Sutter Street, San Francisco, with request for a Railroad Convention Rate Certificate (which *must* be presented to the ticket agent at the time the ticket is purchased).

Convention Rate Certificates—Additional Information

For this convention, special round-trip intrastate convention fares from points on all principal rail lines in California to Del Monte will be authorized on the identification-certificate plan. . . .

Round-trip convention fares referred to *will not apply* from points outside of California or for *interstate* trips; however, for interstate traffic thirty-day round-trip intermediate-class and coach-class tickets, also 21-day first-class tickets are available.

Certificates should be furnished *only to members of the organization* with names of those to whom furnished entered thereon with pen and ink or typewriter.

In order that members of the organization may know of the very low round-trip fares and liberal return limit of May 14, the interested rail lines will very much appreciate your including the following paragraph in the circular or bulletin of convention arrangements which is sent to members of the organization.

Round-Trip Rail Convention Fares and Arrangements

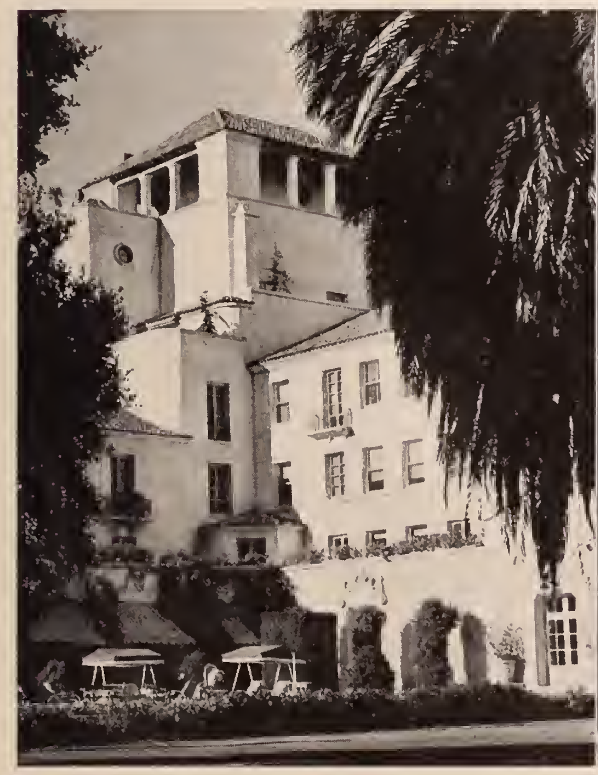
Ticket agents of principal rail lines in California, on presentation and surrender of identification-certificates, will sell round-trip tickets to Del Monte, and the certificates which you will later receive, entitling you to reduced fares, will show on the reverse side the convention fares that will apply to Del Monte from principal California points. Tickets at these convention fares are of three classes as follows:

(a) *First Class:* Tickets at first-class fares will be on basis of first-class one-way adult fare for the round trip, and will be honored in coaches and chair cars, also in sleeping cars, parlor and reserved-seat cars on payment of charge for space occupied.

(b) *Intermediate Class:* Tickets at intermediate (tourist) class fares will be on basis of 85 per cent of the first-class one-way adult fare for the round trip, and will be honored in coaches and chair cars, also in tourist sleeping cars and reserved-seat cars where operated on payment of charge for space occupied.

(c) *Coach Class:* Tickets at coach-class fares will be on basis of 75 per cent of the first-class one-way adult fare for the round trip, and will only be honored in coaches and chair cars.

Tickets will be on sale from April 26 to May 4, inclusive, and return limit will be May 14. Stopovers allowed. If longer return period is desired, consult railroad ticket agent prior to May 14.



An unusual view of Hotel Del Monte seen through the trees of its vast park.

The Roman Plunge, children's pool, tennis courts, and Laguna del Rey as seen from the Tower Room at Del Monte.

X—DEL MONTE AND THE MONTEREY PENINSULA

DEL MONTE: ENTERTAINMENT FEATURES

An observing traveler once said that Del Monte is all things—at once. His description, however brief, does not come far from the mark. For within Del Monte's vast estate of 20,000 acres is nearly every description of recreation and sport imaginable.

Golf.—Would you golf? Within a three-mile radius of Del Monte are five courses: more, in such a concentrated area, than is to be found elsewhere in the world. One of these courses, famous Pebble Beach, was the scene in 1929 of the National Amateur championship. At that time Bobby Jones called it the most picturesque and playable layout of his experience. Cypress Point, Del Monte. the Monterey Peninsula Country Club courses, and Pacific Grove's fine municipal course complete the list.

Tennis.—Is tennis your sport? Del Monte has eleven courts. Every June witnesses the Del Monte tennis championship, when fine players from all parts of the Coast gather to match their skill.

Trapshooting.—Do you go in for trapshooting? Del Monte has the largest and one of the best equipped set of traps in the country. Official gathering place of the Pacific International Trapshooting Association, the Del Monte grounds present the sport at its best. State and sectional tournaments are held there annually as well as the yearly sports powwow of the California Indians in April.

Fishing and Hunting.—Perhaps your sport is fishing. Or hunting. There, too, Del Monte offers the best to be found. But one hour by motor from Del Monte, up the Carmel Valley, is San Clemente, Del Monte's guest ranch. Adjoining and extending into the great national forest that lies between the Salinas Valley and the Coast, San Clemente offers the nimrod and hunter their heart's desire. Then, of course, there are the world-famous waters of Monterey and Carmel bays for deep-sea fishermen.

Swimming.—Perhaps your favorite pastime is swimming, and the popular and healthful fad of sun bathing. Del Monte provides complete facilities to satisfy your desires. The Roman Plunge in the beautiful and spacious hotel park has heated salt water and is open the year round, with a smaller and safe plunge for children. The Beach Club at Pebble Beach has an open-air tank at the water's edge. Then there are the white sandy beaches on Monterey and Carmel bays and the Pacific Ocean to enjoy surf bathing, and the ol' swimmin' hole at the Monterey Peninsula Country Club is another favorite spot.

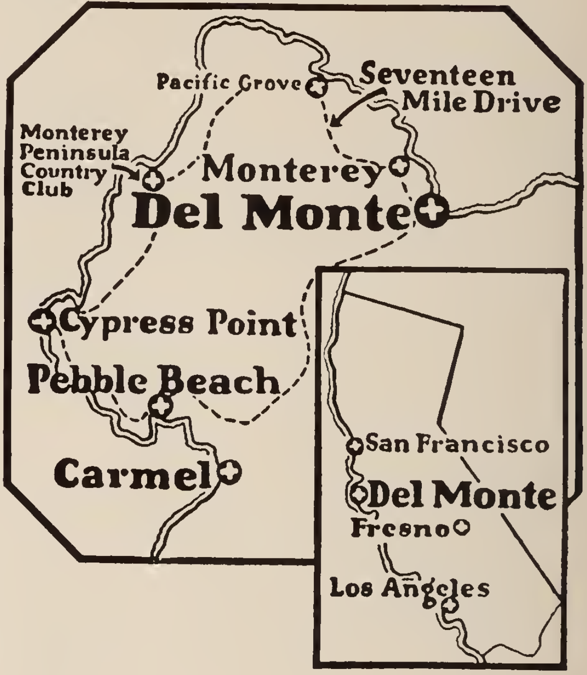
Trails.—Have you tried the bridle paths at Del Monte? If not, you have missed a treat. There are more than one hundred miles of privately owned and signed scenic paths in the forest and along the beaches. A stable of fine mounts is maintained. By all means bring your riding togs.

⁂

MONTEREY

Monterey Peninsula is richly endowed with travel interest. Here are attractions for everyone. Historic-minded motorists who travel with guide book and camera, and others who merely poke around for the fun that is in it, both find their heart's desire within California's famous "Circle of Enchantment."

Good roads, clearly marked, lead the willing motorist to points of special charm and reveal vistas and scenes which artists have chosen to proclaim the most beautiful anywhere. A trip to the Monterey Peninsula and along the Coast to the Big Sur may indeed be called a trip so memorable as never to be forgotten.



The city of Monterey is in itself enough reward for having made the trip. Monterey was discovered by the Spaniard, Cabrillo, in 1542. He called it "Bay of the Pines." and as such was it known until 1602, a decade before the Pilgrims landed on eastern shores, when Viscaino rediscovered it and called it Monterey (King of the Forests) after the Compte de Monterey, then Viceroy of Mexico. Over a century and a half elapsed before white men again set foot on the soil of California. Then came Portola in 1770, who established the Monterey Presidio, and Padre Junipero Serra, who founded the San Carlos Mission.

Monterey was a gay place under Spanish rule. All the glamor of old Spain held forth then, and life there was a perpetual care-free fiesta. In 1821 Mexico threw off the Spanish yoke and a period of unrest followed, culminating in 1846, when Commodore Sloat raised the Stars and Stripes over the historic Customs House, and Monterey became an American possession.

Monterey abounds with historic and beautiful points of interest. Visitors there would do well not to miss the following landmarks: *San Carlos Church,* founded in 1770 by Junipero Serra and once the place of worship for representatives of the Spanish throne, governors, and Presidio officers; *Monterey Presidio,* established by Portola in 1770 and prominent throughout Monterey's history; *First Theater in California,* used by picturesque strolling players as early as 1847. The *Customs House,* over which have flown the flags of Spain, Mexico, and the United States; *Colton Hall,* first capitol building of California. Here was drafted the constitution of California. *Stevenson House:* The beloved Robert Louis Stevenson spent three months here in 1879, and wrote one or two of his memorable works in Monterey. Praise of Monterey and its coast is to be found in some of his books.

Seventeen-Mile Drive.—No trip to the Monterey Peninsula is complete, of course, without including the world-famous Seventeen-Mile Drive. The combination of pines, age-old cypress, and the sparkling blue of the Pacific, is one that hundreds of artists have honored with their canvases.

Part II

PRE-CONVENTION BULLETIN*

FOREWORD.—The official reports which follow will be presented at the coming session of the House of Delegates.

Delegates, therefore, are urged to familiarize themselves with their contents.

Members, likewise, are requested to become familiar with the recommendations in these reports, and to discuss them with other members and delegates.

* * *

I

REPORTS OF GENERAL OFFICERS

REPORT OF THE PRESIDENT

To the Members of the House of Delegates and the Members at large of the California Medical Association:

Your President has visited and conferred with all the County Societies of Northern and Central California, either singly or in joint meetings. The Southern California visitations were made by President-elect Dukes, accompanied in some instances by the President.

The President has attended all meetings held by the Council, Executive Committee and the special session of the House of Delegates. A report of his official findings and recommendations will be given in his address at the first general session of the annual meeting at Del Monte.

He is most appreciative of the expressions of cordiality and good will that have been extended to him, both officially and personally. It has been a busy and a very happy year.

Respectfully submitted,
W. W. Roblee, *President.*

REPORT OF THE PRESIDENT-ELECT

To the President and the House of Delegates:

It has been my pleasure to attend several meetings of County Medical Societies with the President, Doctor Roblee; Councilors Gilman, Rogers, Packard, Howson, Kiger and Emmons.

The southern counties were visited, at the request of Doctor Roblee, and at all of these meetings the Secretary-Editor was a speaker. The counties visited were Imperial, Orange, Riverside, San Bernardino and San Diego, Los Angeles (meetings at Pasadena and Los Angeles), Kern, Ventura and San Luis Obispo, and there was also a luncheon at Santa Maria at which the topic of medical service was discussed. A cancer clinic, too, at San Bernardino County Hospital was attended.

The attendance and interest shown by the members and the Woman's Auxiliary in both the scientific and economic problems is a very encouraging commentary on the work being done by the Officers and Councilors of the California Medical Association.

Your President-elect has also spoken before many lay groups on the California Physicians' Service.

Respectfully submitted,
Charles A. Dukes, *President-elect.*

REPORT OF THE SPEAKER OF THE HOUSE OF DELEGATES

To the President and the House of Delegates:

During the past year your Speaker has attended the meetings of the Council and the Executive Committee, of which bodies he is ex officio, a member. He has performed such special committee duties as have been assigned to him; which duties, during the past year, have been unusually heavy.

The House of Delegates will convene promptly at 8 p. m. on Monday, May 1. Its second meeting will be on Wednesday, May 3. The Speaker urges all delegates to be in their seats at the hour of convening, and takes this occasion to remind the delegates that they have assumed very serious duties in accepting office. These duties are not to be taken lightly, and, even though some small personal sacrifice is demanded, the responsibility of a delegate is such that the inconvenience to himself is to be borne as the price of his office.

The Speaker also wishes to urge all delegates and alternates to read the Pre-Convention Bulletin carefully in order that they may be familiar with the work and the problems of their organization.

Respectfully submitted,
Lowell S. Goin, *Speaker.*

REPORT OF THE VICE-SPEAKER OF THE HOUSE OF DELEGATES

To the President and the House of Delegates:

The duties of the Vice-Speaker during the past year have been of the lightest and most pleasant nature. Due to the outstanding ability of the Speaker of the House of Delegates, his subordinate is quite free from either anxiety or care.

Respectfully submitted,
John H. Graves, *Vice-Speaker.*

REPORT OF THE CHAIRMAN OF THE COUNCIL

To the President and the House of Delegates:

The Chairman of the Council feels that to enumerate the actions and discussions of the Council of the California Medical Association for the past year would be nothing but repetition, and would needlessly take the time of the delegates from other important business. The proceedings of all the meetings of the Council have been printed in CALIFORNIA AND WESTERN MEDICINE, and are available to anyone who cares to peruse them.

There are only two things to which your attention is especially directed at this time. The first and most important is that never before has there been a greater need for unity of action and solidarity in organized medicine. The very existence of our profession may depend upon the ability of the individual to forget himself, and so to take his place beside the other members of the organization with the determination not only to coöperate, but to make sacrifices.

The second point for your serious consideration is the state of finances of the Association. The past year has been costly in many ways, and the receipts for the current year are not sufficient to refill the depleted coffers. There are many expenses that were unknown to us a few years ago and which now cannot be avoided. Funds to meet the new problems which are constantly arising should be provided, and the utmost economy must be practiced by those who are charged with the responsibility of expenditures.

There must be a united effort to make progress, and it may be that our present trials may later be found to have been the fire which gave us not only new metal but, with it, temper and strength.

The annual report of the Council will be presented at the first meeting of the House of Delegates.

Respectfully submitted,
Karl L. Schaupp, *Council Chairman.*

---

* Section 3, Article XII, of the California Medical Association Constitution states, in part: "The Association, prior to the annual session, shall print a 'Pre-Convention Bulletin,' which shall contain reports of officers and committees. . . . A copy of the 'Pre-Convention Bulletin' shall be given to each delegate and alternate on or before registration."

REPORT OF SECRETARY-TREASURER

To the President and the House of Delegates:

Your Secretary-Treasurer begs leave to submit his report under two subheadings: (1) Report of the Treasurer; and (2) Report of the Secretary.

* * *

I. Report of the Treasurer

The following statement of income, expenditures and resources, as certified by the licensed, bonded public accountants (Ernst & Ernst), gives a summary of the year's financial operations:

I

CALIFORNIA MEDICAL ASSOCIATION

INCOME AND EXPENDITURES*

For the period December 18, 1937, to December 31, 1938

INCOME

Dues and General		
Membership dues	$60,035.50	
Exhibits and annual meeting (less installation cost)	2,528.01	
California Medical Association—Services	600.00

COMMENT

The moneys of the California Medical Association may be said to be classified or held in three funds: (1) Administrative (California Medical Association); (2) Reserves ("Trustees Of The California Medical Association"); (3) Custodial (Indemnity Defense Fund). The current maintenance is the first or administrative fund, the chief sources of income for this allocation being the dues from 6,100 members, plus the advertising income from the official journal, CALIFORNIA AND WESTERN MEDICINE. The second or reserve fund contains the resources vested in the separate corporation known as the "Trustees Of The California Medical Association," * a body that came into existence in May, 1930, with function to hold in trust certain reserve resources transferred into its keeping from time to time by the Council of the California Medical Association. The third fund (Indemnity Defense Fund) consists of a partial or residual interest in moneys to be held in trust until about November, 1944. The "Indemnity Defense Fund" † represents the balance in the treasury on December 1, 1923, of that separate group that was organized in the year 1916 to aid in the protection of physicians who might have adverse verdicts, with indemnity judgments, rendered against them. The physicians who had joined this group voluntarily paid ten dollars annually to provide additional indemnity defense for themselves in case of malpractice suit verdicts. It was found necessary to discontinue the plan in 1923. Since that year, many of the members have assigned whatever residuary interest they might have in the fund to the California Medical Association. In 1944 or 1945 it is possible that fund will be liquidated. It is kept intact until the youngest minor on whose behalf a suit could be filed will have reached the age of twenty-one.

The reports of the bonded public accountants (Ernst & Ernst) will be submitted at the annual session to the Reference Committees.

* * *

From the above it is seen that, for practical purposes, the first, or administrative fund, is the one from which an insight of the Association's yearly income and expenditures may be gleaned, and concerning that fund further comments are here made.

In the matter of the California Medical Association expenditures, it is well to keep in mind that in December of each year the Auditing Committee of the Association prepares a tentative budget to cover the fiscal year, which begins at the close of the succeeding annual session. The Executive Committee and Council consider the proposed budget so presented, the Council then submitting it to the House of Delegates for changes and final approval. Recently, succeeding budgets for fiscal years have been in such close relationship that, for practical purposes, they can be used for fiscal years, as regards general comment.

The budget figures adopted in Pasadena in May, 1938, when applied to the calendar year 1938, reveal the following: The total estimated income in the budget ($94,100) exceeded the actual income by $1,192.62 (total income was $92,907.38; estimated budget income was $94,100).

As regards expenditures, the special expenses listed below (of $28,520.85, as noted in the financial report for the twelfth calendar month, December, 1938, under Item 36) were not provided for in the budget of anticipated expenditures.

If these special expenses had not been counted, then the total of all other maintenance expenditures ($82,941.24) would have been considerably less than the amount anticipated and provided for in the budget, for the total estimated expenditures as given in the budget was $88,100 (or adding thereto $6,000 of estimated unexpended balance, $94,100), but only $82,946.24 was actually expended against the various items (Items 8 to 35, inclusive), leaving an unexpended balance or net of $5,173.76 on the maintenance operations proper for the year 1938.

If to this figure of $5,173.76 is added that portion of an estimated $6,000 unexpended income or surplus, as listed in the budget, that was actually received as income, namely, $4,807.38, we have a total of $9,981.14; this last figure indicating the amount of budget allocation for current maintenance expenses that was not expended during the year. (These figures leave out of account, of course, the unforeseen or special expenses, to be discussed below, which were not foreseen, and therefore not included in the budget.)

* * *

The special or unforeseen expenses authorized by the Council during the year 1938-1939 may now be considered. These were unusually heavy and may be listed as follows:

1. New taxes not heretofore levied against the Association (Social Security, $540.98; Unemployment Reserve, $836.84; Sales Tax on CALIFORNIA AND WESTERN MEDICINE, $2,616.20), or a total of $3,994.02. (Note: Between December 31, 1938, and the date of the present report, March 28, 1939, additional taxation moneys have been paid out as follows: Social Security taxes, $42.10; Unemployment Reserve taxes, $209.43; total of both, $251.53).

2. State Humane Pound Act of November, 1938, State election (donation to California Society for Medical Research, $7,000; California Medical Association's separate campaign against the measure, $7,423.69); total, $14,423.69.

3. Settlement to the amount of $7,000 with Secretary Warnshuis, who retired on June 30, 1938. In the rearrangement of positions in the system now in operation there is an annual saving of $4,000 in the salary outlay through the consolidation of the duties of Secretary-Treasurer and Editor and Director of Public Relations.

(4) Special session of House of Delegates at Los Angeles to consider medical service plans, expenses being largely those of transportation and per diems of delegates, $3,459.54. (Between December 31, 1938, and the date of this report, March 28, 1939, the additional expenditure on this item has been $1,211.30; total on this item, $4,670.84.)

5. Legal expenses of State Association for studies and papers to lay the foundation for a medical service organization, $2,626.07 (prior to the incorporation of California Physicians' Service). (All in 1939.)

6. Announcements in advertising pages of Bay region newspapers at the opening of the State's Golden Gate International Exposition, $1,199.84 (paid in 1939). These items (1 to 6) for the year 1938, as just noted, make a total of $28,520.85, and for the year 1939, $15,443.88, making a grand total of $43,964.73.

To the above must be added two accessory items:

7. Cancer Exhibit in the Hall of Science of the Golden Gate Exposition, on which the sum of $2,500 has been paid. Of the ultimate total of $5,000 which will be needed for this exhibit, the sum of $2,714.16 has come from accumulated interest in the Morris Herzstein bequest, which may be used only for purposes outlined in the late Dr. Morris Herzstein's bequest. The difference between that amount and $5,000, namely, $2,285.84, will finally be repaid into the Association's administrative fund, when additional interest moneys come in from the Herzstein bequest, during the next several years.

Item 8, in the amount of $5,038.94, represents the first installment of an authorized loan to the amount of $15,000, which the House of Delegates, in special session at Los Angeles on December 18, 1938, authorized the Council to make to California Physicians' Service. Items 7 and 8 are not included, therefore, as actual charges against the main-

* See CALIFORNIA AND WESTERN MEDICINE, November, 1930, pp. 829 and 833.

† See CALIFORNIA STATE JOURNAL OF MEDICINE, July, 1916, on page 260.

tenance income of the year 1938, for the reasons above noted, the Herzstein not being a part of maintenance income, and the California Physicians' Service item being a loan.

Before leaving the subject of finances, it is well to keep in mind that, during the coming year, a bank loan of $15,000 must be repaid.

If a basic science initiative is approved by the House of Delegates at Del Monte, the sum of something like $30,000 would be needed in 1939-1940 to secure the signatures and carry through the work.

Also to be remembered, is the authorization given by the House of Delegates at its special Los Angeles session in November, 1938, permitting the Council to loan to California Physicians' Service the sum of $15,000, of which sum $5,000 has been advanced.

It is possible that, in addition to the above, other expenditures to cover costs of educational literature on medical service and health insurance plans may be authorized.

II. Report of the Secretary

The central office of the California Medical Association is a busy place. The office personnel consists of five clerical assistants, who aid in routine correspondence, record filing, bookkeeping and accounts, Official Journal, and special duties as they may arise on activities such as the State Humane Pound Act, Medical Service plans, postgraduate schedules, House of Delegates' sessions and others of similar import.

Office Personnel.—The clerical aides, one of whom has been in the Association's service for more than twenty years, a second for eighteen years, a third for thirteen years, a fourth for two years, and a fifth for less than one year, have witnessed a heavy increase in the work as the membership has grown, and as the problems coming into the Central Office have become not only increasingly numerous, but more technical and demanding.

Similarly, as regards the space allotments of the office suite in the 450 Sutter building. The rooms were becoming more and more crowded with old records, so that ease in work was being prevented. Fortunately, the Four-Fifty Sutter Corporation, on our request, gave a half room on the same floor, without increase in rental. This addition, with institution of shelving, has provided space that makes possible a segregation of old records, with room also for occasional and current supplies and reserve stock.

Membership.—It may be of interest to glance at the total membership figures for the last twenty-five years. The totals given are those of December 1 of each year.

Year	*Members*	*Year*	*Members*
1916	2,602	1928	4,638
1917	2,699	1929	4,841
1918	2,534	1930	4,882
1919	2,496	1931	4,955
1920	3,126	1932	4,921
1921	3,445	1933	4,972
1922	3,666	1934	5,094
1923	3,809	1935	5,325
1924	3,945	1936	5,492
1925	4,138	1937	5,784
1926	4,326	1938	6,101
1927	4,449		

It is gratifying to know that the component societies have remained alert in their responsibilities in the matter of membership and that, in nearly all counties, efforts are constantly being made to bring into cordial affiliation and membership all eligible physicians. With impending legislation partaking of state medicine, it is possible that a considerable number of physicians who in the past, for various reasons, have remained somewhat aloof, may now find it to the liking of themselves and their fellows to align themselves as active workers in the ranks of organized medicine.

Component Societies.—For some years, the total number of county societies has been thirty-nine, although four of this number represent districts inclusive of ten counties; so that of the fifty-eight counties in California, a total of forty-five are represented in organized medicine. In explaining why some counties do not have societies, it should be remembered that in the "Forty-Niner" days, constitutional units of California in the northern section of the State were not infrequently established on the basis of mining population. Later, when the diggings lost productive output, the population likewise vanished. Thus, Alpine County, for example, covering some 776 square miles, has today a total population of only 241 persons. A county medical society in that county is naturally an impossibility.

To proceed further, there are, perhaps, only two remaining counties in the State where a conjoint component medical society may well be established; namely, in Inyo County (having an area of 9,991 square miles and a population of 6,555) and Mono County (having an area of 3,030 square miles and a population of 1,360). Much of the drainage basins of these two counties (which in the California Legislature are represented by a senatorial representative in the State Senate of forty members) is today owned by the City of Los Angeles, which draws much of its water supply from the Owens River Valley. On March 2, the Association Secretary, with officers of the Los Angeles County Medical Association, journeyed to the city of Bishop, in Inyo County, to aid in the organization of the Inyo-Mono Medical Society. The new organization will submit its petition for a charter as a component county society of the California Medical Association at the annual session to be held in Del Monte on May 1–4, 1939.

California and Western Medicine.—The peak years in advertising income for the Official Journal were 1928-1929. Then came a marked falling off, with gradual up and down improvement. The total advertising income in 1938 was $24,398.60, which, although considerably lower than in the peak years, compares well with that of other state medical publications, all of which have suffered comparative losses. In the last several months there have been indications of improvement.

Members of the Association are reminded that, if they will write to advertisers who have announcements in the Official Journal, for literature and samples, and mention the name of California and Western Medicine in making purchases (giving preference, other things being equal, to Official Journal advertisers), the income from advertising sources will undoubtedly show an increase. Through such coöperation, California and Western Medicine could become more nearly self-supporting. In helping advertisers in this manner, members would be helping the Association, because less money would then be needed from the general income fund for its support.

Incident to the formulation of medical service plans on a periodic payment basis, it was necessary to place at the disposal of members of the California Medical Association, much of the information that had influenced the House of Delegates and Council to organize the California Physicians' Service. Accordingly, the size of the Official Journal was increased by eight and sixteen page folios to meet this need. The extra expenditure seemed warranted under the circumstances.

Annual Session.—The report of the Committee on Scientific Work deals with the annual session program. It should not be out of place to remind members that the technical or commercial exhibitors at the annual session in Del Monte are worthy of the courteous interest of attending members; not only because of their displays, but also because here, likewise, coöperative appreciation by attending physicians will make for increased income for the Association. We bespeak for the exhibitors the kindly interest of all who will journey to Del Monte on May 1–4, 1939.

Scientific Exhibits.—Some comments, also, in regard to the section on Scientific Exhibits. An effort has been made to secure the registration of a large number of members to present scientific exhibits and medical films. If any members who would be interested in such displays have been overlooked, it is requested that they communicate promptly with the Central Office. Every effort will be made to arrange for placement.

Special Problems and Work:

During the last twelve months, the California Medical Association has been confronted with a larger number of special problems than usual. Among such may be mentioned:

State Humane Pound Act.—The story of the splendid victory over the antivivisectionists has been told in the OFFICIAL JOURNAL. The end-results were a tribute to the splendid coöperative endeavor of members of component county societies and the women's auxiliaries and other friends of medical research. It is regrettable that the battle should have drawn so heavily on the Association's funds, but the expenditure was unavoidable, because the issues at stake were of such vital nature. Thanks are extended to the many workers in all counties of the State, who gave such efficient aid in the distribution of literature and supplies sent out by the Central Office.

Medical Service Plans and the Special Session. The sustained interest during the last decade by the California Medical Association and its members on the important problem of distribution of medical service found expression in 1938 in a special session of the C. M. A. House of Delegates. Resulting therefrom came the formulation of a medical service based on a periodic payment basis, the principles of which had long been under consideration. Later, "California Physicians' Service" came into being. The story of the progress and activities of that organization, recently incorporated, has appeared in the OFFICIAL JOURNAL. The legal and other forms and all correspondence in relation to the new plan which had been accumulated in the Central Office were turned over to the California Physicians' Service when the latter organization established its headquarters in 602 Mills Building, San Francisco.

Postgraduate Work.—The plans for postgraduate work have received much attention and the groundwork has been laid for clinical conferences in many portions of the State, and allocation of topics, speakers, and dates are awaiting decision. This is a large work in itself, for it is not easy to arrange the times of guest speakers and physician audiences, so that the presentations may be made always with equal convenience for all concerned. To ask guest speakers to leave their private professional work for one or several days, and journey considerable distances, requires, in fairness, that the physicians of the communities to be visited shall likewise do their part. The transportation schedules of certain conference teams are now being studied. The coöperation of county societies is requested, so that in each place the experience with a clinical conference may be sufficiently favorable to lay the foundation for continued interest in graduate courses. Since the Association Secretary is also the secretary of the Committee on Postgraduate Activities, it will make for greater ease in outlining plans if all arrangements are made through the Central Office, 450 Sutter Street, San Francisco.

Department of Public Relations.—Because of the seriousness of major problems such as those above enumerated, the Department of Public Relations has not been as active during the last twelve months on matters of lesser policy. Plans are in the making, however, to bring back to the Department the consideration of problems and policies germain to its function.

Visitation Tours.—In the month of November, the Association Secretary accompanied President William W. Roblee on a visitation tour to county societies north of the Sacramento River, up to the Oregon line, and then down along the coast. Subsequently, in January, in company with President-elect Charles A. Dukes, a similar tour was made to the county societies located in the southern section of California, down to the Mexican border. And still later, in company with district councilors, most of the counties in the central portion of the State were visited. Naturally, everywhere, most of the conferences dealt with medical service plans. The visiting officers are deeply appreciative of the cordial manner in which they were received. There can be little doubt as to the value of this important field work, in making for harmonious outlook and unified effort by the medical profession of California.

In conclusion, the Association Secretary begs leave to express his personal appreciation of the kindly spirit extended him in assuming the responsibilities in the Central Office. There has been much work to do, but it has been pleasant to perform, and his thanks go to all who have aided him in the fulfillment of his duties.

Respectfully submitted,

George H. Kress, *Secretary-Treasurer.*

REPORT OF THE EDITOR

To the President and the House of Delegates:

The editor's report on papers received, printed, awaiting publication, or declined, is as follows:

(a) *Report on papers of the annual session at Pasadena, May 9–12, 1938:*

At last year's annual session a total of 144 papers were read before the general meetings and different sections.

A summary of the disposition of the papers read at that year's annual session is as follows:

Pasadena annual session papers published in 1938	17
Pasadena annual session papers published in 1939	18
Pasadena annual session papers read, but published elsewhere, declined or not sent in	87
Pasadena annual session papers in CALIFORNIA AND WESTERN MEDICINE files still awaiting publication (annual session papers in this April issue are not included)	22
Total annual session papers read at Pasadena	144

(b) *Report on special articles which have been printed in* CALIFORNIA AND WESTERN MEDICINE *during the period April, 1938 to April, 1939, inclusive:*

Special and original articles which were published in CALIFORNIA AND WESTERN MEDICINE during the past year (April, 1938 to April, 1939, inclusive) are as follows:

Section papers from annual session at Del Monte, 1937	57
Section papers from annual session at Pasadena, 1938	32
Papers read before general sessions at Pasadena, 1938	3
Lure of Medical History articles	16
Papers accepted from miscellaneous sources (original articles, abstracts of speeches, reprints from other publications, etc.)	35
Clinical Notes and Case Reports	40
Editorials	57
Editorial Comment articles	30
Bedside Medicine symposia	12
Special articles	78
Total papers published during past year	360

(c) *Report on manuscripts in* CALIFORNIA AND WESTERN MEDICINE *files and awaiting publication in April, 1939, and later issues:*

Unpublished papers from annual session at Pasadena	22
Unpublished papers accepted from miscellaneous sources	8
Lure of Medical History articles	5
Clinical Notes and Case Reports	17
Editorial Comment articles	7
Bedside Medicine symposia	2
Total manuscripts on hand, awaiting publication	61

(d) *Report on nonannual session papers submitted:*

Nonannual session papers submitted, but declined	52

Comment.—During recent years CALIFORNIA AND WESTERN MEDICINE, as the OFFICIAL JOURNAL of the California Medical Association, has undergone comparatively few changes in format. Its arrangement of departments and type forms has been designed to promote ease and comfort in perusal, as well as convenience in ready reference; for the day is past when busy physicians can give time to any publication, the reading of which makes for avoidable effort. This desideratum applies to the printed word everywhere, be it the presentation of the subject matter discussed, good or poor, scientific or of other nature.

A new feature introduced during the last year is "Press Clippings," a subdepartment of "News." This was instituted because it is important for members of the Association to know the reaction of the press on proposed health legislation and the plans of the California Medical Association, as embodied in California Physicians' Service. Also on other medical problems and policies, such as county hospitals and the medical care of migrants.

Papers read at the annual sessions of the State Association naturally have priority in consideration. The basic rules of the Council continue to obtain, however, namely, that, inasmuch as the majority of members of the State Association are general practitioners, articles of interest to this larger group of physicians are more apt to be accepted for publication than discourses on technical or rarer subjects, or topics which might more favorably be placed in specialty journals.

The California Medical Association is the expression of organized medicine in the state, and in times such as the present, when fundamentals in economic, social welfare and political activities are all under strain, it is only reasonable that a large portion of the pages of the OFFICIAL JOURNAL should be devoted to information of importance to physicians; even though seemingly far distant from the field of abstract discussion on scientific matters. Consequently, the thought has been constantly kept in mind that word pictures, as true as possible, should each month be so given that all members of the Association, be they in either urban or rural practice, might be able to orient themselves concerning trends, both in scientific and organized medicine, and so visualize not only impending influences of the moment, but also those that are apt to arise in either the near or remote future.

Under instructions from the Council, the officers and members of the House of Delegates of the American Medical Association—supreme parent group of organized medicine in the United States—are on the complimentary mailing list. California's problems are thus regularly brought to the immediate attention of medical leaders in every state in the Union; and it has been gratifying to receive words of commendation for CALIFORNIA AND WESTERN MEDICINE from so many of these colleagues, far distant and in practice under conditions quite different from those that obtain on the Pacific Coast.

Whatever editorial regret exists rests chiefly upon the fact that so large a number of excellent annual session papers must be released each year for publication in other journals. With a membership in excess of six thousand, and the many contributions available and pressing from the programs of both the State Association and its component county societies, there is, however, no other choice. Members who read papers, therefore, howsoever meritorious, are reminded that condensed presentations, if submitted for consideration and possible publication, have a much better chance of acceptance than lengthy articles, coupled often with an excess of expensive tabular matter or illustrations.

The Editor desires to thank the many members who have thus submitted original articles and other contributions, and to express his appreciation to all who, when called upon for special service, have so generously given aid to the OFFICIAL JOURNAL. For this and other reasons, it has been a genuine pleasure to continue to function as editor of CALIFORNIA AND WESTERN MEDICINE.

Respectfully submitted,

George H. Kress, *Editor*.

REPORT OF THE LEGAL DEPARTMENT

To the President and the House of Delegates:

Each year finds the medical profession, as such, subjected to more and more pressure and increasingly violent assaults from organized minorities of one type or another. Of late, certain special interest groups have seemingly acquired a measure of control over government, so that the profession may in the future be faced with governmental intrusion in addition to the activities of private groups. As may be expected, each additional controversy involving the medical profession necessarily increases and extends the duties and labors to be performed by your attorney and his staff.

For the past several years, the report of the legal departmen has shown an increase in the volume of legal work undertaken on behalf of the Association. This year it is necessary, once again, to state that the activities of the legal department are necessarily on the increase.

We will endeavor to review the past year's work as briefly as possible, and at the same time we hope to convey an accurate picture of the various questions referred, and the duties performed.

Corporate Practice.—This department's reports for the past several years have contained paragraphs devoted to the subject of corporate practice. Last year we reported that there was then pending before the California Supreme Court an action entitled: "People of the State of California on the relation of the Board of Medical Examiners vs. Pacific Health Corporation," and that the action involved the right or lack of right of the Pacific Health Corporation (a stock corporation organized for profit) to furnish the services of a selected panel of physicians to its policyholders. We also reported that, at the direction of the Council, we had prepared written briefs in support of the position of the Attorney-General, which was that the Pacific Health Corporation was unlawfully engaged in the corporate practice of medicine. In September, 1938, the California Supreme Court, by a 4-3 decision, decided that the Pacific Health Corporation was engaged in the corporate practice of medicine and that such practice was unlawful. The four justices were of the opinion that the position of the Attorney-General and this office was correct, and they also were apparently of the opinion that a nonprofit corporation defraying the costs of medical service on a periodic payment basis, and not restricting patients' freedom of choice of physician, would not be engaged in the corporate practice of medicine. This decision of the California Supreme Court is of the utmost significance because California Physicians' Service, which was formed pursuant to the direction of the House of Delegates at its special meeting in December, 1938, is a nonprofit corporation providing complete freedom of choice of physician and undertaking to defray the costs of medical care on a periodic payment basis.

After the decision of the California Supreme Court, Pacific Health Corporation petitioned the Supreme Court of the United States for a writ of certiorari. However, the United States Supreme Court recently denied the writ, so that at the present time the decision of the California court is final and conclusive.

County Hospitals.—In May, 1938, the Chairman of the Council appointed a committee, of which Dr. Henry A. Rogers is chairman, to confer with representatives of the various farm groups in this state for the purpose of reaching a solution to the apparent differences of opinion which seemed to exist between the medical profession and farm organizations. Doctors Rogers, Packard, Anderson and Emmons arranged and held several conferences with farm organization representatives and your general counsel; and Mr. Hassard, one of his associates, attended each of them. Many legal problems have arisen in connection with this subject, and a great deal of time has necessarily been spent by the committee and the legal department in their consideration. The satisfactory progress made in this effort to solve the county hospital and other related problems will, no doubt, be reported by Doctor Rogers for the Committee on Farm Organization Conferences, and by Doctor Packard for the Committee on County Hospitals.

Workmen's Compensation Case.—This department's report for the year 1937 contained a résumé of our activities in the case of "Pacific Employers Insurance Company vs. Industrial Accident Commission and Kenneth Tator." At that time we reported that, in the direction of the Council, your general counsel and Mr. Hassard appeared before the California Supreme Court on behalf of several physicians who had rendered professional services to an injured employee, employed in Massachusetts, but injured in California, and whose right to receive compensation in California ws being questioned. We also reported that the California Supreme Court had decided in favor of the injured employee and the physicians; that is, the Supreme Court had decided that compensation was payable in California. Subsequent to our last report, the insurance company involved has appealed to the Supreme Court of the United States. The case was argued orally before the United States Supreme Court by Attorney Frank J. Creede, representing Mr. Tator, and Attorney Everett Corten, representing the Industrial Accident Commission of California, in December, 1938. The case has been fully briefed and is now awaiting decision by the United States Supreme Court.

Engelking vs. Carlson (Res Ipsa Loquitur Case).—In this case the question of law involved is substantially as follows: Is there an inference of negligence which is evidence in favor of the plaintiff in every malpractice action involving an alleged injury received during the course of a major surgical operation? The trial court decided that there was no such inference of negligence, but on appeal the District Court of Appeal held otherwise. Immediately after the decision of the District Court of Appeal, acting pursuant to the direction of the Council, we joined with the attorneys for the defendant physician in an effort to secure a hearing before the Supreme Court of California. A petition for a hearing was prepared and filed, and your general counsel and Mr. Hassard prepared a brief as amici curiae in support of the petition for hearing and presented it to the Supreme Court. The petition was granted and the case was transferred to the Supreme Court, thus automatically terminating the opinion of the District Court of Appeal. The case was orally argued before the Supreme Court late in 1938, your general counsel appearing in court on behalf of the defendant physician (at the request of counsel for the physician). The case is now under submission and a decision may be expected in the near future. This case is of vital importance to all surgeons and to the medical profession generally, because, if it is decided against the defendant, it will further increase the scope of the doctrine of res ipsa loquitur and thereby place a terrific burden and, in our opinion, an unjust responsibility upon all physicians and surgeons undertaking to perform surgical operations.

Osteopathic Cases.—During the past year several problems have arisen with respect to the rights and privileges of osteopaths and osteopathic physicians and surgeons. At the direction of the Council, the legal department has rendered opinions and suggestions to several county societies on this subject. Without going into detail, one typical example may be mentioned. An osteopathic physician and surgeon practicing in a California community contended that he had a legal right to practice in a hospital operated in the community by the municipality, and he threatened to bring suit against the city authorities unless he was permitted to send his patients to the hospital and practice therein. The county medical society requested our assistance, and, after an examination of various decisions throughout the United States, we submitted a written opinion which the county medical society in turn submitted to the city attorney. In our opinion we reviewed cases arising in other states in which it has been held that an osteopath or an osteopathic physician and surgeon may be denied the privileges of public and private hospitals if the hospitals so desire. After this opinion was furnished to the city attorney and to the attorney for the osteopathic physician and surgeon, all threats to sue were discontinued.

Another matter which should be mentioned is the case of *Jordt* vs. *State Board of Education*, which is now pending before the Superior Court in Sacramento. In this action an osteopathic physician and surgeon is suing the State Board of Education for the purpose of requiring it to grant to him a health and development certificate, so that he may qualify as a school physician under the California School Code. At the request of the Attorney-General and at the direction of the Council, this office has kept in touch with the case and has submitted several briefs and memoranda of authority to the Attorney-General's office. The Attorney-General, who represents the State Board of Education, demurred to the complaint, but the demurrer was recently overruled and the case is now ready for trial.

The Humane Pound Initiative.—The Humane Pound Initiative, which was decisively defeated at the last general election in November, 1938, occasioned considerable activity on the part of the legal department. At the direction of the Council, we analyzed each of the terms and provisions of the Humane Pound Initiative and prepared an opinion on its legal features, which was forwarded to the Society for the Promotion of Medical Research. From time to time, at the request of various county medical societies and individual physicians, we further analyzed the initiative, and prepared and submitted various explanatory opinions with respect to its provisions. In addition, your general counsel and his associates did everything in their power to aid in the defeat of the measure.

San Francisco City Employees' Health Insurance System.—In April, 1938, after the Health Service Board of the San Francisco City Employees had adopted a plan for the rendering of medical care, the City and County Controller refused to pay over salary deductions to the Board until the legality of the charter amendment creating a health service system had been finally determined. Thereupon, the Health Service Board commenced a mandamus proceeding in the Supreme Court entitled *"Butterworth* vs. *Boyd."* At the direction of the Council, the legal department followed closely the progress of this case without appearing therein on behalf of any of the parties thereto or as friends of the Court. From time to time reports were made to the Councilors and officers of the Association with respect to the status of the case; and when the Supreme Court, in September, 1938, decided that the charter amendment was constitutional and enforceable, an analysis of the Court's opinion was prepared and furnished to the Association.

Taxation.—For many years the California Medical Association, being a nonprofit, scientific and educational association of doctors of medicine, has been held exempt from most of the great number of taxes levied by Federal, State and local governments. In the past few years many new taxes have been added by Federal and State governments, and there has been a definite tendency to eliminate tax exemptions.

On September 9, 1938, the Commissioner of Internal Revenue of the United States, by a formal ruling, revoked the exemption granted to the California Medical Association many years ago from income, capital stock and excess profit taxes. The existing exemption was based on the fact that the California Medical Association is a nonprofit organization devoted to scientific and educational purposes. The Commissioner, in revoking the prior ruling, stated that the Bureau of Internal Revenue had changed its mind, and no longer considered the California Medical Association to be a scientific and educational organization. A new ruling was immediately issued granting the California Medical Association exemption from income, capital stock and excess profit taxes on the ground that the Association is a "business league." The net effect of this ruling was to leave the Association's exemption from income, capital stock and excess profit taxes undisturbed, but for the first time to subject the Association to Social Security taxes, both Federal and State.

After reviewing authorities and considering all of the surrounding circumstances, the legal department recommended to the Council that it acquiesce in the new ruling of the Commission of Internal Revenue and commence payment of Social Security taxes under Title VIII of the Social Security Act and under the California Unemployment Reserves Act.

In October, 1938, both the Federal and State governments for the first time contended that the California Medical Association was liable for Social Security taxes not only from and after the date of the business league ruling, but also for the years 1936, 1937 and the first nine months of 1938. That is to say, a retroactive effect was sought to be given to the business league ruling. This decision was immediately disputed and a formal protest was submitted to the Commissioner of Internal Revenue.

On March 13, 1939, the legal department was informed that the Treasury Department has decided that the Association must pay a tax plus penalties for the period during which the Department's prior ruling granting an exemption was in full force and effect. Needless to say, this decision is considered erroneous.

Various written documents, including protests, briefs and memoranda, have been prepared, and a number of hearings have been held before Treasury Department officials.

In addition, both the Federal and State governments are now contending that all officers of the California Medical Association, including Councilors and committee chairmen, are the "employees" and subject to payroll taxes. In our opinion, this view is contrary to the law and we are, on behalf of the Association, protesting the departmental rulings.

Malpractice Insurance.—During the past year the legal department has at all times been available to those members of the Association who have desired information and advice with respect to the legal form and legal effect of malpractice insurance policies. A great many members have availed themselves of the services of this department in this regard, so that during the year many opinions have been prepared and submitted on the subject of malpractice insurance. In addition, the legal department keeps in touch with the various surplus line brokers representing Lloyd's underwriters and the American companies in this field, in order to protect and guard the interests of the medical profession.

Medical Service Plan.—Since October, 1938, most of the time of your general counsel and his associate, Mr. Hassard, has been devoted, first, to assisting the special committee of the Council appointed to prepare a medical service plan, and second, after the action of the House of Delegates in Los Angeles, December 18, 1938, to the handling and solution of the multitude of legal problems involved in incorporating and organizing California Physicians' Service. Pursuant to the direction of the Council, the legal department has at all times been available to those officers and members of the Association who have been charged with the duty of effectuating the medical service plan, and since the organization of California Physicians' Service the legal department has carried out all instructions received from the board of trustees of that organization. The immense amount of work involved in formulating a medical service plan on a voluntary monthly prepayment basis can, perhaps, be best expressed by stating that the preparation of the various documents furnished the House of Delegates at its special meeting in Los Angeles constituted only a small portion of the necessary research and labor undertaken.

Legislation.—At the direction of the Council, the legal department has prepared several bills for introduction to the Legislature and, in addition, has prepared amendments to a number of bills introduced by other organizations and groups. Your general counsel and his associate have attended each meeting of the Committee on Public Policy and Legislation, and have at all times endeavored to assist the committee to carrying out its arduous and difficult duties. Over two hundred bills have been analyzed for the committee, so that the Association and its members may be informed with respect to the nature of all legislation relating to the field of medicine now under consideration by the California Legislature. In addition, various memoranda and opinions have been prepared and submitted to the Committee on Public Policy and Legislation regarding pending legislative measures.

Miscellaneous.—During the past year opinions have been requested and furnished dealing with such subjects as disciplinary procedure, the extent of the power of the Medical Society over admissions to membership, legal and ethical aspects of group medical practice, the power of cities to impose license taxes on physicians, the legal effect of medical and hospital indemnity insurance policies, the extent of the power of hospitals to regulate those who may practice therein, and many other things.

An article for the Medical Jurisprudence column in CALIFORNIA AND WESTERN MEDICINE has been prepared each month.

Attendance at conferences of officers, at meetings of the Council, Executive Committee and other standing and special committees, and with the members of a number of county societies where matters of great interest to the medical profession have been considered, has been maintained throughout the year.

It may be proper to state that these matters, covering as they do a wide range of activities, the services of associates of general counsel other than Mr. Howard Hassard, have been found necessary and helpful in the interests of the Association.

Respectfully submitted,
Hartley F. Peart, *General Counsel.*

II

REPORTS OF DISTRICT COUNCILORS

FIRST COUNCILOR DISTRICT

Imperial, Orange, Riverside, San Bernardino, and San Diego Counties

To the President and the House of Delegates:

Our secretary-editor has called for the councilor reports from the nine councilor districts for publication in the Pre-Convention Bulletin of CALIFORNIA AND WESTERN MEDICINE.

Another year has rolled around and medical affairs have seen little change in the "big First District." There has been a noted increase in membership in each of the county societies. Voluntary prepaid hospital service has been purchased by a small number here and there, but the general desire has been for a complete prepaid service.

The county societies in the First District have been visited several times, and once with President-Elect Charles A. Dukes and Secretary-Editor George H. Kress. These men were greeted by large groups, who eagerly listened to the latest word about the California Physicians' Service. None of us wish a change in the present medical relationship, as it now exists, between the doctor and his patient, and none wish to see our profession exploited by an organized group of politicians working under some compulsory plan. It looks as if California was about to be the testing ground. Well, the doctors of medicine of this state are not going to be found unprepared, but will be a united group of over six thousand individuals opposing their regimentation under any other leadership than medical. If group practice must come, let it be medically controlled and directed under a voluntary plan where the patient can select the physician of his choice among those who hold a doctor of medicine license in the State of California.

Respectfully submitted,

Calvert L. Emmons, *Councilor,*
First District.

SECOND COUNCILOR DISTRICT

Los Angeles County

To the President and the House of Delegates:

Decided progress has been made in adding to the membership roll this year, a total net gain of 206 having been recorded.

The parent organization and the various sections and branches have been very active along both scientific and medical economic lines.

With the advent of the California Physicians' Service there has been a marked stimulus to interest in organization and allied matters. The sentiment seems to be overwhelmingly in favor of the plan, and there is no doubt that it will receive enthusiastic support.

Respectfully submitted,

Carl R. Howson, *Councilor,*
Second District.

THIRD COUNCILOR DISTRICT

Kern, San Luis Obispo, Santa Barbara, and Ventura Counties

To the President and the House of Delegates:

As councilor of the Third District, all of the societies were visited with Dr. Charles Dukes, president-elect, and Dr. George Kress, secretary of the California Medical Association. The meetings this year were exceptionally well attended and enthusiastic. In addition to the regular county meetings, Doctors Dukes and Kress and the councilor met with the Santa Maria group, in the northern end of Santa Barbara County, and were entertained there by about twenty members who had been unable to attend the evening before at Santa Barbara.

All the counties in the district have shown a healthy growth, and unusual enthusiasm has been manifested in the important affairs of the California Medical Association. The officers of the component societies have been especially alert and coöperative, and it is apparent that the members of the C. M. A. in the Third District are more alive to the needs and necessities of medicine today than they ever have been before.

Following an exceptionally well put on two-day postgraduate conference in March, 1938, at which more than one hundred registered from the district, the conference was repeated this year along the same lines which were so successful in 1938. It is hoped to make the Santa Barbara conference second to none in the State, and, with the support that has been afforded it and the experience gained in the past two years, it is felt that Santa Barbara can surpass all efforts in 1940.

The coöperation of the Secretary's office and all other State officials is appreciated by all the members of the Third District.

Respectfully submitted,

Louis A. Packard, *Councilor,*
Third District.

FOURTH COUNCILOR DISTRICT

Fresno, Madera, Kings, Tulare, Merced, Mono, Mariposa, Inyo, Calaveras, San Joaquin, Tuolumne and Stanislaus Counties

To the President and the House of Delegates:

A lively interest in the development of California Physicians' Service has been shown throughout the district. Hearty coöperation in establishing the C. P. S. as a going concern may be expected. The defeat of the antivivisection initiative last November was a gratifying demonstration of united action on the part of the profession, pharmacists, nurses, et cetera. Local activity was enthusiastic. Much of value for future contests for the protection of public health was learned.

The San Joaquin County Society, under the leadership of Dr. Charles A. Broaddus, is showing the State what can be done about postgraduate work at home. The plan employed has been commended by the councilor to all other societies in the district.

The councilor has, during the year, visited all societies in the district and has found a ready willingness to coöperate in C. M. A. activities everywhere. The membership is steadily increasing, and society activities, in most instances, are satisfactory. One new county society was recently organized in this district, comprising Inyo and Mono counties. Some change in the councilor district to avoid a trip of almost 1,000 miles to visit this society may be wise.

Service by this councilor on the County Hospital Committee has included conferences with farm organizations and other members of the committee for the development of acceptable changes in the existing laws governing county hospitals, and he believes that, if pending legislation be adopted, it will greatly improve present management of such institutions, benefit the public concerned, and prove of value to the profession.

Respectfully submitted,

A. E. Anderson, *Councilor,*
Fourth District.

FIFTH COUNCILOR DISTRICT

Monterey, San Benito, San Mateo, Santa Clara, and Santa Cruz Counties

To the President and the House of Delegates:

Increasing interest and activity in the problems of the cost of medical care has been manifest in the Fifth District during the past year.

A joint dinner meeting between the Santa Clara County and San Mateo County societies was held at Agnew State Hospital and addressed by President W. W. Roblee and Secretary George H. Kress. A similar joint meeting between Monterey County and Santa Cruz County at Del Monte gave all members in the district an opportunity of becoming better acquainted with our officers.

Monterey County Society is planning to demonstrate their usual hospitality at the annual meeting this year.

Respectfully submitted,

Alfred L. Phillips, *Councilor,*
Fifth District.

SIXTH COUNCILOR DISTRICT

San Francisco County

To the President and the House of Delegates:

The past year has been remarkable for the interest shown by the members of the Sixth District in the attempt of the California Medical Association to build a successful organization through which the cost of sickness can be met by periodic payments.

Our members feel that this has been accomplished through the formation of the California Physicians' Service, and they are united in the determination to do all within their power to help bring success to the new venture.

The usual "county society" problems have been met as a matter more or less of routine. We feel that our strength in unity has grown with the number of our members, which is now the greatest that it has ever been.

Respectfully submitted,
Karl L. Schaupp, *Councilor,*
Sixth District.

SEVENTH COUNCILOR DISTRICT

Alameda and Contra Costa Counties

To the President and the House of Delegates:

The Seventh District, comprising the counties of Alameda and Contra Costa, has shown a favorable condition during the past year.

Alameda County Medical Association has held ten regular meetings, the programs for which were presented in large part by the members of the Association. Three guest speakers appeared before the Association and, in conjunction with the Oakland Forum, a special luncheon meeting honoring Dr. Morris Fishbein, editor of the *Journal of the American Medical Association,* was held.

There has been a steady increase in the growth of the Alameda County Medical Association, forty-five members having been added during the year. Through resignation, death and delinquency of dues, twenty-five members were lost. This leaves an actual net gain of twenty-five members.

The Association has coöperated with city and State health authorities in the establishment of adequate venereal disease clinics, and other matters of public health interest.

The Association of Approved Hospitals has expanded its interests to include a number of neighboring counties.

Alameda County Medical Society notes with pride that 100 per cent of its members were members of the Society for the Promotion of Medical Research, and aided in the defeat of the proposed Humane Pound Act. It is likewise proud of its library, which, in coöperation with Lane Library, is able to bring medical publications to its members.

The Contra Costa County Medical Society has held ten meetings during the year.

There has been an increase in the membership of the Society.

The value of Woman's Auxiliaries in county societies has been demonstrated in Contra Costa County Medical Society during the recent campaign to protect medical research, when the Auxiliary members offered unremitting and effective aid.

Respectfully submitted,
O. D. Hamlin, *Councilor,*
Seventh District.

EIGHTH COUNCILOR DISTRICT

Alpine, Amador, Butte, Colusa, Eldorado, Glenn, Lassen, Modoc, Nevada, Placer, Plumas, Sacramento, Shasta, Sierra, Sutter Tehama, Yolo, and Yuba Counties

To the President and the House of Delegates:

During the past year, visits were made to the various societies in the Eighth District, where meetings were well attended and programs of scientific and practical interest were presented. The members of these societies were found to have a wide and accurate knowledge of medical problems, and were interested in finding ways and means to solve these problems.

With President Roblee and Secretary Kress, official visits were made later in the year, the meetings being well attended and satisfactory.

Respectfully submitted,
F. N. Scatena, *Councilor,*
Eighth District.

NINTH COUNCILOR DISTRICT

Del Norte, Humboldt, Mendocino-Lake, Marin, Napa, Solano, Sonoma and Trinity Counties

To the President and the House of Delegates:

The past year has been a very busy one, as the medical society activities in the ninth district have been on the decided increase.

The Solano County Society held its annual meeting in Vallejo on July 16, entertaining President W. W. Roblee, President-elect Charles Dukes and Secretary-Editor George Kress. This meeting attracted, as usual, medical men from all adjacent county societies.

In May, September, November and December, joint conferences with farm leaders were arranged and held in San Francisco, helping to create a mutual understanding of rural medical needs.

Napa County again held its annual joint meeting with the dentists and attorneys. At the joint meeting with the lawyers, when Mr. Peart was one of the main speakers of the evening, the superior judges, district attorneys and legislators from most of the adjoining counties were present.

The Napa County Annual Jinks Party, held at the Napa Country Club on December 10, was attended by 135, physicians and visitors being present from the entire North Bay area and San Francisco. Dr. Lloyd Kindall's Medical-Dental Band again furnished the main entertainment of the evening. Governor Merriam and several legislators also were present as guests and speakers. These joint meetings should be held by every county medical society in the State, as they help to bring about a better understanding of mutual problems.

In January a district meeting was held at Sonoma to discuss the California Physicians' Service. Every county in the Ninth District was represented, and the action of the special meeting of the House of Delegates held in Los Angeles was freely explained and discussed.

On November 6, 7, and 8, I accompanied President Roblee and Secretary Kress on their trip to the northern counties, holding meetings at Yreka and Eureka, and visiting with doctors at Crescent City and Ukiah. At Ukiah, Doctor Cushman and staff entertained us with a dinner in his house at Talmage. On this trip we inspected, by invitation, the hospital erected at Shasta Dam site, the County Hospital at Yreka and some of the wards at Talmage.

During the year I have made councilor calls upon all of the medical societies in the Ninth District. Several societies have been visited many times. I have attended all councilor and council committee meetings of which I was a member.

Again let me say that, although it has been a very busy year, I have enjoyed to the fullest extent every bit of it.

Respectfully submitted,
Henry S. Rogers, *Councilor,*
Ninth District.

III

REPORTS OF COUNCILORS-AT-LARGE

To the President and the House of Delegates:

This brief report marks another year of effort to lend aid to the members of the medical profession, their individual and organization activities, in advancing the standards of practice and protecting the mutual interests of the people as a whole and the profession.

Many meetings have been attended and important and routine matters deliberated and either settled temporarily or carried on for further consideration until circumstances permitted the adoption of a more mature opinion.

We have started the California Physicians' Service and are working with the hospital service organizations. We are about seven years too late to be effective, but nevertheless should constantly bend every effort to work together in our community interests, which is the philosophy that sustains all of us, irrespective of conditions and actions that may or may not coincide with our personal opinions.

Respectfully submitted,
Harry H. Wilson, *Councilor-at-Large.*

To the President and the House of Delegates:

The main activities of the San Diego area during the past year were those having to do with the election. Not only did we do our bit to defeat the "Humane Pound Act," but we also won out in the local supervisorial race. By so doing we were able to continue the prestige of our County Hospital Committee, which provides a very satisfactory set-up in this county for the care of the indigent sick.

Respectfully submitted,
C. O. Tanner, *Councilor-at-Large.*

To the President and the House of Delegates:

Observation shows both a marked increase on the part of the membership of the California Medical Association in knowledge of and of interest in the important matters now confronting the medical profession.

The question of compulsory or voluntary health insurance is now most important. It still remains for the membership to respond without delay to demands for action by those to whom we entrust our destinies; for there seems to be a determined effort on the part of several factions to regulate the practice of medicine.

Respectfully submitted,
W. H. Kiger, *Councilor-at-Large.*

To the President and the House of Delegates:

As a Councilor-at-large of the Association, I have participated in a number of meetings of the Council and served as a member of the committee which formulated the plan for California Physicians' Service.

The results of these activities are matters of record.

Respectfully submitted,
T. Henshaw Kelly, M.D.,
Councilor-at-large.

To the President and the House of Delegates:

In years during which the Legislature is in session your councilor-at-large must give extra time to the work of the Committee on Public Policy and Legislation. However, he has joined with the Association officers in their visitations to the district in which he is located and has endeavored to be of aid whenever possible.

Respectfully submitted,
Junius B. Harris, *Councilor-at-Large.*

To the President and the House of Delegates:

During the past year considerable time was spent by your Councilor-at-large at committee meetings dealing with questions concerning certain activities relating to the Golden Gate International Exposition.

Still more time was devoted, as chairman, to your Special Committee on Animal Experimentation. This committee was specially concerned with the defeat of the so-called "Humane Pound Bill," an antivivisection measure submitted to the voters at the general election in November, 1938. The chairman was authorized as the committee's representative on the Executive Committee of the California Society for the Promotion of Medical Research, organized in 1915 by medical, educational and business leaders throughout the State, to promote medical research and combat attacks and legislation tending to restrict it. During the year your Councilor-at-large served as chairman of the Campaign Committee of this latter organization.

Considerable time has also been devoted to the work of our San Francisco County Committee on malpractice insurance.

Respectfully submitted,
Philip K. Gilman, *Councilor-at-Large.*

IV

REPORTS OF STANDING COMMITTEES

EXECUTIVE COMMITTEE

T. Henshaw Kelly, Chairman
William W. Roblee, President.
Charles A. Dukes, President-elect.
Howard Morrow, Past President.
Lowell S. Goin, Speaker, House of Delegates.
Karl L. Schaupp, Chairman of the Council.
T. Henshaw Kelly, Chairman, Auditing Committee.
George G. Reinle, Chairman, Committee on Public Relations.
George H. Kress, Secretary-Treasurer—Editor.

To the President and the House of Delegates:

The Executive Committee has had only one meeting this year, the business of the Association having required a sufficient number of Council meetings to make further meetings of the Executive Committee unnecessary.

The minutes of the Executive Committee are incorporated in the Council minutes.

Respectfully submitted,
T. Henshaw Kelly, M.D., *Chairman.*

AUDITING COMMITTEE

Executive Group

T. Henshaw Kelly, Chairman, 1939
O. D. Hamlin, 1939
Philip K. Gilman, 1939

To the President and the House of Delegates:

The Auditing Committee has conducted its usual duties during the past year and the Auditor's report of the status of finances, which is the main part of this report, is kept on file in the offices of the Association and will be filed at the Association desk during the meeting at Del Monte.

Respectfully submitted,
T. Henshaw Kelly, M.D., *Chairman.*

COMMITTEE ON ASSOCIATED SOCIETIES AND TECHNICAL GROUPS

Executive Group

John V. Barrow, Chairman, 1940
Edwin L. Bruck, 1941
W. H. Geistweit, 1939

To the President and the House of Delegates:

The Committee on Associated Societies and Technical groups begs to submit its usual report along the line of its usual activities.

Reports from Dr. W. H. Geistweit, Jr., of San Diego, and Dr. Edwin L. Bruck of San Francisco, coincide with my own activities in aiding the Auxiliary in an advisory capacity at various times.

We had under plans the listing of the voting capacity of physicians and patients if and when called upon by the State Council or the Committee on Legislation. The essential need of this work was forestalled by other methods of handling the voting campaign in the last election, and is practically always provided for by the Committee on Public Relations and other committees of the Association.

Each of us has contacted the nursing organizations of our communities, and Doctor Geistweit has rendered very valuable service with the nurses in his district, in particular in consideration of their proposed legislation aiming at a separate nursing board. The opposition encountered from certain other committees in this matter suggests again a closer relation between our committee and other committees when matters concerning one of our groups are being considered.

We regret the failure of coördinating efforts between the Nursing Association and the State Medical Association before the Nurses' Association began formulating its bill. However, our feeble efforts to forestall this situation were unavailing, although Doctor Geistweit was particularly active in his section in trying to arrive at a better understanding.

We respectfully request the approval of the Council in the promulgation of conjoint meetings all over the State among local societies of each associated organization. We would like to be able to find out the plans of these associations and technical groups before any action is taken by them in matters of mutual interest.

In our doing this we do not wish to be thought to supplant the work of any other committees of the Association. Our findings will serve only for the information of the State Council, to which they will be submitted as early as possible.

Respectfully submitted,
John V. Barrow, *Chairman.*

COMMITTEE ON HEALTH AND PUBLIC INSTRUCTION

Executive Group

Fred B. Clarke, Chairman, 1941
W. R. P. Clark, 1939 Benjamin W. Black, 1940

To the President and the House of Delegates:

The most important work that this committee has done this year was to appoint, at the suggestion of the Council, a subcommittee on "Pneumonia Control."

The personnel of this committee is as follows: Roy E. Thomas, chairman, Los Angeles; Lambert B. Coblentz, San Francisco; Edwin L. Bruck, San Francisco; Karl F. Meyer, San Francisco; William P. Shephard, San Francisco; George D. Maner, Los Angeles, and Daniel B. Comstock, Los Angeles.

The purpose of this committee is to familiarize the doctors of California as to the latest methods of treating pneumonia.

The committee has urged the development of the Speakers' Bureau in the larger county units of the State, with the expectation that they can contribute to the education of the public in matters relating to health.

Respectfully submitted,
Fred B. Clarke, *Chairman.*

COMMITTEE ON HISTORY AND OBITUARIES

Executive Group

Frank R. Makinson, Chairman, 1941
A. Elmer Belt, 1940 J. Marion Read, 1939
The Secretary, ex-officio The Editor, ex-officio

To the President and the House of Delegates:

Your Committee on History and Obituaries is pleased to report that its work is progressing slowly, but continuously; however, committee meetings have not been part of the star performance.

The biographical data blanks have been sent out and we trust that everyone will avail himself of the opportunity to assist the committee in its work by filling out the blanks completely, and returning them to the headquarters of the Association.

It is felt that one accomplishment is of special interest, namely, a portrait of Benjamin Franklin Keene. This was found in Georgia, and permission has been obtained to photograph it. Doctor Keene was president of the California Medical Association, having served during the year 1856.

It is recommended that five hundred dollars be allotted and ear-marked for the use of this committee in purchasing old journals, books, and other archives pertaining to the history of our Association.

Seventy-three of our members passed to their great reward during 1938. May their souls rest in peace! The entire list of names appears in the Supplement to CALIFORNIA AND WESTERN MEDICINE bearing the date of March, 1939. It seems only fitting that three names should be especially mentioned: those of Emmet Rixford of San Francisco, Joseph P. Widney of Los Angeles, and Joseph M. King of Los Angeles, who served as our president in 1932.

Respectfully submitted,
Frank R. Makinson, *Chairman.*

COMMITTEE ON HOSPITALS, DISPENSARIES, AND CLINICS

Executive Group

W. E. Mitchell, Chairman, 1939
Karl L. Schaupp, 1940 George Dawson, 1941

To the President and the House of Delegates:

The Committee on Hospitals, Dispensaries, and Clinics has not met during the past year. Therefore, no problems have been referred to this committee.

Respectfully submitted,
W. E. Mitchell, *Chairman.*

COMMITTEE ON INDUSTRIAL PRACTICE

Executive Group

Philip Stephens, Chairman, 1939
Harry E. Zaiser, 1940 Morton R. Gibbons, 1941

To the President and the House of Delegates:

Little has transpired officially or unofficially in connection with the above committee which would be of sufficient interest to embody in a formal report.

Inasmuch as there has been a change in the State Administration, there are many rumors as to certain action or actions to be taken by the Administration in regard to our State Compensation Insurance Act. However, there is nothing of sufficient authenticity to record. One of the most favorable rumors to be mentioned is that the present Administration has signified a sincere desire to make a broader and more equitable distribution of the State industrial fund work than was allegedly made by the previous Administration. No doubt, there will be some attempt made by legislative enactment to change features of the act, but none as yet has come to our notice of sufficient importance to record. There is still a growing tendency on the part of large groups, especially the metropolitan districts, to get a large majority of the accidental insurance work in industry and a marked lessening in the number of cases distributed to individual surgeons amply fitted professionally to give full care to this type of minor and major surgery. From the standpoint of the insurance carrier it might be stated that one reason for this condition is due either to the inability, inexperience or negligence on the part of the individual doctors to render proper, sufficient and understandable reports so necessary to conduct the lay activity of the carriers' business that there is a tendency on the part of these carriers to send work to the larger groups who have ample clerical force and enterprise to make these objections rare and almost unknown. It would seem to us that certain information, educational in character, should be disseminated either locally or by the State educational group, which would be of considerable value to the younger or older men who desire to do this particular class of work, especially those located in the metropolitan and industrial communities.

Respectfully submitted,
Philip Stephens, *Chairman.*

COMMITTEE ON MEDICAL DEFENSE

Executive Group

George G. Reinle, Chairman, 1938
Fred R. De Lappe, 1939 John P. Nuttall, 1940

To the President and the House of Delegates:

Medical defense (malpractice defense) is a subject of increasing interest to all physicians, because, during the past twenty-five years, members of the medical profession have presumably been selected as a group from whom money, under threat of scandalous publicity, might be more or less easily extracted. So numerous have been such onslaughts in the courts, and so susceptible to specious arguments have so many juries shown themselves to be, as evidenced in heavy verdicts for plaintiff patients, that several casualty and insurance companies, who formerly operated in California, have entirely withdrawn from the state. For the same reason, the premium rates of the remaining companies have not only been greatly increased, but the amount of coverage indemnity has been considerably lessened.

It is true that part of this may be due to the psychology of the times—the desire on the part of many persons to try to get "easy money," that is, money without working for it; but, in addition, another factor is the type of patient enumerated above, with an indiscreet physician, who consciously or unconsciously had spoken out of turn in unnecessary disparagement of a colleague, in combination with an attorney-at-law willing, on a contingent basis, to enter suit, if costs were covered. These, as in many past malpractice cases that have occupied the time of courts, all continue to operate.

Which emphasizes the merit of the plan in vogue in some of the New England, and also some of the Pacific states, that in any case of a threatened malpractice suit, a special committee of physicians calls before it all physicians who have seen the patient making the complaint, and all physicians whose testimony was apt to be called for in court; a possible instrument of great value to members, both of the legal and medical professions. Your Committee on Medical Defense is making a study of these plans, and hopes in due time to present the same to the State Association Council, and with its permission, to the County Medical Societies. It may be taken for granted that the malpractice problem is one worthy of earnest attention, and if a plan could be put into operation whereby malpractice suits would be reduced in number, and the insurance coverage costs also lessened, then such an effort should be made.

Respectfully submitted,
George G. Reinle, *Chairman.*

COMMITTEE ON MEDICAL ECONOMICS

Executive Group

John H. Graves, Chairman, 1941
Edward M. Pallette, 1940 William R. Molony, Sr., 1939

To the President and the House of Delegates:

The usual activity during the past year in regard to health insurance has brought a large volume of problems before this committee for study and analysis.

Suggestions and conclusions of the committee are from time to time submitted for consideration to the Public Relations Committee.

A written report was submitted at the Conference of Standing Committees and County Secretaries at their meeting in San Francisco on February 27, 1939.

Respectfully submitted,
John H. Graves, *Chairman.*

COMMITTEE ON MEDICAL EDUCATION AND MEDICAL INSTITUTIONS

Executive Group

Loren R. Chandler, Chairman, 1939
John B. Doyle, 1940 B. O. Raulston, 1938

To the President and the House of Delegates:

Your Committee on Medical Education and Medical Institutions has coöperated with the four medical schools in California and, with your Committee on Postgraduate Education, has considered matters referred to it by the Association, appointing a subcommittee on tuberculosis to make a study of the facilities in this State for the treatment of tuberculosis and other pulmonary diseases, and to coöperate with all existing agencies for the improvement of necessary conditions.

Your committee sees no need to report on the work of each medical school in California, as their activities are described adequately from time to time in bulletins and reports.

Respectfully submitted,
L. R. Chandler, *Chairman.*

COMMITTEE ON MEMBERSHIP AND ORGANIZATION

Executive Group

George D. Maner, Chairman, 1941
G. Dan Delprat, 1940 Dewey R. Powell, 1939
The Secretary, ex-officio

To the President and the House of Delegates:

The Committee on Membership and Organization of the California Medical Association held no formal meetings during the year.

The efficiency of the component county association organizations, together with specific campaigns for membership in some of the county units, necessarily preclude the activities and functions of this committee.

The responsibilities of seeing that all eligible physicians are informed as to the advantages of membership is in the hands of the various component county units.

Recent resolutions adopted by the House of Delegates of the American Medical Association relative to accredited hospitals permitting only members of component societies on their staffs has created a problem for admission committees, especially in some of the metropolitan centers, in that many undesirable physicians now are applying for membership so that they will be able to be listed as staff members of accredited hospitals.

The total membership of the California Medical Association as of January 1 was 6,077, as compared with 5,867 in 1937. The number of deaths was 78; a net gain in membership of 132.

The total number of physicians in the State in 1938 was 9,785; thus, there are 3,698 physicians who are nonmembers at present.

An analysis shows that of those nonmembers about 5 or 6 per cent have been former members who have been dropped for nonpayment of dues or other causes, and that about 15 per cent are physicians fifty-five years of age or older who in the past have never been desirous of associating with organized medicine and thus are a questionable value at the present time.

The survey also shows that about 10 per cent of the nonmembers fall in the advertising or quack classification and are not eligible. About 2 per cent are independents or malcontents and would not join under any conditions.

At present it is estimated that of the 3,698 nonmembers only about 1,500 or thereabouts should be considered as desirable.

As the necessity arises your committee stands ready to initiate and carry through such plans and programs as are deemed best and wisest.

It is the opinion of your committee that any plans proposed for intensive membership drives by county units should be considered carefully and thoughtfully by their governing bodies and the question of eligibility should be investigated carefully before election. However, all county society secretaries should inform desirable nonmembers as to the advantages of becoming members of their county societies.

Respectfully submitted,
George D. Maner, *Chairman.*

COMMITTEE ON POSTGRADUATE ACTIVITIES

Executive Group

John C. Ruddock, Chairman, 1940
F. E. Clough, 1941 F. F. Gundrum, 1939
The Secretary, ex-officio

To the President and the House of Delegates:

The Committee on Postgraduate Activities has had several meetings during the past year. The committee has carried on extensive correspondence between the office of the Association, among themselves, and with various committees and units throughout the State.

The committee feels that the precedent, which has been established by the publication of a five-year study program for graduates in medicine, is very worth while and the changes which have appeared in the last issue, called Supplement Number Two, have been caused by the experience of its application for the past year, as well as by recommendations from various specialized units throughout the State. The subjects as listed in the Supplement are not intended for didactic work in medicine. They are not designed to provide physicians for any specialty, but they are intended to afford to units and localities an opportunity to form a program, and to obtain speakers, so that the members of that locality may remain abreast of scientific programs and apply what they gain in their daily practice with an understanding of the underlying problems and fundamentals.

The Council of the California Medical Association has recognized the fact that organized medicine has an obligation to fulfill, and has promptly carried out the recommendations of the committee in order to afford an opportunity to its membership to engage in continuous educational study with a minimum of inconvenience, time and expense.

It has been stressed, from time to time, that the California Medical Association is not running a postgraduate school. However, the Association, through its executive offices at 450 Sutter Street, San Francisco, will list and attempt to make available to the membership, in various communities throughout the State, opportunities for postgraduate conferences and study. The details of the conferences in the localities must, of necessity, be left to the local committee. It is not the purpose of the committee to assign speakers. However, the committee, after circulation of numerous questionnaires during the past year, has accumulated the names of men who are available to localities for certain of the specified courses as listed in the Supplement. These names will be furnished the local committees in order to assist them to invite the speakers. This committee wishes to stress that they would desire the local committee to issue its own invitations to the speakers, asking them to conform, as closely as possible, to the outline in the prescribed curriculum as noted in the Supplement to California and Western Medicine.

Due to the large geographical extent of the State of California, with its mountains which divide the State into such definite areas, the committee feels that for certain northern areas teams should be made up, and dates so arranged, that a number of conferences can be given by one team in one circuit. Traveling in certain areas must be by auto and, therefore, conferences can only be arranged during certain seasons of the year.

It is extremely gratifying to the committee to find such widespread response in answer to its questionnaires for participation in these postgraduate conferences.

There has been a prompt response and coöperation by the four medical schools in this state, as well as excellent response by various organized commissions and allied medical and social groups.

The committee has been unable, as yet, to work out a satisfactory program with the California State Board of Health whereby the use of Social Security funds can be utilized in financing that part of the program which deals with child and maternal welfare. Recently, a program was devised whereby the various child and maternal welfare programs have been designated, but these are entirely under the sponsorship of the Board of Health, and our participation is only in assisting in the program. It is hoped that further participation in postgraduate study under the Social Security funds available to this state can be attained. The California Medical Association has the machinery, it has the program, it has the men who desire the training, and the Association is anxious to place this program into effect. The legal restrictions that have been placed around the

Social Security funds have prevented, until this time, a full participation in it.

It is hoped that the work of this Committee, which has now been started and is now on a definite basis, will be continued. The Committee has felt that clinical rather than didactic lectures are the programs of choice for postgraduate conferences. The Committee realizes that there are certain members of the California Medical Association who will not embrace the opportunities for postgraduate conferences which are offered to them. However, the opportunities will be available, and if they are not taken advantage of, then those men will lose who do not embrace them.

The Committee wishes at this time to thank the Council of the California Medical Association, the committees and such allied organizations and sections who have assisted them in the preparation of the supplement, and the membership at large for the interest they have taken in postgraduate activities.

Respectfully submitted,
John C. Ruddock, *Chairman.*

COMMITTEE ON PUBLICATIONS

Executive Group

Ralph Eusden, Chairman, 1940
Ruggles A. Cushman, 1941 Oscar Reiss, 1939
The Editor, ex-officio The Secretary, ex-officio

To the President and the House of Delegates:

The report of the Editor of California and Western Medicine is to be considered in connection with this Committee's report.

The Publications Committee recommends as worthy of notice the editorial policy, the physical arrangement of contents, and the contents itself of the official organ, and commends the Editor on the fact of this Journal's high standards.

We are now in the midst of changing social and economic conditions and, just as throughout time medicine has adapted itself to social changes, we shall again adjust to the changing social customs and aspirations.

Of necessity, editorial comment and publication of articles pertinent to the Medical Association's position in this economic-political situation have been provided, to the end that our membership may be well and honestly advised.

Too long our light has been under a bushel, and we are now placed in the position of taking the offensive. Let this be increasingly emphasized.

Our Journal continues to hold an outstanding position in the field of state and regional journals.

This being a legislative year for the state, the Committee urges that you thoroughly read your Journal for initiative guidance.

As stated in a previous committee report, the policy of the Editor in publishing State Association, convention papers and original papers, and giving preference to clinical presentations, has been maintained. When, because of the manifold number of papers, some, of sheer necessity, could not be published, effort has been made to get publication in corresponding journals.

The Committee recommends the whole-hearted support of the Council and House of Delegates to the present and projected character and policy of California and Western Medicine.

The Committee further wishes to express complete confidence in and respect for the Editor of California and Western Medicine, and to bid him godspeed in going forward.

Respectfully submitted,
Ralph B. Eusden, *Chairman.*

COMMITTEE ON PUBLIC POLICY AND LEGISLATION

Executive Group

Junius B. Harris, Chairman, 1941
E. T. Remmen, 1940 The President-elect, ex officio
The President, ex officio T. Henshaw Kelly, 1939

To the President and the House of Delegates:

The California Legislature is now in session. A progress report was made at the Conference of County Society Secretaries on February 25. At the annual session at Del Monte, further report will be made. Members who desire information concerning pending legislation will find comments thereon in California and Western Medicine, March, 1939, on page 213. Proposed legislation having relation to medical practice and public health standards, as presented this year, if anything, is of a more serious nature than usual. The alert interest of all members of the Association is urged.

Respectfully submitted,
Junius B. Harris, *Chairman.*

COMMITTEE ON PUBLIC RELATIONS

The Committee on Public Relations consists of the chairmen of the following standing committees and of certain general officers of the Association, all serving ex officio. The chairman of the committee is George G. Reinle, the secretary is George H. Kress. The director of the Department of Public Relations is George H. Kress. The chairman of the Committee on Public Relations is ex officio a member of the Council.

Fred B. Clarke, Chairman, Committee on Health and Public Instruction.
W. Earl Mitchell, Chairman, Committee on Hospitals, Dispensaries, Clinics.
Philip Stephens, Chairman, Committee on Industrial Practice.
George G. Reinle, Chairman, Committee on Medical Defense.
George D. Maner, Chairman, Committee on Membership and Organization.
John H. Graves, Chairman, Committee on Medical Economics.
Junius B. Harris, Chairman, Committee on Public Policy and Legislation.
Alson R. Kilgore, Chairman, Cancer Commission.
John C. Ruddock, Chairman, Committee on Postgraduate Activities.
William W. Roblee, President of California Medical Association.
Charles A. Dukes, President-elect.
George H. Kress, Secretary-Treasurer.

Communications for the Public Relations Department should be addressed to the Director, George H. Kress, M. D., Room 2004, 450 Sutter Street, San Francisco.

To the President and the House of Delegates:

During the last year the problems confronting the medical profession in California were of a special and important nature, such as the State Humane Pound Act and plans for medical service on a periodic payment basis, these demanding attention not only from one, but from several committees and groups, as well as of the Council.

As regards the first measure, Proposition No. 2, which was presented to the voters as an initiative proposition on the November, 1938, ballot, the Director of the Department of Public Relations sent out literature from the Central Office of the Association, to all County Societies and their members, outlining plans of procedure whereby all agencies friendly to medical research, were brought into the battle against that proposed law, which went down to deserved defeat.

The Chairman and Secretary of the Committee, with President-elect Dukes, attended the second annual session of the Pacific States Medical Executives Conference in Portland. The exchange of views by representatives from the various Pacific states was most profitable to all who were in attendance. Of particular interest were the discussions on malpractice defense procedures. The Committee had as its representative at the special session of the American Medical Association House of Delegates in Chicago, President W. W. Roblee.

Owing to the heavy drain on the Association's finances, only one regularly called special meeting was held, pending matters being decided in good part through exchange of views by letters.

This Committee can fill an important need, and during the coming year, renewed effort will be made to have it function in line with original plan.

Respectfully submitted,
George G. Reinle, *Chairman.*

COMMITTEE ON SCIENTIFIC WORK

Executive Group

George H. Kress, Chairman ex officio
Lemuel P. Adams, 1940 F. M. Pottenger, 1939
J. Homer Woolsey, 1938
William H. Barrow, (Section on Medicine)
Ray B. McCarty, (Section on Surgery)

To the President and the House of Delegates:

The schedules for the twelve scientific sections of the California Medical Association, as given in this annual session program of the Pre-Convention Bulletin Supplement to the April issue of California and Western Medicine, represent the joint efforts of the State Committee on Scientific Work and the Section Secretaries, and it is the hope of those who have played a part in arranging for the section activities that what has been planned will be carried through in a manner in every way acceptable and pleasing to members in attendance.

Hence, the committee will appreciate criticisms or suggestions for betterment; for successful annual sessions hinge, in a large measure, on attention to even minor details. Memoranda or suggestions for changes may be left with the registration clerks or Association secretary, or mailed to the Central Office, 450 Sutter Building, San Francisco.

Respectfully submitted,
George H. Kress, *Chairman.*

CANCER COMMISSION

Executive Group

Charles A. Dukes, Chairman
Otto Pflueger, Secretary
Orville Meland, Secretary for Southern Section
A. Herman Zeiler Harold Brunn
Gertrude Moore Henry J. Ullmann
Clarence G. Toland

To the President and the House of Delegates:

The Cancer Commission is primarily interested in professional education. During the past few months we have been active in furthering professional education along two lines:

(*a*) Postgraduate. A short time ago each member received a supplement to California and Western Medicine, prepared by Doctor Ruddock and his committee. In this brochure, wherein are listed a number of topics, are a number relating to cancer. We have submitted names of qualified men to appear on the programs dealing with malignant conditions. It is proposed to send out teams of three men, comprised of a clinician, a pathologist, and a radiologist, to conduct a half-day meeting. They will hold clinics, present slides, and discuss the clinical course, diagnosis, and treatment pertaining to the particular subject under discussion.

(*b*) Creation of a new section at the conference held on the Sunday before the annual meeting of the State Association. Heretofore, the Commission has sponsored the pathologic and radiologic conferences, at which specialists in these divisions have taken part. It is now proposed to have a section for the general men and surgeons. It is hoped that fifty men will register and bring their microscopes. At this meeting the pathology will be presented and explained, with comments on treatment by a surgeon and radiologist.

(*c*) Pathology and radiology meetings were sponsored by the Commission at the State meeting in Pasadena and also a mid-winter conference on pathology in Los Angeles in December. All of these were very well attended.

At the present time the Commission is undertaking a survey of the cancer clinics throughout the state, and letters have been sent to all the county secretaries asking them to forward to us a list of all the cancer clinics established in each county. This is being undertaken with the idea of lending approval to such clinics as warrant it, depending upon their standards of operation.

In order to reach younger men in the medical schools, on approval of the Council, a copy of the report of the Cancer Commission studies has been sent to each senior and junior student in all the medical schools in the state, as well as to the house staffs of the large hospitals.

Lay education, though looked upon as a vital phase of the cancer program, has been carried out only indirectly, in that members of the Commission have acted in an executive capacity for the Women's Field Army campaign of the American Society for the Control of Cancer. During this last fall it was suggested that the Woman's Auxiliary to the State Association take part in this work, and with the approval of the Council this was done. The success of this plan remains to be seen. We frequently see patients visiting physicians earlier as a result of this campaign.

Respectfully submitted,
Alson R. Kilgore, *Chairman.*

V

REPORTS OF SPECIAL AND COUNCIL COMMITTEES

COMMITTEE ON MEDICAL RESEARCH

Executive Group

Philip K. Gilman, Chairman
Loren R. Chandler Charles A. Dukes

To the President and the House of Delegates:

Your Committee on Medical Research is pleased to report defeat at the hands of the voters of California of the so-called "State Humane Pound Law" at the election in November last.

Since the election, your committee as a whole has been less active.

Following the decisive defeat of the antivivisection pound act, the members of your committee and many members of the California Society for the Promotion of Medical Research felt that the time had arrived when a real humane pound bill should be introduced at the present session of the Legislature at Sacramento.

Your chairman has, at the request of the Council of the California Medical Association, coöperated in drawing up such a bill for introduction by our Legislative Committee.

Respectfully submitted,
P. K. Gilman, *Chairman.*

COMMITTEE ON LOCAL ARRANGEMENTS: ANNUAL SESSION AT DEL MONTE, MAY 1-4, 1939

Executive Group

Mast Wolfson, Chairman
Alfred L. Phillips Curtis B. Gorham
W. M. Gratiot H. R. Lusignan
Association Secretary ex-officio

To the President and the House of Delegates:

Several meetings have taken place with both the local and the central committee members. Plans are well in hand and things are shaping up so that members may enjoy themselves to the fullest extent in many diversified fields. Entertainment will be organized, from dancing to golf, fishing, trap shooting, etc., so bring the necessary equipment to suit your particular need. We hope to make this a great and enjoyable meeting.

Respectfully submitted,
Mast Wolfsohn, *Chairman.*

COMMITTEE ON HOSPITALS

Executive Group

Louis A. Packard, Chairman
Axcel E. Anderson Calvert L. Emmons

To the President and the House of Delegates:

Your Committee on Hospitals has been active throughout the past year. Continued study of the county hospitals and the problems associated with them have been carefully reviewed.

The most important accomplishment, we feel, is the relationship established between the California Medical Association and the Farm Bureau Federation and allied groups. Bitter opponents in the past, these groups, through round-table conferences, have ironed out their difficulties and in so doing come to the conclusion that both groups were trying to arrive at the same destination by different paths. At this time compatibility of thought and action has been reached, and legislation was introduced by the farm group which follows the ideas developed in conferences.

It is hoped that future years will see the harmony now existing continued and extended to other fields.

Respectfully submitted,
Louis A. Packard, *Chairman.*

SUB-COMMITTEE ON PNEUMONIA CONTROL

Executive Group

Roy E. Thomas, Chairman
William P. Shepard, Secretary
Edwin L. Bruck Lambert B. Coblentz
Karl F. Meyer George D. Maner
Daniel D. Comstock

To the President and the House of Delegates:

The Committee on Pneumonia Control was authorized to function as a subcommittee of the standing Committee on Health and Public Instruction. The subcommittee in turn has been functioning through two subgroups, one for the northern, the other for the southern end of the State. We have also acted in conjunction with the California Medical Association Committee on Postgraduate Activities. A detailed report will appear in California and Western Medicine.

Respectfully submitted,
Roy E. Thomas, *Chairman.*

COMMITTEE ON SYPHILIS

Executive Group

Howard Morrow, Chairman
Charles W. Barnett William H. Goeckerman

To the President and the House of Delegates:

The venereal disease control program administered by the Bureau of Venereal Diseases, State Department of Health, has continued to expand during the past year. There has been increasing coöperation on the part of physicians in private practice and general approval of the control measures that have been adopted.

The number of cases of syphilis reported has continued to increase. This is illustrated by the following figures as provided by the State Department of Health: 1936—11,725, 1937—17,282, 1938—23,313. There has been marked expansion of clinic resources. Treatments for syphilis administered in clinics during the past three years are as follows: 1936—206,185, 1937—301,185, 1938—458,138. The number of clinic centers where treatment is available has been increased in the past two years from 70 to 110. During the past year there has been expansion of clinic facilities in Los Angeles City and the following counties: Imperial, Santa Barbara, Monterey, Santa Cruz, Fresno, Contra Costa, San Francisco, Sonoma, and to lesser degree in other counties.

Sufficient drugs for 427,611 treatments were distributed free to private physicians by the State Department of Health during 1938.

There are now twenty-four full-time health departments taking care of 81½ per cent of the population of the State. Through funds provided by the State Department of Health, twenty-one physicians received postgraduate training in venereal disease control at the Curriculum in Public Health at the University of California during the past year. Ten conferences on syphilis were held before county medical societies. Pamphlets pertaining to diagnosis and treatment of syphilis were mailed by the State Department of Health to approximately 5,000 physicians.

Public Health laboratory services have been rendered more available to physicians in private practice for tests on indigent and marginal patients. A mailing dark-field service was inaugurated by the State Laboratory.

A number of county medical societies have actively participated in local educational programs and in the development of more adequate local facilities for the control of syphilis. This committee has encouraged such activity and has coöperated in every way possible with the official agencies assigned to carry out the venereal disease control activities.

Respectfully submitted,
Howard Morrow, *Chairman.*

SPECIAL COMMITTEE ON A BASIC SCIENCE LAW

Executive Group

George H. Kress, General Chairman
Morton R. Gibbons, Chairman (for Bay Region)
Edward M. Pallette, Chairman (for Southern California)
Junius B. Harris, Chairman (for remainder of State)

To the President and the House of Delegates:

States in which multiple healing-art boards of examiners have received legal recognition must expect to witness, when their legislatures are in session, more or less constant attempts by "new" cultist groups, to secure legal sanction.

California has just such "multiple healing-art boards": (1) Board of Medical Examiners; (2) Board of Osteopathic Examiners; (3) Board of Chiropractic Examiners. Among these the Medical Board exists through legislative enactment, but the Osteopathic and Chiropractic Boards were created through initiative vote of the citizenry.

A group that has been recurrently knocking at the door of the California Legislature is that which calls itself "Naturopathic." In the present session of the California Legislature, this year's Naturopathic effort (Assembly Bill 1203) was submitted to the legislators on January 23, and a vigorous educational campaign is now being waged by the disciples to secure legal recognition.

Nonsectarian or regular medicine does not demand that a commonwealth refuse to grant recognition to sectarian practitioners of the healing art, provided that, at least, fundamental standards of preliminary education be complied with. Healing-art practice, with responsibility for the health and lives of fellow humans, demands that every licensed practitioner, no matter to what group he may belong, should have that basic education giving warrant of mental capacity to grasp the significance of changes in the diagnosis and treatment of disease and injury. It is just there that a Basic Science law is of value in the protection of the health and lives of citizens.

The essential provision of most basic science laws lies in this: that, prior to the right of any individual to take an examination for licensure by his respective board, he shall have filed with that body a certificate, showing that he has passed the examination of the Basic Science Board. The preliminary education usually demanded is at least the equivalent of a four-year high school course, plus one or two years of liberal arts work, such as are given in the freshman and sophomore years of a state university course. Certainly, that is not too much to ask, and nothing less should be accepted by a state.

Had not the State Humane Pound Act initiative thrust itself into the foreground at the November, 1938, state election, it is more than probable that an initiative petition for a Basic Science law would have been submitted to the people at that time. This subject has been repeatedly discussed in California and Western Medicine during the last ten years, and in the April, 1938 Pre-Convention

Bulletin, on page 51, is given a list of references to articles upon the theme which have appeared in the OFFICIAL JOURNAL. Members, consequently, who are interested should consult the bibliography to be found there.

The California Medical Association House of Delegates, in years gone by, have authorized the Council to proceed with a Basic Science initiative, but each time unforeseen contingencies have arisen to prevent the carrying out of these instructions.

Since the next state election will be held in November, 1940, and the preparation of an initiative law and the necessary securing of signatures is a task requiring months of thought and effort, it is suggested that the House of Delegates, at the Del Monte session in May, 1939, will indicate its wishes in this most important matter. The files of the Special Committee, to whom was delegated this study during the last ten years, will be turned over to whomsoever is placed in charge, because the plans will need much continued thought and work.

Respectfully submitted,
George H. Kress, *General Chairman.*

COMMITTEE ON CANCER EXHIBIT: GOLDEN GATE INTERNATIONAL EXPOSITION

Executive Group

T. Henshaw Kelly, Chairman
Edward M. Pallette
Charles A. Dukes
Karl F. Meyer
Hartley F. Peart

To the President and the House of Delegates:

The Council of the California Medical Association appropriated funds from the Herzstein Bequest to build and maintain an exhibit in the Hall of Science at the Golden Gate International Exposition, on cancer.

The committee, in coöperation with Mr. Milton Silverman, Director of the Hall of Science, created the exhibit to answer in the present state of our knowledge the questions, What is Cancer? How can it be discovered? What can be done for it? and, What is the probable future course of cancer research?

The committee is grateful to Mr. Silverman for his interest, help and coöperation, and the exhibit was ready when the Fair opened.

Respectfully submitted,
T. Henshaw Kelly, M.D., *Chairman.*

ADDENDUM*

MINUTES OF THE MEETING OF THE COUNTY SECRETARIES OF THE CALIFORNIA MEDICAL ASSOCIATION †

The meeting of the County Secretaries of the California Medical Association was held in the Franciscan Room of the Sir Francis Drake Hotel, February 25, 1939.

CALL TO ORDER

The meeting was called to order by Dr. Robert A. Peers, who had been designated to preside. County Secretaries present were:

Robert A. Peers	Placer County Society
M. M. Booth	Napa County Society
Lester R. Nielson	Fresno County Society
Joseph S. Woolford	Humboldt County Society
C. S. Campton	Kern County Society
Victor W. Hart	Siskiyou County Society
Hoyt R. Gant	Stanislaus County Society
Leon M. Swift	Yuba-Sutter County Society
T. E. Albers	Sonoma County Society
George D. Maner	Los Angeles County Society
E. M. Bingham	San Luis Obispo County Society
A. A. Morrison	Ventura County Society
Glenn Curtis	Orange County Society
A. E. Varden	San Bernardino County Society
Thomas A. Card	Riverside County Society
Herbert Archibald	Monterey County Society
William A. Clarke	Imperial County Society
Samuel R. Randall	Santa Cruz County Society
John W. Green	Solano County Society
Glenn E. Millar	Sacramento County Society
George H. Rohrbacher	San Joaquin County Society
Carl W. Clark	Marin County Society

Also present were:

George H. Kress	Association Secretary
Ruggles Cushman	Delegate from Mendocino County

PURPOSE OF MEETING AND QUESTIONS SUBMITTED

Doctor Peers explained that the purpose of the meeting was to afford an opportunity for the Secretaries to debate informally various questions which had been sent to Doctor Kress for discussion at this meeting. Doctor Peers stated also that it would be in order for this body to make suggestions and recommendations. The questions were taken up in the following order:

⁂

1. Question presented by Doctor Bingham of San Luis Obispo:

What is the present status concerning the A.M.A. Survey of Medical Care in the counties represented by the Secretaries present at the meeting?

The general opinion seemed to be that too great a burden had been placed on the County Secretaries, and a number of those present stated that apparently the County Society members felt the same way, as the percentage of completed returns was very small. Dr. George Maner of Los Angeles suggested that this be referred to the Council, and that the Council be requested to reaffirm its stand on this matter; that the Committee of Five had submitted this information in the form of the California Medical Economics Survey.

⁂

2. Question presented by Doctor Woolford of Humboldt:

What is the best method of publicizing and selling California Physicians' Service to the public? When are we going to present this, and how are we going to do it?

Dr. George Maner reported regarding the Questions and Answers submitted by the Trustees of the C.P.S. to the Los Angeles Medical Association for use in their Bulletin. Doctor Maner reports that these are of much value.

Doctor Maner made the suggestion that C.P.S. Questions and Answers, similar to those furnished to the Los Angeles County Medical Association, be furnished to all County Societies.

The suggestion was made that the C.P.S. Questions and Answers be printed in CALIFORNIA AND WESTERN MEDICINE.‡

⁂

3. Doctor Clarke of Imperial County, asked about Postgraduate Clinics.

Because this matter is No. 10 of Part 5 of the general program, this question was referred to the general meeting.

⁂

4. Question presented by Doctor Clarke of Imperial County:

How will the present status of the insurance plan affect smaller communities?

This matter was referred to the general meeting, as Part 2 of the program is a symposium on medical service activities.

⁂

5. Doctor Clark of Marin County, asks:

What part should the County Society play in putting over physicians' health insurance plan?

Doctor Booth stated that he felt every possible effort should be made to get the insurance plan operating in smaller communities as quickly as in San Francisco and in Los Angeles. Doctor Booth felt that our Secretaries' group should stress the importance of getting the group operating in small communities.

---

* This addendum is given place in the Pre-Convention Bulletin because of the importance of the services rendered to organized medicine by the secretaries of the component county medical societies.

† Meeting was held at the mid-year Conference of Officers of the California Medical Association and of Secretaries of component County Medical Societies at the Sir Francis Drake Hotel, San Francisco, on Saturday, February 25, 1939.

‡ The questions and answers were printed in CALIFORNIA AND WESTERN MEDICINE, March, 1939, issue, on page 247.

* * *

6. Doctor Morrison of Ventura County:

In re Public Health Advisory Committee of Ventura County.

Doctor Morrison explained how, in Ventura County, a Public Health Advisory Committee had been formed, which is made up of representative members of all county organizations. The Committee has been advisory to the Board of Supervisors and has proved of great value. These county organizations consist of such groups as P.-T.A., Women's Luncheon Clubs, Chambers of Commerce, Service Clubs, etc. Doctor Morrison is Chairman of the Educational Committee. He feels that great good has resulted from the activities of this Public Health Advisory Committee, and that this work could be duplicated to advantage in other small communities.

* * *

7. Questions presented by Doctor Booth of Napa County:

Regarding the mileage charges of general practitioners outside of small towns? Regarding question of fees for x-ray services?

These matters were referred to the general session.

* * *

8. Question presented by Doctor Swift of Yuba-Sutter County:

Regarding C.M.A. Insurance Plan: How are they to be brought before the people, and how is the plan going to be sold?

Doctor Swift stated that in his district, three or four private insurance agencies are selling health and hospital insurance through that field, and it is about all worked, and we are wondering how this Association insurance is going to be worked out in this community?

County Secretaries refer this to the General Session for discussion.

* * *

9. Question presented by Doctor Peers of Placer County:

Proposed Amendment to Constitution, which would provide for life membership in California Medical Association, upon payment of a stipulated fee after a membership of twenty years.

Doctor Peers explained that, as men become advanced in years, with steadily-decreasing incomes, it not infrequently becomes difficult to meet the annual dues. Doctor Peers felt that if there were an amendment to the Constitution whereby it would be possible to secure life membership after a certain age by the payment of a stipulated fee, much embarrassment could be saved these older practitioners. Doctor Peers suggested the age of sixty. In order to safeguard the plan, he suggested that only those members who had been active members for twenty consecutive years could be eligible, and then only when endorsed for life membership by their County Societies. This provoked considerable discussion, all of which was favorable; the only difference of opinion being as to details, such as the age-limit or the amount of the stipulated fee. It was moved by Doctor Curtis of Orange County, and seconded by Doctor Card of Riverside County, that the Secretaries suggest that the Council appoint a committee to study such an amendment to the Constitution, whereby, upon the payment of $100, after a membership of twenty years in the California Medical Association and upon reaching the age of sixty years, a member may be made a life member of the California Medical Association. Motion carried. Doctor Hart of Siskiyou, suggested that a member who has had a membership in the California Medical Association for twenty years, upon reaching the age of seventy-five, be automatically made a life member of the California Medical Association, without the payment of additional dues or assessments.

* * *

10. Question presented by Doctor Peers of Placer County:

Discussion of health studies of educational institutions, such as high schools, junior colleges, by members of the County Medical Societies.

In explanation, Doctor Peers read a letter from the Principal of the Placer Union High School and of the Placer Junior College, asking for a survey by the County Medical Society and for suggestions as to how best these institutions could handle their public-health problems. After discussion, Doctor Card suggested that the following recommendation be made to the Council:

"It is the sense of the Secretaries of the County Societies that some unified action or course be prescribed, whereby the medical societies could be of definite help in these problems of school examinations."

There was discussion by Doctors Maner, Nielson, Green, and Doctor Card, after which Doctor Card made the motion, which was seconded by Doctor Varden. Motion carried.

* * *

11. Question presented by Doctor Green of Solano County:

Can some measure be designated whereby a doctor may file a suit in reply to the damages to his personal reputation after a malpractice suit has been filed against him?

Referred to General Session.

* * *

12. Presented by Doctor Green of Solano County:

Suggested that perhaps, through the operation of the C.P.S., many patients would ultimately seek city doctors and city hospitals rather than those in their own territories.

Referred to the General Session, the Council and, by suggestion of Doctor Kress, to the California Physicians' Service.

* * *

13. Question presented by Doctor Packard, Councilor for the Third District:

Question was regarding special license plates for automobiles of Doctors of Medicine.

It was stated that some time ago the Council dismissed a plan to ask for a special auto license plate for M.D.'s. On inquiry, it is found that in many of the smaller cities, local laws concerning parking, etc., are set aside for M.D.'s, if they have a distinguishing plate or mark on their car. This is of distinct advantage in many places. Many members of component societies might favor this, if it were brought to their attention.

The motion was made by Doctor Woolford of Humboldt County, as follows:

It is the feeling of the secretaries of component county societies that if an emblem be put on cars it be the official emblem of the American Medical Association. Motion seconded by Doctor Nielson of Fresno County, and carried.

* * *

14. Doctor Kress suggested that the Secretaries hold a follow-up or supplementary meeting to this conference, say of one or two hours' duration on the Sunday afternoon preceding the annual session in Del Monte. He stated he would send out blanks and get the reaction of the Secretaries regarding this proposed meeting.

* * *

15. Doctor Maner of Los Angeles, asks that the major topic for the meeting, if held, be concerned with scientific programs in county societies.

ADJOURNMENT

The meeting was adjourned at 10:35 a. m.

Respectfully submitted,
Robert A. Peers, *Chairman.*

HISTORIC POINTS OF INTEREST OF MONTEREY, CAPITAL OF OLD CALIFORNIA

Monterey, romantic capital of old California from 1776 to the end of 1849—and de facto from 1770 to 1776—was the political and social center of the vast empire of Spain and of Mexico that stretched from the Rockies to the Pacific and from the Oregon line to the Rio Grande and the Gila.

Though many interesting buildings from Colonial days have disappeared, more have survived than in any other city in the Far West—a half-hundred, many surrounded by their old gardens. Thus Old Monterey "where America began in the West" takes on the aspect of a national monument.

The following places are directly on the route indicated on map. (Copies of map may be secured at the Hotel Del Monte desk):

1. *Royal Presidio Chapel* of San Carlos de Borromeo de Monterey. Founded on June 3, 1770, to become the Mission church at the port, it became instead the church for the Spanish colonists and soldiers. The present Presidio Chapel was dedicated in 1795. It has been in continuous use since that date and is the only Presidio Church in California to survive.

2. *Casa Madariaga.* Originally a simple adobe of the Mexican era.

3. *Casa Pacheco.* Built in the 1840's. Restored in 1929.

4. *Casa Abrego.* Built in the 1840's by Don José Abrego, it was noted for its hospitality. Restored and owned by a well-known artist.

5. *Site of Washington Hotel.* First hotel in California.

6. *Robert Louis Stevenson House.* Old "French Hotel," where Robert Louis Stevenson spent the fall months of 1879 in a room on the second floor, facing west. Wrote "Vendetta of the West," essay on "Thoreau," blocked out "Amateur Emigrant" and "Prince Otto" in the old house. Descended the stairs on the west side to take his dinners with Jules Simoneau, the old French philosopher, who was also a famous cook. His restaurant was made world-famous by Robert Louis Stevenson through his gratitude to his kindly benefactor. Only remaining house in the West occupied by Robert Louis Stevenson.

7. *Site of "El Cuartel."* First American Capitol west of the Rocky Mountains. In part now occupied by the Chamber of Commerce building.

8. *Site of Simoneau's Restaurant.* A favorite spot of Robert Louis Stevenson.

9. *Headquarters of General José Castro.* See marker, which also indicates position of

10. *The Bull and Bear Pit* of old Spanish and Mexican days.

11. *Cooper House.* Built by Don Juan Bautista Cooper for his bride, Dona Encarnacion Vallejo, it comes down from the early Mexican period. Don Juan was one of the first Yankee skippers to settle in Monterey.

12. *Casa Amesti.* One of the finest examples of Old Monterey domestic architecture. Built in the early '30's by Don José Amesti for his daughter as a wedding gift when she became the bride of James McKinley.

13. *Casa De la Torre.* (Adobe Gift and Book Shop) the "Green Adobe." It was the home and court of Alcalde José Joaquin de la Torre, who held office when the Americans captured the Old Capitol.

14. *Stokes House* is one of the distinguished old adobes of the brave, gay days when California was young. Built in the '30's by Doctor Stokes. Many famous balls were held in its large sola, mostly cascaron bailes.

15. *The Gutierrez* adobes, diagonally across the street, adorn Main Street (Calle Principal in the days before the Gringo came).

16. *The "House of Four Winds"* derived its name from the weather vane on its roof. Built by Thomas Oliver Larkin. The adobe is said to have served the early American administration as a hall of records. Restored and owned by the Women's Civic Club.

17. *Sherman Quarters,* where General William Tecumseh Sherman lived while serving Colonel Richard D. Mason, military governor of California, as adjutant-general. General Henry W. H. Halleck occupied a log cabin near by.

18. *The Larkin House* was built in 1835 by Thomas Oliver Larkin for his residence and his merchandise store, the entrance to the latter on Jefferson Street. From 1842 to 1844 the picturesque adobe was the American consulate, its owner the only consul from the United States to Mexico. The house was the rendezvous for all English-speaking foreigners, particularly Americans, from the late '30's and the scene of notable hospitality. The house is now owned and occupied by a granddaughter of the astute American consul. The gardens, surrounded by a characteristic tile-topped stone wall, are enchanting.

19. *Colton Hall* was ready for occupancy in the spring of '49, having been built by the Rev. Walter Colton, Yankee alcalde, from the proceeds of fines of gamblers and wine-bibbers, together with the proceeds of sales of town lots. It was designed for a meeting-place (upper floor) and for school purposes. Here it was that the First Constitution of California was written—September to October, 1849. Recent research, however, has proved that it was not the first American Capitol of California. El Cuartel, torn down in the late '80's, had that honor.

The old Monterey calaboose adjoins the "Constitution Hall" (1854). Many impromptu hangings took place here without "benefit of clergy" or consent of the law, notably that of Anastasio Garcia, a famous "bad man."

20. *Brown-Underwood Adobe.* See marker.

21. *Casa Vasquez.* Home of a sister of Tiburcio Vasquez, Monterey's own bandit. Originally a one-story adobe.

22. *Gordon House.* Built in early 1850's of milled lumber brought from Australia.

23. *Casa de la Torre.* Built for Don José Joaquin de la Torre, alcalde of the Old Capital.

24. *Casa Serrano* was built by Don Florencio Serrano, alcalde under the Mexican régime. Still owned by the Serrano family. (Now Cademartori's.)

25. *Merritt House* in a large formal garden (next to church). Built by Judge Merritt in the '60's.

26. *Casa Soberanes, "House of the Blue Gate,"* is easily identified. It was built in the early Mexican regime by Don Felicano Soberanes, who married one of the beautiful daughters of Don Ignacio Vallejo. Restored by present owner.

27. *Henry House,* where Miss Lou Henry became the bride of young Herbert Hoover.

28. *California's "First Theatre."* Built by Jack Swan (who came to Monterey in 1843) for a lodging house and saloon for sailors like himself; the adobe has experienced a variety of scenes—resort for whalers, a saloon, and the first building in California where an admittance charge was made for a theatrical performance. The first troupers were made up of members of Stevenson's New York Regiment while garrisoned in Monterey in 1848. Owned by the State of California and administered by the State Park Commission. Open from 1 to 5. Free.

29. *Casa de Oro* (House of Gold). Adobe where miners during the gold-rush days used to leave their pokes for safekeeping.

30. *Casa Verde.* where Charles Warren Stoddard wrote many of his California stories and poems. He passed his last days in the Parshley house on Larkin Street, between Franklin and Scott. His grave is in the old Monterey cemetery on El Estero.
